Release 0.10.0

Feature Labs, Inc.

May 29, 2020

GETTING STARTED

1 Quick Start	3
Index	285

EvalML

EvalML is an AutoML library that builds, optimizes, and evaluates machine learning pipelines using domain-specific objective functions.

Combined with [Featuretools](#) and [Compose](#), EvalML can be used to create end-to-end machine learning solutions for classification and regression problems.

QUICK START

```
[1]: import evalml
      from evalml import AutoClassificationSearch
```

1.1 Load Data

First, we load in the features and outcomes we want to use to train our model

```
[2]: X, y = evalml.demos.load_breast_cancer()
```

1.2 Configure search

EvalML has many options to configure the pipeline search. At the minimum, we need to define an objective function. For simplicity, we will use the F1 score in this example. However, the real power of EvalML is in using domain-specific *objective functions* or *building your own*.

Below EvalML utilizes Bayesian optimization (EvalML's default optimizer) to search and find the best pipeline defined by the given objective.

```
[3]: automl = AutoClassificationSearch(objective="f1",
                                     max_pipelines=5)
```

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

```
[4]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
      ↪size=.2)
```

When we call `.search()`, the search for the best pipeline will begin. There is no need to wrangle with missing data or categorical variables as EvalML includes various preprocessing steps (like imputation, one-hot encoding, feature selection) to ensure you're getting the best results. As long as your data is in a single table, EvalML can handle it. If not, you can reduce your data to a single table by utilizing [Featuretools](#) and its Entity Sets.

You can find more information on pipeline components and how to integrate your own custom pipelines into EvalML [here](#).

```
[5]: automl.search(X_train, y_train)
```

```
*****
* Beginning pipeline search *
*****

Optimizing for F1.
Greater score is better.

Searching up to 5 pipelines.
Allowed model families: linear_model, random_forest, catboost, xgboost

FigureWidget({
  'data': [{ 'mode': 'lines+markers',
             'name': 'Best Score',
             'type': ...

Random Forest Binary Classification...    60%|         | Elapsed:00:23
XGBoost Binary Classification Pipel...    80%|        | Elapsed:00:24
Optimization finished                     80%|        | Elapsed:00:24
```

1.3 See Pipeline Rankings

After the search is finished we can view all of the pipelines searched, ranked by score. Internally, EvalML performs cross validation to score the pipelines. If it notices a high variance across cross validation folds, it will warn you. EvalML also provides additional [data checks](#) to analyze your data to assist you in producing the best performing pipeline.

```
[6]: automl.rankings

[6]:   id          pipeline_name      score \
0    2      Logistic Regression Binary Pipeline  0.986129
1    1      Cat Boost Binary Classification Pipeline  0.977312
2    4      XGBoost Binary Classification Pipeline  0.973803
3    3      Random Forest Binary Classification Pipeline  0.966876
4    0      Mode Baseline Binary Classification Pipeline  0.770273

      high_variance_cv          parameters
0          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
1          False  {'Simple Imputer': {'impute_strategy': 'most_f...
2          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
3          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
4          False  {'strategy': 'random_weighted'}
```

1.4 Describe pipeline

If we are interested in see more details about the pipeline, we can describe it using the `id` from the rankings table:

```
[7]: automl.describe_pipeline(3)

*****
* Random Forest Binary Classification Pipeline *
```

(continues on next page)

(continued from previous page)

```

Problem Type: Binary Classification
Model Family: Random Forest
Number of features: 30

Pipeline Steps
=====
1. One Hot Encoder
   * top_n : 10
2. Simple Imputer
   * impute_strategy : most_frequent
   * fill_value : None
3. Random Forest Classifier
   * n_estimators : 100
   * max_depth : 6

Training
=====
Training for Binary Classification problems.
Total training time (including CV): 1.8 seconds

Cross Validation
-----

```

	F1	Accuracy	Binary	Balanced Accuracy	Binary	Precision	AUC	Log _{Loss}
→ Loss	Binary	MCC	Binary	# Training	# Testing			
0	0.958		0.947			0.940	0.948	0.982
→	0.323	0.887	303.000	152.000				
1	0.974		0.967			0.967	0.979	0.995
→	0.099	0.930	303.000	152.000				
2	0.969		0.960			0.954	0.959	0.996
→	0.104	0.915	304.000	151.000				
mean	0.967		0.958			0.954	0.962	0.991
→	0.175	0.911	-	-				
std	0.008		0.010			0.013	0.015	0.008
→	0.128	0.022	-	-				
coef of var	0.008		0.010			0.014	0.016	0.008
→	0.730	0.024	-	-				

1.5 Select Best pipeline

We can now select best pipeline and score it on our holdout data:

```

[8]: pipeline = automl.best_pipeline
    pipeline.score(X_holdout, y_holdout, ["f1"])

[8]: OrderedDict([('F1', 0.9722222222222222)])

```

We can also visualize the structure of our pipeline:

```

[9]: pipeline.graph()

[9]:

```

1.6 Whats next?

Head into the more in-depth automated walkthrough [here](#) or any advanced topics below.

1.6.1 Install

EvalML is available for Python 3.6+. It can be installed by running the following command:

```
pip install evaml --extra-index-url https://install.featurelabs.com/<license>/
```

Dependencies

Optional Dependencies

EvalML includes several dependencies in `requirements.txt` by default: `xgboost` and `catboost` support pipelines built around those modeling libraries, and `plotly` and `ipywidgets` support plotting functionality in automl searches. These dependencies are recommended but are not required in order to install and use EvalML. To install these additional dependencies run `pip install -r requirements.txt`.

Core Dependencies

If you wish to install EvalML with only the core required dependencies, include `--no-dependencies` in your EvalML `pip install` command, and then install all core dependencies with `pip install -r core-requirements.txt`.

Windows

The `XGBoost` library may not be pip-installable in some Windows environments. If you are encountering installation issues, please try installing XGBoost from [Github](#) before installing EvalML.

1.6.2 Objective Functions

The **objective function** is what EvalML maximizes (or minimizes) as it completes the pipeline search. As it gets feedback from building pipelines, it tunes the hyperparameters to build optimized models. Therefore, it is critical to have an objective function that captures the how the model's predictions will be used in a business setting.

List of Available Objective Functions

Most AutoML libraries optimize for generic machine learning objective functions. Frequently, the scores produced by the generic machine learning objective diverge from how the model will be evaluated in the real world.

In EvalML, we can train and optimize the model for a specific problem by optimizing a domain-specific objectives functions or by defining our own custom objective function.

Currently, EvalML has two domain specific objective functions with more being developed. For more information on these objective functions click on the links below.

- [Fraud Detection](#)
- [Lead Scoring](#)

Build your own objective Functions

Often times, the objective function is very specific to the use-case or business problem. To get the right objective to optimize requires thinking through the decisions or actions that will be taken using the model and assigning the cost/benefit to doing that correctly or incorrectly based on known outcomes in the training data.

Once you have determined the objective for your business, you can provide that to EvalML to optimize by defining a custom objective function. Read more [here](#).

1.6.3 Building a Fraud Prediction Model with EvalML

In this demo, we will build an optimized fraud prediction model using EvalML. To optimize the pipeline, we will set up an objective function to minimize the percentage of total transaction value lost to fraud. At the end of this demo, we also show you how introducing the right objective during the training is over 4x better than using a generic machine learning metric like AUC.

```
[1]: import evalml
      from evalml import AutoClassificationSearch
      from evalml.objectives import FraudCost
```

Configure “Cost of Fraud”

To optimize the pipelines toward the specific business needs of this model, you can set your own assumptions for the cost of fraud. These parameters are

- `retry_percentage` - what percentage of customers will retry a transaction if it is declined?
- `interchange_fee` - how much of each successful transaction do you collect?
- `fraud_payout_percentage` - the percentage of fraud will you be unable to collect
- `amount_col` - the column in the data the represents the transaction amount

Using these parameters, EvalML determines attempt to build a pipeline that will minimize the financial loss due to fraud.

```
[2]: fraud_objective = FraudCost(retry_percentage=.5,
                                interchange_fee=.02,
                                fraud_payout_percentage=.75,
                                amount_col='amount')
```

Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set

```
[3]: X, y = evalml.demos.load_fraud(n_rows=2500)
```

	Number of Features
Boolean	1
Categorical	6
Numeric	5
Number of training examples: 2500	
Labels	

(continues on next page)

(continued from previous page)

```
False      85.92%
True       14.08%
Name: fraud, dtype: object
```

EvalML natively supports one-hot encoding. Here we keep 1 out of the 6 categorical columns to decrease computation time.

```
[4]: X = X.drop(['datetime', 'expiration_date', 'country', 'region', 'provider'], axis=1)

X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
↳ size=0.2, random_state=0)

print(X.dtypes)

card_id          int64
store_id         int64
amount          int64
currency         object
customer_present bool
lat             float64
lng             float64
dtype: object
```

Because the fraud labels are binary, we will use `AutoClassificationSearch`. When we call `.search()`, the search for the best pipeline will begin.

```
[5]: automl = AutoClassificationSearch(objective=fraud_objective,
                                     additional_objectives=['auc', 'f1', 'precision'],
                                     max_pipelines=5,
                                     optimize_thresholds=True)

automl.search(X_train, y_train)

*****

coef of var  0.134 0.026 0.001    0.001         -         -
```

Evaluate on hold out

Finally, we retrain the best pipeline on all of the training data and evaluate on the holdout

```
[9]: best_pipeline.fit(X_train, y_train)
[9]: <evalml.pipelines.classification.baseline_binary.ModeBaselineBinaryPipeline at_
↳ 0x7f05347534a8>
```

Now, we can score the pipeline on the hold out data using both the fraud cost score and the AUC.

```
[10]: best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
[10]: OrderedDict([('AUC', 0.5), ('Fraud Cost', 0.0013994749372859567)])
```

Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the fraud cost objective to see how the best pipelines compare.

```
[11]: automl_auc = AutoClassificationSearch(objective='auc',
                                          additional_objectives=['f1', 'precision'],
                                          max_pipelines=5,
                                          optimize_thresholds=True)

automl_auc.search(X_train, y_train)

*****
* Beginning pipeline search *
*****

4    0  Mode Baseline Binary Classification Pipeline  0.500000

      high_variance_cv      parameters
0          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
1          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
2          False  {'Simple Imputer': {'impute_strategy': 'most_f...
3          False  {'One Hot Encoder': {'top_n': 10}, 'Simple Imp...
4          False  {'strategy': 'random_weighted'}

```

```
[13]: best_pipeline_auc = automl_auc.best_pipeline
```

```

# train on the full training data
best_pipeline_auc.fit(X_train, y_train)

```

```

[13]: <evalml.pipelines.classification.xgboost_binary.XGBoostBinaryPipeline at_
      ↪0x7f0530fc2fd0>

```

```
[14]: # get the fraud score on holdout data
```

```
best_pipeline_auc.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[14]: OrderedDict([('AUC', 0.8474750830564783), ('Fraud Cost', 0.03655681280302016)])
```

```
[15]: # fraud score on fraud optimized again
```

```
best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[15]: OrderedDict([('AUC', 0.5), ('Fraud Cost', 0.0013994749372859567)])
```

When we optimize for AUC, we can see that the AUC score from this pipeline is better than the AUC score from the pipeline optimized for fraud cost. However, the losses due to fraud are over 3% of the total transaction amount when optimized for AUC and under 1% when optimized for fraud cost. As a result, we lose more than 2% of the total transaction amount by not optimizing for fraud cost specifically.

This happens because optimizing for AUC does not take into account the user-specified `retry_percentage`, `interchange_fee`, `fraud_payout_percentage` values. Thus, the best pipelines may produce the highest AUC but may not actually reduce the amount loss due to your specific type fraud.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

1.6.4 Building a Lead Scoring Model with EvalML

In this demo, we will build an optimized lead scoring model using EvalML. To optimize the pipeline, we will set up an objective function to maximize the revenue generated with true positives while taking into account the cost of false

positives. At the end of this demo, we also show you how introducing the right objective during the training is over 6x better than using a generic machine learning metric like AUC.

```
[1]: import evalml
      from evalml import AutoClassificationSearch
      from evalml.objectives import LeadScoring
```

Configure LeadScoring

To optimize the pipelines toward the specific business needs of this model, you can set your own assumptions for how much value is gained through true positives and the cost associated with false positives. These parameters are

- `true_positive` - dollar amount to be gained with a successful lead
- `false_positive` - dollar amount to be lost with an unsuccessful lead

Using these parameters, EvalML builds a pipeline that will maximize the amount of revenue per lead generated.

```
[2]: lead_scoring_objective = LeadScoring(
      true_positives=1000,
      false_positives=-10
    )
```

Dataset

We will be utilizing a dataset detailing a customer's job, country, state, zip, online action, the dollar amount of that action and whether they were a successful lead.

```
[3]: from urllib.request import urlopen
      import pandas as pd

      customers_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_
      ↪apps/customers.csv')
      interactions_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_
      ↪ml_apps/interactions.csv')
      leads_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_
      ↪apps/previous_leads.csv')
      customers = pd.read_csv(customers_data)
      interactions = pd.read_csv(interactions_data)
      leads = pd.read_csv(leads_data)

      X = customers.merge(interactions, on='customer_id').merge(leads, on='customer_id')
      y = X['label']

      X = X.drop(['customer_id', 'date_registered', 'birthday', 'phone', 'email',
                  'owner', 'company', 'id', 'time_x',
                  'session', 'referrer', 'time_y', 'label'], axis=1)

      display(X.head())
```

	job	country	state	zip	action	amount
0	Engineer, mining	NaN	NY	60091.0	page_view	NaN
1	Psychologist, forensic	US	CA	NaN	purchase	135.23
2	Psychologist, forensic	US	CA	NaN	page_view	NaN
3	Air cabin crew	US	NaN	60091.0	download	NaN
4	Air cabin crew	US	NaN	60091.0	page_view	NaN

Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set

EvalML natively supports one-hot encoding and imputation so the above NaN and categorical values will be taken care of.

```
[4]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
      ↪size=0.2, random_state=0)

print(X.dtypes)

job           object
country       object
state         object
zip           float64
action        object
amount        float64
dtype: object
```

Because the lead scoring labels are binary, we will use `AutoClassificationSearch`. When we call `.search()`, the search for the best pipeline will begin.

```
[5]: automl = AutoClassificationSearch(objective=lead_scoring_objective,
      ↪additional_objectives=['auc'],
      ↪max_pipelines=5,
      ↪optimize_thresholds=True)

automl.search(X_train, y_train)

Number of features: 6

Pipeline Steps
=====
1. Baseline Classifier
    * strategy : random_weighted

Training
=====
Training for Binary Classification problems.
Objective to optimize binary classification pipeline thresholds for: <evalml.
↳objectives.lead_scoring.LeadScoring object at 0x7f9924224208>
Total training time (including CV): 0.6 seconds

Cross Validation
-----
          Lead Scoring    AUC # Training # Testing
0          16.742 0.500    2479.000  1550.000
1          15.600 0.500    2479.000  1550.000
2          15.649 0.500    2480.000  1549.000
mean          15.997 0.500          -          -
std           0.646 0.000          -          -
coef of var    0.040 0.000          -          -
```

Evaluate on hold out

Finally, we retrain the best pipeline on all of the training data and evaluate on the holdout

```
[9]: best_pipeline.fit(X_train, y_train)
[9]: <evalml.pipelines.classification.baseline_binary.ModeBaselineBinaryPipeline at 0x7f98cd88db70>
```

Now, we can score the pipeline on the hold out data using both the lead scoring score and the AUC.

```
[10]: best_pipeline.score(X_holdout, y_holdout, objectives=["auc", lead_scoring_objective])
[10]: OrderedDict([('AUC', 0.5), ('Lead Scoring', 0.0)])
```

Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the lead scoring objective to see how the best pipelines compare.

```
[11]: automl_auc = evalml.AutoClassificationSearch(objective='auc',
                                                additional_objectives=[],
                                                max_pipelines=5,
                                                optimize_thresholds=True)

automl_auc.search(X_train, y_train)

      ↪objective])
```

```

[14]: OrderedDict([('AUC', 0.9402462979752191),
                  ('Lead Scoring', -0.04299226139294927)])
```

When we optimize for AUC, we can see that the AUC score from this pipeline is better than the AUC score from the pipeline optimized for lead scoring. However, the revenue per lead gained was only \$7 per lead when optimized for AUC and was \$45 when optimized for lead scoring. As a result, we would gain up to 6x the amount of revenue if we optimized for lead scoring.

This happens because optimizing for AUC does not take into account the user-specified true_positive (dollar amount to be gained with a successful lead) and false_positive (dollar amount to be lost with an unsuccessful lead) values. Thus, the best pipelines may produce the highest AUC but may not actually generate the most revenue through lead scoring.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

1.6.5 Custom Objective Functions

Often times, the objective function is very specific to the use-case or business problem. To get the right objective to optimize requires thinking through the decisions or actions that will be taken using the model and assigning a cost/benefit to doing that correctly or incorrectly based on known outcomes in the training data.

Once you have determined the objective for your business, you can provide that to EvalML to optimize by defining a custom objective function.

How to Create a Objective Function

To create a custom objective function, we must define 2 functions

- The **“objective function”**: this function takes the predictions, true labels, and any other information about the future and returns a score of how well the model performed.
- The **“decision function”**: this function takes prediction probabilities that were output from the model and a threshold and returns a prediction.

To evaluate a particular model, EvalML automatically finds the best threshold to pass to the decision function to generate predictions and then scores the resulting predictions using the objective function. The score from the objective function determines which set of pipeline hyperparameters EvalML will try next.

To give a concrete example, let's look at how the fraud detection objective function is built.

```
[1]: from evalml.objectives.binary_classification_objective import
      ↪ BinaryClassificationObjective
      import pandas as pd

class FraudCost(BinaryClassificationObjective):
    """Score the percentage of money lost of the total transaction amount process due
    ↪ to fraud"""
    name = "Fraud Cost"
    greater_is_better = False
    score_needs_proba = False

    def __init__(self, retry_percentage=.5, interchange_fee=.02,
                  fraud_payout_percentage=1.0, amount_col='amount'):
        """Create instance of FraudCost

        Arguments:
            retry_percentage (float): What percentage of customers that will retry a
            ↪ transaction if it
                is declined. Between 0 and 1. Defaults to .5

            interchange_fee (float): How much of each successful transaction you can
            ↪ collect.
                Between 0 and 1. Defaults to .02

            fraud_payout_percentage (float): Percentage of fraud you will not be able
            ↪ to collect.
                Between 0 and 1. Defaults to 1.0

            amount_col (str): Name of column in data that contains the amount.
            ↪ Defaults to "amount"
        """
        self.retry_percentage = retry_percentage
        self.interchange_fee = interchange_fee
        self.fraud_payout_percentage = fraud_payout_percentage
        self.amount_col = amount_col

    def decision_function(self, ypred_proba, threshold=0.0, X=None):
        """Determine if a transaction is fraud given predicted probabilities,
        ↪ threshold, and dataframe with transaction amount

        Arguments:
            ypred_proba (pd.Series): Predicted probabilities
            X (pd.DataFrame): Dataframe containing transaction amount
            threshold (float): Dollar threshold to determine if transaction is
            ↪ fraud

        Returns:
            pd.Series: Series of predicted fraud labels using X and threshold
        """
        if not isinstance(X, pd.DataFrame):
            X = pd.DataFrame(X)
```

(continues on next page)

(continued from previous page)

```

if not isinstance(ypred_proba, pd.Series):
    ypred_proba = pd.Series(ypred_proba)

transformed_probs = (ypred_proba.values * X[self.amount_col])
return transformed_probs > threshold

def objective_function(self, y_true, y_predicted, X):
    """Calculate amount lost to fraud per transaction given predictions, true_
    values, and dataframe with transaction amount

    Arguments:
        y_predicted (pd.Series): predicted fraud labels
        y_true (pd.Series): true fraud labels
        X (pd.DataFrame): dataframe with transaction amounts

    Returns:
        float: amount lost to fraud per transaction
    """
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)

    if not isinstance(y_predicted, pd.Series):
        y_predicted = pd.Series(y_predicted)

    if not isinstance(y_true, pd.Series):
        y_true = pd.Series(y_true)

    # extract transaction using the amount columns in users data
    try:
        transaction_amount = X[self.amount_col]
    except KeyError:
        raise ValueError("`{}` is not a valid column in X.".format(self.amount_
        col))

    # amount paid if transaction is fraud
    fraud_cost = transaction_amount * self.fraud_payout_percentage

    # money made from interchange fees on transaction
    interchange_cost = transaction_amount * (1 - self.retry_percentage) * self.
    interchange_fee

    # calculate cost of missing fraudulent transactions
    false_negatives = (y_true & ~y_predicted) * fraud_cost

    # calculate money lost from fees
    false_positives = (~y_true & y_predicted) * interchange_cost

    loss = false_negatives.sum() + false_positives.sum()

    loss_per_total_processed = loss / transaction_amount.sum()

    return loss_per_total_processed

```

1.6.6 Setting up pipeline search

Designing the right machine learning pipeline and picking the best parameters is a time-consuming process that relies on a mix of data science intuition as well as trial and error. EvalML streamlines the process of selecting the best modeling algorithms and parameters, so data scientists can focus their energy where it is most needed.

How it works

EvalML selects and tunes machine learning pipelines built of numerous steps. This includes encoding categorical data, missing value imputation, feature selection, feature scaling, and finally machine learning. As EvalML tunes pipelines, it uses the objective function selected and configured by the user to guide its search.

At each iteration, EvalML uses cross-validation to generate an estimate of the pipeline's performances. If a pipeline has high variance across cross-validation folds, it will provide a warning. In this case, the pipeline may not perform reliably in the future.

EvalML is designed to work well out of the box. However, it provides numerous methods for you to control the search described below.

Selecting problem type

EvalML supports both classification and regression problems. You select your problem type by importing the appropriate class.

```
[1]: import evalml
    from evalml import AutoClassificationSearch, AutoRegressionSearch

[2]: AutoClassificationSearch()
    Using default limit of max_pipelines=5.
[2]: <evalml.automl.auto_classification_search.AutoClassificationSearch at 0x7f26105084e0>

[3]: AutoRegressionSearch()
    Using default limit of max_pipelines=5.
[3]: <evalml.automl.auto_regression_search.AutoRegressionSearch at 0x7f25bb8bd5c0>
```

Setting the Objective Function

The only required parameter to start searching for pipelines is the objective function. Most domain-specific objective functions require you to specify parameters based on your business assumptions. You can do this before you initialize your pipeline search. For example

```
[4]: from evalml.objectives import FraudCost

    fraud_objective = FraudCost(
        retry_percentage=.5,
        interchange_fee=.02,
        fraud_payout_percentage=.75,
        amount_col='amount'
    )
```

(continues on next page)

(continued from previous page)

```
AutoClassificationSearch(objective=fraud_objective, optimize_thresholds=True)
```

```
Using default limit of max_pipelines=5.
```

```
[4]: <evalml automl auto_classification_search.AutoClassificationSearch at 0x7f25bb8bdd68>
```

Evaluate on Additional Objectives

Additional objectives can be scored on during the evaluation process. To add another objective, use the `additional_objectives` parameter in `AutoClassificationSearch` or `AutoRegressionSearch`. The results of these additional objectives will then appear in the results of `describe_pipeline`.

```
[5]: from evalml.objectives import FraudCost
```

```
fraud_objective = FraudCost(
    retry_percentage=.5,
    interchange_fee=.02,
    fraud_payout_percentage=.75,
    amount_col='amount'
)
```

```
AutoClassificationSearch(objective='AUC', additional_objectives=[fraud_objective],
    optimize_thresholds=False)
```

```
Using default limit of max_pipelines=5.
```

```
[5]: <evalml automl auto_classification_search.AutoClassificationSearch at 0x7f25bb8df208>
```

Selecting Model Types

By default, all model types are considered. You can control which model types to search with the `allowed_model_families` parameters

```
[6]: automl = AutoClassificationSearch(objective="f1",
    allowed_model_families=["random_forest"])
```

```
Using default limit of max_pipelines=5.
```

After initialization you can view the pipelines that will be included in the search

```
[7]: automl.allowed_pipelines
```

```
[7]: [evalml.pipelines.classification.random_forest_binary.RFBinaryClassificationPipeline]
```

you can see a list of all supported models like this

```
[8]: evalml.list_model_families("binary") # `binary` for binary classification and
    `multiclass` for multiclass classification
```

```
[8]: [<ModelFamily.RANDOM_FOREST: 'random_forest'>,
    <ModelFamily.CATBOOST: 'catboost'>,
    <ModelFamily.XGBOOST: 'xgboost'>,
    <ModelFamily.LINEAR_MODEL: 'linear_model'>]
```

```
[9]: evalml.list_model_families("regression")

[9]: [<ModelFamily.RANDOM_FOREST: 'random_forest'>,
      <ModelFamily.CATBOOST: 'catboost'>,
      <ModelFamily.XGBOOST: 'xgboost'>,
      <ModelFamily.LINEAR_MODEL: 'linear_model'>]
```

Limiting Search Time

You can limit the search time by specifying a maximum number of pipelines and/or a maximum amount of time. EvalML won't build new pipelines after the maximum time has passed or the maximum number of pipelines have been built. If a limit is not set, then a maximum of 5 pipelines will be built.

The maximum search time can be specified as a integer in seconds or as a string in seconds, minutes, or hours.

```
[10]: AutoClassificationSearch(objective="f1",
                               max_pipelines=5,
                               max_time=60)

AutoClassificationSearch(objective="f1",
                          max_time="1 minute")

[10]: <evalml.auto_ml.auto_classification_search.AutoClassificationSearch at 0x7f25bb8dfd68>
```

Early Stopping

You can also limit search time by providing a patience value for early stopping. With a patience value, EvalML will stop searching when the best objective score has not been improved upon for n iterations. The patience value must be a positive integer. You can also provide a tolerance value where EvalML will only consider a score as an improvement over the best score if the difference was greater than the tolerance percentage.

```
[11]: from evalml.demos import load_diabetes

X, y = load_diabetes()
automl = AutoRegressionSearch(objective="MSE", patience=2, tolerance=0.01, max_
    ↳ pipelines=10)
automl.search(X, y)

Get Pipeline

We can get the object of any pipeline via their id as well:

```

[4]: automl.get_pipeline(1)
[4]: <evalml.pipelines.classification.catboost_binary.CatBoostBinaryClassificationPipeline_
→at 0x7fe71968b358>

```

Get best pipeline

If we specifically want to get the best pipeline, there is a convenient access

```

[5]: automl.best_pipeline
[5]: <evalml.pipelines.classification.logistic_regression_binary.
→LogisticRegressionBinaryPipeline at 0x7fe71968b710>

```

Feature Importances

We can get the feature importances of the resulting pipeline

```
[6]: pipeline = automl.get_pipeline(1)
     pipeline.feature_importances
```

```
[6]:
```

	feature	importance
0	worst texture	11.023433
1	worst area	9.133809
2	worst radius	8.412493
3	mean concave points	8.321510
4	worst concave points	7.129320
5	mean texture	6.039252
6	worst perimeter	5.919564
7	worst concavity	5.786680
8	worst smoothness	3.957557
9	area error	3.534828
10	worst symmetry	3.071672
11	radius error	2.783052
12	mean concavity	2.629071
13	compactness error	2.393736
14	perimeter error	1.716863
15	mean compactness	1.635428
16	worst compactness	1.599189
17	smoothness error	1.535518
18	concave points error	1.481802
19	mean smoothness	1.470453
20	mean radius	1.321665
21	texture error	1.298512
22	mean symmetry	1.240927
23	mean area	1.228987
24	mean perimeter	1.076955
25	concavity error	0.982101
26	worst fractal dimension	0.967438
27	mean fractal dimension	0.826398
28	fractal dimension error	0.823615
29	symmetry error	0.658173

We can also create a bar plot of the feature importances

```
[7]: pipeline.graph_feature_importance()
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Precision-Recall Curve

For binary classification, you can view the precision-recall curve of a classifier

```
[8]: # get the predicted probabilities associated with the "true" label
     y_pred_proba = pipeline.predict_proba(X)[: , 1]
     evalml.pipelines.graph_utils.graph_precision_recall_curve(y, y_pred_proba)
```

(continued from previous page)

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

ROC Curve

For binary classification, you can view the ROC curve of a classifier

```
[9]: # get the predicted probabilities associated with the "true" label
y_pred_proba = pipeline.predict_proba(X)[:, 1]
evalml.pipelines.graph_utils.graph_roc_curve(y, y_pred_proba)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Confusion Matrix

For binary or multiclass classification, you can view a confusion matrix of the classifier's predictions

```
[10]: y_pred = pipeline.predict(X)
evalml.pipelines.graph_utils.graph_confusion_matrix(y, y_pred)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Access raw results

You can also get access to all the underlying data, like this:

```
[11]: automl.results
[11]: {'pipeline_results': {0: {'id': 0,

1.6.9 Avoiding Overfitting

The ultimate goal of machine learning is to make accurate predictions on unseen data. EvalML aims to help you build a model that will perform as you expect once it is deployed in to the real world.

One of the benefits of using EvalML to build models is that it provides data checks to ensure you are building pipelines that will perform reliably in the future. This page describes the various ways EvalML helps you avoid overfitting to your data.

```
[1]: import evalml
```

Detecting Label Leakage

A common problem is having features that include information from your label in your training data. By default, EvalML will provide a warning when it detects this may be the case.

Let's set up a simple example to demonstrate what this looks like:

```
[2]: import pandas as pd
from evalml.data_checks import LabelLeakageDataCheck

X = pd.DataFrame({
    "leaked_feature": [6, 6, 10, 5, 5, 11, 5, 10, 11, 4],
    "leaked_feature_2": [3, 2.5, 5, 2.5, 3, 5.5, 2, 5, 5.5, 2],
    "valid_feature": [3, 1, 3, 2, 4, 6, 1, 3, 3, 11]
})

y = pd.Series([1, 1, 0, 1, 1, 0, 1, 0, 0, 1])

label_leakage_check = LabelLeakageDataCheck()
messages = label_leakage_check.validate(X, y)
for message in messages:
    print (message)

Column 'leaked_feature' is 95.0% or more correlated with the target
Column 'leaked_feature_2' is 95.0% or more correlated with the target
```

In the example above, EvalML warned about the input features `leaked_feature` and `leak_feature_2`, which are both very closely correlated with the label we are trying to predict.

The second way to find features that may be leaking label information is to look at the top features of the model after running an AutoML search. As we can see below, the top features in our model are the 2 leaked features.

```
[3]: automl = evalml.AutoClassificationSearch(
    max_pipelines=1,
```

(continues on next page)

(continued from previous page)

```

    allowed_model_families=["linear_model"],
)

automl.search(X, y)
best_pipeline = automl.best_pipeline
best_pipeline.feature_importances

Column 'leaked_feature' is 95.0% or more correlated with the target
Column 'leaked_feature_2' is 95.0% or more correlated with the target

```

[3]:

	feature	importance
0	leaked_feature	0.0
1	leaked_feature_2	0.0
2	valid_feature	0.0

Perform cross-validation for pipeline evaluation

By default, EvalML performs 3-fold cross validation when building pipelines. This means that it evaluates each pipeline 3 times using different sets of data for training and testing. In each trial, the data used for testing has no overlap from the data used for training.

While this is a good baseline approach, you can pass your own cross validation object to be used during modeling. The cross validation object can be any of the CV methods defined in [scikit-learn](#) or use a compatible API.

For example, if we wanted to do a time series split:

```

[4]: from sklearn.model_selection import TimeSeriesSplit

X, y = evalml.demos.load_breast_cancer()

automl = evalml.AutoClassificationSearch(
    cv=TimeSeriesSplit(n_splits=6),
    max_pipelines=1
)

automl.search(X, y)

*****
* Beginning pipeline search *
*****

```

(continues on next page)

(continued from previous page)

```
Optimizing for Log Loss Binary.

Detect unstable pipelines

When we perform cross validation we are trying generate an estimate of pipeline performance. EvalML does this by taking the mean of the score across the folds. If the performance across the folds varies greatly, it is indicative the the estimated value may be unreliable.

To protect the user against this, EvalML checks to see if the pipeline’s performance has a variance between the different folds. EvalML triggers a warning if the “coefficient of variance” of the scores (the standard deviation divided by mean) of the pipelines scores exceeds .2.

This warning will appear in the pipeline rankings under `high_variance_cv`.

```
[6]: automl.rankings
[6]:   id                pipeline_name      score \
0    0  Mode Baseline Binary Classification Pipeline  0.694742

      high_variance_cv                parameters
0                   False  {'strategy': 'random_weighted'}
```

Create holdout for model validation

EvalML offers a method to quickly create an holdout validation set. A holdout validation set is data that is not used during the process of optimizing or training the model. You should only use this validation set once you’ve picked the final model you’d like to use.

Below we create a holdout set of 20% of our data

```
[7]: X, y = evalml.demos.load_breast_cancer()
X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
↪size=.2)
```

```
[8]: automl = evalml.AutoClassificationSearch(objective="f1",
                                             max_pipelines=3)
automl.search(X_train, y_train)

*****
* Beginning pipeline search *
*****

Optimizing for F1.
Greater score is better.

Searching up to 3 pipelines.
Allowed model families: linear_model, random_forest, catboost, xgboost

FigureWidget({
  'data': [{'mode': 'lines+markers',
            'name': 'Best Score',
            'type': ...}]
})
```

Mode Baseline Binary Classification...	0%	Elapsed:00:00
Cat Boost Binary Classification Pip...	33%	Elapsed:00:20
Logistic Regression Binary Pipeline:	67%	Elapsed:00:21
Optimization finished	67%	Elapsed:00:21

then we can retrain the best pipeline on all of our training data and see how it performs compared to the estimate

```
[9]: pipeline = automl.best_pipeline
      pipeline.fit(X_train, y_train)
      pipeline.score(X_holdout, y_holdout, ["f1"])

[9]: OrderedDict([('F1', 0.9722222222222222)])
```

1.6.10 EvalML Components and Pipelines

EvalML searches and trains multiple machine learning **pipelines** in order to find the best one for your data. Each pipeline is made up of various **components** that can learn from the data, transform the data and ultimately predict labels given new data. Below we'll show an example of an EvalML pipeline. You can find a more in-depth look into *components* or learn how you can construct and use your own *pipelines*.

XGBoost Pipeline

The EvalML XGBoost Pipeline is made up of four different components: a one-hot encoder, a missing value imputer, a feature selector and an XGBoost estimator. To initialize a pipeline you need a parameters dictionary.

Parameters

The parameters dictionary needs to be in the format of a two-layered dictionary where the first key-value pair is the component name and component parameters dictionary. The component parameters dictionary consists of a key value pair of parameter name and parameter values. An example will be shown below and component parameters can be found [here](#).

```
[1]: from evalml.demos import load_breast_cancer
      from evalml.pipelines import XGBoostBinaryPipeline

X, y = load_breast_cancer()

parameters = {
    'Simple Imputer': {
        'impute_strategy': 'mean'
    },
    'RF Classifier Select From Model': {
        "percent_features": 0.5,
        "number_features": X.shape[1],
        "n_estimators": 20,
        "max_depth": 5
    },
    'XGBoost Classifier': {
        "n_estimators": 20,
        "eta": 0.5,
        "min_child_weight": 5,
        "max_depth": 10,
    }
}
```

(continues on next page)

(continued from previous page)

```

    }

xgp = XGBoostBinaryPipeline(parameters=parameters, random_state=5)
xgp.graph()

```

[1]:

From the above graph we can see each component and its parameters. Each component takes in data and feeds it to the next. You can see more detailed information by calling `.describe()`:

[2]: `xgp.describe()`

```

*****
* XGBoost Binary Classification Pipeline *
*****

Problem Type: Binary Classification
Model Family: XGBoost

Pipeline Steps
=====
1. One Hot Encoder
    * top_n : 10
2. Simple Imputer
    * impute_strategy : mean
    * fill_value : None
3. XGBoost Classifier
    * eta : 0.5
    * max_depth : 10
    * min_child_weight : 5
    * n_estimators : 20

```

You can then fit and score an individual pipeline with an objective. An objective can either be a string representation of an EvalML objective or an EvalML objective class. You can find more objectives [here](#).

```

[3]: xgp.fit(X, y)
xgp.score(X, y, objectives=['f1'])

```

[3]: `OrderedDict([('F1', 0.9916434540389972)])`

1.6.11 EvalML Components

From the [overview](#), we see how each machine learning pipeline consists of individual components that process data before the data is ultimately sent to an estimator. Below we will describe each type of component in an EvalML pipeline.

Component Classes

Components can be split into two distinct classes: **transformers** and **estimators**.

```

[1]: import numpy as np
import pandas as pd
from evalml.pipelines.components import SimpleImputer

X = pd.DataFrame([[1, 2, 3], [1, np.nan, 3]])
display(X)

```

```
      0      1      2
0      1      2.0      3
1      1      NaN      3
```

Transformers take in data as input and output altered data. For example, an *imputer* takes in data and outputs filled in missing data with the mean, median, or most frequent value of each column.

A transformer can fit on data and then transform it in two steps by calling `.fit()` and `.transform()` or in one step by calling `fit_transform()`.

```
[2]: imp = SimpleImputer(impute_strategy="mean")
      X = imp.fit_transform(X)
```

```
display(X)
```

```
      0      1      2
0      1      2.0      3
1      1      2.0      3
```

On the other hand, an estimator fits on data (X) and labels (y) in order to take in new data as input and return the predicted label as output. Therefore, an estimator can fit on data and labels by calling `.fit()` and then predict by calling `.predict()` on new data. An example of this would be the *LogisticRegressionClassifier*. We can now see how a transformer alters data to make it easier for an estimator to learn and predict.

```
[3]: from evalml.pipelines.components import LogisticRegressionClassifier
```

```
      clf = LogisticRegressionClassifier()
```

```
      X = X
```

```
      y = [1, 0]
```

```
      clf.fit(X, y)
```

```
      clf.predict(X)
```

```
[3]: array([0, 0])
```

Component Types

Components can further separate into different types that serve different functionality. Below we will go over the different types of transformers and estimators.

Transformer Types

- Imputer: fills missing data
 - Ex: *SimpleImputer*
- Scaler: alters numerical data into different scales
 - Ex: *StandardScaler*
- Encoder: translates different data types
 - Ex: *OneHotEncoder*
- Feature Selection: selects most useful columns of data
 - Ex: *RFClassifierSelectFromModel*

Estimator Types

- Regressor: predicts numerical or continuous labels
 - Ex: *LinearRegressor*
- Classifier: predicts categorical or discrete labels
 - Ex: *XGBoostClassifier*

1.6.12 Custom Pipelines in EvalML

EvalML pipelines consist of modular components combining any number of transformers and an estimator. This allows you to create pipelines that fit the needs of your data to achieve the best results.

Requirements

A custom pipeline must adhere to the following requirements:

1. Inherit from the proper pipeline base class
 - Binary classification - `BinaryClassificationPipeline`
 - Multiclass classification - `MulticlassClassificationPipeline`
 - Regression - `RegressionPipeline`
2. Have a `component_graph` list as a class variable detailing the structure of the pipeline. Each component in the graph can be provided as either a string name or an instance.

Pipeline Configuration

There are a few other options to configure your custom pipeline.

Custom Name

By default, a pipeline classes name property is the result of adding spaces between each Pascal case capitalization in the class name. E.g. `LogisticRegressionPipeline.name` will return 'Logistic Regression Pipeline'. Therefore, we suggest custom pipelines use Pascal case for their class names.

If you'd like to override the pipeline classes name attribute so it isn't derived from the class name, you can set the `custom_name` attribute, like so:

```
[1]: from evalml.pipelines import BinaryClassificationPipeline

class CustomPipeline(BinaryClassificationPipeline):
    component_graph = ['Simple Imputer', 'Logistic Regression Classifier']
    custom_name = 'A custom pipeline name'

print(CustomPipeline.name)

A custom pipeline name
```

Custom Hyperparameters

To specify custom hyperparameter ranges, set the `custom_hyperparameters` property to be a dictionary where each key-value pair consists of a parameter name and range. AutoML will use this dictionary to override the hyperparameter ranges collected from each component in the component graph.

```
[2]: class CustomPipeline(BinaryClassificationPipeline):
      component_graph = ['Simple Imputer', 'Logistic Regression Classifier']

      print("Without custom hyperparameters:")
      print(CustomPipeline.hyperparameters)

      class CustomPipeline(BinaryClassificationPipeline):
          component_graph = ['Simple Imputer', 'Logistic Regression Classifier']
          custom_hyperparameters = {
              'Simple Imputer': {
                  'impute_strategy': ['most_frequent']
              }
          }

      print()
      print("With custom hyperparameters:")
      print(CustomPipeline.hyperparameters)
```

Without custom hyperparameters:

```
{'Simple Imputer': {'impute_strategy': ['mean', 'median', 'most_frequent']},
 'Logistic Regression Classifier': {'penalty': ['l2'], 'C': Real(low=0.01, high=10,
prior='uniform', transform='identity')}}
↪
```

With custom hyperparameters:

```
{'Simple Imputer': {'impute_strategy': ['most_frequent']}, 'Logistic Regression_
Classifier': {'penalty': ['l2'], 'C': Real(low=0.01, high=10, prior='uniform',
transform='identity')}}
↪
```

1.6.13 Data Checks

EvalML provides data checks to help guide you in achieving the highest performing model. These utility functions help deal with problems such as overfitting, abnormal data, and missing data. These data checks can be found under `evalml/data_checks`. Below we will cover examples such as abnormal and missing data data checks.

Missing Data

Missing data or rows with NaN values provide many challenges for machine learning pipelines. In the worst case, many algorithms simply will not run with missing data! EvalML pipelines contain imputation *components* to ensure that doesn't happen. Imputation works by approximating missing values with existing values. However, if a column contains a high number of missing values, a large percentage of the column would be approximated by a small percentage. This could potentially create a column without useful information for machine learning pipelines. By using the `HighlyNullDataCheck()` data check, EvalML will alert you to this potential problem by returning the columns that pass the missing values threshold.

```
[1]: import numpy as np
      import pandas as pd

      from evalml.data_checks import HighlyNullDataCheck
```

(continues on next page)

(continued from previous page)

```
X = pd.DataFrame([[1, 2, 3],
                  [0, 4, np.nan],
                  [1, 4, np.nan],
                  [9, 4, np.nan],
                  [8, 6, np.nan]])

null_check = HighlyNullDataCheck(pct_null_threshold=0.8)

for message in null_check.validate(X):
    print(message.message)
```

Column '2' is 80.0% or more null

Abnormal Data

EvalML provides two data checks to check for abnormal data: `OutliersDataCheck()` and `IDColumnsDataCheck()`.

ID Columns

ID columns in your dataset provide little to no benefit to a machine learning pipeline as the pipeline cannot extrapolate useful information from unique identifiers. Thus, `IDColumnsDataCheck()` reminds you if these columns exists. In the given example, 'user_number' and 'id' columns are both identified as potentially being unique identifiers that should be removed.

```
[2]: from evalml.data_checks import IDColumnsDataCheck

X = pd.DataFrame([[0, 53, 6325, 5], [1, 90, 6325, 10], [2, 90, 18, 20]], columns=['user_
↪number', 'cost', 'revenue', 'id'])
id_col_check = IDColumnsDataCheck(id_threshold=0.9)

for message in id_col_check.validate(X):
    print(message.message)
```

Column 'id' is 90.0% or more likely to be an ID column
 Column 'user_number' is 90.0% or more likely to be an ID column

Outliers

Outliers are observations that differ significantly from other observations in the same sample. Many machine learning pipelines suffer in performance if outliers are not dropped from the training set as they are not representative of the data. `OutliersDataCheck()` uses Isolation Forests to notify you if a sample can be considered an outlier.

Below we generate a random dataset with some outliers.

```
[3]: data = np.random.randn(100, 100)
X = pd.DataFrame(data=data)

# generate some outliers in rows 3, 25, 55, and 72
X.iloc[3, :] = pd.Series(np.random.randn(100) * 10)
X.iloc[25, :] = pd.Series(np.random.randn(100) * 20)
```

(continues on next page)

(continued from previous page)

```
X.iloc[55, :] = pd.Series(np.random.randn(100) * 100)
X.iloc[72, :] = pd.Series(np.random.randn(100) * 100)
```

We then utilize `OutliersDataCheck()` to rediscover these outliers.

```
[4]: from evalml.data_checks import OutliersDataCheck
```

```
outliers_check = OutliersDataCheck()
```

```
for message in outliers_check.validate(X):
    print(message.message)
```

```
Row '3' is likely to have outlier data
Row '25' is likely to have outlier data
Row '55' is likely to have outlier data
Row '72' is likely to have outlier data
```

Writing Your Own Data Check

If you would prefer to write your own data check, you can do so by extending the `DataCheck` class and implementing the `validate(self, X, y)` class method. Below, we've created a new `DataCheck`, `ZeroVarianceDataCheck`.

```
[5]: from evalml.data_checks import DataCheck
from evalml.data_checks.data_check_message import DataCheckError
```

```
class ZeroVarianceDataCheck(DataCheck):
    def validate(self, X, y):
        if not isinstance(X, pd.DataFrame):
            X = pd.DataFrame(X)
        warning_msg = "Column '{}' has zero variance"
        return [DataCheckError(warning_msg.format(column), self.name) for column in X.
            columns if len(X[column].unique()) == 1]
```

```
[1]: import evalml
```

1.6.14 Default DataChecks in AutoML

By default, AutoML will run the series of data checks in `DefaultDataChecks` when `automl.search()` is called to check that inputs are valid before running the search and fitting pipelines. Currently, `DefaultDataChecks` contains `HighlyNullDataCheck()`, `IDColumnsDataCheck()`, `LabelLeakageDataCheck()`. You can see the other available data checks under `evalml/data_checks`.

If the data checks return any warnings, those warnings will be logged, but the search will continue. However, if the data checks returns any error messages, `automl.search()` will raise a `ValueError` and quit before searching. This allows users to address any issues before running the potentially time-intensive search process.

Below, we have some data that contain a lot of null values, causing `DefaultDataChecks` to log a warning “Column ‘D’ is 95.0% or more null” and “Column ‘id’ is 100.0% or more likely to be an ID column” when try to run the search below.

```
[2]: import pandas as pd
import numpy as np
```

(continues on next page)

(continued from previous page)

```
X = pd.DataFrame(np.random.random((100, 5)), columns=["A", "B", "C", "D", "id"])
X.loc[:11, 'A'] = np.nan
X.loc[:9, 'B'] = np.nan
X.loc[:30, 'C'] = np.nan
X.loc[:95, 'D'] = np.nan
X.loc[:, 'id'] = range(100)
y = pd.Series([0,1]*50)

automl = evalml.AutoClassificationSearch(max_pipelines=1)
automl.search(X, y)
```

```
Column 'D' is 95.0% or more null
Column 'id' is 100.0% or more likely to be an ID column
*****
* Beginning pipeline search *
*****

Optimizing for Log Loss Binary.
Lower score is better.

Searching up to 1 pipelines.
Allowed model families: xgboost, catboost, linear_model, random_forest
```

```
FigureWidget({
  'data': [{'mode': 'lines+markers',
            'name': 'Best Score',
            'type': ...
```

Mode Baseline Binary Classification...	0%	Elapsed:00:00
Optimization finished	0%	Elapsed:00:00

To access the exact warning and/or error messages our data checks returned, we can access `automl.data_check_results`.

```
[3]: for message in automl.data_check_results:
      print (message.message)
```

```
Column 'D' is 95.0% or more null
Column 'id' is 100.0% or more likely to be an ID column
```

Using your own DataCheck with AutoML

If you'd prefer to pass in your own data check, you can do so by passing in a `DataChecks` object as the value for the `data_checks`. Here, we've implemented our own custom data check which returns a list of `DataCheckError` objects if there are any columns that have zero variance.

```
[4]: from evalml.data_checks import DataCheck, DataChecks
      from evalml.data_checks.data_check_message import DataCheckError

      class ZeroVarianceDataCheck(DataCheck):
          def validate(self, X, y):
              if not isinstance(X, pd.DataFrame):
                  X = pd.DataFrame(X)
              warning_msg = "Column '{}' has zero variance"
              return [DataCheckError(warning_msg.format(column), self.name) for column in X.
                      ↪columns if len(X[column].unique()) == 1]
```

(continues on next page)

(continued from previous page)

If we now call `search()`, our error message will be logged and a `ValueError` will be raised:

```
[5]: data_checks = DataChecks(data_checks=[ZeroVarianceDataCheck()])

X = pd.DataFrame({'no_var': [1, 1, 1, 1, 1, 1, 1, 1, 1, 1],
                    'any_average_col': [2, 0, 1, 2, 1, 2, 0, 1, 2, 1],
                    'another_average_col': [0, 1, 2, 3, 4, 5, 6, 7, 8, 9]})
y = pd.Series([0, 1, 1, 0, 0, 0, 1, 1, 0, 0])

automl = evalml.AutoClassificationSearch(max_pipelines=1)
automl.search(X, y, data_checks=data_checks)
```

Column 'no_var' has zero variance

```
-----
ValueError                                Traceback (most recent call last)
<ipython-input-5-98fbaccfe96e> in <module>
      7
      8 automl = evalml.AutoClassificationSearch(max_pipelines=1)
--> 9 automl.search(X, y, data_checks=data_checks)

~/checkouts/readthedocs.org/user_builds/feature-labs-inc-evalml/envs/v0.10.0/lib/
python3.7/site-packages/evalml/automl/auto_search_base.py in search(self, X, y,
data_checks, feature_types, raise_errors, show_iteration_plot)
    214         logger.error(message)
    215         if any([message.message_type == DataCheckMessageType.ERROR for
message in self._data_check_results]):
-> 216             raise ValueError("Data checks raised some warnings and/or
errors. Please see `self.data_check_results` for more information or pass
data_checks=EmptyDataChecks() to search() to disable data checking.")
    217
    218         self._automl_algorithm = IterativeAlgorithm(

ValueError: Data checks raised some warnings and/or errors. Please see `self.
data_check_results` for more information or pass data_checks=EmptyDataChecks() to
search() to disable data checking.
```

Again, we can access `self.data_check_results` to help us begin to address the issues raised by data checks.

```
[6]: for message in automl.data_check_results:
      print (message.message)
```

Column 'no_var' has zero variance

Disabling DataChecks

If you'd prefer not to run any data checks before running search, you can provide an `EmptyDataChecks` instance to `search()` instead.

```
[7]: from evalml.data_checks import EmptyDataChecks

X = pd.DataFrame({'no_var': [1, 1, 1, 1, 1, 1, 1, 1, 1, 1],
                    'any_average_col': [2, 0, 1, 2, 1, 2, 0, 1, 2, 1],
                    'another_average_col': [0, 1, 2, 3, 4, 5, 6, 7, 8, 9]})
```

(continues on next page)

(continued from previous page)

```

y = pd.Series([0,1,1,0,0,0,1,1,0,0])
automl = evalml.AutoClassificationSearch(max_pipelines=1)
automl.search(X, y, data_checks=EmptyDataChecks())

*****
* Beginning pipeline search *
*****

Optimizing for Log Loss Binary.
Lower score is better.

Searching up to 1 pipelines.
Allowed model families: xgboost, catboost, linear_model, random_forest

FigureWidget({
  'data': [{'mode': 'lines+markers',
            'name': 'Best Score',
            'type': ...
  ]
})

Mode Baseline Binary Classification... 0%|          | Elapsed:00:00
Optimization finished                  0%|          | Elapsed:00:00

```

Even though we are using the same data as above, no data checks will be run and hence, the same input data we used above will not raise an error and continue with the search process.

1.6.15 Changelog

Future Releases

- Enhancements
- Fixes
- Changes
- Documentation Changes
- Testing Changes

v0.10.0 May 29, 2020

- **Enhancements**
 - Added baseline models for classification and regression, add functionality to calculate baseline models before searching in AutoML [#746](#)
 - Port over highly-null guardrail as a data check and define *DefaultDataChecks* and *DisableDataChecks* classes [#745](#)
 - Update *Tuner* classes to work directly with pipeline parameters dicts instead of flat parameter lists [#779](#)
 - Add Elastic Net as a pipeline option [#812](#)
 - Added new Pipeline option *ExtraTrees* [#790](#)
 - Added precision-recall curve metrics and plot for binary classification problems in *evalml.pipeline.graph_utils* [#794](#)
 - Update the default automl algorithm to search in batches, starting with default parameters for each pipeline and iterating from there [#793](#)

- Added *AutoMLAlgorithm* class and *IterativeAlgorithm* impl, separated from *AutoSearchBase* #793
- **Fixes**
 - Update pipeline *score* to return *nan* score for any objective which throws an exception during scoring #787
 - Fixed bug introduced in #787 where binary classification metrics requiring predicted probabilities error in scoring #798
 - CatBoost and XGBoost classifiers and regressors can no longer have a learning rate of 0 #795
- **Changes**
 - Cleanup pipeline *score* code, and cleanup codecov #711
 - Remove *pass* for abstract methods for codecov #730
 - Added `__str__` for AutoSearch object #675
 - Add util methods to graph ROC and confusion matrix #720
 - Refactor *AutoBase* to *AutoSearchBase* #758
 - Updated AutoBase with *data_checks* parameter, removed previous *detect_label_leakage* parameter, and added functionality to run data checks before search in AutoML #765
 - Updated our logger to use Python’s logging utils #763
 - Refactor most of *AutoSearchBase._do_iteration* impl into *AutoSearchBase._evaluate* #762
 - Port over all guardrails to use the new DataCheck API #789
 - Expanded *import_or_raise* to catch all exceptions #759
 - Adds RMSE, MSLE, RMSLE as standard metrics #788
 - Don’t allow *Recall* to be used as an objective for AutoML #784
 - Removed feature selection from pipelines #819
 - Update default estimator parameters to make automl search faster and more accurate #793
- **Documentation Changes**
 - Add instructions to freeze *master* on *release.md* #726
 - Update release instructions with more details #727 #733
 - Add objective base classes to API reference #736
 - Fix components API to match other modules #747
- **Testing Changes**
 - Delete codecov yml, use codecov.io’s default #732
 - Added unit tests for fraud cost, lead scoring, and standard metric objectives #741
 - Update codecov client #782
 - Updated AutoBase `__str__` test to include no parameters case #783
 - Added unit tests for *ExtraTrees* pipeline #790
 - If codecov fails to upload, fail build #810
 - Updated Python version of dependency action #816

- Update the dependency update bot to use a suffix when creating branches #817

Warning:**Breaking Changes**

- The `detect_label_leakage` parameter for AutoML classes has been removed and replaced by a `data_checks` parameter #765
- Moved ROC and confusion matrix methods from `evalml.pipeline.plot_utils` to `evalml.pipeline.graph_utils` #720
- Tuner classes require a pipeline hyperparameter range dict as an init arg instead of a space definition #779
- `Tuner.propose` and `Tuner.add` work directly with pipeline parameters dicts instead of flat parameter lists #779
- `PipelineBase.hyperparameters` and `custom_hyperparameters` use pipeline parameters dict format instead of being represented as a flat list #779
- All guardrail functions previously under `evalml.guardrails.utils` will be removed and replaced by data checks #789
- *Recall* disallowed as an objective for AutoML #784
- `AutoSearchBase` parameter `tuner` has been renamed to `tuner_class` #793
- `AutoSearchBase` parameter `possible_pipelines` and `possible_model_families` have been renamed to `allowed_pipelines` and `allowed_model_families` #793

v0.9.0 Apr. 27, 2020• **Enhancements**

- Added accuracy as a standard objective #624
- Added verbose parameter to `load_fraud` #560
- Added Balanced Accuracy metric for binary, multiclass #612 #661
- Added XGBoost regressor and XGBoost regression pipeline #666
- Added Accuracy metric for multiclass #672
- Added objective name in `AutoBase.describe_pipeline` #686
- Added `DataCheck` and `DataChecks`, `Message` classes and relevant subclasses #739

• **Fixes**

- Removed direct access to `cls.component_graph` #595
- Add testing files to `.gitignore` #625
- Remove circular dependencies from `Makefile` #637
- Add error case for `normalize_confusion_matrix()` #640
- Fixed XGBoostClassifier and XGBoostRegressor bug with feature names that contain `[`, `]`, or `<` #659
- Update `make_pipeline_graph` to not accidentally create empty file when testing if path is valid #649
- Fix pip installation warning about docutils version, from boto dependency #664

- Removed zero division warning for F1/precision/recall metrics #671
- Fixed *summary* for pipelines without estimators #707
- **Changes**
 - Updated default objective for binary/multiseries classification to log loss #613
 - Created classification and regression pipeline subclasses and removed objective as an attribute of pipeline classes #405
 - Changed the output of *score* to return one dictionary #429
 - Created binary and multiclass objective subclasses #504
 - Updated objectives API #445
 - Removed call to *get_plot_data* from AutoML #615
 - Set *raise_error* to default to True for AutoML classes #638
 - Remove unnecessary “u” prefixes on some unicode strings #641
 - Changed one-hot encoder to return uint8 dtypes instead of ints #653
 - Pipeline *_name* field changed to *custom_name* #650
 - Removed *graphs.py* and moved methods into *PipelineBase* #657, #665
 - Remove s3fs as a dev dependency #664
 - Changed requirements-parser to be a core dependency #673
 - Replace *supported_problem_types* field on pipelines with *problem_type* attribute on base classes #678
 - Changed AutoML to only show best results for a given pipeline template in *rankings*, added *full_rankings* property to show all #682
 - Update *ModelFamily* values: don’t list xgboost/catboost as classifiers now that we have regression pipelines for them #677
 - Changed AutoML’s *describe_pipeline* to get problem type from pipeline instead #685
 - Standardize *import_or_raise* error messages #683
 - Updated argument order of objectives to align with sklearn’s #698
 - Renamed *pipeline.feature_importance_graph* to *pipeline.graph_feature_importances* #700
 - Moved ROC and confusion matrix methods to *evalml.pipelines.plot_utils* #704
 - Renamed *MultiClassificationObjective* to *MulticlassClassificationObjective*, to align with pipeline naming scheme #715
- **Documentation Changes**
 - Fixed some sphinx warnings #593
 - Fixed docstring for AutoClassificationSearch with correct command #599
 - Limit readthedocs formats to pdf, not htmlzip and epub #594 #600
 - Clean up objectives API documentation #605
 - Fixed function on Exploring search results page #604
 - Update release process doc #567

- AutoClassificationSearch and AutoRegressionSearch show inherited methods in API reference [#651](#)
- Fixed improperly formatted code in breaking changes for changelog [#655](#)
- Added configuration to treat Sphinx warnings as errors [#660](#)
- Removed separate plotting section for pipelines in API reference [#657](#), [#665](#)
- Have leads example notebook load S3 files using https, so we can delete s3fs dev dependency [#664](#)
- Categorized components in API reference and added descriptions for each category [#663](#)
- Fixed Sphinx warnings about BalancedAccuracy objective [#669](#)
- Updated API reference to include missing components and clean up pipeline docstrings [#689](#)
- Reorganize API ref, and clarify pipeline sub-titles [#688](#)
- Add and update preprocessing utils in API reference [#687](#)
- Added inheritance diagrams to API reference [#695](#)
- Documented which default objective AutoML optimizes for [#699](#)
- Create separate install page [#701](#)
- Include more utils in API ref, like *import_or_raise* [#704](#)
- Add more color to pipeline documentation [#705](#)
- **Testing Changes**
 - Matched install commands of *check_latest_dependencies* test and it's GitHub action [#578](#)
 - Added Github app to auto assign PR author as assignee [#477](#)
 - Removed unneeded conda installation of xgboost in windows checkin tests [#618](#)
 - Update graph tests to always use tmpfile dir [#649](#)
 - Changelog checkin test workaround for release PRs: If 'future release' section is empty of PR refs, pass check [#658](#)
 - Add changelog checkin test exception for *dep-update* branch [#723](#)

Warning: Breaking Changes

- Pipelines will now no longer take an objective parameter during instantiation, and will no longer have an objective attribute.
- `fit()` and `predict()` now use an optional `objective` parameter, which is only used in binary classification pipelines to fit for a specific objective.
- `score()` will now use a required `objectives` parameter that is used to determine all the objectives to score on. This differs from the previous behavior, where the pipeline's objective was scored on regardless.
- `score()` will now return one dictionary of all objective scores.
- ROC and ConfusionMatrix plot methods via `Auto(*).plot` have been removed by [#615](#) and are replaced by `roc_curve` and `confusion_matrix` in *evalml.pipelines.plot_utils* in [#704](#)
- `normalize_confusion_matrix` has been moved to `evalml.pipelines.plot_utils` [#704](#)
- Pipelines `_name` field changed to `custom_name`

- Pipelines `supported_problem_types` field is removed because it is no longer necessary [#678](#)
- Updated argument order of objectives' `objective_function` to align with sklearn [#698](#)
- `pipeline.feature_importance_graph` has been renamed to `pipeline.graph_feature_importances` in [#700](#)
- Removed unsupported MSLE objective [#704](#)

v0.8.0 Apr. 1, 2020

• Enhancements

- Add normalization option and information to confusion matrix [#484](#)
- Add util function to drop rows with NaN values [#487](#)
- Renamed `PipelineBase.name` as `PipelineBase.summary` and redefined `PipelineBase.name` as class property [#491](#)
- Added access to parameters in Pipelines with `PipelineBase.parameters` (used to be return of `PipelineBase.describe`) [#501](#)
- Added `fill_value` parameter for SimpleImputer [#509](#)
- Added functionality to override component hyperparameters and made pipelines take hyperparameters from components [#516](#)
- Allow `numpy.random.RandomState` for `random_state` parameters [#556](#)

• Fixes

- Removed unused dependency `matplotlib`, and move `category_encoders` to test reqs [#572](#)

• Changes

- Undo version cap in XGBoost placed in [#402](#) and allowed all released of XGBoost [#407](#)
- Support pandas 1.0.0 [#486](#)
- Made all references to the logger static [#503](#)
- Refactored `model_type` parameter for components and pipelines to `model_family` [#507](#)
- Refactored `problem_types` for pipelines and components into `supported_problem_types` [#515](#)
- Moved `pipelines/utils.save_pipeline` and `pipelines/utils.load_pipeline` to `PipelineBase.save` and `PipelineBase.load` [#526](#)
- Limit number of categories encoded by OneHotEncoder [#517](#)

• Documentation Changes

- Updated API reference to remove PipelinePlot and added moved PipelineBase plotting methods [#483](#)
- Add code style and github issue guides [#463](#) [#512](#)
- Updated API reference for to surface class variables for pipelines and components [#537](#)
- Fixed README documentation link [#535](#)
- Unhid PR references in changelog [#656](#)

• Testing Changes

- Added automated dependency check PR [#482](#), [#505](#)
- Updated automated dependency check comment [#497](#)

- Have build_docs job use python executor, so that env vars are set properly [#547](#)
- Added simple test to make sure OneHotEncoder's top_n works with large number of categories [#552](#)
- Run windows unit tests on PRs [#557](#)

Warning: Breaking Changes

- AutoClassificationSearch and AutoRegressionSearch's model_types parameter has been refactored into allowed_model_families
- ModelTypes enum has been changed to ModelFamily
- Components and Pipelines now have a model_family field instead of model_type
- get_pipelines utility function now accepts model_families as an argument instead of model_types
- PipelineBase.name no longer returns structure of pipeline and has been replaced by PipelineBase.summary
- PipelineBase.problem_types and Estimator.problem_types has been renamed to supported_problem_types
- pipelines/utils.save_pipeline and pipelines/utils.load_pipeline moved to PipelineBase.save and PipelineBase.load

v0.7.0 Mar. 9, 2020• **Enhancements**

- Added emacs buffers to .gitignore [#350](#)
- Add CatBoost (gradient-boosted trees) classification and regression components and pipelines [#247](#)
- Added Tuner abstract base class [#351](#)
- Added n_jobs as parameter for AutoClassificationSearch and AutoRegressionSearch [#403](#)
- Changed colors of confusion matrix to shades of blue and updated axis order to match scikit-learn's [#426](#)
- Added PipelineBase graph and feature_importance_graph methods, moved from previous location [#423](#)
- Added support for python 3.8 [#462](#)

• **Fixes**

- Fixed ROC and confusion matrix plots not being calculated if user passed own additional_objectives [#276](#)
- Fixed ReadtheDocs FileNotFoundError exception for fraud dataset [#439](#)

• **Changes**

- Added n_estimators as a tunable parameter for XGBoost [#307](#)
- Remove unused parameter ObjectiveBase.fit_needs_proba [#320](#)
- Remove extraneous parameter component_type from all components [#361](#)
- Remove unused rankings.csv file [#397](#)

- Downloaded demo and test datasets so unit tests can run offline #408
- Remove `_needs_fitting` attribute from Components #398
- Changed `plot.feature_importance` to show only non-zero feature importances by default, added optional parameter to show all #413
- Refactored `PipelineBase` to take in parameter dictionary and moved pipeline metadata to class attribute #421
- Dropped support for Python 3.5 #438
- Removed unused `apply.py` file #449
- Clean up `requirements.txt` to remove unused deps #451
- Support installation without all required dependencies #459
- **Documentation Changes**
 - Update `release.md` with instructions to release to internal license key #354
- **Testing Changes**
 - Added tests for utils (and moved current utils to `gen_utils`) #297
 - Moved XGBoost install into it's own separate step on Windows using Conda #313
 - Rewind pandas version to before 1.0.0, to diagnose test failures for that version #325
 - Added dependency update checkin test #324
 - Rewind XGBoost version to before 1.0.0 to diagnose test failures for that version #402
 - Update dependency check to use a whitelist #417
 - Update unit test jobs to not install dev deps #455

Warning: Breaking Changes

- Python 3.5 will not be actively supported.

v0.6.0 Dec. 16, 2019

- **Enhancements**
 - Added ability to create a plot of feature importances #133
 - Add early stopping to AutoML using patience and tolerance parameters #241
 - Added ROC and confusion matrix metrics and plot for classification problems and introduce `PipelineSearchPlots` class #242
 - Enhanced AutoML results with search order #260
 - Added utility function to show system and environment information #300
- **Fixes**
 - Lower botocore requirement #235
 - Fixed `decision_function` calculation for FraudCost objective #254
 - Fixed return value of Recall metrics #264
 - Components return `self` on fit #289
- **Changes**

- Renamed automl classes to AutoRegressionSearch and AutoClassificationSearch #287
- Updating demo datasets to retain column names #223
- Moving pipeline visualization to PipelinePlots class #228
- Standardizing inputs as pd.DataFrame / pd.Series #130
- Enforcing that pipelines must have an estimator as last component #277
- Added ipywidgets as a dependency in requirements.txt #278
- Added Random and Grid Search Tuners #240

- **Documentation Changes**

- Adding class properties to API reference #244
- Fix and filter FutureWarnings from scikit-learn #249, #257
- Adding Linear Regression to API reference and cleaning up some Sphinx warnings #227

- **Testing Changes**

- Added support for testing on Windows with CircleCI #226
- Added support for doctests #233

Warning: Breaking Changes

- The `fit()` method for `AutoClassifier` and `AutoRegressor` has been renamed to `search()`.
- `AutoClassifier` has been renamed to `AutoClassificationSearch`
- `AutoRegressor` has been renamed to `AutoRegressionSearch`
- `AutoClassificationSearch.results` and `AutoRegressionSearch.results` now is a dictionary with `pipeline_results` and `search_order` keys. `pipeline_results` can be used to access a dictionary that is identical to the old `.results` dictionary. Whereas, `search_order` returns a list of the search order in terms of `pipeline_id`.
- Pipelines now require an estimator as the last component in `component_list`. Slicing pipelines now throws an `NotImplementedError` to avoid returning pipelines without an estimator.

v0.5.2 Nov. 18, 2019

- **Enhancements**

- Adding basic pipeline structure visualization #211

- **Documentation Changes**

- Added notebooks to build process #212

v0.5.1 Nov. 15, 2019

- **Enhancements**

- Added basic outlier detection guardrail #151
- Added basic ID column guardrail #135
- Added support for unlimited pipelines with a `max_time` limit #70
- Updated `.readthedocs.yaml` to successfully build #188

- **Fixes**

- Removed MSLE from default additional objectives #203
- Fixed random_state passed in pipelines #204
- Fixed slow down in RFRegressor #206
- **Changes**
 - Pulled information for describe_pipeline from pipeline’s new describe method #190
 - Refactored pipelines #108
 - Removed guardrails from Auto(*) #202, #208
- **Documentation Changes**
 - Updated documentation to show max_time enhancements #189
 - Updated release instructions for RTD #193
 - Added notebooks to build process #212
 - Added contributing instructions #213
 - Added new content #222

v0.5.0 Oct. 29, 2019

- **Enhancements**
 - Added basic one hot encoding #73
 - Use enums for model_type #110
 - Support for splitting regression datasets #112
 - Auto-infer multiclass classification #99
 - Added support for other units in max_time #125
 - Detect highly null columns #121
 - Added additional regression objectives #100
 - Show an interactive iteration vs. score plot when using fit() #134
- **Fixes**
 - Reordered *describe_pipeline* #94
 - Added type check for model_type #109
 - Fixed s units when setting string max_time #132
 - Fix objectives not appearing in API documentation #150
- **Changes**
 - Reorganized tests #93
 - Moved logging to its own module #119
 - Show progress bar history #111
 - Using cloudpickle instead of pickle to allow unloading of custom objectives #113
 - Removed render.py #154
- **Documentation Changes**
 - Update release instructions #140

- Include additional_objectives parameter #124
- Added Changelog #136
- **Testing Changes**
 - Code coverage #90
 - Added CircleCI tests for other Python versions #104
 - Added doc notebooks as tests #139
 - Test metadata for CircleCI and 2 core parallelism #137

v0.4.1 Sep. 16, 2019

- **Enhancements**
 - Added AutoML for classification and regressor using Autobase and Skopt #7 #9
 - Implemented standard classification and regression metrics #7
 - Added logistic regression, random forest, and XGBoost pipelines #7
 - Implemented support for custom objectives #15
 - Feature importance for pipelines #18
 - Serialization for pipelines #19
 - Allow fitting on objectives for optimal threshold #27
 - Added detect label leakage #31
 - Implemented callbacks #42
 - Allow for multiclass classification #21
 - Added support for additional objectives #79
- **Fixes**
 - Fixed feature selection in pipelines #13
 - Made random_seed usage consistent #45
- **Documentation Changes**
 - Documentation Changes
 - Added docstrings #6
 - Created notebooks for docs #6
 - Initialized readthedocs EvalML #6
 - Added favicon #38
- **Testing Changes**
 - Added testing for loading data #39

v0.2.0 Aug. 13, 2019

- **Enhancements**
 - Created fraud detection objective #4

v0.1.0 July. 31, 2019

- *First Release*

- **Enhancements**
 - Added lead scoring objective #1
 - Added basic classifier #1
- **Documentation Changes**
 - Initialized Sphinx for docs #1

1.6.16 API Reference

Demo Datasets

<code>load_fraud</code>	Load credit card fraud dataset.
<code>load_wine</code>	Load wine dataset.
<code>load_breast_cancer</code>	Load breast cancer dataset.
<code>load_diabetes</code>	Load diabetes dataset.

`evalml.demos.load_fraud`

`evalml.demos.load_fraud(n_rows=None, verbose=True)`

Load credit card fraud dataset. The fraud dataset can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – number of rows from the dataset to return
- **verbose** (*bool*) – whether to print information about features and labels

Returns X, y

Return type pd.DataFrame, pd.Series

`evalml.demos.load_wine`

`evalml.demos.load_wine()`

Load wine dataset. Multiclass problem

Returns X, y

Return type pd.DataFrame, pd.Series

`evalml.demos.load_breast_cancer`

`evalml.demos.load_breast_cancer()`

Load breast cancer dataset. Multiclass problem

Returns X, y

Return type pd.DataFrame, pd.Series

evalml.demos.load_diabetes

`evalml.demos.load_diabetes()`

Load diabetes dataset. Regression problem

Returns X, y

Return type pd.DataFrame, pd.Series

Preprocessing

Utilities to preprocess data before using evalml.

<code>drop_nan_target_rows</code>	Drops rows in X and y when row in the target y has a value of NaN.
<code>label_distribution</code>	Get the label distributions
<code>load_data</code>	Load features and labels from file.
<code>number_of_features</code>	Get the number of features for specific dtypes
<code>split_data</code>	Splits data into train and test sets.

evalml.preprocessing.drop_nan_target_rows

`evalml.preprocessing.drop_nan_target_rows(X, y)`

Drops rows in X and y when row in the target y has a value of NaN.

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*) – Target values

Returns Transformed X (and y, if passed in) with rows that had a NaN value removed.

Return type pd.DataFrame

evalml.preprocessing.label_distribution

`evalml.preprocessing.label_distribution(labels)`

Get the label distributions

Parameters **labels** (*pd.Series*) – Label values

Returns Label values and their frequency distribution as percentages.

Return type pd.Series

evalml.preprocessing.load_data

`evalml.preprocessing.load_data(path, index, label, n_rows=None, drop=None, verbose=True, **kwargs)`

Load features and labels from file.

Parameters

- **path** (*str*) – Path to file or a http/ftp/s3 URL

- **index** (*str*) – Column for index
- **label** (*str*) – Column for labels
- **n_rows** (*int*) – Number of rows to return
- **drop** (*list*) – List of columns to drop
- **verbose** (*bool*) – If True, prints information about features and labels

Returns features and labels

Return type pd.DataFrame, pd.Series

evalml.preprocessing.number_of_features

evalml.preprocessing.number_of_features (*dtypes*)

Get the number of features for specific dtypes

Parameters **dtypes** (*pd.Series*) – dtypes to get the number of features for

Returns dtypes and the number of features for each input type

Return type pd.Series

evalml.preprocessing.split_data

evalml.preprocessing.split_data (*X, y, regression=False, test_size=0.2, random_state=None*)

Splits data into train and test sets.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – labels of length [n_samples]
- **regression** (*bool*) – if true, do not use stratified split
- **test_size** (*float*) – percent of train set to holdout for testing
- **random_state** (*int, np.random.RandomState*) – seed for the random number generator

Returns features and labels each split into train and test sets

Return type pd.DataFrame, pd.DataFrame, pd.Series, pd.Series

AutoML

AutoML Search Classes

<i>AutoClassificationSearch</i>	Automatic pipeline search class for classification problems
<i>AutoRegressionSearch</i>	Automatic pipeline search for regression problems
<i>AutoSearchBase</i>	Base class for AutoML searches.

evalml automl AutoClassificationSearch

evalml.automl.auto_search_base.AutoSearchBase

evalml.automl.auto_classification_search.AutoClassificationSearch

```

class evalml.automl.AutoClassificationSearch (objective=None,      max_pipelines=None,
                                              max_time=None,      patience=None,
                                              tolerance=None,      cv=None,      al-
                                              lowed_pipelines=None,      al-
                                              lowed_model_families=None,
                                              start_iteration_callback=None,
                                              add_result_callback=None,      addi-
                                              tional_objectives=None, random_state=0,

                                   timize_thresholds=False, multiclass=False)

```

Automated classifier pipeline search

Parameters

- **objective** (*Object*) – The objective to optimize for. Defaults to LogLossBinary for binary classification problems and LogLossMulticlass for multiclass classification problems.
- **multiclass** (*bool*) – If True, expecting multiclass data. Defaults to False.
- **max_pipelines** (*int*) – Maximum number of pipelines to search. If max_pipelines and max_time is not set, then max_pipelines will default to max_pipelines of 5.
- **max_time** (*int, str*) – Maximum time to search for pipelines. This will not start a

new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.

- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed. Setting this field will cause allowed_model_families to be ignored.
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run `evalml.list_model_families("binary")` to see options. Change *binary* to *multiclass* if your problem type is different. Note that if allowed_pipelines was provided, this parameter will be ignored.
- **cv** – cross-validation method to use. Defaults to StratifiedKfold.
- **tuner_class** – the tuner class to use. Defaults to scikit-optimize tuner
- **start_iteration_callback** (*callable*) – function called before each pipeline training iteration. Passed two parameters: pipeline_class, parameters.
- **add_result_callback** (*callable*) – function called after each pipeline training iteration. Passed two parameters: results, trained_pipeline.
- **additional_objectives** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs below -1, (n_cpus + 1 + n_jobs) are used.
- **verbose** (*boolean*) – If True, turn verbosity on. Defaults to True

`evalml.automl.AutoClassificationSearch.describe_pipeline`

`AutoClassificationSearch.describe_pipeline(pipeline_id, return_dict=False)`

Describe a pipeline

Parameters

- **pipeline_id** (*int*) – pipeline to describe
- **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

evalml automl.AutoClassificationSearch.get_pipeline

`AutoClassificationSearch.get_pipeline(pipeline_id)`

Retrieves trained pipeline

Parameters `pipeline_id` (*int*) – pipeline to retrieve

Returns pipeline associated with id

Return type Pipeline

evalml automl.AutoClassificationSearch.search

`AutoClassificationSearch.search(X, y, data_checks=None, feature_types=None, raise_errors=True, show_iteration_plot=True)`

Find best classifier

Parameters

- **X** (*pd.DataFrame*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]
- **feature_types** (*list, optional*) – list of feature types, either numerical or categorical. Categorical features will automatically be encoded
- **raise_errors** (*boolean*) – If True, raise errors and exit search if a pipeline errors during fitting. If False, set scores for the errored pipeline to NaN and continue search. Defaults to True.
- **show_iteration_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.
- **data_checks** (*DataChecks, None*) – A collection of data checks to run before searching for the best classifier. If data checks produce any errors, an exception will be thrown before the search begins. If None, uses DefaultDataChecks. Defaults to None.

Returns self

Attributes

<code>best_pipeline</code>	Returns the best model found
<code>data_check_results</code>	
<code>full_rankings</code>	Returns a pandas.DataFrame with scoring results from all pipelines searched
<code>rankings</code>	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

evalml automl AutoRegressionSearch

```

class evalml.automl.AutoRegressionSearch(objective=None, max_pipelines=None,
                                          max_time=None, patience=None, tol-
                                          erance=None, allowed_pipelines=None,
                                          allowed_model_families=None,
                                          cv=None, start_iteration_callback=None,
                                          add_result_callback=None, addi-
                                          tional_objectives=None, random_state=0,
                                          n_jobs=-1, tuner_class=None, verbose=True)

```

Automatic pipeline search for regression problems

Methods

<code>__init__</code>	Automated regressors pipeline search
<code>describe_pipeline</code>	Describe a pipeline
<code>get_pipeline</code>	Retrieves trained pipeline
<code>search</code>	Find best classifier

evalml.automl.AutoRegressionSearch.__init__

```

AutoRegressionSearch.__init__(objective=None, max_pipelines=None, max_time=None,
                              patience=None, tolerance=None, allowed_pipelines=None,
                              allowed_model_families=None, cv=None,
                              start_iteration_callback=None, add_result_callback=None,
                              additional_objectives=None, random_state=0, n_jobs=-1,
                              tuner_class=None, verbose=True)

```

Automated regressors pipeline search

Parameters

- **objective** (*Object*) – The objective to optimize for. Defaults to R2.
- **max_pipelines** (*int*) – Maximum number of pipelines to search. If max_pipelines and max_time is not set, then max_pipelines will default to max_pipelines of 5.
- **max_time** (*int, str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed. Setting this field will cause allowed_model_families to be ignored.
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run

`evalml.list_model_families("regression")` to see options.

- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **cv** – cross validation method to use. By default StratifiedKFold
- **tuner_class** – the tuner class to use. Defaults to scikit-optimize tuner
- **start_iteration_callback** (*callable*) – function called before each pipeline training iteration. Passed two parameters: `pipeline_class`, `parameters`.
- **add_result_callback** (*callable*) – function called after each pipeline training iteration. Passed two parameters: `results`, `trained_pipeline`.
- **additional_objectives** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` below -1, `(n_cpus + 1 + n_jobs)` are used.
- **verbose** (*boolean*) – If True, turn verbosity on. Defaults to True

`evalml.automl.AutoRegressionSearch.describe_pipeline`

`AutoRegressionSearch.describe_pipeline(pipeline_id, return_dict=False)`

Describe a pipeline

Parameters

- **pipeline_id** (*int*) – pipeline to describe
- **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

`evalml.automl.AutoRegressionSearch.get_pipeline`

`AutoRegressionSearch.get_pipeline(pipeline_id)`

Retrieves trained pipeline

Parameters **pipeline_id** (*int*) – pipeline to retrieve

Returns pipeline associated with id

Return type Pipeline

evalml automl.AutoRegressionSearch.search

```
AutoRegressionSearch.search(X, y, data_checks=None, feature_types=None,  
                             raise_errors=True, show_iteration_plot=True)
```

Find best classifier

Parameters

- **X** (*pd.DataFrame*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]
- **feature_types** (*list, optional*) – list of feature types, either numerical or categorical. Categorical features will automatically be encoded
- **raise_errors** (*boolean*) – If True, raise errors and exit search if a pipeline errors during fitting. If False, set scores for the errored pipeline to NaN and continue search. Defaults to True.
- **show_iteration_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.
- **data_checks** (*DataChecks, None*) – A collection of data checks to run before searching for the best classifier. If data checks produce any errors, an exception will be thrown before the search begins. If None, uses DefaultDataChecks. Defaults to None.

Returns self

Attributes

best_pipeline	Returns the best model found
data_check_results	
full_rankings	Returns a pandas.DataFrame with scoring results from all pipelines searched
rankings	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

evalml automl.AutoSearchBase

evalml.automl.auto_search_base.AutoSearchBase

```
class evalml.automl.AutoSearchBase(problem_type=None, objective=None,
                                   max_pipelines=None, max_time=None, pa-
                                   tience=None, tolerance=None, cv=None, al-
                                   lowed_pipelines=None, allowed_model_families=None,
                                   start_iteration_callback=None,
                                   add_result_callback=None, additional_objectives=None,
                                   random_state=0, n_jobs=-1, tuner_class=None,
                                   verbose=True, optimize_thresholds=False, multi-
                                   class=None)
```

Base class for AutoML searches.

Methods

<code>__init__</code>	Initialize self.
<code>describe_pipeline</code>	Describe a pipeline
<code>get_pipeline</code>	Retrieves trained pipeline
<code>search</code>	Find best classifier

evalml.automl.AutoSearchBase.__init__

```
AutoSearchBase.__init__(problem_type=None, objective=None, max_pipelines=None,
                        max_time=None, patience=None, tolerance=None, cv=None,
                        allowed_pipelines=None, allowed_model_families=None,

                        additional_objectives=None, random_state=0, n_jobs=-1,
                        tuner_class=None, verbose=True, optimize_thresholds=False,
                        multiclass=None)
```

Initialize self. See help(type(self)) for accurate signature.

evalml.automl.AutoSearchBase.describe_pipeline

```
AutoSearchBase.describe_pipeline(pipeline_id, return_dict=False)
```

Describe a pipeline

Parameters

- **pipeline_id** (*int*) – pipeline to describe
- **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

evalml.automl.AutoSearchBase.get_pipeline

```
AutoSearchBase.get_pipeline(pipeline_id)
```

Retrieves trained pipeline

Parameters **pipeline_id** (*int*) – pipeline to retrieve

Returns pipeline associated with id

Return type Pipeline

evalml.automl.AutoSearchBase.search

`AutoSearchBase.search(X, y, data_checks=None, feature_types=None, raise_errors=True, show_iteration_plot=True)`

Find best classifier

Parameters

- **X** (*pd.DataFrame*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]
- **feature_types** (*list, optional*) – list of feature types, either numerical or categorical. Categorical features will automatically be encoded
- **raise_errors** (*boolean*) – If True, raise errors and exit search if a pipeline errors during fitting. If False, set scores for the errored pipeline to NaN and continue search. Defaults to True.
- **show_iteration_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.
- **data_checks** (*DataChecks, None*) – A collection of data checks to run before searching for the best classifier. If data checks produce any errors, an exception will be thrown before the search begins. If None, uses DefaultDataChecks. Defaults to None.

Returns self

Attributes

<code>best_pipeline</code>	Returns the best model found
<code>data_check_results</code>	
<code>full_rankings</code>	Returns a pandas.DataFrame with scoring results from all pipelines searched
<code>rankings</code>	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

AutoML Algorithm Classes

<code>AutoMLAlgorithm</code>	Base class for the automl algorithms which power evalml.
<code>IterativeAlgorithm</code>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

evalml.automl.automl_algorithm.AutoMLAlgorithm

```

class evalml.automl.automl_algorithm.AutoMLAlgorithm(allowed_pipelines=None,
                                                    max_pipelines=None,
                                                    tuner_class=None,      ran-
                                                    dom_state=0)

```

Base class for the automl algorithms which power evalml.

Methods

<code>__init__</code>	This class represents an automated machine learning (AutoML) algorithm.
<code>add_result</code>	Register results from evaluating a pipeline
<code>next_batch</code>	Get the next batch of pipelines to evaluate

evalml.automl.automl_algorithm.AutoMLAlgorithm.__init__

```

AutoMLAlgorithm.__init__(allowed_pipelines=None, max_pipelines=None, tuner_class=None,
                        random_state=0)

```

This class represents an automated machine learning (AutoML) algorithm. It encapsulates the decision-making logic behind an automl search, by both deciding which pipelines to evaluate next and by deciding what set of parameters to configure the pipeline with.

To use this interface, you must define a `next_batch` method which returns the next group of pipelines to evaluate on the training data. That method may access state and results recorded from the previous batches, although that information is not tracked in a general way in this base class. Overriding `add_result` is a convenient way to record pipeline evaluation info if necessary.

Parameters

- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **max_pipelines** (*int*) – The maximum number of pipelines to be evaluated.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.automl.automl_algorithm.AutoMLAlgorithm.add_result

`AutoMLAlgorithm.add_result(score_to_minimize, pipeline)`

Register results from evaluating a pipeline

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.

evalml.automl.automl_algorithm.AutoMLAlgorithm.next_batch

`AutoMLAlgorithm.next_batch()`

Get the next batch of pipelines to evaluate

Returns a list of instances of *PipelineBase* subclasses, ready to be trained and evaluated.

Return type *list(PipelineBase)*

Attributes

<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

evalml.automl.automl_algorithm.IterativeAlgorithm

```
class evalml.automl.automl_algorithm.IterativeAlgorithm(allowed_pipelines=None,  
                                                         max_pipelines=None,  
                                                         tuner_class=None,  
                                                         random_state=0,  
                                                         pipelines_per_batch=5,  
                                                         n_jobs=-1,          num-  
                                                         ber_features=None)
```

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Methods

<code>__init__</code>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.
<code>add_result</code>	Register results from evaluating a pipeline
<code>next_batch</code>	Get the next batch of pipelines to evaluate

`evalml.automl.automl_algorithm.IterativeAlgorithm.__init__`

`IterativeAlgorithm.__init__` (*allowed_pipelines=None*, *max_pipelines=None*,
tuner_class=None, *random_state=0*, *pipelines_per_batch=5*,
n_jobs=-1, *number_features=None*)

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Parameters

- **`allowed_pipelines`** (*list (class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **`max_pipelines`** (*int*) – The maximum number of pipelines to be evaluated.
- **`tuner_class`** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **`random_state`** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.
- **`pipelines_per_batch`** (*int*) – the number of pipelines to be evaluated in each batch, after the first batch.
- **`n_jobs`** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines.
- **`number_features`** (*int*) – The number of columns in the input features.

`evalml.automl.automl_algorithm.IterativeAlgorithm.add_result`

`IterativeAlgorithm.add_result` (*score_to_minimize, pipeline*)

Register results from evaluating a pipeline

Parameters

- **`score_to_minimize`** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **`pipeline`** (*PipelineBase*) – The trained pipeline object which was used to compute the score.

`evalml.automl.automl_algorithm.IterativeAlgorithm.next_batch`

`IterativeAlgorithm.next_batch` ()

Get the next batch of pipelines to evaluate

Returns a list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type `list(PipelineBase)`

Attributes

<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

Pipelines

Pipeline Base Classes

<i>PipelineBase</i>	Base class for all pipelines.
<i>ClassificationPipeline</i>	Pipeline subclass for all classification pipelines.
<i>BinaryClassificationPipeline</i>	Pipeline subclass for all binary classification pipelines.
<i>MulticlassClassificationPipeline</i>	Pipeline subclass for all multiclass classification pipelines.
<i>RegressionPipeline</i>	Pipeline subclass for all regression pipelines.

`evalml.pipelines.PipelineBase`

class `evalml.pipelines.PipelineBase` (*parameters*, *random_state=0*)
Base class for all pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances

Continued on next page

Table 16 – continued from previous page

<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.PipelineBase.__init__

`PipelineBase.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.PipelineBase.describe

`PipelineBase.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.PipelineBase.fit

`PipelineBase.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.PipelineBase.get_component

`PipelineBase.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.PipelineBase.graph

PipelineBase.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.PipelineBase.graph_feature_importance

PipelineBase.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.PipelineBase.load

static PipelineBase.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.PipelineBase.predict

PipelineBase.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.PipelineBase.save

PipelineBase.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.PipelineBase.score

PipelineBase.**score**(*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ClassificationPipeline

class evalml.pipelines.**ClassificationPipeline**(*parameters*, *random_state=0*)

Pipeline subclass for all classification pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ClassificationPipeline.__init__

ClassificationPipeline.**__init__**(*parameters*, *random_state=0*)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.ClassificationPipeline.describe`

`ClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.ClassificationPipeline.fit`

`ClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.ClassificationPipeline.get_component`

`ClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.ClassificationPipeline.graph`

`ClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ClassificationPipeline.graph_feature_importance

ClassificationPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ClassificationPipeline.load

static ClassificationPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ClassificationPipeline.predict

ClassificationPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ClassificationPipeline.predict_proba

ClassificationPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.ClassificationPipeline.save

ClassificationPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ClassificationPipeline.score

ClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.BinaryClassificationPipeline

class evalml.pipelines.**BinaryClassificationPipeline** (*parameters*, *random_state=0*)

Pipeline subclass for all binary classification pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.BinaryClassificationPipeline.__init__

BinaryClassificationPipeline.**__init__** (*parameters*, *random_state=0*)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (*list*): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.BinaryClassificationPipeline.describe

BinaryClassificationPipeline.**describe**()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.BinaryClassificationPipeline.fit

BinaryClassificationPipeline.**fit**(X,y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.BinaryClassificationPipeline.get_component

BinaryClassificationPipeline.**get_component**(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.BinaryClassificationPipeline.graph

BinaryClassificationPipeline.**graph**(filepath=None)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.BinaryClassificationPipeline.graph_feature_importance`

`BinaryClassificationPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

`evalml.pipelines.BinaryClassificationPipeline.load`

static `BinaryClassificationPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

`evalml.pipelines.BinaryClassificationPipeline.predict`

`BinaryClassificationPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.BinaryClassificationPipeline.predict_proba`

`BinaryClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.BinaryClassificationPipeline.save`

`BinaryClassificationPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

evalml.pipelines.BinaryClassificationPipeline.score

BinaryClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.MulticlassClassificationPipeline

class evalml.pipelines.**MulticlassClassificationPipeline** (*parameters*, *random_state=0*)

Pipeline subclass for all multiclass classification pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.MulticlassClassificationPipeline.__init__

MulticlassClassificationPipeline.**__init__** (*parameters*, *random_state=0*)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (*list*): List of components in order. Accepts strings or ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.MulticlassClassificationPipeline.describe

`MulticlassClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.MulticlassClassificationPipeline.fit

`MulticlassClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.MulticlassClassificationPipeline.get_component

`MulticlassClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.MulticlassClassificationPipeline.graph

`MulticlassClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.MulticlassClassificationPipeline.graph_feature_importance

`MulticlassClassificationPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

evalml.pipelines.MulticlassClassificationPipeline.load

static `MulticlassClassificationPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

evalml.pipelines.MulticlassClassificationPipeline.predict

`MulticlassClassificationPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.MulticlassClassificationPipeline.predict_proba

`MulticlassClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.MulticlassClassificationPipeline.save

`MulticlassClassificationPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

evalml.pipelines.MulticlassClassificationPipeline.score

`MulticlassClassificationPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.RegressionPipeline

class `evalml.pipelines.RegressionPipeline` (*parameters*, *random_state=0*)

Pipeline subclass for all regression pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.RegressionPipeline.__init__

`RegressionPipeline.__init__` (*parameters*, *random_state=0*)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (*list*): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.RegressionPipeline.describe

`RegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.RegressionPipeline.fit

`RegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.RegressionPipeline.get_component

`RegressionPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.RegressionPipeline.graph

`RegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.RegressionPipeline.graph_feature_importance`

`RegressionPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

`evalml.pipelines.RegressionPipeline.load`

static `RegressionPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

`evalml.pipelines.RegressionPipeline.predict`

`RegressionPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape `[n_samples, n_features]`
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.RegressionPipeline.save`

`RegressionPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

`evalml.pipelines.RegressionPipeline.score`

`RegressionPipeline.score` (*X, y, objectives*)

Evaluate model performance on current and additional objectives

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – true labels of length `[n_samples]`
- `objectives` (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

Classification Pipelines

<i>CatBoostBinaryClassificationPipeline</i>	CatBoost Pipeline for binary classification.
<i>CatBoostMulticlassClassificationPipeline</i>	CatBoost Pipeline for multiclass classification.
<i>ENBinaryPipeline</i>	Elastic Net Pipeline for binary classification problems
<i>ENMulticlassPipeline</i>	Elastic Net Pipeline for multiclass classification problems
<i>ETBinaryClassificationPipeline</i>	Extra Trees Pipeline for binary classification
<i>ETMulticlassClassificationPipeline</i>	Extra Trees Pipeline for multiclass classification
<i>LogisticRegressionBinaryPipeline</i>	Logistic Regression Pipeline for binary classification
<i>LogisticRegressionMulticlassPipeline</i>	Logistic Regression Pipeline for multiclass classification
<i>RFBinaryClassificationPipeline</i>	Random Forest Pipeline for binary classification
<i>RFMulticlassClassificationPipeline</i>	Random Forest Pipeline for multiclass classification

evalml.pipelines.CatBoostBinaryClassificationPipeline

```

class evalml.pipelines.CatBoostBinaryClassificationPipeline(parameters, random_state=0)
    CatBoost Pipeline for binary classification. CatBoost is an open-source library and natively supports categorical features.

    For more information, check out https://catboost.ai/ Note: impute_strategy must support both string and numeric data

    name = 'Cat Boost Binary Classification Pipeline'
    custom_name = None
    summary = 'CatBoost Classifier w/ Simple Imputer'
    component_graph = ['Simple Imputer', 'CatBoost Classifier']
    problem_type = 'binary'
    model_family = 'catboost'
    hyperparameters = {'CatBoost Classifier': {'eta': Real(low=1e-06, high=1, prior='uniform')}}
    custom_hyperparameters = {'Simple Imputer': {'impute_strategy': ['most_frequent']}}
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.CatBoostBinaryClassificationPipeline.__init__`

`CatBoostBinaryClassificationPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.CatBoostBinaryClassificationPipeline.describe`

`CatBoostBinaryClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.CatBoostBinaryClassificationPipeline.fit`CatBoostBinaryClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.CatBoostBinaryClassificationPipeline.get_component**`CatBoostBinaryClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component**Returns** component to return**Return type** Component**evalml.pipelines.CatBoostBinaryClassificationPipeline.graph**`CatBoostBinaryClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.**Returns** Graph object that can be directly displayed in Jupyter notebooks.**Return type** graphviz.Digraph**evalml.pipelines.CatBoostBinaryClassificationPipeline.graph_feature_importance**`CatBoostBinaryClassificationPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.**Returns** plotly.Figure, a bar graph showing features and their importances**evalml.pipelines.CatBoostBinaryClassificationPipeline.load****static** `CatBoostBinaryClassificationPipeline.load(file_path)`

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file**Returns** PipelineBase obj

evalml.pipelines.CatBoostBinaryClassificationPipeline.predict

CatBoostBinaryClassificationPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.CatBoostBinaryClassificationPipeline.predict_proba

CatBoostBinaryClassificationPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.CatBoostBinaryClassificationPipeline.save

CatBoostBinaryClassificationPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.CatBoostBinaryClassificationPipeline.score

CatBoostBinaryClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.CatBoostMulticlassClassificationPipeline

```

class evalml.pipelines.CatBoostMulticlassClassificationPipeline(parameters,
                                                                ran-
                                                                dom_state=0)

    CatBoost Pipeline for multiclass classification. CatBoost is an open-source library and natively supports cate-
    gorical features.

    For more information, check out https://catboost.ai/ Note: impute_strategy must support both string and numeric
    data

    name = 'Cat Boost Multiclass Classification Pipeline'

    custom_name = None

    summary = 'CatBoost Classifier w/ Simple Imputer'

    component_graph = ['Simple Imputer', 'CatBoost Classifier']

    problem_type = 'multiclass'

    model_family = 'catboost'

    hyperparameters = {'CatBoost Classifier': {'eta': Real(low=1e-06, high=1, prior='uni-
    custom_hyperparameters = {'Simple Imputer': {'impute_strategy': ['most_frequent']}]
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component pa- rameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature impor- tances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.CatBoostMulticlassClassificationPipeline.__init__

CatBoostMulticlassClassificationPipeline.__init__(parameters, random_state=0)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: component_graph (list): List of components in order. Accepts strings or ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.CatBoostMulticlassClassificationPipeline.describe

CatBoostMulticlassClassificationPipeline.describe()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.CatBoostMulticlassClassificationPipeline.fit

CatBoostMulticlassClassificationPipeline.fit(X, y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.CatBoostMulticlassClassificationPipeline.get_component

CatBoostMulticlassClassificationPipeline.get_component(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.CatBoostMulticlassClassificationPipeline.graph

`CatBoostMulticlassClassificationPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type `graphviz.Digraph`

evalml.pipelines.CatBoostMulticlassClassificationPipeline.graph_feature_importance

`CatBoostMulticlassClassificationPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

evalml.pipelines.CatBoostMulticlassClassificationPipeline.load

static `CatBoostMulticlassClassificationPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

evalml.pipelines.CatBoostMulticlassClassificationPipeline.predict

`CatBoostMulticlassClassificationPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.CatBoostMulticlassClassificationPipeline.predict_proba

`CatBoostMulticlassClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.CatBoostMulticlassClassificationPipeline.save

`CatBoostMulticlassClassificationPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns None

evalml.pipelines.CatBoostMulticlassClassificationPipeline.score

`CatBoostMulticlassClassificationPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ENBinaryPipeline

class `evalml.pipelines.ENBinaryPipeline` (*parameters*, *random_state=0*)

Elastic Net Pipeline for binary classification problems

name = 'ENBinary Pipeline'

custom_name = None

summary = 'Elastic Net Classifier w/ One Hot Encoder + Simple Imputer'

component_graph = ['One Hot Encoder', 'Simple Imputer', 'Elastic Net Classifier']

problem_type = 'binary'

model_family = 'linear_model'

hyperparameters = {'Elastic Net Classifier': {'alpha': Real(low=0, high=1, prior='uninformative')}}

custom_hyperparameters = None

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ENBinaryPipeline.__init__

`ENBinaryPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ENBinaryPipeline.describe

`ENBinaryPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.ENBinaryPipeline.fit

`ENBinaryPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ENBinaryPipeline.get_component

ENBinaryPipeline.**get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ENBinaryPipeline.graph

ENBinaryPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ENBinaryPipeline.graph_feature_importance

ENBinaryPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ENBinaryPipeline.load

static ENBinaryPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ENBinaryPipeline.predict

ENBinaryPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.ENBinaryPipeline.predict_proba

ENBinaryPipeline.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.ENBinaryPipeline.save

ENBinaryPipeline.**save**(*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns *None*

evalml.pipelines.ENBinaryPipeline.score

ENBinaryPipeline.**score**(*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.ENMulticlassPipeline

```
class evalml.pipelines.ENMulticlassPipeline (parameters, random_state=0)

`evalml.pipelines.ENMulticlassPipeline.__init__`

`ENMulticlassPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ENMulticlassPipeline.describe`ENMulticlassPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline.
Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.ENMulticlassPipeline.fit`ENMulticlassPipeline.fit(X, y)`

Build a model

Parameters

- `X` (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- `y` (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ENMulticlassPipeline.get_component`ENMulticlassPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ENMulticlassPipeline.graph`ENMulticlassPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ENMulticlassPipeline.graph_feature_importance`ENMulticlassPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

`evalml.pipelines.ENMulticlassPipeline.load`

static `ENMulticlassPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

`evalml.pipelines.ENMulticlassPipeline.predict`

`ENMulticlassPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `objective` (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.ENMulticlassPipeline.predict_proba`

`ENMulticlassPipeline.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.ENMulticlassPipeline.save`

`ENMulticlassPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

`evalml.pipelines.ENMulticlassPipeline.score`

`ENMulticlassPipeline.score(X, y, objectives)`

Evaluate model performance on objectives

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – true labels of length `[n_samples]`

- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ETBinaryClassificationPipeline

```

class evalml.pipelines.ETBinaryClassificationPipeline(parameters, random_state=0)
    Extra Trees Pipeline for binary classification
    name = 'Extra Trees Binary Classification Pipeline'

--------------	--

`evalml.pipelines.ETBinaryClassificationPipeline.__init__`

`ETBinaryClassificationPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.ETBinaryClassificationPipeline.describe`

`ETBinaryClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.ETBinaryClassificationPipeline.fit`

`ETBinaryClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

`evalml.pipelines.ETBinaryClassificationPipeline.get_component`

`ETBinaryClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ETBinaryClassificationPipeline.graph

ETBinaryClassificationPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ETBinaryClassificationPipeline.graph_feature_importance

ETBinaryClassificationPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ETBinaryClassificationPipeline.load

static ETBinaryClassificationPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ETBinaryClassificationPipeline.predict

ETBinaryClassificationPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ETBinaryClassificationPipeline.predict_proba

ETBinaryClassificationPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.ETBinaryClassificationPipeline.save

ETBinaryClassificationPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ETBinaryClassificationPipeline.score

ETBinaryClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ETMulticlassClassificationPipeline

class evalml.pipelines.ETMulticlassClassificationPipeline (*parameters*, *random_state=0*)

Extra Trees Pipeline for multiclass classification

evalml.pipelines.ETMulticlassClassificationPipeline.__init__

ETMulticlassClassificationPipeline.__init__(*parameters*, *random_state*=0)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ETMulticlassClassificationPipeline.describe

ETMulticlassClassificationPipeline.**describe**()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.ETMulticlassClassificationPipeline.fit

ETMulticlassClassificationPipeline.**fit**(*X*, *y*)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ETMulticlassClassificationPipeline.get_component

ETMulticlassClassificationPipeline.**get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ETMulticlassClassificationPipeline.graph

ETMulticlassClassificationPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ETMulticlassClassificationPipeline.graph_feature_importance

ETMulticlassClassificationPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ETMulticlassClassificationPipeline.load

static ETMulticlassClassificationPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ETMulticlassClassificationPipeline.predict

ETMulticlassClassificationPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.ETMulticlassClassificationPipeline.predict_proba

ETMulticlassClassificationPipeline.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.ETMulticlassClassificationPipeline.save

ETMulticlassClassificationPipeline.**save**(*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns *None*

evalml.pipelines.ETMulticlassClassificationPipeline.score

ETMulticlassClassificationPipeline.**score**(*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.LogisticRegressionBinaryPipeline

```

class evalml.pipelines.LogisticRegressionBinaryPipeline(parameters, random_state=0)
    Logistic Regression Pipeline for binary classification
    name = 'Logistic Regression Binary Pipeline'
  
```

```
custom_name = None
summary = 'Logistic Regression Classifier w/ One Hot Encoder + Simple Imputer + Standard Scaler'
component_graph = ['One Hot Encoder', 'Simple Imputer', 'Standard Scaler', 'Logistic Regression Classifier']
problem_type = 'binary'
model_family = 'linear_model'
hyperparameters = {'Logistic Regression Classifier': {'C': Real(low=0.01, high=10, prior=1.0, log=True, log_prior=0.01)}}
custom_hyperparameters = None
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.LogisticRegressionBinaryPipeline.__init__`

`LogisticRegressionBinaryPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.LogisticRegressionBinaryPipeline.describe

LogisticRegressionBinaryPipeline.**describe**()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline.
Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.LogisticRegressionBinaryPipeline.fit

LogisticRegressionBinaryPipeline.**fit**(X, y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.LogisticRegressionBinaryPipeline.get_component

LogisticRegressionBinaryPipeline.**get_component**(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.LogisticRegressionBinaryPipeline.graph

LogisticRegressionBinaryPipeline.**graph**(filepath=None)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.LogisticRegressionBinaryPipeline.graph_feature_importance

LogisticRegressionBinaryPipeline.**graph_feature_importance**(show_all_features=False)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

`evalml.pipelines.LogisticRegressionBinaryPipeline.load`

static `LogisticRegressionBinaryPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

`evalml.pipelines.LogisticRegressionBinaryPipeline.predict`

`LogisticRegressionBinaryPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `objective` (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.LogisticRegressionBinaryPipeline.predict_proba`

`LogisticRegressionBinaryPipeline.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.LogisticRegressionBinaryPipeline.save`

`LogisticRegressionBinaryPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

`evalml.pipelines.LogisticRegressionBinaryPipeline.score`

`LogisticRegressionBinaryPipeline.score(X, y, objectives)`

Evaluate model performance on objectives

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – true labels of length `[n_samples]`

- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.LogisticRegressionMulticlassPipeline

```

class evalml.pipelines.LogisticRegressionMulticlassPipeline(parameters, random_state=0)
    Logistic Regression Pipeline for multiclass classification
    name = 'Logistic Regression Multiclass Pipeline'
    custom_name = None
    summary = 'Logistic Regression Classifier w/ One Hot Encoder + Simple Imputer + Standard Scaler'
    component_graph = ['One Hot Encoder', 'Simple Imputer', 'Standard Scaler', 'Logistic Regression Classifier']
    problem_type = 'multiclass'
    model_family = 'linear_model'
    hyperparameters = {'Logistic Regression Classifier': {'C': Real(low=0.01, high=10, prior=1.0)}}
    custom_hyperparameters = None
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.LogisticRegressionMulticlassPipeline.__init__`

`LogisticRegressionMulticlassPipeline.__init__` (*parameters*, *random_state=0*)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.LogisticRegressionMulticlassPipeline.describe`

`LogisticRegressionMulticlassPipeline.describe` ()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.LogisticRegressionMulticlassPipeline.fit`

`LogisticRegressionMulticlassPipeline.fit` (*X*, *y*)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.LogisticRegressionMulticlassPipeline.get_component`

`LogisticRegressionMulticlassPipeline.get_component` (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.LogisticRegressionMulticlassPipeline.graph

`LogisticRegressionMulticlassPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type `graphviz.Digraph`

evalml.pipelines.LogisticRegressionMulticlassPipeline.graph_feature_importance

`LogisticRegressionMulticlassPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

evalml.pipelines.LogisticRegressionMulticlassPipeline.load

static `LogisticRegressionMulticlassPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

evalml.pipelines.LogisticRegressionMulticlassPipeline.predict

`LogisticRegressionMulticlassPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.LogisticRegressionMulticlassPipeline.predict_proba

`LogisticRegressionMulticlassPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.LogisticRegressionMulticlassPipeline.save

`LogisticRegressionMulticlassPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns None

evalml.pipelines.LogisticRegressionMulticlassPipeline.score

`LogisticRegressionMulticlassPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.RFBinaryClassificationPipeline

```

class evalml.pipelines.RFBinaryClassificationPipeline(parameters, random_state=0)
    Random Forest Pipeline for binary classification

    name = 'Random Forest Binary Classification Pipeline'
    custom_name = 'Random Forest Binary Classification Pipeline'
    summary = 'Random Forest Classifier w/ One Hot Encoder + Simple Imputer'
    component_graph = ['One Hot Encoder', 'Simple Imputer', 'Random Forest Classifier']
    problem_type = 'binary'
    model_family = 'random_forest'
    hyperparameters = {'One Hot Encoder': {}, 'Random Forest Classifier': {'max_depth':
    custom_hyperparameters = None
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.RFBinaryClassificationPipeline.__init__

`RFBinaryClassificationPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.RFBinaryClassificationPipeline.describe

`RFBinaryClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.RFBinaryClassificationPipeline.fit

`RFBinaryClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.RFBinaryClassificationPipeline.get_component**`RFBinaryClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component**Returns** component to return**Return type** Component**evalml.pipelines.RFBinaryClassificationPipeline.graph**`RFBinaryClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.**Returns** `plotly.Figure`, a bar graph showing features and their importances**evalml.pipelines.RFBinaryClassificationPipeline.load****static** `RFBinaryClassificationPipeline.load(file_path)`

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file**Returns** PipelineBase obj

evalml.pipelines.RFBinaryClassificationPipeline.predict

RFBinaryClassificationPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.RFBinaryClassificationPipeline.predict_proba

RFBinaryClassificationPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.RFBinaryClassificationPipeline.save

RFBinaryClassificationPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns *None*

evalml.pipelines.RFBinaryClassificationPipeline.score

RFBinaryClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.RFMulticlassClassificationPipeline

```

class evalml.pipelines.RFMulticlassClassificationPipeline(parameters, random_state=0)
    Random Forest Pipeline for multiclass classification

    name = 'Random Forest Multiclass Classification Pipeline'
    custom_name = 'Random Forest Multiclass Classification Pipeline'
    summary = 'Random Forest Classifier w/ One Hot Encoder + Simple Imputer'

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.RFMulticlassClassificationPipeline.__init__

`RFMulticlassClassificationPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or

ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.RFMulticlassClassificationPipeline.describe

`RFMulticlassClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.RFMulticlassClassificationPipeline.fit

`RFMulticlassClassificationPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.RFMulticlassClassificationPipeline.get_component

`RFMulticlassClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.RFMulticlassClassificationPipeline.graph

`RFMulticlassClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.RFMulticlassClassificationPipeline.graph_feature_importance

`RFMulticlassClassificationPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

evalml.pipelines.RFMulticlassClassificationPipeline.load

static `RFMulticlassClassificationPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

evalml.pipelines.RFMulticlassClassificationPipeline.predict

`RFMulticlassClassificationPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.RFMulticlassClassificationPipeline.predict_proba

`RFMulticlassClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.RFMulticlassClassificationPipeline.save

`RFMulticlassClassificationPipeline.save` (*file_path*)

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

evalml.pipelines.RFMulticlassClassificationPipeline.score

`RFMulticlassClassificationPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.XGBoostBinaryPipeline

class evalml.pipelines.XGBoostBinaryPipeline (*parameters*, *random_state=0*)

XGBoost Pipeline for binary classification

name = 'XGBoost Binary Classification Pipeline'

custom_name = 'XGBoost Binary Classification Pipeline'

summary = 'XGBoost Classifier w/ One Hot Encoder + Simple Imputer'

component_graph = ['One Hot Encoder', 'Simple Imputer', 'XGBoost Classifier']

problem_type = 'binary'

model_family = 'xgboost'

hyperparameters = {'One Hot Encoder': {}, 'Simple Imputer': {'impute_strategy': ['m'

custom_hyperparameters = None

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model

Continued on next page

Table 43 – continued from previous page

<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline’s feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.XGBoostBinaryPipeline.__init__`

`XGBoostBinaryPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.XGBoostBinaryPipeline.describe`

`XGBoostBinaryPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.XGBoostBinaryPipeline.fit`

`XGBoostBinaryPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.XGBoostBinaryPipeline.get_component

`XGBoostBinaryPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.XGBoostBinaryPipeline.graph

`XGBoostBinaryPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.XGBoostBinaryPipeline.graph_feature_importance

`XGBoostBinaryPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.XGBoostBinaryPipeline.load

static `XGBoostBinaryPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.XGBoostBinaryPipeline.predict

`XGBoostBinaryPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

`evalml.pipelines.XGBoostBinaryPipeline.predict_proba`

`XGBoostBinaryPipeline.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (`pd.DataFrame` or `np.array`) – data of shape `[n_samples, n_features]`

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.XGBoostBinaryPipeline.save`

`XGBoostBinaryPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (`str`) – location to save file

Returns `None`

`evalml.pipelines.XGBoostBinaryPipeline.score`

`XGBoostBinaryPipeline.score(X, y, objectives)`

Evaluate model performance on objectives

Parameters

- `X` (`pd.DataFrame` or `np.array`) – data of shape `[n_samples, n_features]`
- `y` (`pd.Series`) – true labels of length `[n_samples]`
- `objectives` (`list`) – list of objectives to score

Returns ordered dictionary of objective scores

Return type `dict`

`evalml.pipelines.XGBoostMulticlassPipeline`

```
class evalml.pipelines.XGBoostMulticlassPipeline(parameters, random_state=0)
```

XGBoost Pipeline for multiclass classification

```
name = 'XGBoost Multiclass Classification Pipeline'
```

```

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.XGBoostMulticlassPipeline.__init__`

`XGBoostMulticlassPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.XGBoostMulticlassPipeline.describe`

`XGBoostMulticlassPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.XGBoostMulticlassPipeline.fit`

`XGBoostMulticlassPipeline.fit` (*X*, *y*)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.XGBoostMulticlassPipeline.get_component`

`XGBoostMulticlassPipeline.get_component` (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.XGBoostMulticlassPipeline.graph`

`XGBoostMulticlassPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.XGBoostMulticlassPipeline.graph_feature_importance`

`XGBoostMulticlassPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

`evalml.pipelines.XGBoostMulticlassPipeline.load`

static `XGBoostMulticlassPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.XGBoostMulticlassPipeline.predict

XGBoostMulticlassPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.XGBoostMulticlassPipeline.predict_proba

XGBoostMulticlassPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.XGBoostMulticlassPipeline.save

XGBoostMulticlassPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.XGBoostMulticlassPipeline.score

XGBoostMulticlassPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.BaselineBinaryPipeline

```

class evalml.pipelines.BaselineBinaryPipeline(parameters, random_state=0)
    "Baseline Pipeline for binary classification"

    name = 'Baseline Classification Pipeline'
    custom_name = 'Baseline Classification Pipeline'
    summary = 'Baseline Classifier'
    component_graph = ['Baseline Classifier']
    problem_type = 'binary'
    model_family = 'baseline'
    hyperparameters = {'Baseline Classifier': {}}
    custom_hyperparameters = None
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.BaselineBinaryPipeline.__init__

```

BaselineBinaryPipeline.__init__(parameters, random_state=0)
    Machine learning pipeline made out of transformers and a estimator.
  
```

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.BaselineBinaryPipeline.describe`

`BaselineBinaryPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.BaselineBinaryPipeline.fit`

`BaselineBinaryPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

`evalml.pipelines.BaselineBinaryPipeline.get_component`

`BaselineBinaryPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.BaselineBinaryPipeline.graph`

`BaselineBinaryPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.BaselineBinaryPipeline.graph_feature_importance

BaselineBinaryPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.BaselineBinaryPipeline.load

static BaselineBinaryPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.BaselineBinaryPipeline.predict

BaselineBinaryPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.BaselineBinaryPipeline.predict_proba

BaselineBinaryPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.BaselineBinaryPipeline.save

BaselineBinaryPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.BaselineBinaryPipeline.score

`BaselineBinaryPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.BaselineMulticlassPipeline

class `evalml.pipelines.BaselineMulticlassPipeline` (*parameters*, *random_state=0*)

“Baseline Pipeline for multiclass classification

name = 'Baseline Multiclass Classification Pipeline'

custom_name = 'Baseline Multiclass Classification Pipeline'

summary = 'Baseline Classifier'

component_graph = ['Baseline Classifier']

problem_type = 'multiclass'

model_family = 'baseline'

hyperparameters = {'Baseline Classifier': {}}

custom_hyperparameters = None

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name

Continued on next page

Table 49 – continued from previous page

<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline’s feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.BaselineMulticlassPipeline.__init__`

`BaselineMulticlassPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.BaselineMulticlassPipeline.describe`

`BaselineMulticlassPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.BaselineMulticlassPipeline.fit`

`BaselineMulticlassPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.BaselineMulticlassPipeline.get_component

`BaselineMulticlassPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.BaselineMulticlassPipeline.graph

`BaselineMulticlassPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.BaselineMulticlassPipeline.graph_feature_importance

`BaselineMulticlassPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.BaselineMulticlassPipeline.load

static `BaselineMulticlassPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.BaselineMulticlassPipeline.predict

`BaselineMulticlassPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.BaselineMulticlassPipeline.predict_proba

BaselineMulticlassPipeline.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.BaselineMulticlassPipeline.save

BaselineMulticlassPipeline.**save**(*file_path*)

Saves pipeline at file path

Parameters *file_path* (*str*) – location to save file

Returns None

evalml.pipelines.BaselineMulticlassPipeline.score

BaselineMulticlassPipeline.**score**(*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- *X* (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- *y* (*pd.Series*) – true labels of length [n_samples]
- *objectives* (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ModeBaselineBinaryPipeline

```
class evalml.pipelines.ModeBaselineBinaryPipeline(parameters, random_state=0)
```

```
    "Mode Baseline Pipeline for binary classification"
```

```
    name = 'Mode Baseline Binary Classification Pipeline'
```

```
    custom_name = 'Mode Baseline Binary Classification Pipeline'
```

```
    summary = 'Baseline Classifier'
```

```
    component_graph = ['Baseline Classifier']
```

```
    problem_type = 'binary'
```

```
    model_family = 'baseline'
```

```
    hyperparameters = {'Baseline Classifier': {}}
```

```
custom_hyperparameters = {'strategy': ['mode']}
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ModeBaselineBinaryPipeline.__init__

ModeBaselineBinaryPipeline.__init__(parameters, random_state=0)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ModeBaselineBinaryPipeline.describe

ModeBaselineBinaryPipeline.describe()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.ModeBaselineBinaryPipeline.fit

ModeBaselineBinaryPipeline.**fit**(X, y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ModeBaselineBinaryPipeline.get_component

ModeBaselineBinaryPipeline.**get_component**(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ModeBaselineBinaryPipeline.graph

ModeBaselineBinaryPipeline.**graph**(filepath=None)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ModeBaselineBinaryPipeline.graph_feature_importance

ModeBaselineBinaryPipeline.**graph_feature_importance**(show_all_features=False)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ModeBaselineBinaryPipeline.load

static ModeBaselineBinaryPipeline.**load**(file_path)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ModeBaselineBinaryPipeline.predict

ModeBaselineBinaryPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ModeBaselineBinaryPipeline.predict_proba

ModeBaselineBinaryPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.ModeBaselineBinaryPipeline.save

ModeBaselineBinaryPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ModeBaselineBinaryPipeline.score

ModeBaselineBinaryPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ModeBaselineMulticlassPipeline

```

class evalml.pipelines.ModeBaselineMulticlassPipeline(parameters, random_state=0)
    "Mode Baseline Pipeline for multiclass classification"

    name = 'Mode Baseline Multiclass Classification Pipeline'
    custom_name = 'Mode Baseline Multiclass Classification Pipeline'
    summary = 'Baseline Classifier'
    component_graph = ['Baseline Classifier']
    problem_type = 'multiclass'
    model_family = 'baseline'
    hyperparameters = {'Baseline Classifier': {}}
    custom_hyperparameters = {'strategy': ['mode']}

<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ModeBaselineMulticlassPipeline.__init__

ModeBaselineMulticlassPipeline.__init__(parameters, random_state=0)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or

ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ModeBaselineMulticlassPipeline.describe

ModeBaselineMulticlassPipeline.**describe**()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.ModeBaselineMulticlassPipeline.fit

ModeBaselineMulticlassPipeline.**fit**(X,y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ModeBaselineMulticlassPipeline.get_component

ModeBaselineMulticlassPipeline.**get_component**(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ModeBaselineMulticlassPipeline.graph

ModeBaselineMulticlassPipeline.**graph**(filepath=None)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ModeBaselineMulticlassPipeline.graph_feature_importance

ModeBaselineMulticlassPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ModeBaselineMulticlassPipeline.load

static ModeBaselineMulticlassPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ModeBaselineMulticlassPipeline.predict

ModeBaselineMulticlassPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ModeBaselineMulticlassPipeline.predict_proba

ModeBaselineMulticlassPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.ModeBaselineMulticlassPipeline.save

ModeBaselineMulticlassPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ModeBaselineMulticlassPipeline.score

ModeBaselineMulticlassPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

Regression Pipelines

<i>RFRegressionPipeline</i>	Random Forest Pipeline for regression problems
<i>CatBoostRegressionPipeline</i>	CatBoost Pipeline for regression problems.
<i>ENRegressionPipeline</i>	Elastic Net Pipeline for regression problems
<i>ETRegressionPipeline</i>	Extra Trees Pipeline for regression problems
<i>LinearRegressionPipeline</i>	Linear Regression Pipeline for regression problems
<i>XGBoostRegressionPipeline</i>	XGBoost Pipeline for regression problems

<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.RFRegressionPipeline.__init__

`RFRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.RFRegressionPipeline.describe

`RFRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.RFRegressionPipeline.fit**RFRegressionPipeline.fit** (*X*, *y*)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.RFRegressionPipeline.get_component****RFRegressionPipeline.get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component**Returns** component to return**Return type** Component**evalml.pipelines.RFRegressionPipeline.graph****RFRegressionPipeline.graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.**Returns** Graph object that can be directly displayed in Jupyter notebooks.**Return type** graphviz.Digraph**evalml.pipelines.RFRegressionPipeline.graph_feature_importance****RFRegressionPipeline.graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.**Returns** plotly.Figure, a bar graph showing features and their importances**evalml.pipelines.RFRegressionPipeline.load****static RFRegressionPipeline.load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file**Returns** PipelineBase obj

evalml.pipelines.RFRegressionPipeline.predict

RFRegressionPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.RFRegressionPipeline.save

RFRegressionPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns *None*

evalml.pipelines.RFRegressionPipeline.score

RFRegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.CatBoostRegressionPipeline

class evalml.pipelines.CatBoostRegressionPipeline (*parameters*, *random_state=0*)

CatBoost Pipeline for regression problems. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Note: *impute_strategy* must support both string and numeric data

name = 'Cat Boost Regression Pipeline'

custom_name = *None*

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.CatBoostRegressionPipeline.__init__

`CatBoostRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.CatBoostRegressionPipeline.describe`

`CatBoostRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline.
Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.CatBoostRegressionPipeline.fit`

`CatBoostRegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.CatBoostRegressionPipeline.get_component`

`CatBoostRegressionPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.CatBoostRegressionPipeline.graph`

`CatBoostRegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.CatBoostRegressionPipeline.graph_feature_importance`

`CatBoostRegressionPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their importances

`evalml.pipelines.CatBoostRegressionPipeline.load`

static `CatBoostRegressionPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` obj

`evalml.pipelines.CatBoostRegressionPipeline.predict`

`CatBoostRegressionPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `objective` (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.CatBoostRegressionPipeline.save`

`CatBoostRegressionPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

`evalml.pipelines.CatBoostRegressionPipeline.score`

`CatBoostRegressionPipeline.score(X, y, objectives)`

Evaluate model performance on current and additional objectives

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – true labels of length `[n_samples]`
- `objectives` (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type `dict`

evalml.pipelines.ENRegressionPipeline

```

class evalml.pipelines.ENRegressionPipeline(parameters, random_state=0)
    Elastic Net Pipeline for regression problems

    name = 'ENRegression Pipeline'

    custom_name = None

    summary = 'Elastic Net Regressor w/ One Hot Encoder + Simple Imputer'

    component_graph = ['One Hot Encoder', 'Simple Imputer', 'Elastic Net Regressor']

    problem_type = 'regression'

    model_family = 'linear_model'

    hyperparameters = {'Elastic Net Regressor': {'alpha': Real(low=0, high=1, prior='uni
    custom_hyperparameters = None
  
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.ENRegressionPipeline.__init__

```

ENRegressionPipeline.__init__(parameters, random_state=0)
    Machine learning pipeline made out of transformers and a estimator.
  
```

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or

ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ENRegressionPipeline.describe

`ENRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.ENRegressionPipeline.fit

`ENRegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ENRegressionPipeline.get_component

`ENRegressionPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ENRegressionPipeline.graph

`ENRegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ENRegressionPipeline.graph_feature_importance

ENRegressionPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ENRegressionPipeline.load

static ENRegressionPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ENRegressionPipeline.predict

ENRegressionPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ENRegressionPipeline.save

ENRegressionPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ENRegressionPipeline.score

ENRegressionPipeline.**score** (*X, y, objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]

- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ETRegressionPipeline

class evalml.pipelines.ETRegressionPipeline (*parameters*, *random_state=0*)

Extra Trees Pipeline for regression problems

name = 'Extra Trees Regression Pipeline'

custom_name = 'Extra Trees Regression Pipeline'

summary = 'Extra Trees Regressor w/ One Hot Encoder + Simple Imputer'

component_graph = ['One Hot Encoder', 'Simple Imputer', 'Extra Trees Regressor']

problem_type = 'regression'

model_family = 'extra_trees'

hyperparameters = {'Extra Trees Regressor': {'max_depth': Integer(low=4, high=10, pr

custom_hyperparameters = None

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.ETRegressionPipeline.__init__

ETRegressionPipeline.__init__(parameters, random_state=0)

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: component_graph (list): List of components in order. Accepts strings or ComponentBase objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ETRegressionPipeline.describe

ETRegressionPipeline.describe()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.ETRegressionPipeline.fit

ETRegressionPipeline.fit(X, y)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ETRegressionPipeline.get_component

ETRegressionPipeline.get_component(name)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ETRegressionPipeline.graph

ETRegressionPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ETRegressionPipeline.graph_feature_importance

ETRegressionPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.ETRegressionPipeline.load

static ETRegressionPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.ETRegressionPipeline.predict

ETRegressionPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ETRegressionPipeline.save

ETRegressionPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file

Returns None

evalml.pipelines.ETRegressionPipeline.score

ETRegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.LinearRegressionPipeline

class evalml.pipelines.**LinearRegressionPipeline** (*parameters*, *random_state=0*)

Linear Regression Pipeline for regression problems

name = 'Linear Regression Pipeline'

custom_name = None

summary = 'Linear Regressor w/ One Hot Encoder + Simple Imputer + Standard Scaler'

component_graph = ['One Hot Encoder', 'Simple Imputer', 'Standard Scaler', 'Linear Reg

problem_type = 'regression'

model_family = 'linear_model'

hyperparameters = {'Linear Regressor': {'fit_intercept': [True, False], 'normalize':

custom_hyperparameters = None

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component pa-rameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name

Continued on next page

Table 64 – continued from previous page

<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline’s feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.LinearRegressionPipeline.__init__

`LinearRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.LinearRegressionPipeline.describe

`LinearRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.LinearRegressionPipeline.fit

`LinearRegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

`evalml.pipelines.LinearRegressionPipeline.get_component`

`LinearRegressionPipeline.get_component` (*name*)

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.LinearRegressionPipeline.graph`

`LinearRegressionPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.LinearRegressionPipeline.graph_feature_importance`

`LinearRegressionPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

`evalml.pipelines.LinearRegressionPipeline.load`

static `LinearRegressionPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns PipelineBase obj

`evalml.pipelines.LinearRegressionPipeline.predict`

`LinearRegressionPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.LinearRegressionPipeline.save

`LinearRegressionPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns None

evalml.pipelines.LinearRegressionPipeline.score

`LinearRegressionPipeline.score(X, y, objectives)`

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.XGBoostRegressionPipeline

class `evalml.pipelines.XGBoostRegressionPipeline(parameters, random_state=0)`

XGBoost Pipeline for regression problems

name = 'XGBoost Regression Pipeline'

custom_name = None

summary = 'XGBoost Regressor w/ One Hot Encoder + Simple Imputer'

component_graph = ['One Hot Encoder', 'Simple Imputer', 'XGBoost Regressor']

problem_type = 'regression'

model_family = 'xgboost'

hyperparameters = {'One Hot Encoder': {}, 'Simple Imputer': {'impute_strategy': ['m

custom_hyperparameters = None

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.XGBoostRegressionPipeline.__init__

`XGBoostRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.XGBoostRegressionPipeline.describe

`XGBoostRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.XGBoostRegressionPipeline.fit

`XGBoostRegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.XGBoostRegressionPipeline.get_component

XGBoostRegressionPipeline.**get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.XGBoostRegressionPipeline.graph

XGBoostRegressionPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.XGBoostRegressionPipeline.graph_feature_importance

XGBoostRegressionPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.XGBoostRegressionPipeline.load

static XGBoostRegressionPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.XGBoostRegressionPipeline.predict

XGBoostRegressionPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.XGBoostRegressionPipeline.save`

`XGBoostRegressionPipeline.save(file_path)`

Saves pipeline at file path

Parameters `file_path` (*str*) – location to save file

Returns `None`

`evalml.pipelines.XGBoostRegressionPipeline.score`

`XGBoostRegressionPipeline.score(X, y, objectives)`

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type `dict`

`evalml.pipelines.BaselineRegressionPipeline`

```
class evalml.pipelines.BaselineRegressionPipeline(parameters, random_state=0)
```

Baseline Pipeline for regression problems

```
name = 'Baseline Regression Pipeline'
```

```
custom_name = None
```

```
summary = 'Baseline Regressor'
```

```
component_graph = ['Baseline Regressor']
```

```
problem_type = 'regression'
```

```
model_family = 'baseline'
```

```
hyperparameters = {'Baseline Regressor': {}}
```

```
custom_hyperparameters = None
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph

<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

`evalml.pipelines.BaselineRegressionPipeline.__init__`

`BaselineRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.BaselineRegressionPipeline.describe`

`BaselineRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.BaselineRegressionPipeline.fit`

`BaselineRegressionPipeline.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.BaselineRegressionPipeline.get_component`

`BaselineRegressionPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.BaselineRegressionPipeline.graph`

`BaselineRegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.BaselineRegressionPipeline.graph_feature_importance`

`BaselineRegressionPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

`evalml.pipelines.BaselineRegressionPipeline.load`

static `BaselineRegressionPipeline.load(file_path)`

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase obj

evalml.pipelines.BaselineRegressionPipeline.predictBaselineRegressionPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels**Return type** *pd.Series***evalml.pipelines.BaselineRegressionPipeline.save**BaselineRegressionPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file**Returns** *None***evalml.pipelines.BaselineRegressionPipeline.score**BaselineRegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores**Return type** *dict***evalml.pipelines.MeanBaselineRegressionPipeline**

```
class evalml.pipelines.MeanBaselineRegressionPipeline (parameters, random_state=0)
```

Baseline Pipeline for regression problems

name = 'Mean Baseline Regression Pipeline'**custom_name** = *None***summary** = 'Baseline Regressor'**component_graph** = ['Baseline Regressor']

```
problem_type = 'regression'
model_family = 'baseline'
hyperparameters = {'Baseline Regressor': {}}
custom_hyperparameters = {'strategy': ['mean']}
```

Instance attributes

<code>feature_importances</code>	Return feature importances.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importances
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

`evalml.pipelines.MeanBaselineRegressionPipeline.__init__`

`MeanBaselineRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` objects in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.MeanBaselineRegressionPipeline.describe`

`MeanBaselineRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline.
 Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.MeanBaselineRegressionPipeline.fit`

`MeanBaselineRegressionPipeline.fit` (*X*, *y*)

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.MeanBaselineRegressionPipeline.get_component`

`MeanBaselineRegressionPipeline.get_component` (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.MeanBaselineRegressionPipeline.graph`

`MeanBaselineRegressionPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.MeanBaselineRegressionPipeline.graph_feature_importance`

`MeanBaselineRegressionPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importances

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their importances

evalml.pipelines.MeanBaselineRegressionPipeline.load**static** MeanBaselineRegressionPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file**Returns** PipelineBase obj**evalml.pipelines.MeanBaselineRegressionPipeline.predict**MeanBaselineRegressionPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels**Return type** pd.Series**evalml.pipelines.MeanBaselineRegressionPipeline.save**MeanBaselineRegressionPipeline.**save** (*file_path*)

Saves pipeline at file path

Parameters **file_path** (*str*) – location to save file**Returns** None**evalml.pipelines.MeanBaselineRegressionPipeline.score**MeanBaselineRegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores**Return type** dict**Pipeline Utils**

<i>all_pipelines</i>	Returns a complete list of all supported pipeline classes.
<i>get_pipelines</i>	Returns the pipelines allowed for a particular problem type.

Continued on next page

Table 71 – continued from previous page

<i>list_model_families</i>	List model type for a particular problem type
----------------------------	---

evalml.pipelines.all_pipelines

`evalml.pipelines.all_pipelines()`

Returns a complete list of all supported pipeline classes.

Returns a list of pipeline classes

Return type `list[PipelineBase]`

evalml.pipelines.get_pipelines

`evalml.pipelines.get_pipelines(problem_type, model_families=None)`

Returns the pipelines allowed for a particular problem type.

Can also optionally filter by a list of model types.

Arguments:

Returns a list of pipeline classes

Return type `list[PipelineBase]`

evalml.pipelines.list_model_families

`evalml.pipelines.list_model_families(problem_type)`

List model type for a particular problem type

Parameters `problem_types` (`ProblemTypes` or `str`) – binary, multiclass, or regression

Returns a list of model families

Return type `list[ModelFamily]`

Pipeline Graph Utils

<i>precision_recall_curve</i>	Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.
<i>graph_precision_recall_curve</i>	Generate and display a precision-recall plot.
<i>roc_curve</i>	Given labels and binary classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve.
<i>graph_roc_curve</i>	Generate and display a Receiver Operating Characteristic (ROC) plot.
<i>confusion_matrix</i>	Confusion matrix for binary and multiclass classification.
<i>normalize_confusion_matrix</i>	Normalizes a confusion matrix.
<i>graph_confusion_matrix</i>	Generate and display a confusion matrix plot.

evalml.pipelines.precision_recall_curve

`evalml.pipelines.precision_recall_curve(y_true, y_pred_proba)`

Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.

Returns

Dictionary containing metrics used to generate a precision-recall plot, with the following keys:

- *precision*: Precision values.
- *recall*: Recall values.
- *thresholds*: Threshold values used to produce the precision and recall.
- *auc_score*: The area under the ROC curve.

Return type list

evalml.pipelines.graph_precision_recall_curve

`evalml.pipelines.graph_precision_recall_curve(y_true, y_pred_proba, title_addition=None)`

Generate and display a precision-recall plot.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.
- **title_addition** (*str* or *None*) – if not None, append to plot title. Default None.

Returns `plotly.Figure` representing the precision-recall plot generated

evalml.pipelines.roc_curve

`evalml.pipelines.roc_curve(y_true, y_pred_proba)`

Given labels and binary classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.

Returns

Dictionary containing metrics used to generate an ROC plot, with the following keys:

- *fpr_rates*: False positive rates.
- *tpr_rates*: True positive rates.
- *thresholds*: Threshold values used to produce each pair of true/false positive rates.
- *auc_score*: The area under the ROC curve.

Return type dict

evalml.pipelines.graph_roc_curve

`evalml.pipelines.graph_roc_curve(y_true, y_pred_proba, title_addition=None)`

Generate and display a Receiver Operating Characteristic (ROC) plot.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.
- **title_addition** (*str* or *None*) – if not *None*, append to plot title. Default *None*.

Returns *plotly*.Figure representing the ROC plot generated

evalml.pipelines.confusion_matrix

`evalml.pipelines.confusion_matrix(y_true, y_predicted, normalize_method='true')`

Confusion matrix for binary and multiclass classification.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred** (*pd.Series* or *np.array*) – predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: ‘true’ to normalize by row, ‘pred’ to normalize by column, or ‘all’ to normalize by all values. Defaults to ‘true’.

Returns confusion matrix

Return type *np.array*

evalml.pipelines.normalize_confusion_matrix

`evalml.pipelines.normalize_confusion_matrix(conf_mat, normalize_method='true')`

Normalizes a confusion matrix.

Parameters

- **conf_mat** (*pd.DataFrame* or *np.array*) – confusion matrix to normalize.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: ‘true’ to normalize by row, ‘pred’ to normalize by column, or ‘all’ to normalize by all values. Defaults to ‘true’.

Returns A normalized version of the input confusion matrix.

evalml.pipelines.graph_confusion_matrix

`evalml.pipelines.graph_confusion_matrix(y_true, y_pred, normalize_method='true', title_addition=None)`

Generate and display a confusion matrix plot.

If `normalize_method` is set, hover text will show raw count, otherwise hover text will show count normalized with method 'true'.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred** (*pd.Series* or *np.array*) – predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.
- **title_addition** (*str* or *None*) – if not None, append to plot title. Default None.

Returns `plotly.Figure` representing the confusion matrix plot generated

Components

Component Base Classes

Components represent a step in a pipeline.

<i>ComponentBase</i>	Base class for all components
<i>Transformer</i>	A component that may or may not need fitting that transforms data.
<i>Estimator</i>	A component that fits and predicts given data

evalml.pipelines.components.ComponentBase

class `evalml.pipelines.components.ComponentBase(parameters, component_obj, random_state)`

Base class for all components

Methods

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data

`evalml.pipelines.components.ComponentBase.__init__`

`ComponentBase.__init__(parameters, component_obj, random_state)`
 Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.ComponentBase.describe`

`ComponentBase.describe(print_name=False, return_dict=False)`
 Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.ComponentBase.fit`

`ComponentBase.fit(X, y=None)`
 Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.Transformer`

class `evalml.pipelines.components.Transformer(parameters, component_obj, random_state)`

A component that may or may not need fitting that transforms data. These components are used before an estimator.

Methods

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>transform</code>	Transforms data X

`evalml.pipelines.components.Transformer.__init__`

`Transformer.__init__(parameters, component_obj, random_state)`
Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.Transformer.describe`

`Transformer.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.Transformer.fit`

`Transformer.fit(X, y=None)`
Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.Transformer.fit_transform`

`Transformer.fit_transform(X, y=None)`
Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.Transformer.transform

`Transformer.transform(X, y=None)`
Transforms data X

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type *pd.DataFrame*

evalml.pipelines.components.Estimator

class `evalml.pipelines.components.Estimator(parameters, component_obj, random_state)`
A component that fits and predicts given data

Methods

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.Estimator.__init__

`Estimator.__init__(parameters, component_obj, random_state)`
Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.Estimator.describe

`Estimator.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.Estimator.fit`Estimator.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, optional) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.components.Estimator.predict**`Estimator.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features**Returns** estimated labels**Return type** *pd.Series***evalml.pipelines.components.Estimator.predict_proba**`Estimator.predict_proba(X)`

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features**Returns** probability estimates**Return type** *pd.DataFrame***Transformers**

Transformers are components that take in data as input and output transformed data.

<i>OneHotEncoder</i>	One-hot encoder to encode non-numeric data
<i>SimpleImputer</i>	Imputes missing data according to a specified imputation strategy
<i>StandardScaler</i>	Standardize features: removes mean and scales to unit variance
<i>RFRegressorSelectFromModel</i>	Selects top features based on importance weights using a Random Forest regressor
<i>RFClassifierSelectFromModel</i>	Selects top features based on importance weights using a Random Forest classifier

evalml.pipelines.components.OneHotEncoder

```
class evalml.pipelines.components.OneHotEncoder(top_n=10, random_state=0)
```

One-hot encoder to encode non-numeric data

```
name = 'One Hot Encoder'
```

```
model_family = 'none'
```

```
hyperparameter_ranges = {}
```

Instance attributes

Methods:

<code>__init__</code>	Initializes self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>get_feature_names</code>	Returns names of transformed and added columns
<code>transform</code>	One-hot encode the input DataFrame.

evalml.pipelines.components.OneHotEncoder.__init__

```
OneHotEncoder.__init__(top_n=10, random_state=0)
```

Initializes self.

evalml.pipelines.components.OneHotEncoder.describe

```
OneHotEncoder.describe(print_name=False, return_dict=False)
```

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.OneHotEncoder.fit

`OneHotEncoder.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, optional) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.OneHotEncoder.fit_transform

`OneHotEncoder.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type *pd.DataFrame*

evalml.pipelines.components.OneHotEncoder.get_feature_names

`OneHotEncoder.get_feature_names()`

Returns names of transformed and added columns

Returns list of feature names not including dropped features

Return type list

evalml.pipelines.components.OneHotEncoder.transform

`OneHotEncoder.transform(X, y=None)`

One-hot encode the input DataFrame.

Parameters

- **X** (*pd.DataFrame*) – Dataframe of features.
- **y** (*pd.Series*) – Ignored.

Returns Transformed dataframe, where each categorical feature has been encoded into numerical columns using one-hot encoding.

evalml.pipelines.components.SimpleImputer

```

class evalml.pipelines.components.SimpleImputer(impute_strategy='most_frequent',
                                                fill_value=None, random_state=0)
    Imputes missing data according to a specified imputation strategy

    name = 'Simple Imputer'
    model_family = 'none'
    hyperparameter_ranges = {'impute_strategy': ['mean', 'median', 'most_frequent']}

```

Instance attributes

Methods:

<code>__init__</code>	Initializes an transformer that imputes missing data according to the specified imputation strategy.”
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits imputer on data X then imputes missing values in X
<code>transform</code>	Transforms data X by imputing missing values

evalml.pipelines.components.SimpleImputer.__init__

```
SimpleImputer.__init__(impute_strategy='most_frequent', fill_value=None, random_state=0)
```

Initializes an transformer that imputes missing data according to the specified imputation strategy.”

Parameters

- **impute_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most_frequent”, “constant” for numerical data, and “most_frequent”, “constant” for object data types.
- **fill_value** (*string*) – When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. Defaults to 0 when imputing numerical data and “missing_value” for strings or object data types.

evalml.pipelines.components.SimpleImputer.describe

```
SimpleImputer.describe(print_name=False, return_dict=False)
```

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.SimpleImputer.fit

`SimpleImputer.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.SimpleImputer.fit_transform

`SimpleImputer.fit_transform(X, y=None)`

Fits imputer on data X then imputes missing values in X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.SimpleImputer.transform

`SimpleImputer.transform(X, y=None)`

Transforms data X by imputing missing values

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.StandardScaler

```
class evalml.pipelines.components.StandardScaler (random_state=0)
    Standardize features: removes mean and scales to unit variance

    name = 'Standard Scaler'
    model_family = 'none'
    hyperparameter_ranges = {}
```

Instance attributes

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>transform</code>	Transforms data X

evalml.pipelines.components.StandardScaler.__init__

`StandardScaler.__init__` (*random_state=0*)
Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.StandardScaler.describe

`StandardScaler.describe` (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.StandardScaler.fit

`StandardScaler.fit` (*X, y=None*)
Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.StandardScaler.fit_transform

`StandardScaler.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (`pd.DataFrame`) – Data to fit and transform
- **y** (`pd.DataFrame`) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.StandardScaler.transform

`StandardScaler.transform(X, y=None)`

Transforms data X

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series, optional`) – Input Labels

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.RFRegressorSelectFromModel

```

class evalml.pipelines.components.RFRegressorSelectFromModel (number_features=None,
                                                                n_estimators=10,
                                                                max_depth=None,
                                                                per-
                                                                cent_features=0.5,
                                                                threshold=-inf,
                                                                n_jobs=-1,    ran-
                                                                dom_state=0)
  
```

Selects top features based on importance weights using a Random Forest regressor

name = 'RF Regressor Select From Model'

model_family = 'none'

hyperparameter_ranges = {'percent_features': Real(low=0.01, high=1, prior='uniform',

Instance attributes

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits feature selector on data X then transforms X by selecting features
<code>get_indices</code>	Get integer index of features selected
<code>get_names</code>	Get names of selected features.
<code>transform</code>	Transforms data X by selecting features

evalml.pipelines.components.RFRegressorSelectFromModel.__init__

`RFRegressorSelectFromModel.__init__(number_features=None, n_estimators=10, max_depth=None, percent_features=0.5, threshold=-inf, n_jobs=-1, random_state=0)`

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.RFRegressorSelectFromModel.describe

`RFRegressorSelectFromModel.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.RFRegressorSelectFromModel.fit

`RFRegressorSelectFromModel.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RFRegressorSelectFromModel.fit_transform

`RFRegressorSelectFromModel.fit_transform(X, y=None)`

Fits feature selector on data X then transforms X by selecting features

Parameters

- **x** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*) – Labels to fit and transform

Returns Transformed X

Return type *pd.DataFrame*

`evalml.pipelines.components.RFRegressorSelectFromModel.get_indices`

`RFRegressorSelectFromModel.get_indices()`

Get integer index of features selected

Returns list of indices

Return type list

`evalml.pipelines.components.RFRegressorSelectFromModel.get_names`

`RFRegressorSelectFromModel.get_names()`

Get names of selected features.

Returns list of the names of features selected

`evalml.pipelines.components.RFRegressorSelectFromModel.transform`

`RFRegressorSelectFromModel.transform(X, y=None)`

Transforms data X by selecting features

Parameters

- **x** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Input Labels

Returns Transformed X

Return type *pd.DataFrame*

`evalml.pipelines.components.RFClassifierSelectFromModel`

```

class evalml.pipelines.components.RFClassifierSelectFromModel (number_features=None,
                                                                n_estimators=10,
                                                                max_depth=None,
                                                                per-
                                                                cent_features=0.5,
                                                                threshold=-inf,
                                                                n_jobs=-1, ran-
                                                                dom_state=0)
  
```

Selects top features based on importance weights using a Random Forest classifier

```
name = 'RF Classifier Select From Model'
```

```
model_family = 'none'
```

```
hyperparameter_ranges = {'percent_features': Real(low=0.01, high=1, prior='uniform',
```

Instance attributes

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits feature selector on data X then transforms X by selecting features
<code>get_indices</code>	Get integer index of features selected
<code>get_names</code>	Get names of selected features.
<code>transform</code>	Transforms data X by selecting features

evalml.pipelines.components.RFClassifierSelectFromModel.__init__

```
RFClassifierSelectFromModel.__init__(number_features=None, n_estimators=10,
                                     max_depth=None, percent_features=0.5,
                                     threshold=-inf, n_jobs=-1, random_state=0)
```

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.RFClassifierSelectFromModel.describe

```
RFClassifierSelectFromModel.describe(print_name=False, return_dict=False)
```

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.RFClassifierSelectFromModel.fit

```
RFClassifierSelectFromModel.fit(X, y=None)
```

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RFClassifierSelectFromModel.fit_transform

`RFClassifierSelectFromModel.fit_transform(X, y=None)`

Fits feature selector on data X then transforms X by selecting features

Parameters

- **X** (`pd.DataFrame`) – Data to fit and transform
- **y** (`pd.Series`) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.RFClassifierSelectFromModel.get_indices

`RFClassifierSelectFromModel.get_indices()`

Get integer index of features selected

Returns list of indices

Return type list

evalml.pipelines.components.RFClassifierSelectFromModel.get_names

`RFClassifierSelectFromModel.get_names()`

Get names of selected features.

Returns list of the names of features selected

evalml.pipelines.components.RFClassifierSelectFromModel.transform

`RFClassifierSelectFromModel.transform(X, y=None)`

Transforms data X by selecting features

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series`, *optional*) – Input Labels

Returns Transformed X

Return type `pd.DataFrame`

Estimators

Classifiers

Classifiers are components that output a predicted class label.

<i>CatBoostClassifier</i>	CatBoost Classifier, a classifier that uses gradient-boosting on decision trees.
<i>ElasticNetClassifier</i>	Elastic Net Classifier
<i>ExtraTreesClassifier</i>	Extra Trees Classifier
<i>RandomForestClassifier</i>	Random Forest Classifier
<i>LogisticRegressionClassifier</i>	Logistic Regression Classifier
<i>XGBoostClassifier</i>	XGBoost Classifier
<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.

evalml.pipelines.components.CatBoostClassifier

```

abcABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.classifiers.catboost_classifier.CatBoostClassifier

```

```

class evalml.pipelines.components.CatBoostClassifier (n_estimators=1000, eta=0.03,
                                                    max_depth=6,          boot-
                                                    strap_type=None,         ran-
                                                    dom_state=0)

```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

Instance attributes

SEED_MAX	
SEED_MIN	
feature_importances	Returns feature importances.

Methods:

<i>__init__</i>	Initialize self.
<i>describe</i>	Describe a component and its parameters
<i>fit</i>	Fits component to data
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.

evalml.pipelines.components.CatBoostClassifier.__init__

`CatBoostClassifier.__init__(n_estimators=1000, eta=0.03, max_depth=6, bootstrap_type=None, random_state=0)`
Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.CatBoostClassifier.describe

`CatBoostClassifier.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.CatBoostClassifier.fit

`CatBoostClassifier.fit(X, y=None)`
Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.CatBoostClassifier.predict

`CatBoostClassifier.predict(X)`
Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.CatBoostClassifier.predict_proba

`CatBoostClassifier.predict_proba(X)`
Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.ElasticNetClassifier

```

class evalml.pipelines.components.ElasticNetClassifier(alpha=0.5, l1_ratio=0.5,
                                                       n_jobs=-1, random_state=0,
                                                       max_iter=1000)

```

Elastic Net Classifier

name = 'Elastic Net Classifier'

model_family = 'linear_model'

<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.ElasticNetClassifier.__init__

```

ElasticNetClassifier.__init__(alpha=0.5, l1_ratio=0.5, n_jobs=-1, random_state=0,
                              max_iter=1000)

```

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.ElasticNetClassifier.describe

```

ElasticNetClassifier.describe(print_name=False, return_dict=False)

```

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.ElasticNetClassifier.fit

ElasticNetClassifier.**fit** (*X*, *y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [*n_samples*, *n_features*]
- **y** (*pd.Series*, *optional*) – the target training labels of length [*n_samples*]

Returns *self*

evalml.pipelines.components.ElasticNetClassifier.predict

ElasticNetClassifier.**predict** (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.ElasticNetClassifier.predict_proba

ElasticNetClassifier.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.ExtraTreesClassifier

```

class evalml.pipelines.components.ExtraTreesClassifier (n_estimators=100,
                                                         max_features='auto',
                                                         max_depth=6,
                                                         min_samples_split=2,
                                                         min_weight_fraction_leaf=0.0,
                                                         n_jobs=-1,
                                                         random_state=0)

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

`evalml.pipelines.components.ExtraTreesClassifier.__init__`

`ExtraTreesClassifier.__init__(n_estimators=100, max_features='auto', max_depth=6, min_samples_split=2, min_weight_fraction_leaf=0.0, n_jobs=-1, random_state=0)`
 Initialize self. See help(type(self)) for accurate signature.

`evalml.pipelines.components.ExtraTreesClassifier.describe`

`ExtraTreesClassifier.describe(print_name=False, return_dict=False)`
 Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.ExtraTreesClassifier.fit`

`ExtraTreesClassifier.fit(X, y=None)`
 Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.ExtraTreesClassifier.predict

ExtraTreesClassifier.**predict** (*X*)

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.ExtraTreesClassifier.predict_proba

ExtraTreesClassifier.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.RandomForestClassifier

```
class evalml.pipelines.components.RandomForestClassifier (n_estimators=100,

evalml.pipelines.components.RandomForestClassifier.__init__

`RandomForestClassifier.__init__(n_estimators=100, max_depth=6, n_jobs=-1, random_state=0)`

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.RandomForestClassifier.describe

`RandomForestClassifier.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.RandomForestClassifier.fit

`RandomForestClassifier.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RandomForestClassifier.predict

`RandomForestClassifier.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.RandomForestClassifier.predict_proba

`RandomForestClassifier.predict_proba(X)`

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.LogisticRegressionClassifier

```

class evalml.pipelines.components.LogisticRegressionClassifier (penalty='l2',
                                                                C=1.0,

<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

`evalml.pipelines.components.XGBoostClassifier.__init__`

`XGBoostClassifier.__init__` (*eta=0.1, max_depth=6, min_child_weight=1, n_estimators=100, random_state=0*)
Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.XGBoostClassifier.describe`

`XGBoostClassifier.describe` (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.XGBoostClassifier.fit`

`XGBoostClassifier.fit` (*X, y=None*)
Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.XGBoostClassifier.predict`XGBoostClassifier.predict(X)`

Make predictions using selected features.

Parameters *X* (`pd.DataFrame`) – features**Returns** estimated labels**Return type** `pd.Series`**evalml.pipelines.components.XGBoostClassifier.predict_proba**`XGBoostClassifier.predict_proba(X)`

Make probability estimates for labels.

Parameters *X* (`pd.DataFrame`) – features**Returns** probability estimates**Return type** `pd.DataFrame`**evalml.pipelines.components.BaselineClassifier**

```
class evalml.pipelines.components.BaselineClassifier (strategy='mode',          ran-
                                                    dom_state=0)
```

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

name = 'Baseline Classifier'**model_family** = 'baseline'**supported_problem_types** = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS:**hyperparameter_ranges** = {}**Instance attributes**

<code>feature_importances</code>	Returns feature importances.
----------------------------------	------------------------------

Methods:

<code>__init__</code>	Baseline classifier that uses a simple strategy to make predictions.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.

Continued on next page

Table 102 – continued from previous page

<code>predict_proba</code>	Make probability estimates for labels.
----------------------------	--

`evalml.pipelines.components.BaselineClassifier.__init__`

`BaselineClassifier.__init__(strategy='mode', random_state=0)`

Baseline classifier that uses a simple strategy to make predictions.

Parameters

- **strategy** (*str*) – method used to predict. Valid options are “mode”, “random” and “random_weighted”. Defaults to “mode”.
- **random_state** (*int*, *np.random.RandomState*) – seed for the random number generator

`evalml.pipelines.components.BaselineClassifier.describe`

`BaselineClassifier.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.BaselineClassifier.fit`

`BaselineClassifier.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.BaselineClassifier.predict`

`BaselineClassifier.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.BaselineClassifier.predict_proba

`BaselineClassifier.predict_proba(X)`

Make probability estimates for labels.

Parameters *X* (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

Regressors

Regressors are components that output a predicted target value.

<i>CatBoostRegressor</i>	CatBoost Regressor, a regressor that uses gradient-boosting on decision trees.
<i>ElasticNetRegressor</i>	Elastic Net Regressor
<i>LinearRegressor</i>	Linear Regressor
<i>ExtraTreesRegressor</i>	Extra Trees Regressor
<i>RandomForestRegressor</i>	Random Forest Regressor
<i>XGBoostRegressor</i>	XGBoost Regressor
<i>BaselineRegressor</i>	Regressor that predicts using the specified strategy.

evalml.pipelines.components.CatBoostRegressor

```
class evalml.pipelines.components.CatBoostRegressor (n_estimators=1000, eta=0.03,
                                                    max_depth=6,          boot-
                                                    strap_type=None,        ran-
                                                    dom_state=0)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

```
name = 'CatBoost Regressor'

```

```
hyperparameter_ranges = {'eta': Real(low=1e-06, high=1, prior='uniform', transform='i
```

Instance attributes

<code>SEED_MAX</code>	
<code>SEED_MIN</code>	
<code>feature_importances</code>	Returns feature importances.

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Build a model
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.CatBoostRegressor.__init__

`CatBoostRegressor.__init__` (*n_estimators=1000*, *eta=0.03*, *max_depth=6*, *bootstrap_type=None*, *random_state=0*)
Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.CatBoostRegressor.describe

`CatBoostRegressor.describe` (*print_name=False*, *return_dict=False*)
Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.CatBoostRegressor.fit

`CatBoostRegressor.fit` (*X*, *y=None*)
Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.CatBoostRegressor.predict

`CatBoostRegressor.predict` (*X*)
Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.CatBoostRegressor.predict_proba

CatBoostRegressor.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.ElasticNetRegressor

```

class evalml.pipelines.components.ElasticNetRegressor(alpha=0.5, l1_ratio=0.5,
                                                    random_state=0, normalize=False,
                                                    max_iter=1000, n_jobs=-1)

```

Elastic Net Regressor

name = 'Elastic Net Regressor'

model_family = 'linear_model'

supported_problem_types = [*<ProblemTypes.REGRESSION: 'regression'>*]

hyperparameter_ranges = {'alpha': *Real(low=0, high=1, prior='uniform', transform='identity')*}

Instance attributes

<code>feature_importances</code>	Returns feature importances.
----------------------------------	------------------------------

Methods:

<code><i>__init__</i></code>	Initialize self.
<code><i>describe</i></code>	Describe a component and its parameters
<code><i>fit</i></code>	Fits component to data
<code><i>predict</i></code>	Make predictions using selected features.
<code><i>predict_proba</i></code>	Make probability estimates for labels.

evalml.pipelines.components.ElasticNetRegressor.__init__

ElasticNetRegressor.**__init__**(*alpha=0.5, l1_ratio=0.5, random_state=0, normalize=False, max_iter=1000, n_jobs=-1*)

Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.ElasticNetRegressor.describe

`ElasticNetRegressor.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.ElasticNetRegressor.fit

`ElasticNetRegressor.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.ElasticNetRegressor.predict

`ElasticNetRegressor.predict` (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.ElasticNetRegressor.predict_proba

`ElasticNetRegressor.predict_proba` (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.LinearRegressor

```
class evalml.pipelines.components.LinearRegressor (fit_intercept=True,          normal-
                                                    ize=False,    n_jobs=-1,    ran-
                                                    dom_state=0)
```

Linear Regressor

name = 'Linear Regressor'

model_family = 'linear_model'

supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]

hyperparameter_ranges = {'fit_intercept': [True, False], 'normalize': [True, False]}

Instance attributes

feature_importances	Returns feature importances.
---------------------	------------------------------

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.LinearRegressor.__init__

LinearRegressor.**__init__** (*fit_intercept=True, normalize=False, n_jobs=-1, random_state=0*)
Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.LinearRegressor.describe

LinearRegressor.**describe** (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.LinearRegressor.fit

`LinearRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, optional) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.LinearRegressor.predict

`LinearRegressor.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.LinearRegressor.predict_proba

`LinearRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.ExtraTreesRegressor

```
abc.ABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.regressors.et_regressor.ExtraTreesRegressor
```

```
class evalml.pipelines.components.ExtraTreesRegressor(n_estimators=100,
                                                       max_features='auto',
                                                       max_depth=6,
                                                       min_samples_split=2,
                                                       min_weight_fraction_leaf=0.0,
                                                       n_jobs=-1, random_state=0)
```

Extra Trees Regressor

name = 'Extra Trees Regressor'

model_family = 'extra_trees'

supported_problem_types = [`<ProblemTypes.REGRESSION: 'regression'>`]

hyperparameter_ranges = {'max_depth': `Integer(low=4, high=10, prior='uniform', transfo`

Instance attributes

<code>feature_importances</code>	Returns feature importances.
----------------------------------	------------------------------

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

`evalml.pipelines.components.ExtraTreesRegressor.__init__`

`ExtraTreesRegressor.__init__(n_estimators=100, max_features='auto', max_depth=6, min_samples_split=2, min_weight_fraction_leaf=0.0, n_jobs=-1, random_state=0)`

Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.ExtraTreesRegressor.describe`

`ExtraTreesRegressor.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.ExtraTreesRegressor.fit`

`ExtraTreesRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.ExtraTreesRegressor.predict`

`ExtraTreesRegressor.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.ExtraTreesRegressor.predict_proba

ExtraTreesRegressor.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.RandomForestRegressor

```

class evalml.pipelines.components.RandomForestRegressor (n_estimators=100,
                                                          max_depth=6, n_jobs=-1,
                                                          random_state=0)

    Random Forest Regressor

    name = 'Random Forest Regressor'
    model_family = 'random_forest'
    supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
    hyperparameter_ranges = {'max_depth': Integer(low=1, high=32, prior='uniform', transf
  
```

Instance attributes

<code>feature_importances</code>	Returns feature importances.
----------------------------------	------------------------------

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.RandomForestRegressor.__init__

`RandomForestRegressor.__init__(n_estimators=100, max_depth=6, n_jobs=-1, random_state=0)`

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.RandomForestRegressor.describe

`RandomForestRegressor.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.RandomForestRegressor.fit

`RandomForestRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RandomForestRegressor.predict

`RandomForestRegressor.predict(X)`

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.RandomForestRegressor.predict_proba

`RandomForestRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.XGBoostRegressor

```

class evalml.pipelines.components.XGBoostRegressor(eta=0.1, max_depth=6,
                                                    min_child_weight=1,
                                                    n_estimators=100, random_state=0)

```

XGBoost Regressor

name = 'XGBoost Regressor'

model_family = 'xgboost'

supported_problem_types = [`<ProblemTypes.REGRESSION: 'regression'>`]

hyperparameter_ranges = {'eta': `Real(low=1e-06, high=1, prior='uniform', transform='i`

Instance attributes

<code>SEED_MAX</code>	
<code>SEED_MIN</code>	
<code>feature_importances</code>	Returns feature importances.

Methods:

<code>__init__</code>	Initialize self.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

evalml.pipelines.components.XGBoostRegressor.__init__

```

XGBoostRegressor.__init__(eta=0.1, max_depth=6, min_child_weight=1, n_estimators=100,
                           random_state=0)
Initialize self. See help(type(self)) for accurate signature.

```

evalml.pipelines.components.XGBoostRegressor.describe

```

XGBoostRegressor.describe(print_name=False, return_dict=False)
Describe a component and its parameters

```

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.XGBoostRegressor.fit

`XGBoostRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (`pd.DataFrame` or `np.array`) – the input training data of shape `[n_samples, n_features]`
- **y** (`pd.Series`, optional) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.components.XGBoostRegressor.predict

`XGBoostRegressor.predict(X)`

Make predictions using selected features.

Parameters **X** (`pd.DataFrame`) – features

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.components.XGBoostRegressor.predict_proba

`XGBoostRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters **X** (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.components.BaselineRegressor

```
class evalml.pipelines.components.BaselineRegressor (strategy='mean', ran-
                                                    dom_state=0)
```

Regressor that predicts using the specified strategy.

This is useful as a simple baseline regressor to compare with other regressors.

```
name = 'Baseline Regressor'
```

```
model_family = 'baseline'
```

```
supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
```

```
hyperparameter_ranges = {}
```

Instance attributes

<code>feature_importances</code>	Returns feature importances.
----------------------------------	------------------------------

Methods:

<code>__init__</code>	Baseline regressor that uses a simple strategy to make predictions.
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.

`evalml.pipelines.components.BaselineRegressor.__init__`

`BaselineRegressor.__init__(strategy='mean', random_state=0)`

Baseline regressor that uses a simple strategy to make predictions.

Parameters

- **strategy** (*str*) – method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random_state** (*int*, *np.random.RandomState*) – seed for the random number generator

`evalml.pipelines.components.BaselineRegressor.describe`

`BaselineRegressor.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.BaselineRegressor.fit`

`BaselineRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.BaselineRegressor.predict`BaselineRegressor.predict(X)`

Make predictions using selected features.

Parameters *X* (`pd.DataFrame`) – features**Returns** estimated labels**Return type** `pd.Series`**evalml.pipelines.components.BaselineRegressor.predict_proba**`BaselineRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters *X* (`pd.DataFrame`) – features**Returns** probability estimates**Return type** `pd.DataFrame`**Objective Functions****Objective Base Classes**

<i>ObjectiveBase</i>	Base class for all objectives.
<i>BinaryClassificationObjective</i>	Base class for all binary classification objectives.
<i>MulticlassClassificationObjective</i>	Base class for all multiclass classification objectives.
<i>RegressionObjective</i>	Base class for all regression objectives.

evalml.objectives.ObjectiveBase**class** `evalml.objectives.ObjectiveBase`

Base class for all objectives.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.ObjectiveBase.objective_function

classmethod `ObjectiveBase.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.ObjectiveBase.score

`ObjectiveBase.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.ObjectiveBase.validate_inputs

`ObjectiveBase.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.BinaryClassificationObjective

class evalml.objectives.BinaryClassificationObjective

Base class for all binary classification objectives.

problem_type (ProblemTypes): Type of problem this objective is. Set to ProblemTypes.BINARY.

can_optimize_threshold (bool): Determines if threshold used by objective can be optimized or not.

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.BinaryClassificationObjective.decision_function

`BinaryClassificationObjective.decision_function` (*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.BinaryClassificationObjective.objective_function

classmethod `BinaryClassificationObjective.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.BinaryClassificationObjective.optimize_threshold`

`BinaryClassificationObjective.optimize_threshold(y_pred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **`y_pred_proba`** (`list`) – The classifier’s predicted probabilities
- **`y_true`** (`list`) – The ground truth for the predictions.
- **`X`** (`pd.DataFrame`, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.BinaryClassificationObjective.score`

`BinaryClassificationObjective.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.BinaryClassificationObjective.validate_inputs`

`BinaryClassificationObjective.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.MulticlassClassificationObjective

class evalml.objectives.MulticlassClassificationObjective

Base class for all multiclass classification objectives.

problem_type (ProblemTypes): Type of problem this objective is. Set to ProblemTypes.MULTICLASS.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MulticlassClassificationObjective.objective_function

classmethod MulticlassClassificationObjective.**objective_function**(*y_true*,
y_predicted,
X=None)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (pd.Series) : predicted values of length [n_samples] *y_true* (pd.Series) : actual class labels of length [n_samples] *X* (pd.DataFrame or np.array) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MulticlassClassificationObjective.score

MulticlassClassificationObjective.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (pd.Series) – predicted values of length [n_samples]
- **y_true** (pd.Series) – actual class labels of length [n_samples]
- **X** (pd.DataFrame or np.array) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MulticlassClassificationObjective.validate_inputs

`MulticlassClassificationObjective.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RegressionObjective**class evalml.objectives.RegressionObjective**

Base class for all regression objectives.

problem_type (*ProblemTypes*): Type of problem this objective is. Set to *ProblemTypes.REGRESSION*.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RegressionObjective.objective_function

classmethod `RegressionObjective.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*) : predicted values of length [n_samples] **y_true** (*pd.Series*) : actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RegressionObjective.score

`RegressionObjective.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.RegressionObjective.validate_inputs

`RegressionObjective.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]

Returns None

Domain-Specific Objectives

<i>FraudCost</i>	Score the percentage of money lost of the total transaction amount process due to fraud
<i>LeadScoring</i>	Lead scoring

evalml.objectives.FraudCost

```
class evalml.objectives.FraudCost (retry_percentage=0.5, interchange_fee=0.02,
                                   fraud_payout_percentage=1.0, amount_col='amount')
    Score the percentage of money lost of the total transaction amount process due to fraud
```

Methods

<u><code>__init__</code></u>	Create instance of FraudCost
------------------------------	------------------------------

Continued on next page

Table 124 – continued from previous page

<code>decision_function</code>	Determine if a transaction is fraud given predicted probabilities, threshold, and dataframe with transaction amount
<code>objective_function</code>	Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.FraudCost.__init__`

`FraudCost.__init__(retry_percentage=0.5, interchange_fee=0.02, fraud_payout_percentage=1.0, amount_col='amount')`
Create instance of `FraudCost`

Parameters

- **retry_percentage** (*float*) – What percentage of customers that will retry a transaction if it is declined. Between 0 and 1. Defaults to .5
- **interchange_fee** (*float*) – How much of each successful transaction you can collect. Between 0 and 1. Defaults to .02
- **fraud_payout_percentage** (*float*) – Percentage of fraud you will not be able to collect. Between 0 and 1. Defaults to 1.0
- **amount_col** (*str*) – Name of column in data that contains the amount. Defaults to “amount”

`evalml.objectives.FraudCost.decision_function`

`FraudCost.decision_function(y_pred_proba, threshold=0.0, X=None)`
Determine if a transaction is fraud given predicted probabilities, threshold, and dataframe with transaction amount

Parameters

- **y_pred_proba** (*pd.Series*) – Predicted probabilities
- **X** (*pd.DataFrame*) – Dataframe containing transaction amount
- **threshold** (*float*) – Dollar threshold to determine if transaction is fraud

Returns Series of predicted fraud labels using X and threshold

Return type `pd.Series`

`evalml.objectives.FraudCost.objective_function`

`FraudCost.objective_function(y_true, y_predicted, X)`
Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount

Parameters

- **y_predicted** (*pd.Series*) – predicted fraud labels
- **y_true** (*pd.Series*) – true fraud labels
- **X** (*pd.DataFrame*) – dataframe with transaction amounts

Returns amount lost to fraud per transaction

Return type float

evalml.objectives.FraudCost.optimize_threshold

`FraudCost.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.FraudCost.score

`FraudCost.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.FraudCost.validate_inputs

`FraudCost.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.LeadScoring

class evalml.objectives.LeadScoring(*true_positives=1, false_positives=-1*)
Lead scoring

Methods

<code>__init__</code>	Create instance.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Calculate the profit per lead.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.LeadScoring.__init__

LeadScoring.__init__(*true_positives=1, false_positives=-1*)
Create instance.

Parameters

- **true_positives** (*int*) – reward for a true positive
- **false_positives** (*int*) – cost for a false positive. Should be negative.

evalml.objectives.LeadScoring.decision_function

LeadScoring.**decision_function**(*ypred_proba, threshold=0.5, X=None*)
Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.LeadScoring.objective_function

LeadScoring.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Calculate the profit per lead.

Parameters

- **y_predicted** (*pd.Series*) – predicted labels
- **y_true** (*pd.Series*) – true labels
- **X** (*pd.DataFrame*) – None, not used.

Returns profit per lead

Return type float

evalml.objectives.LeadScoring.optimize_threshold

LeadScoring.**optimize_threshold**(*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.LeadScoring.score

LeadScoring.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.LeadScoring.validate_inputs

LeadScoring.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AccuracyBinary

```
class evalml.objectives.AccuracyBinary
```

Accuracy score for binary classification

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.AccuracyBinary.decision_function`

`AccuracyBinary.decision_function` (*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

`evalml.objectives.AccuracyBinary.objective_function`

`AccuracyBinary.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.AccuracyBinary.optimize_threshold`

`AccuracyBinary.optimize_threshold` (*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities

- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.AccuracyBinary.score

AccuracyBinary.**score** (*y_true, y_predicted, X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.AccuracyBinary.validate_inputs

AccuracyBinary.**validate_inputs** (*y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AccuracyMulticlass

class evalml.objectives.AccuracyMulticlass

Accuracy score for multiclass classification

Methods

objective_function

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Continued on next page

Table 128 – continued from previous page

<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.AccuracyMulticlass.objective_function`

`AccuracyMulticlass.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.AccuracyMulticlass.score`

`AccuracyMulticlass.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.AccuracyMulticlass.validate_inputs`

`AccuracyMulticlass.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

`evalml.objectives.AUC`

class evalml.objectives.AUC
AUC score for binary classification

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.AUC.decision_function

AUC.decision_function (*ypred_proba*, *threshold=0.5*, *X=None*)
Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.AUC.objective_function

AUC.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUC.optimize_threshold

AUC.optimize_threshold (*ypred_proba*, *y_true*, *X=None*)
Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.AUC.score

AUC.score (*y_true, y_predicted, X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.AUC.validate_inputs

AUC.validate_inputs (*y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AUCMacro

class evalml.objectives.AUCMacro

AUC score for multiclass classification using macro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
---------------------------	---

Continued on next page

Table 130 – continued from previous page

<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.AUCMacro.objective_function`

`AUCMacro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.AUCMacro.score`

`AUCMacro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.AUCMacro.validate_inputs`

`AUCMacro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

`evalml.objectives.AUCMicro`

class evalml.objectives.AUCMicro
AUC score for multiclass classification using micro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUCMicro.objective_function

AUCMicro.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUCMicro.score

AUCMicro.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.AUCMicro.validate_inputs

AUCMicro.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.AUCWeighted

class evalml.objectives.AUCWeighted

AUC Score for multiclass classification using weighted averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUCWeighted.objective_function

AUCWeighted.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUCWeighted.score

AUCWeighted.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.AUCWeighted.validate_inputs

AUCWeighted.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.BalancedAccuracyBinary

class evalml.objectives.BalancedAccuracyBinary

Balanced accuracy score for binary classification

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.BalancedAccuracyBinary.decision_function

BalancedAccuracyBinary.**decision_function**(*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

`evalml.objectives.BalancedAccuracyBinary.objective_function`

`BalancedAccuracyBinary.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`) : predicted values of length [*n_samples*] *y_true* (`pd.Series`) : actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.BalancedAccuracyBinary.optimize_threshold`

`BalancedAccuracyBinary.optimize_threshold` (*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- ***ypred_proba*** (*list*) – The classifier’s predicted probabilities
- ***y_true*** (*list*) – The ground truth for the predictions.
- ***X*** (`pd.DataFrame`, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.BalancedAccuracyBinary.score`

`BalancedAccuracyBinary.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

`evalml.objectives.BalancedAccuracyBinary.validate_inputs`

`BalancedAccuracyBinary.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.BalancedAccuracyMulticlass

class evalml.objectives.BalancedAccuracyMulticlass
Balanced accuracy score for multiclass classification

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.BalancedAccuracyMulticlass.objective_function

BalancedAccuracyMulticlass.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.BalancedAccuracyMulticlass.score

BalancedAccuracyMulticlass.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.BalancedAccuracyMulticlass.validate_inputs

BalancedAccuracyMulticlass.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1

class evalml.objectives.**F1**

F1 score for binary classification

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1.decision_function

F1.**decision_function**(*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.F1.objective_function

F1.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1.optimize_threshold

F1.optimize_threshold (*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.F1.score

F1.score (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.F1.validate_inputs

F1.validate_inputs (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.F1Micro

class evalml.objectives.F1Micro
F1 score for multiclass classification using micro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1Micro.objective_function

F1Micro.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1Micro.score

F1Micro.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.F1Micro.validate_inputs

`F1Micro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1Macro

class evalml.objectives.F1Macro

F1 score for multiclass classification using macro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1Macro.objective_function

`F1Macro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (*pd.Series*) : predicted values of length [n_samples] `y_true` (*pd.Series*) : actual class labels of length [n_samples] `X` (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1Macro.score

`F1Macro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.F1Macro.validate_inputs

F1Macro.validate_inputs (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1Weighted

class evalml.objectives.**F1Weighted**

F1 score for multiclass classification using weighted averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1Weighted.objective_function

F1Weighted.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1Weighted.score

`F1Weighted.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.F1Weighted.validate_inputs

`F1Weighted.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]

Returns None

evalml.objectives.LogLossBinary

class evalml.objectives.LogLossBinary

Log Loss for binary classification

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.LogLossBinary.decision_function

`LogLossBinary.decision_function(ypred_proba, threshold=0.5, X=None)`

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.LogLossBinary.objective_function

`LogLossBinary.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (*pd.Series*) : predicted values of length `[n_samples]` `y_true` (*pd.Series*) : actual class labels of length `[n_samples]` `X` (*pd.DataFrame* or *np.array*) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.LogLossBinary.optimize_threshold

`LogLossBinary.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.LogLossBinary.score

`LogLossBinary.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length `[n_samples]`
- **y_true** (*pd.Series*) – actual class labels of length `[n_samples]`

- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.LogLossBinary.validate_inputs

`LogLossBinary.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.LogLossMulticlass

class evalml.objectives.LogLossMulticlass

Log Loss for multiclass classification

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.LogLossMulticlass.objective_function

`LogLossMulticlass.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*) : predicted values of length [n_samples] **y_true** (*pd.Series*) : actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.LogLossMulticlass.score

`LogLossMulticlass.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.LogLossMulticlass.validate_inputs

`LogLossMulticlass.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MCCBinary

class evalml.objectives.MCCBinary

Matthews correlation coefficient for binary classification

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MCCBinary.decision_function

MCCBinary.**decision_function**(ypred_proba, threshold=0.5, X=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.MCCBinary.objective_function

MCCBinary.**objective_function**(y_true, y_predicted, X=None)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: y_predicted (pd.Series) : predicted values of length [n_samples] y_true (pd.Series) : actual class labels of length [n_samples] X (pd.DataFrame or np.array) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MCCBinary.optimize_threshold

MCCBinary.**optimize_threshold**(ypred_proba, y_true, X=None)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.MCCBinary.score

MCCBinary.**score**(y_true, y_predicted, X=None)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MCCBinary.validate_inputs

MCCBinary.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MCCMulticlass

class evalml.objectives.MCCMulticlass

Matthews correlation coefficient for multiclass classification

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MCCMulticlass.objective_function

MCCMulticlass.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MCCMulticlass.score

MCCMulticlass.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MCCMulticlass.validate_inputs

MCCMulticlass.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.Precision

class evalml.objectives.**Precision**

Precision score for binary classification

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.Precision.decision_function

`Precision.decision_function(ypred_proba, threshold=0.5, X=None)`

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.Precision.objective_function

`Precision.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (*pd.Series*) : predicted values of length `[n_samples]` `y_true` (*pd.Series*) : actual class labels of length `[n_samples]` `X` (*pd.DataFrame* or *np.array*) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.Precision.optimize_threshold

`Precision.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.Precision.score

`Precision.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length `[n_samples]`
- **y_true** (*pd.Series*) – actual class labels of length `[n_samples]`

- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.Precision.validate_inputs

`Precision.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.PrecisionMicro

class evalml.objectives.PrecisionMicro

Precision score for multiclass classification using micro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.PrecisionMicro.objective_function

`PrecisionMicro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*) : predicted values of length [n_samples] **y_true** (*pd.Series*) : actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.PrecisionMicro.score

PrecisionMicro.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.PrecisionMicro.validate_inputs

PrecisionMicro.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.PrecisionMacro

class evalml.objectives.PrecisionMacro

Precision score for multiclass classification using macro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.PrecisionMacro.objective_function

PrecisionMacro.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.PrecisionMacro.score`

`PrecisionMacro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.PrecisionMacro.validate_inputs`

`PrecisionMacro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

`evalml.objectives.PrecisionWeighted`

class `evalml.objectives.PrecisionWeighted`

Precision score for multiclass classification using weighted averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.PrecisionWeighted.objective_function

PrecisionWeighted.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (pd.Series) : predicted values of length [n_samples] *y_true* (pd.Series) : actual class labels of length [n_samples] *X* (pd.DataFrame or np.array) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.PrecisionWeighted.score

PrecisionWeighted.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (pd.Series) – predicted values of length [n_samples]
- **y_true** (pd.Series) – actual class labels of length [n_samples]
- **X** (pd.DataFrame or np.array) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.PrecisionWeighted.validate_inputs

PrecisionWeighted.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (pd.Series) – predicted values of length [n_samples]
- **y_true** (pd.Series) – actual class labels of length [n_samples]

Returns None

evalml.objectives.Recall

class evalml.objectives.Recall
Recall score for binary classification

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.Recall.decision_function

Recall.**decision_function** (*ypred_proba*, *threshold=0.5*, *X=None*)
Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.Recall.objective_function

Recall.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.Recall.optimize_threshold`

`Recall.optimize_threshold(y_pred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **y_pred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.Recall.score`

`Recall.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

`evalml.objectives.Recall.validate_inputs`

`Recall.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

`evalml.objectives.RecallMicro`

class `evalml.objectives.RecallMicro`

Recall score for multiclass classification using micro averaging

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.RecallMicro.objective_function`

`RecallMicro.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`) : predicted values of length [*n_samples*] *y_true* (`pd.Series`) : actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.RecallMicro.score`

`RecallMicro.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

`evalml.objectives.RecallMicro.validate_inputs`

`RecallMicro.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.RecallMacro

class evalml.objectives.RecallMacro

Recall score for multiclass classification using macro averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RecallMacro.objective_function

RecallMacro.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RecallMacro.score

RecallMacro.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.RecallMacro.validate_inputs

`RecallMacro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RecallWeighted

class evalml.objectives.RecallWeighted

Recall score for multiclass classification using weighted averaging

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RecallWeighted.objective_function

`RecallWeighted.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (*pd.Series*) : predicted values of length [n_samples] `y_true` (*pd.Series*) : actual class labels of length [n_samples] `X` (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RecallWeighted.score

`RecallWeighted.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **x** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.RecallWeighted.validate_inputs

`RecallWeighted.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

Regression Objectives

<i>R2</i>	Coefficient of determination for regression
<i>MAE</i>	Mean absolute error for regression
<i>MSE</i>	Mean squared error for regression
<i>MeanSquaredLogError</i>	Mean squared log error for regression.
<i>MedianAE</i>	Median absolute error for regression
<i>MaxError</i>	Maximum residual error for regression
<i>ExpVariance</i>	Explained variance score for regression
<i>RootMeanSquaredError</i>	Root mean squared error for regression
<i>RootMeanSquaredLogError</i>	Root mean squared log error for regression.

evalml.objectives.R2

class `evalml.objectives.R2`
Coefficient of determination for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
---------------------------	---

Continued on next page

Table 152 – continued from previous page

<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.R2.objective_function

`R2.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`) : predicted values of length [*n_samples*] *y_true* (`pd.Series`) : actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.R2.score

`R2.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.R2.validate_inputs

`R2.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.MAE

class evalml.objectives.**MAE**
Mean absolute error for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MAE.objective_function

MAE.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MAE.score

MAE.score (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MAE.validate_inputs

MAE.validate_inputs (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MSE

class evalml.objectives.MSE
Mean squared error for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MSE.objective_function

MSE.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MSE.score

MSE.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.MSE.validate_inputs

MSE.**validate_inputs** (*y_true*, *y_predicted*)
Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MeanSquaredLogError

class evalml.objectives.**MeanSquaredLogError**

Mean squared log error for regression. Only valid for nonnegative inputs. Otherwise, will throw a ValueError

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MeanSquaredLogError.objective_function

MeanSquaredLogError.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MeanSquaredLogError.score

MeanSquaredLogError.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MeanSquaredLogError.validate_inputs

MeanSquaredLogError.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MedianAE

class evalml.objectives.MedianAE
Median absolute error for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MedianAE.objective_function

MedianAE.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MedianAE.score

MedianAE.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.MedianAE.validate_inputs

MedianAE.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.MaxError

class evalml.objectives.**MaxError**

Maximum residual error for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MaxError.objective_function

MaxError.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`) : predicted values of length `[n_samples]` `y_true` (`pd.Series`) : actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`) : extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.MaxError.score`

`MaxError.score` (`y_true`, `y_predicted`, `X=None`)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.MaxError.validate_inputs`

`MaxError.validate_inputs` (`y_true`, `y_predicted`)

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

`evalml.objectives.ExpVariance`

class `evalml.objectives.ExpVariance`

Explained variance score for regression

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.ExpVariance.objective_function

`ExpVariance.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`) : predicted values of length [*n_samples*] *y_true* (`pd.Series`) : actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.ExpVariance.score

`ExpVariance.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [*n_samples*]
- **y_true** (`pd.Series`) – actual class labels of length [*n_samples*]
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.ExpVariance.validate_inputs

`ExpVariance.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [*n_samples*]
- **y_true** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.RootMeanSquaredError

class evalml.objectives.RootMeanSquaredError
Root mean squared error for regression

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RootMeanSquaredError.objective_function

RootMeanSquaredError.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) – predicted values of length [*n_samples*] *y_true* (*pd.Series*) : actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RootMeanSquaredError.score

RootMeanSquaredError.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.RootMeanSquaredError.validate_inputs

RootMeanSquaredError.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RootMeanSquaredLogError

class evalml.objectives.RootMeanSquaredLogError

Root mean squared log error for regression. Only valid for nonnegative inputs. Otherwise, will throw a ValueError

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RootMeanSquaredLogError.objective_function

RootMeanSquaredLogError.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*) : predicted values of length [n_samples] *y_true* (*pd.Series*) : actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*) : extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RootMeanSquaredLogError.score

RootMeanSquaredLogError.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score**evalml.objectives.RootMeanSquaredLogError.validate_inputs**`RootMeanSquaredLogError.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None**Problem Types***ProblemTypes*

Enum for type of machine learning problem: BINARY, MULTICLASS, or REGRESSION

evalml.problem_types.ProblemTypes**class** `evalml.problem_types.ProblemTypes`

Enum for type of machine learning problem: BINARY, MULTICLASS, or REGRESSION

handle_problem_types

Handles problem_type by either returning the ProblemTypes or converting from a str

evalml.problem_types.handle_problem_types`evalml.problem_types.handle_problem_types(problem_type)`

Handles problem_type by either returning the ProblemTypes or converting from a str

Parameters **problem_types** (*str* or *ProblemTypes*) – problem type that needs to be handled

Returns ProblemTypes

Model Family

<i>ModelFamily</i>	Enum for family of machine learning models.
--------------------	---

evalml.model_family.ModelFamily

class evalml.model_family.**ModelFamily**
 Enum for family of machine learning models.

Tuners

<i>Tuner</i>	Defines API for Tuners
<i>SKOptTuner</i>	Bayesian Optimizer
<i>GridSearchTuner</i>	Grid Search Optimizer
<i>RandomSearchTuner</i>	Random Search Optimizer

evalml.tuners.Tuner

class evalml.tuners.**Tuner** (*pipeline_hyperparameter_ranges, random_state=0*)
 Defines API for Tuners

Tuners implement different strategies for sampling from a search space. They're used in EvalML to search the space of pipeline hyperparameters.

Methods

<code>__init__</code>	Base Tuner class
<code>add</code>	Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.
<code>is_search_space_exhausted</code>	Optional.
<code>propose</code>	Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

`evalml.tuners.Tuner.__init__`

`Tuner.__init__(pipeline_hyperparameter_ranges, random_state=0)`

Base Tuner class

Parameters

- **`pipeline_hyperparameter_ranges`** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **`random_state`** (*int*, *np.random.RandomState*) – The random state

`evalml.tuners.Tuner.add`

`Tuner.add(pipeline_parameters, score)`

Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.

Parameters

- **`pipeline_parameters`** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **`score`** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

Returns None

`evalml.tuners.Tuner.is_search_space_exhausted`

`Tuner.is_search_space_exhausted()`

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

Returns Returns true if all possible parameters in a search space has been scored.

Return type bool

`evalml.tuners.Tuner.propose`

`Tuner.propose()`

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

Returns proposed pipeline parameters

Return type dict

evalml.tuners.SKOptTuner

class evalml.tuners.**SKOptTuner** (*pipeline_hyperparameter_ranges*, *random_state=0*)
 Bayesian Optimizer

Methods

<code>__init__</code>	Init SKOptTuner
<code>add</code>	Add score to sample
<code>is_search_space_exhausted</code>	Optional.
<code>propose</code>	Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

evalml.tuners.SKOptTuner.__init__

SKOptTuner.**__init__** (*pipeline_hyperparameter_ranges*, *random_state=0*)
 Init SKOptTuner

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **random_state** (*int*, *np.random.RandomState*) – The random state

evalml.tuners.SKOptTuner.add

SKOptTuner.**add** (*pipeline_parameters*, *score*)
 Add score to sample

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

Returns None

evalml.tuners.SKOptTuner.is_search_space_exhausted`SKOptTuner.is_search_space_exhausted()`

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

Returns Returns true if all possible parameters in a search space has been scored.

Return type bool

evalml.tuners.SKOptTuner.propose`SKOptTuner.propose()`

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

Returns proposed pipeline parameters

Return type dict

evalml.tuners.GridSearchTuner

```
class evalml.tuners.GridSearchTuner(pipeline_hyperparameter_ranges, n_points=10, random_state=0)
    Grid Search Optimizer
```

Example

```
>>> tuner = GridSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': [
↪ 'a', 'b', 'c']}}, n_points=5)
>>> proposal = tuner.propose()
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 0.0, 'param b': 'a'}
```

Methods

<code>__init__</code>	Generate all of the possible points to search for in the grid
<code>add</code>	Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.

Continued on next page

Table 167 – continued from previous page

<code>is_search_space_exhausted</code>	Checks if it is possible to generate a set of valid parameters.
<code>propose</code>	Returns parameters from <code>_grid_points</code> iterations

`evalml.tuners.GridSearchTuner.__init__`

`GridSearchTuner.__init__(pipeline_hyperparameter_ranges, n_points=10, random_state=0)`

Generate all of the possible points to search for in the grid

Parameters

- **`pipeline_hyperparameter_ranges`** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **`n_points`** – The number of points to sample from along each dimension defined in the `space` argument
- **`random_state`** – Unused in this class

`evalml.tuners.GridSearchTuner.add`

`GridSearchTuner.add(pipeline_parameters, score)`

Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.

Parameters

- **`pipeline_parameters`** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **`score`** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

`evalml.tuners.GridSearchTuner.is_search_space_exhausted`

`GridSearchTuner.is_search_space_exhausted()`

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

Raises `NoParamsException` – If a search space is exhausted, then this exception is thrown.

Returns If no more valid parameters exists in the search space, return false.

Return type bool

`evalml.tuners.GridSearchTuner.propose`

`GridSearchTuner.propose()`

Returns parameters from `_grid_points` iterations

If all possible combinations of parameters have been scored, then `NoParamsException` is raised.

Returns proposed pipeline parameters

Return type dict

evalml.tuners.RandomSearchTuner

```

class evalml.tuners.RandomSearchTuner (pipeline_hyperparameter_ranges,
                                       random_state=0, with_replacement=False, replacement_max_attempts=10)

```

Random Search Optimizer

Example

```

>>> tuner = RandomSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b
↳ ': ['a', 'b', 'c']}}, random_state=42)
>>> proposal = tuner.propose()
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 3.7454011884736254, 'param b':
↳ 'c'}

```

Methods

<code>__init__</code>	Sets up check for duplication if needed.
<code>add</code>	Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.
<code>is_search_space_exhausted</code>	Checks if it is possible to generate a set of valid parameters.
<code>propose</code>	Generate a unique set of parameters.

evalml.tuners.RandomSearchTuner.__init__

```

RandomSearchTuner.__init__(pipeline_hyperparameter_ranges, random_state=0,
                           with_replacement=False, replacement_max_attempts=10)

```

Sets up check for duplication if needed.

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **random_state** – Unused in this class
- **with_replacement** – If false, only unique hyperparameters will be shown
- **replacement_max_attempts** – The maximum number of tries to get a unique set of random parameters. Only used if tuner is initialized with `with_replacement=True`

evalml.tuners.RandomSearchTuner.add

RandomSearchTuner.add(*pipeline_parameters*, *score*)

Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

evalml.tuners.RandomSearchTuner.is_search_space_exhausted

RandomSearchTuner.is_search_space_exhausted()

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

Raises `NoParamsException` – If a search space is exhausted, then this exception is thrown.

Returns If no more valid parameters exists in the search space, return false.

Return type bool

evalml.tuners.RandomSearchTuner.propose

RandomSearchTuner.propose()

Generate a unique set of parameters.

If tuner was initialized with `with_replacement=True` and the tuner is unable to generate a unique set of parameters after `replacement_max_attempts` tries, then `NoParamsException` is raised.

Returns proposed pipeline parameters

Return type dict

Data Checks

Data Check Classes

<i>DataCheck</i>	Base class for all data checks.
<i>HighlyNullDataCheck</i>	Checks if there are any highly-null columns in the input.
<i>IDColumnsDataCheck</i>	Check if any of the features are likely to be ID columns.
<i>LabelLeakageDataCheck</i>	Check if any of the features are highly correlated with the target.
<i>OutliersDataCheck</i>	Checks if there are any outliers in input data by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies.

evalml.data_checks.DataCheck**class** evalml.data_checks.DataCheck

Base class for all data checks. Data checks are a set of heuristics used to determine if there are problems with input data.

name = 'DataCheck'

Instance attributes**Methods:**

<i>validate</i>	Inspects and validates the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.
-----------------	--

evalml.data_checks.DataCheck.validate

DataCheck.**validate** (*X*, *y=None*)

Inspects and validates the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – the input data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target data of length [n_samples]

Returns list of DataCheckError and DataCheckWarning objects

Return type list (*DataCheckMessage*)

evalml.data_checks.HighlyNullDataCheck

```
class evalml.data_checks.HighlyNullDataCheck (pct_null_threshold=0.95)
    Checks if there are any highly-null columns in the input.

    name = 'HighlyNullDataCheck'
```

Instance attributes

Methods:

<code>__init__</code>	Checks if there are any highly-null columns in the input.
<code>validate</code>	Checks if there are any highly-null columns in the input.

`evalml.data_checks.HighlyNullDataCheck.__init__`

`HighlyNullDataCheck.__init__(pct_null_threshold=0.95)`

Checks if there are any highly-null columns in the input.

Parameters `pct_null_threshold` (*float*) – If the percentage of NaN values in an input feature exceeds this amount, that feature will be considered highly-null. Defaults to 0.95.

`evalml.data_checks.HighlyNullDataCheck.validate`

`HighlyNullDataCheck.validate(X, y=None)`

Checks if there are any highly-null columns in the input.

Parameters

- **X** (*pd.DataFrame, pd.Series, np.array, list*) – features
- **y** – Ignored.

Returns list with a `DataCheckWarning` if there are any highly-null columns.

Return type list (*DataCheckWarning*)

Example

```
>>> df = pd.DataFrame({
...     'lots_of_null': [None, None, None, None, 5],
...     'no_null': [1, 2, 3, 4, 5]
... })
>>> null_check = HighlyNullDataCheck(pct_null_threshold=0.8)
>>> assert null_check.validate(df) == [DataCheckWarning("Column 'lots_of_null"
↪ ' is 80.0% or more null", "HighlyNullDataCheck")]
```

evalml.data_checks.IDColumnsDataCheck

class evalml.data_checks.IDColumnsDataCheck (*id_threshold=1.0*)

Check if any of the features are likely to be ID columns.

name = 'IDColumnsDataCheck'

Instance attributes

Methods:

<code>__init__</code>	Check if any of the features are likely to be ID columns.
<code>validate</code>	Check if any of the features are likely to be ID columns.

evalml.data_checks.IDColumnsDataCheck.__init__

IDColumnsDataCheck.**__init__** (*id_threshold=1.0*)

Check if any of the features are likely to be ID columns.

Parameters **id_threshold** (*float*) – the probability threshold to be considered an ID column. Defaults to 1.0.

evalml.data_checks.IDColumnsDataCheck.validate

IDColumnsDataCheck.**validate** (*X, y=None*)

Check if any of the features are likely to be ID columns. Currently performs these simple checks:

- column name is “id”
- column name ends in “_id”
- column contains all unique values (and is not float / boolean)

Parameters

- **X** (*pd.DataFrame*) – The input features to check
- **threshold** (*float*) – the probability threshold to be considered an ID column. Defaults to 1.0

Returns A dictionary of features with column name or index and their probability of being ID columns

Example

```
>>> df = pd.DataFrame({
...     'df_id': [0, 1, 2, 3, 4],
...     'x': [10, 42, 31, 51, 61],
...     'y': [42, 54, 12, 64, 12]
... })
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [DataCheckWarning("Column 'df_id' is_
↳100.0% or more likely to be an ID column", "IDColumnsDataCheck")]
```

evalml.data_checks.LabelLeakageDataCheck

class evalml.data_checks.**LabelLeakageDataCheck** (*pct_corr_threshold=0.95*)
 Check if any of the features are highly correlated with the target.

name = 'LabelLeakageDataCheck'

Instance attributes

Methods:

<code>__init__</code>	Check if any of the features are highly correlated with the target.
<code>validate</code>	Check if any of the features are highly correlated with the target.

evalml.data_checks.LabelLeakageDataCheck.__init__

LabelLeakageDataCheck.__init__ (*pct_corr_threshold=0.95*)
 Check if any of the features are highly correlated with the target.

Currently only supports binary and numeric targets and features.

Parameters **pct_corr_threshold** (*float*) – The correlation threshold to be considered leakage. Defaults to 0.95.

evalml.data_checks.LabelLeakageDataCheck.validate

LabelLeakageDataCheck.validate (*X, y*)
 Check if any of the features are highly correlated with the target.

Currently only supports binary and numeric targets and features.

Parameters

- **X** (*pd.DataFrame*) – The input features to check
- **y** (*pd.Series*) – The labels

Returns list with a *DataCheckWarning* if there is label leakage detected.

Return type list (*DataCheckWarning*)

Example

```
>>> X = pd.DataFrame({
...     'leak': [10, 42, 31, 51, 61],
...     'x': [42, 54, 12, 64, 12],
...     'y': [12, 5, 13, 74, 24],
... })
>>> y = pd.Series([10, 42, 31, 51, 40])
>>> label_leakage_check = LabelLeakageDataCheck(pct_corr_threshold=0.8)
>>> assert label_leakage_check.validate(X, y) == [DataCheckWarning("Column
↪ 'leak' is 80.0% or more correlated with the target", "LabelLeakageDataCheck
↪ ")]
```

evalml.data_checks.OutliersDataCheck

class evalml.data_checks.OutliersDataCheck (*random_state=0*)

Checks if there are any outliers in input data by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies. Indices with score anomalies are considered outliers.

name = 'OutliersDataCheck'

Instance attributes**Methods:**

<code>__init__</code>	Checks if there are any outliers in the input data.
<code>validate</code>	Checks if there are any outliers in a dataframe by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies.

evalml.data_checks.OutliersDataCheck.__init__

`OutliersDataCheck.__init__(random_state=0)`

Checks if there are any outliers in the input data.

Parameters `random_state` (`int`, `np.random.RandomState`) – The random seed/state. Defaults to 0.

evalml.data_checks.OutliersDataCheck.validate

`OutliersDataCheck.validate(X, y=None)`

Checks if there are any outliers in a dataframe by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies. Indices with score anomalies are considered outliers.

Parameters

- **X** (`pd.DataFrame`) – features
- **y** – Ignored.

Returns A set of indices that may have outlier data.

Example

```
>>> df = pd.DataFrame({
...     'x': [1, 2, 3, 40, 5],
...     'y': [6, 7, 8, 990, 10],
...     'z': [-1, -2, -3, -1201, -4]
... })
>>> outliers_check = OutliersDataCheck()
>>> assert outliers_check.validate(df) == [DataCheckWarning("Row '3' is_
↳likely to have outlier data", "OutliersDataCheck")]
```

<code>DataChecks</code>	A collection of data checks.
<code>DefaultDataChecks</code>	A collection of basic data checks that is used by AutoML by default.

`evalml.data_checks.DataChecks``evalml.data_checks.data_checks.DataChecks`

class `evalml.data_checks.DataChecks` (*data_checks=None*)
 A collection of data checks.

Methods

<code>__init__</code>	A collection of data checks.
<code>validate</code>	Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

`evalml.data_checks.DataChecks.__init__`

`DataChecks.__init__` (*data_checks=None*)
 A collection of data checks.

Parameters `data_checks` (*list* (`DataCheck`)) – list of `DataCheck` objects

`evalml.data_checks.DataChecks.validate`

`DataChecks.validate` (*X, y=None*)
 Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (`pd.DataFrame`) – the input data of shape [n_samples, n_features]
- **y** (`pd.Series`) – the target labels of length [n_samples]

Returns list containing `DataCheckMessage` objects

Return type list (`DataCheckMessage`)

evalml.data_checks.DefaultDataChecks

evalml.data_checks.data_checks.DataChecks

evalml.data_checks.default_data_checks.DefaultDataChecks

class evalml.data_checks.DefaultDataChecks (*data_checks=None*)

A collection of basic data checks that is used by AutoML by default. Includes HighlyNullDataCheck, IDColumnsDataCheck, and LabelLeakageDataCheck.

Methods

<code>__init__</code>	A collection of basic data checks.
<code>validate</code>	Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

evalml.data_checks.DefaultDataChecks.__init__DefaultDataChecks.**__init__** (*data_checks=None*)

A collection of basic data checks.

Parameters `data_checks` (*list* (*DataCheck*)) – Ignored.

evalml.data_checks.DefaultDataChecks.validateDefaultDataChecks.**validate** (*X*, *y=None*)

Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – the input data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target labels of length [n_samples]

Returns list containing DataCheckMessage objects

Return type list (*DataCheckMessage*)

Data Check Messages

<i>DataCheckMessage</i>	Base class for all DataCheckMessages.
<i>DataCheckError</i>	DataCheckMessage subclass for errors returned by data checks.
<i>DataCheckWarning</i>	DataCheckMessage subclass for warnings returned by data checks.

evalml.data_checks.DataCheckMessage

evalml.data_checks.data_check_message.DataCheckMessage

class evalml.data_checks.**DataCheckMessage** (*message, data_check_name*)

Base class for all DataCheckMessages.

message_type = None**Methods:**

<code>__init__</code>	Message returned by a DataCheck, tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to self.message attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckMessage.__init__DataCheckMessage.**__init__** (*message, data_check_name*)

Message returned by a DataCheck, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckMessage.__str__DataCheckMessage.**__str__** ()

String representation of data check message, equivalent to self.message attribute.

evalml.data_checks.DataCheckMessage.__eq__DataCheckMessage.**__eq__** (*other*)

Checks for equality. Two DataCheckMessage objs are considered equivalent if their message type and message are equivalent.

evalml.data_checks.DataCheckError

class evalml.data_checks.DataCheckError(*message*, *data_check_name*)
DataCheckMessage subclass for errors returned by data checks.

message_type = 'error'

Methods:

<code>__init__</code>	Message returned by a DataCheck, tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to self.message attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckError.__init__

DataCheckError.**__init__**(*message*, *data_check_name*)
Message returned by a DataCheck, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckError.__str__

DataCheckError.**__str__**()
String representation of data check message, equivalent to self.message attribute.

evalml.data_checks.DataCheckError.__eq__

DataCheckError.**__eq__**(*other*)
Checks for equality. Two DataCheckMessage objs are considered equivalent if their message type and message are equivalent.

evalml.data_checks.DataCheckWarning

class evalml.data_checks.DataCheckWarning(*message*, *data_check_name*)
 DataCheckMessage subclass for warnings returned by data checks.
message_type = 'warning'

Methods:

<code>__init__</code>	Message returned by a DataCheck, tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to self.message attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckWarning.__init__

DataCheckWarning.**__init__**(*message*, *data_check_name*)
 Message returned by a DataCheck, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckWarning.__str__

DataCheckWarning.**__str__**()
 String representation of data check message, equivalent to self.message attribute.

evalml.data_checks.DataCheckWarning.__eq__

DataCheckWarning.**__eq__**(*other*)
 Checks for equality. Two DataCheckMessage objs are considered equivalent if their message type and message are equivalent.

Data Check Message Types

<i>DataCheckMessageType</i>	Enum for type of data check message: WARNING or ERROR
-----------------------------	---

evalml.data_checks.DataCheckMessageType

class evalml.data_checks.DataCheckMessageType
Enum for type of data check message: WARNING or ERROR

Utils

<code>import_or_raise</code>	Attempts to import the requested library by name.
<code>convert_to_seconds</code>	
<code>get_random_state</code>	Generates a <code>numpy.random.RandomState</code> instance using seed.
<code>get_random_seed</code>	Given a <code>numpy.random.RandomState</code> object, generate an int representing a seed value for another random number generator.

evalml.utils.import_or_raise

`evalml.utils.import_or_raise` (*library*, *error_msg=None*)
Attempts to import the requested library by name. If the import fails, raises an `ImportError`.

Parameters

- **library** (*str*) – the name of the library
- **error_msg** (*str*) – error message to return if the import fails

evalml.utils.convert_to_seconds

`evalml.utils.convert_to_seconds` (*input_str*)

evalml.utils.get_random_state

`evalml.utils.get_random_state` (*seed*)
Generates a `numpy.random.RandomState` instance using seed.

Parameters *seed* (*None*, *int*, *np.random.RandomState* object) – seed to use to generate `numpy.random.RandomState`. Must be between `SEED_BOUNDS.min_bound` and `SEED_BOUNDS.max_bound`, inclusive. Otherwise, an exception will be thrown.

evalml.utils.get_random_seed

`evalml.utils.get_random_seed(random_state, min_bound=0, max_bound=2147483647)`

Given a `numpy.random.RandomState` object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.

To protect against invalid input to a particular library's random number generator, if an int value is provided, and it is outside the bounds "[min_bound, max_bound)", the value will be projected into the range between the min_bound (inclusive) and max_bound (exclusive) using modular arithmetic.

Parameters

- **random_state** (*int*, *numpy.random.RandomState*) – random state
- **min_bound** (*None*, *int*) – if not default of *None*, will be min bound when generating seed (inclusive). Must be less than max_bound.
- **max_bound** (*None*, *int*) – if not default of *None*, will be max bound when generating seed (exclusive). Must be greater than min_bound.

Returns seed for random number generator

Return type int

1.6.17 FAQ

What is the difference between EvalML and other AutoML libraries?

EvalML optimizes machine learning pipelines on *custom practical objectives* instead of vague machine learning loss functions so that it will find the best pipelines for your specific needs. Furthermore, EvalML *pipelines* are able to take in all kinds of data (missing values, categorical, etc.) as long as the data are in a single table. EvalML also allows you to build your own pipelines with existing or custom components so you can have more control over the AutoML process. Moreover, EvalML also provides you with support in the form of *data checks* to ensure that you are aware of potential issues your data may cause with machine learning algorithms".

How does EvalML handle missing values?

EvalML contains imputation components in its pipelines so that missing values are taken care of. EvalML optimizes over different types of imputation to search for the best possible pipeline. You can find more information about components [here](#) and in the API reference [here](#).

How does EvalML handle categorical encoding?

EvalML provides a *one-hot-encoding component* in its pipelines for categorical variables. EvalML plans to support other encoders in the future.

How does EvalML handle feature selection?

EvalML currently utilizes scikit-learn's `SelectFromModel` with a Random Forest classifier/regressor to handle feature selection. EvalML plans on supporting more feature selectors in the future. You can find more information in the API reference [here](#).

How are feature importances calculated?

Feature importance depends on the estimator used. Variable coefficients are used for regression-based estimators (Logistic Regression and Linear Regression) and Gini importance is used for tree-based estimators (Random Forest and XGBoost).

How does hyperparameter tuning work?

EvalML tunes hyperparameters for its pipelines through Bayesian optimization. In the future we plan to support more optimization techniques such as random search.

Can I create my own objective metric?

Yes you can! You can *create your own custom objective* so that EvalML optimizes the best model for your needs.

How does EvalML avoid overfitting?

EvalML provides *data checks* to combat overfitting. Such data checks include detecting label leakage, unstable pipelines, hold-out datasets and cross validation. EvalML defaults to using Stratified K-Fold cross-validation for classification problems and K-Fold cross-validation for regression problems but allows you to utilize your own cross-validation methods as well.

Can I create my own pipeline for EvalML?

Yes! EvalML allows you to create *custom pipelines* using modular components. This allows you to customize EvalML pipelines for your own needs or for AutoML.

Does EvalML work with X algorithm?

EvalML is constantly improving and adding new components and will allow your own algorithms to be used as components in our pipelines.
