Combined with [Featuretools](#) and [Compose](#), EvalML can be used to create end-to-end supervised machine learning solutions.

INSTALL

EvalML is available for Python 3.6+. It can be installed by running the following command:

```
pip install evalml
```

1.1 Core vs Optional Dependencies

EvalML includes several optional dependencies. The `xgboost` and `catboost` packages support pipelines built around those modeling libraries. The `plotly` and `ipywidgets` packages support plotting functionality in automl searches. These dependencies are recommended, and are included with EvalML by default but are not required in order to install and use EvalML.

EvalML's core dependencies are listed in `core-requirements.txt` in the source code, and optional requirements are listed in `requirements.txt`.

To install EvalML with only the core required dependencies, download the EvalML source from [pypi](#) to access the requirements files. Then run the following:

```
pip install evalml --no-dependencies
pip install -r core-requirements.txt
```

1.2 Windows

The `XGBoost` library may not be pip-installable in some Windows environments. If you are encountering installation issues, please try installing XGBoost from [Github](#) before installing EvalML.

START

In this guide, we'll show how you can use EvalML to automatically find the best pipeline for predicting whether a patient has breast cancer. Along the way, we'll highlight EvalML's built-in tools and features for understanding and interacting with the search process.

```
[1]: import evalml
from evalml import AutoMLSearch

2020-08-06 20:26:50,166 featuretools - WARNING      Featuretools failed to load plugin_
↳ nlp_primitives from library nlp_primitives. For a full stack trace, set logging to_
↳ debug.

/home/docs/checkouts/readthedocs.org/user_builds/feature-labs-inc-evalml/envs/v0.12.2/
↳ lib/python3.7/site-packages/evalml/pipelines/components/transformers/preprocessing/
↳ text_featurizer.py:31: RuntimeWarning: No text columns were given to TextFeaturizer,

  warnings.warn("No text columns were given to TextFeaturizer, component will have no_
↳ effect", RuntimeWarning)
```

First, we load in the features and outcomes we want to use to train our model.

```
[2]: X, y = evalml.demos.load_breast_cancer()
```

EvalML has many options to configure the pipeline search. At the minimum, we need to define an objective function. For simplicity, we will use the F1 score in this example. However, the real power of EvalML is in using domain-specific *objective functions* or *building your own*.

Below EvalML utilizes Bayesian optimization (EvalML's default optimizer) to search and find the best pipeline defined by the given objective.

```
[3]: automl = AutoMLSearch(problem_type="binary", objective="f1", max_pipelines=5)
```

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

```
[4]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
↳ size=.2)
```

When we call `search()`, the search for the best pipeline will begin. There is no need to wrangle with missing data or categorical variables as EvalML includes various preprocessing steps (like imputation, one-hot encoding, feature selection) to ensure you're getting the best results. As long as your data is in a single table, EvalML can handle it. If not, you can reduce your data to a single table by utilizing [Featuretools](#) and its Entity Sets.

You can find more information on pipeline components and how to integrate your own custom pipelines into EvalML [here](#).

```
[5]: automl.search(X_train, y_train)

Generating pipelines to search over...
*****
* Beginning pipeline search *
*****

Optimizing for F1.
Greater score is better.

Searching up to 5 pipelines.
Allowed model families: random_forest, catboost, linear_model, xgboost

FigureWidget({
  'data': [{'mode': 'lines+markers',
            'name': 'Best Score',
            'type': ...

(1/5) Mode Baseline Binary Classification P... Elapsed:00:00

Search finished after 00:36
Best pipeline: Logistic Regression Classifier w/ Imputer + Standard Scaler
Best pipeline F1: 0.964168
```

After the search is finished we can view all of the pipelines searched, ranked by score. Internally, EvalML performs cross validation to score the pipelines. If it notices a high variance across cross validation folds, it will warn you. EvalML also provides additional *data checks* to analyze your data to assist you in producing the best performing pipeline.

```
[6]: automl.rankings

[6]:   id      pipeline_name      score \

```

If we are interested in see more details about the pipeline, we can view a summary description using the `id` from the rankings table:

```
[7]: automl.describe_pipeline(3)
```

```
*****
* Random Forest Classifier w/ Imputer *
*****

Problem Type: Binary Classification
Model Family: Random Forest

Pipeline Steps
=====
1. Imputer
    * categorical_impute_strategy : most_frequent
    * numeric_impute_strategy : mean
    * fill_value : None
2. Random Forest Classifier
    * n_estimators : 100
    * max_depth : 6
    * n_jobs : -1

Training
=====
Training for Binary Classification problems.
Total training time (including CV): 1.6 seconds

Cross Validation
-----
```

	F1	Accuracy	Binary	Balanced Accuracy	Binary	Precision	AUC	Log ₂
→ Loss Binary	MCC	Binary	# Training	# Testing				
0	0.901		0.928		0.918	0.926	0.986	↵
→ 0.148	0.845	303.000	152.000					
1	0.926		0.947		0.933	0.980	0.984	↵
→ 0.158	0.889	303.000	152.000					
2	0.957		0.967		0.970	0.932	0.999	↵
→ 0.093	0.931	304.000	151.000					
mean	0.928		0.947		0.940	0.946	0.989	↵
→ 0.133	0.888	-	-					
std	0.028		0.020		0.027	0.030	0.008	↵
→ 0.035	0.043	-	-					
coef of var	0.030		0.021		0.029	0.031	0.008	↵
→ 0.265	0.048	-	-					

We can also view the pipeline parameters directly:

```
[8]: pipeline = automl.get_pipeline(3)
print(pipeline.parameters)
```

```
{'Imputer': {'categorical_impute_strategy': 'most_frequent',
→ 'numeric_impute_strategy': 'mean', 'fill_value': None}, 'Random Forest Classifier':
→ {'n_estimators': 100, 'max_depth': 6, 'n_jobs': -1}}
```

We can now select the best pipeline and score it on our holdout data:

```
[9]: pipeline = automl.best_pipeline
pipeline.fit(X_train, y_train)
pipeline.score(X_holdout, y_holdout, ["f1"])
```

```
[9]: OrderedDict([('F1', 1.0)])
```

We can also visualize the structure of the components contained by the pipeline:

```
[10]: pipeline.graph()
```

```
[10]:
```

TUTORIALS

Below are examples of how to apply EvalML to a variety of problems:

3.1 Building a Fraud Prediction Model with EvalML

In this demo, we will build an optimized fraud prediction model using EvalML. To optimize the pipeline, we will set up an objective function to minimize the percentage of total transaction value lost to fraud. At the end of this demo, we also show you how introducing the right objective during the training is over 4x better than using a generic machine learning metric like AUC.

```
[1]: import evalml
      from evalml import AutoMLSearch
      from evalml.objectives import FraudCost
```

```
2020-08-06 20:20:05,012 featuretools - WARNING      Featuretools failed to load plugin
↳ nlp_primitives from library nlp_primitives. For a full stack trace, set logging to
↳ debug.

  warnings.warn("No text columns were given to TextFeaturizer, component will have no
↳ effect", RuntimeWarning)
```

3.1.1 Configure “Cost of Fraud”

To optimize the pipelines toward the specific business needs of this model, you can set your own assumptions for the cost of fraud. These parameters are

- `retry_percentage` - what percentage of customers will retry a transaction if it is declined?
- `interchange_fee` - how much of each successful transaction do you collect?
- `fraud_payout_percentage` - the percentage of fraud will you be unable to collect
- `amount_col` - the column in the data the represents the transaction amount

Using these parameters, EvalML determines attempt to build a pipeline that will minimize the financial loss due to fraud.

```
[2]: fraud_objective = FraudCost(retry_percentage=.5,
                                interchange_fee=.02,
                                fraud_payout_percentage=.75,
                                amount_col='amount')
```

3.1.2 Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set

```
[3]: X, y = evalml.demos.load_fraud(n_rows=2500)
```

```

                Number of Features
Boolean                1
Categorical            6
Numeric               5

Number of training examples: 2500
Labels
False    85.92%
True     14.08%
Name: fraud, dtype: object
```

EvalML natively supports one-hot encoding. Here we keep 1 out of the 6 categorical columns to decrease computation time.

```
[4]: X = X.drop(['datetime', 'expiration_date', 'country', 'region', 'provider'], axis=1)

X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
    ↪size=0.2, random_state=0)

print(X.dtypes)

card_id          int64
store_id         int64
amount           int64
currency         object
customer_present bool
lat              float64
lng              float64
dtype: object
```

Because the fraud labels are binary, we will use `AutoMLSearch(problem_type='binary')`. When we call `.search()`, the search for the best pipeline will begin.

```
[5]: automl = AutoMLSearch(problem_type='binary',
                            objective=fraud_objective,
                            additional_objectives=['auc', 'f1', 'precision'],
                            max_pipelines=5,
                            optimize_thresholds=True)

automl.search(X_train, y_train)

4                 True  {'Baseline Classifier': {'strategy': 'mode'}}
```

to select the best pipeline we can run

```
[7]: best_pipeline = automl.best_pipeline
```

Describe pipeline

You can get more details about any pipeline. Including how it performed on other objective functions.

```
[8]: automl.describe_pipeline(automl.rankings.iloc[1]["id"])

*****
* Random Forest Classifier w/ Imputer + One Hot Encoder *
*****

Problem Type: Binary Classification
Model Family: Random Forest

Pipeline Steps
=====
1. Imputer
    * categorical_impute_strategy : most_frequent
    * numeric_impute_strategy : mean
    * fill_value : None
2. One Hot Encoder
    * top_n : 10
    * categories : None
    * drop : None
    * handle_unknown : ignore
    * handle_missing : error
3. Random Forest Classifier
    * n_estimators : 100
    * max_depth : 6
    * n_jobs : -1

Training
=====
Training for Binary Classification problems.
Objective to optimize binary classification pipeline thresholds for: <evalml.
↳objectives.fraud_cost.FraudCost object at 0x7fdc5d48b7f0>
Total training time (including CV): 3.3 seconds

Cross Validation
-----
```

	Fraud Cost	AUC	F1	Precision	# Training	# Testing
0	0.002	0.861	0.247	0.141	1066.000	667.000
1	0.002	0.846	0.247	0.141	1066.000	667.000
2	0.002	0.856	0.247	0.141	1067.000	666.000
mean	0.002	0.854	0.247	0.141	-	-
std	0.000	0.008	0.000	0.000	-	-
coef of var	0.055	0.009	0.001	0.001	-	-

3.1.3 Evaluate on hold out

Finally, we retrain the best pipeline on all of the training data and evaluate on the holdout

```
[9]: best_pipeline.fit(X_train, y_train)
```

```
[9]: <evalml.pipelines.utils.make_pipeline.<locals>.GeneratedPipeline at 0x7fdc5caf03c8>
```

Now, we can score the pipeline on the hold out data using both the fraud cost score and the AUC.

```
[10]: best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[10]: OrderedDict([('AUC', 0.8225415282392027),
                  ('Fraud Cost', 0.004329350526560073)])
```

3.1.4 Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the fraud cost objective to see how the best pipelines compare.

```
[11]: automl_auc = AutoMLSearch(problem_type='binary',
                                objective='auc',
                                additional_objectives=['f1', 'precision'],
                                max_pipelines=5,
                                optimize_thresholds=True)

automl_auc.search(X_train, y_train)

Generating pipelines to search over...
*****
* Beginning pipeline search *
*****

Optimizing for AUC.

      high_variance_cv      parameters
0      False  {'Imputer': {'categorical_impute_strategy': 'm...
1      False  {'Imputer': {'categorical_impute_strategy': 'm...
2      False  {'Imputer': {'categorical_impute_strategy': 'm...
3      False  {'Imputer': {'categorical_impute_strategy': 'm...
4      False      {'Baseline Classifier': {'strategy': 'mode'}}
```

```
[13]: best_pipeline_auc = automl_auc.best_pipeline

      # train on the full training data
      best_pipeline_auc.fit(X_train, y_train)
```

```
[13]: <evalml.pipelines.utils.make_pipeline.<locals>.GeneratedPipeline at 0x7fdc59b9b2b0>
```

```
[14]: # get the fraud score on holdout data
      best_pipeline_auc.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[14]: OrderedDict([('AUC', 0.8415946843853821),
                  ('Fraud Cost', 0.004329350526560073)])
```

```
[15]: # fraud score on fraud optimized again
      best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[15]: OrderedDict([('AUC', 0.8225415282392027),
                  ('Fraud Cost', 0.004329350526560073)])
```

When we optimize for AUC, we can see that the AUC score from this pipeline is better than the AUC score from the pipeline optimized for fraud cost. However, the losses due to fraud are over 3% of the total transaction amount when optimized for AUC and under 1% when optimized for fraud cost. As a result, we lose more than 2% of the total transaction amount by not optimizing for fraud cost specifically.

This happens because optimizing for AUC does not take into account the user-specified `retry_percentage`, `interchange_fee`, `fraud_payout_percentage` values. Thus, the best pipelines may produce the highest AUC but may not actually reduce the amount loss due to your specific type fraud.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

3.2 Building a Lead Scoring Model with EvalML

In this demo, we will build an optimized lead scoring model using EvalML. To optimize the pipeline, we will set up an objective function to maximize the revenue generated with true positives while taking into account the cost of false

positives. At the end of this demo, we also show you how introducing the right objective during the training is over 6x better than using a generic machine learning metric like AUC.

```
[1]: import evalml
from evalml import AutoMLSearch
from evalml.objectives import LeadScoring

2020-08-06 20:22:28,251 featuretools - WARNING      Featuretools failed to load plugin_

  warnings.warn("No text columns were given to TextFeaturizer, component will have no_
↳ effect", RuntimeWarning)
```

3.2.1 Configure LeadScoring

To optimize the pipelines toward the specific business needs of this model, you can set your own assumptions for how much value is gained through true positives and the cost associated with false positives. These parameters are

- `true_positive` - dollar amount to be gained with a successful lead
- `false_positive` - dollar amount to be lost with an unsuccessful lead

Using these parameters, EvalML builds a pipeline that will maximize the amount of revenue per lead generated.

```
[2]: lead_scoring_objective = LeadScoring(
    true_positives=1000,
    false_positives=-10
)
```

3.2.2 Dataset

We will be utilizing a dataset detailing a customer's job, country, state, zip, online action, the dollar amount of that action and whether they were a successful lead.

```
[3]: from urllib.request import urlopen
import pandas as pd

customers_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_
↳ apps/customers.csv')
interactions_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_
↳ ml_apps/interactions.csv')
leads_data = urlopen('https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_
↳ apps/previous_leads.csv')
customers = pd.read_csv(customers_data)
interactions = pd.read_csv(interactions_data)
leads = pd.read_csv(leads_data)

X = customers.merge(interactions, on='customer_id').merge(leads, on='customer_id')
y = X['label']

X = X.drop(['customer_id', 'date_registered', 'birthday', 'phone', 'email',
```

(continues on next page)

(continued from previous page)

```
'owner', 'company', 'id', 'time_x',
'session', 'referrer', 'time_y', 'label', 'country'], axis=1)

display(X.head())
```

	job	state	zip	action	amount
0	Engineer, mining	NY	60091.0	page_view	NaN
1	Psychologist, forensic	CA	NaN	purchase	135.23
2	Psychologist, forensic	CA	NaN	page_view	NaN
3	Air cabin crew	NaN	60091.0	download	NaN
4	Air cabin crew	NaN	60091.0	page_view	NaN

3.2.3 Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set

EvalML natively supports one-hot encoding and imputation so the above NaN and categorical values will be taken care of.

```
[4]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(X, y, test_
      ↪size=0.2, random_state=0)
```

```
print(X.dtypes)
```

```
job          object
state        object
zip          float64
action       object
amount       float64
dtype: object
```

Because the lead scoring labels are binary, we will use `AutoMLSearch(problem_type='binary')`. When we call `.search()`, the search for the best pipeline will begin.

```
[5]: automl = AutoMLSearch(problem_type='binary',
                           objective=lead_scoring_objective,
                           additional_objectives=['auc'],
                           max_pipelines=5,
                           optimize_thresholds=True)

automl.search(X_train, y_train)
```

```

    * min_child_weight : 1
    * n_estimators : 100

Training
=====
Training for Binary Classification problems.
Objective to optimize binary classification pipeline thresholds for: <evalml.
↳objectives.lead_scoring.LeadScoring object at 0x7f8fe89cce10>
Total training time (including CV): 76.9 seconds

Cross Validation
-----
```

	Lead Scoring	AUC	# Training	# Testing
0	39.826	0.722	2479.000	1550.000
1	41.948	0.713	2479.000	1550.000
2	41.840	0.679	2480.000	1549.000
mean	41.205	0.705	-	-
std	1.195	0.023	-	-
coef of var	0.029	0.032	-	-

3.2.4 Evaluate on hold out

Finally, we retrain the best pipeline on all of the training data and evaluate on the holdout

```
[9]: best_pipeline.fit(X_train, y_train)
[9]: <evalml.pipelines.utils.make_pipeline.<locals>.GeneratedPipeline at 0x7f8fe89cc1d0>
```

Now, we can score the pipeline on the hold out data using both the lead scoring score and the AUC.

```
[10]: best_pipeline.score(X_holdout, y_holdout, objectives=["auc", lead_scoring_objective])
[10]: OrderedDict([('AUC', 0.6662964641885766),
                  ('Lead Scoring', -0.051590713671539126)])
```

3.2.5 Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the lead scoring objective to see how the best pipelines compare.

```
[11]: automl_auc = evalml.AutoMLSearch(problem_type='binary',
                                     objective='auc',
                                     additional_objectives=[],
                                     max_pipelines=5,
                                     optimize_thresholds=True)

automl_auc.search(X_train, y_train)
```

Generating pipelines to search over...

 * Beginning pipeline search *

Optimizing for AUC.
 Greater score is better.

3	False	{'Imputer': {'categorical_impute_strategy': 'm...	
4	False	{'Baseline Classifier': {'strategy': 'mode'}}	

```
[13]: best_pipeline_auc = automl_auc.best_pipeline
```

```
# train on the full training data
best_pipeline_auc.fit(X_train, y_train)
```

```
[13]: <evalml.pipelines.utils.make_pipeline.<locals>.GeneratedPipeline at 0x7f8fe7b24c18>
```

```
[14]: # get the auc and lead scoring score on holdout data
best_pipeline_auc.score(X_holdout, y_holdout, objectives=["auc", lead_scoring_
↳objective])
```

```
[14]: OrderedDict([('AUC', 0.6662964641885766),
                  ('Lead Scoring', -0.051590713671539126)])
```

When we optimize for AUC, we can see that the AUC score from this pipeline is better than the AUC score from the pipeline optimized for lead scoring. However, the revenue per lead gained was only \$7 per lead when optimized for AUC and was \$45 when optimized for lead scoring. As a result, we would gain up to 6x the amount of revenue if we optimized for lead scoring.

This happens because optimizing for AUC does not take into account the user-specified true_positive (dollar amount to be gained with a successful lead) and false_positive (dollar amount to be lost with an unsuccessful lead) values. Thus, the best pipelines may produce the highest AUC but may not actually generate the most revenue through lead scoring.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

These guides include in-depth descriptions and explanations of EvalML's features.

4.1 Automated Machine Learning (AutoML) Search

4.1.1 Background

Machine Learning

Machine learning (ML) is the process of constructing a mathematical model of a system based on a sample dataset collected from that system.

One of the main goals of training an ML model is to teach the model to separate the signal present in the data from the noise inherent in system and in the data collection process. If this is done effectively, the model can then be used to make accurate predictions about the system when presented with new, similar data. Additionally, introspecting on an ML model can reveal key information about the system being modeled, such as which inputs and transformations of the inputs are most useful to the ML model for learning the signal in the data, and are therefore the most predictive.

There are a **variety** of ML problem types. Supervised learning describes the case where the collected data contains an output value to be modeled and a set of inputs with which to train the model. EvalML focuses on training supervised learning models.

EvalML supports three common supervised ML problem types. The first is regression, where the target value to model is a continuous numeric value. Next are binary and multiclass classification, where the target value to model consists of two or more discrete values or categories. The choice of which supervised ML problem type is most appropriate depends on domain expertise and on how the model will be evaluated and used.

AutoML and Search

AutoML is the process of automating the construction, training and evaluation of ML models. Given a data and some configuration, AutoML searches for the most effective and accurate ML model or models to fit the dataset. During the search, AutoML will explore different combinations of model type, model parameters and model architecture.

An effective AutoML solution offers several advantages over constructing and tuning ML models by hand. AutoML can assist with many of the difficult aspects of ML, such as avoiding overfitting and underfitting, imbalanced data, detecting data leakage and other potential issues with the problem setup, and automatically applying best-practice data cleaning, feature engineering, feature selection and various modeling techniques. AutoML can also leverage search algorithms to optimally sweep the hyperparameter search space, resulting in model performance which would be difficult to achieve by manual training.

4.1.2 AutoML in EvalML

EvalML supports all of the above and more.

In its simplest usage, the AutoML search interface requires only the input data, the target data and a `problem_type` specifying what kind of supervised ML problem to model.

```
[1]: import evalml

X, y = evalml.demos.load_breast_cancer()

automl = evalml.automl.AutoMLSearch(problem_type='binary')
automl.search(X, y)
```

(continues on next page)

(continued from previous page)

```
Best pipeline: Logistic Regression Classifier w/ Imputer + Standard Scaler
Best pipeline Log Loss Binary: 0.091164
```

The AutoML search will log its progress, reporting each pipeline and parameter set evaluated during the search.

By default, AutoML will search a fixed number of pipeline and parameter pairs (5). The first pipeline to be evaluated will always be a baseline model representing a trivial solution.

The AutoML interface supports a variety of other parameters. For a comprehensive list, please [refer to the API reference](#).

Using custom pipelines

EvalML's AutoML algorithm generates a set of pipelines to search with. To provide a custom set instead, set `allowed_pipelines` to a list of [custom pipeline](#) classes. Note: this will prevent AutoML from generating other pipelines to search over.

```
[2]: from evalml.pipelines import MulticlassClassificationPipeline

class CustomMulticlassClassificationPipeline(MulticlassClassificationPipeline):
    component_graph = ['Simple Imputer', 'Random Forest Classifier']

automl_custom = evalml.automl.AutoMLSearch(problem_type='multiclass', allowed_
→pipelines=[CustomMulticlassClassificationPipeline])

Using default limit of max_pipelines=5.
```

Stopping the search early

To stop the search early, hit `Ctrl-C`. This will bring up a prompt asking for confirmation. Responding with `y` will immediately stop the search. Responding with `n` will continue the search.

4.1.3 View Rankings

A summary of all the pipelines built can be returned as a pandas DataFrame which is sorted by score.

```
[3]: automl.rankings
```

```
[3]:
```

	id	pipeline_name	score \
0	4	Logistic Regression Classifier w/ Imputer + St...	0.091164
1	2	XGBoost Classifier w/ Imputer	0.100965
2	3	Random Forest Classifier w/ Imputer	0.122537
3	1	CatBoost Classifier w/ Imputer	0.390101
4	0	Mode Baseline Binary Classification Pipeline	12.868443

	high_variance_cv	parameters
0	False	{'Imputer': {'categorical_impute_strategy': 'm...
1	True	{'Imputer': {'categorical_impute_strategy': 'm...
2	False	{'Imputer': {'categorical_impute_strategy': 'm...
3	False	{'Imputer': {'categorical_impute_strategy': 'm...
4	False	{'Baseline Classifier': {'strategy': 'mode'}}

4.1.4 Describe Pipeline

Each pipeline is given an `id`. We can get more information about any particular pipeline using that `id`. Here, we will get more information about the pipeline with `id = 1`.

```
[4]: automl.describe_pipeline(1)
```

```
*****
* CatBoost Classifier w/ Imputer *
*****

Problem Type: Binary Classification
Model Family: CatBoost

    * numeric_impute_strategy : mean
    * fill_value : None
2. CatBoost Classifier
    * n_estimators : 10
    * eta : 0.03
    * max_depth : 6
    * bootstrap_type : None

Training
=====
Training for Binary Classification problems.
Total training time (including CV): 0.7 seconds

Cross Validation
-----
```

		Log Loss Binary	Accuracy Binary	Balanced Accuracy Binary	F1	
	AUC	MCC	Binary # Training	Binary # Testing		
→ Precision			0.398	0.926	0.910	0.896
0						0.
→ 952	0.984	0.843	379.000	190.000		
1			0.391	0.963	0.954	0.949
→ 985	0.996	0.922	379.000	190.000		0.
2			0.382	0.963	0.965	0.951
→ 932	0.989	0.922	380.000	189.000		0.
mean		0.390		0.951	0.943	0.932
→ 956	0.989	0.895	-	-		0.
std		0.008		0.021	0.029	0.031
→ 027	0.006	0.046	-	-		0.
coef of var		0.020		0.022	0.031	0.034
→ 028	0.006	0.051	-	-		0.

4.1.5 Get Pipeline

We can get the object of any pipeline via their `id` as well:

```
[5]: pipeline = automl.get_pipeline(1)
print(pipeline.name)
print(pipeline.parameters)
```

```
CatBoost Classifier w/ Imputer
{'Imputer': {'categorical_impute_strategy': 'most_frequent',
↳ 'numeric_impute_strategy': 'mean', 'fill_value': None}, 'CatBoost Classifier':
↳ {'n_estimators': 10, 'eta': 0.03, 'max_depth': 6, 'bootstrap_type': None}}
```

Get best pipeline

If we specifically want to get the best pipeline, there is a convenient accessor for that.

```
[6]: best_pipeline = automl.best_pipeline
print(best_pipeline.name)
print(best_pipeline.parameters)

Logistic Regression Classifier w/ Imputer + Standard Scaler
{'Imputer': {'categorical_impute_strategy': 'most_frequent',
↳ 'numeric_impute_strategy': 'mean', 'fill_value': None}, 'Logistic Regression
↳ Classifier': {'penalty': 'l2', 'C': 1.0, 'n_jobs': -1}}
```

4.1.6 Access raw results

The `AutoMLSearch` class records detailed results information under the `results` field, including information about the cross-validation scoring and parameters.

```
[7]: automl.results

[7]: {'pipeline_results': {0: {'id': 0,
    'pipeline_name': 'Mode Baseline Binary Classification Pipeline',

4.2 Objectives

4.2.1 Overview

One of the key choices to make when training an ML model is what metric to choose by which to measure the efficacy of the model at learning the signal. Such metrics are useful for comparing how well the trained models generalize to new similar data.

This choice of metric is a key component of AutoML because it defines the cost function the AutoML search will seek to optimize. In EvalML, these metrics are called **objectives**. AutoML will seek to minimize (or maximize)

the objective score as it explores more pipelines and parameters and will use the feedback from scoring pipelines to tune the available hyperparameters and continue the search. Therefore, it is critical to have an objective function that represents how the model will be applied in the intended domain of use.

EvalML supports a variety of objectives from traditional supervised ML including [mean squared error](#) for regression problems and [cross entropy](#) or [area under the ROC curve](#) for classification problems. EvalML also allows the user to define a custom objective using their domain expertise, so that AutoML can search for models which provide the most value for the user's problem.

4.2.2 Core Objectives

Use the `get_objectives` method to get a list of which objectives are included with EvalML for each problem type:

```
[1]: from evalml.objectives import get_objectives
from evalml.problem_types import ProblemTypes

for objective in get_objectives(ProblemTypes.BINARY):
    print(objective.name)
```

```

EvalML defines a base objective class for each problem type: `RegressionObjective`, `BinaryClassificationObjective` and `MulticlassClassificationObjective`. All EvalML objectives are a subclass of one of these.

4.2.3 Custom Objectives

Often times, the objective function is very specific to the use-case or business problem. To get the right objective to optimize requires thinking through the decisions or actions that will be taken using the model and assigning a cost/benefit to doing that correctly or incorrectly based on known outcomes in the training data.

Once you have determined the objective for your business, you can provide that to EvalML to optimize by defining a custom objective function.

Defining a Custom Objective Function

To create a custom objective class, we must define several elements:

- `name`: The printable name of this objective.

- `objective_function`: This function takes the predictions, true labels, and an optional reference to the inputs, and returns a score of how well the model performed.
- `greater_is_better`: True if a higher `objective_function` value represents a better solution, and otherwise False.
- `score_needs_proba`: Only for classification objectives. True if the objective is intended to function with predicted probabilities as opposed to predicted values (example: cross entropy for classifiers).
- `decision_function`: Only for binary classification objectives. This function takes predicted probabilities that were output from the model and a binary classification threshold, and returns predicted values.

Example: Fraud Detection

To give a concrete example, let's look at how the *fraud detection* objective function is built.

```
[2]: from evalml.objectives.binary_classification_objective import _
      BinaryClassificationObjective
      import pandas as pd

class FraudCost(BinaryClassificationObjective):
    """Score the percentage of money lost of the total transaction amount process due
    to fraud"""
    name = "Fraud Cost"
    greater_is_better = False
    score_needs_proba = False

    def __init__(self, retry_percentage=.5, interchange_fee=.02,
                  fraud_payout_percentage=1.0, amount_col='amount'):
        """Create instance of FraudCost

        Arguments:
            retry_percentage (float): What percentage of customers that will retry a
            transaction if it
            is declined. Between 0 and 1. Defaults to .5

            interchange_fee (float): How much of each successful transaction you can
            collect.
            Between 0 and 1. Defaults to .02

            fraud_payout_percentage (float): Percentage of fraud you will not be able
            to collect.
            Between 0 and 1. Defaults to 1.0

            amount_col (str): Name of column in data that contains the amount.
            Defaults to "amount"
        """
        self.retry_percentage = retry_percentage
        self.interchange_fee = interchange_fee
        self.fraud_payout_percentage = fraud_payout_percentage
        self.amount_col = amount_col

    def decision_function(self, ypred_proba, threshold=0.0, X=None):
        """Determine if a transaction is fraud given predicted probabilities,
        threshold, and dataframe with transaction amount

        Arguments:
```

(continues on next page)

(continued from previous page)

```

        ypred_proba (pd.Series): Predicted probabilities
        X (pd.DataFrame): Dataframe containing transaction amount
        threshold (float): Dollar threshold to determine if transaction is_
↪ fraud

    Returns:
        pd.Series: Series of predicted fraud labels using X and threshold
    """
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)

    if not isinstance(ypred_proba, pd.Series):
        ypred_proba = pd.Series(ypred_proba)

    transformed_probs = (ypred_proba.values * X[self.amount_col])
    return transformed_probs > threshold

def objective_function(self, y_true, y_predicted, X):
    """Calculate amount lost to fraud per transaction given predictions, true_
↪ values, and dataframe with transaction amount

    Arguments:
        y_predicted (pd.Series): predicted fraud labels
        y_true (pd.Series): true fraud labels
        X (pd.DataFrame): dataframe with transaction amounts

    Returns:
        float: amount lost to fraud per transaction
    """
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)

    if not isinstance(y_predicted, pd.Series):
        y_predicted = pd.Series(y_predicted)

    if not isinstance(y_true, pd.Series):
        y_true = pd.Series(y_true)

    # extract transaction using the amount columns in users data
    try:
        transaction_amount = X[self.amount_col]
    except KeyError:
        raise ValueError("`{}` is not a valid column in X.".format(self.amount_
↪ col))

    # amount paid if transaction is fraud
    fraud_cost = transaction_amount * self.fraud_payout_percentage

    # money made from interchange fees on transaction
    interchange_cost = transaction_amount * (1 - self.retry_percentage) * self.
↪ interchange_fee

    # calculate cost of missing fraudulent transactions
    false_negatives = (y_true & ~y_predicted) * fraud_cost

    # calculate money lost from fees
    false_positives = (~y_true & y_predicted) * interchange_cost

```

(continues on next page)

(continued from previous page)

```

    loss = false_negatives.sum() + false_positives.sum()

    loss_per_total_processed = loss / transaction_amount.sum()

    return loss_per_total_processed

```

4.3 Components

Components are the lowest level of building blocks in EvalML. Each component represents a fundamental operation to be applied to data.

All components accept parameters as keyword arguments to their `__init__` methods. These parameters can be used to configure behavior.

Each component class definition must include a human-readable `name` for the component. Additionally, each component class may expose parameters for AutoML search by defining a `hyperparameter_ranges` attribute containing the parameters in question.

EvalML splits components into two categories: **transformers** and **estimators**.

4.3.1 Transformers

Transformers subclass the `Transformer` class, and define a `fit` method to learn information from training data and a `transform` method to apply a learned transformation to new data.

For example, an *imputer* is configured with the desired impute strategy to follow, for instance the mean value. The imputers `fit` method would learn the mean from the training data, and the `transform` method would fill the learned mean value in for any missing values in new data.

All transformers can execute `fit` and `transform` separately or in one step by calling `fit_transform`. Defining a custom `fit_transform` method can facilitate useful performance optimizations in some cases.

```
[1]: import numpy as np
import pandas as pd
from evalml.pipelines.components import SimpleImputer

X = pd.DataFrame([[1, 2, 3], [1, np.nan, 3]])
display(X)

2020-08-06 20:28:27,971 featuretools - WARNING    Featuretools failed to load plugin_

0  1  2.0  3
1  1  NaN  3

```

```
[2]: imp = SimpleImputer(impute_strategy="mean")
      X = imp.fit_transform(X)

      display(X)

      0    1    2
0    1    2.0  3
1    1    2.0  3
```

Below is a list of all transformers included with EvalML:

```
[3]: from evalml.pipelines.components.utils import all_components, Estimator, Transformer
      for component in all_components:
          if issubclass(component, Transformer):
              print(f"Transformer: {component.name}")

Transformer: Text Featurization Component
Transformer: Drop Null Columns Transformer
Transformer: DateTime Featurization Component
Transformer: Select Columns Transformer
Transformer: Drop Columns Transformer
Transformer: Standard Scaler
Transformer: Imputer
Transformer: Per Column Imputer
Transformer: Simple Imputer
Transformer: RF Regressor Select From Model
Transformer: RF Classifier Select From Model
Transformer: One Hot Encoder
```

4.3.2 Estimators

Each estimator wraps an ML algorithm. Estimators subclass the `Estimator` class, and define a `fit` method to learn information from training data and a `predict` method for generating predictions from new data. Classification estimators should also define a `predict_proba` method for generating predicted probabilities.

Estimator classes each define a `model_family` attribute indicating what type of model is used.

Here's an example of using the *LogisticRegressionClassifier* estimator to fit and predict on a simple dataset:

```
[4]: from evalml.pipelines.components import LogisticRegressionClassifier

      clf = LogisticRegressionClassifier()

      X = X
      y = [1, 0]

      clf.fit(X, y)
      clf.predict(X)

[4]: 0    0
      1    0
      dtype: int64
```

Below is a list of all estimators included with EvalML:

```
[5]: from evalml.pipelines.components.utils import all_components, Estimator, Transformer
      for component in all_components:
```

(continues on next page)

(continued from previous page)

```

if isinstance(component, Estimator):
    print(f"Estimator: {component.name}")

```

```

Estimator: Baseline Regressor
Estimator: Extra Trees Regressor
Estimator: XGBoost Regressor
Estimator: CatBoost Regressor
Estimator: Random Forest Regressor
Estimator: Linear Regressor
Estimator: Elastic Net Regressor
Estimator: Baseline Classifier
Estimator: Extra Trees Classifier
Estimator: Elastic Net Classifier
Estimator: CatBoost Classifier
Estimator: XGBoost Classifier
Estimator: Random Forest Classifier
Estimator: Logistic Regression Classifier

```

4.3.3 Defining Custom Components

EvalML allows you to easily create your own custom components by following the steps below.

Custom Transformers

Your transformer must inherit from the correct subclass. In this case *Transformer* for components that transform data. Next we will use EvalML's *DropNullColumns* as an example.

```

[6]: import pandas as pd
from evalml.pipelines.components import Transformer

class DropNullColumns(Transformer):
    """Transformer to drop features whose percentage of NaN values exceeds a
    ↪specified threshold"""
    name = "Drop Null Columns Transformer"
    hyperparameter_ranges = {}

    def __init__(self, pct_null_threshold=1.0, random_state=0, **kwargs):
        """Initializes an transformer to drop features whose percentage of NaN values
        ↪exceeds a specified threshold.

        Arguments:
            pct_null_threshold(float): The percentage of NaN values in an input
            ↪feature to drop.
            Must be a value between [0, 1] inclusive. If equal to 0.0, will drop
            ↪columns with any null values.
            If equal to 1.0, will drop columns with all null values. Defaults to
            ↪0.95.
        """
        if pct_null_threshold < 0 or pct_null_threshold > 1:
            raise ValueError("pct_null_threshold must be a float between 0 and 1,
            ↪inclusive.")
        parameters = {"pct_null_threshold": pct_null_threshold}
        parameters.update(kwargs)

```

(continues on next page)

(continued from previous page)

```

self._cols_to_drop = None
super().__init__(parameters=parameters,
                 component_obj=None,
                 random_state=random_state)

def fit(self, X, y=None):
    pct_null_threshold = self.parameters["pct_null_threshold"]
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)
    percent_null = X.isnull().mean()
    if pct_null_threshold == 0.0:
        null_cols = percent_null[percent_null > 0]
    else:
        null_cols = percent_null[percent_null >= pct_null_threshold]
    self._cols_to_drop = list(null_cols.index)
    return self

def transform(self, X, y=None):
    """Transforms data X by dropping columns that exceed the threshold of null_
    ↪ values.
    Arguments:
        X (pd.DataFrame): Data to transform
        y (pd.Series, optional): Targets
    Returns:
        pd.DataFrame: Transformed X
    """

    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)
    return X.drop(columns=self._cols_to_drop, axis=1)

```

Required fields

For a transformer you must provide a class attribute name indicating a human-readable name.

Required methods

Likewise, there are select methods you need to override as `Transformer` is an abstract base class:

- `__init__()` - the `__init__()` method of your transformer will need to call `super().__init__()` and pass three parameters in: a `parameters` dictionary holding the parameters to the component, the `component_obj`, and the `random_state` value. You can see that `component_obj` is set to `None` above and we will discuss `component_obj` in depth later on.
- `fit()` - the `fit()` method is responsible for fitting your component on training data.
- `transform()` - after fitting a component, the `transform()` method will take in new data and transform accordingly. Note: a component must call `fit()` before `transform()`.

You can also call or override `fit_transform()` that combines `fit()` and `transform()` into one method.

Custom Estimators

Your estimator must inherit from the correct subclass. In this case *Estimator* for components that predict new target values. Next we will use EvalML's *BaselineRegressor* as an example.

```
[7]: import numpy as np
import pandas as pd

from evalml.model_family import ModelFamily
from evalml.pipelines.components.estimators import Estimator
from evalml.problem_types import ProblemTypes

class BaselineRegressor(Estimator):
    """Regressor that predicts using the specified strategy.

    This is useful as a simple baseline regressor to compare with other regressors.
    """
    name = "Baseline Regressor"
    hyperparameter_ranges = {}
    model_family = ModelFamily.BASELINE
    supported_problem_types = [ProblemTypes.REGRESSION]

    def __init__(self, strategy="mean", random_state=0, **kwargs):
        """Baseline regressor that uses a simple strategy to make predictions.

        Arguments:
            strategy (str): method used to predict. Valid options are "mean", "median"
            ↪ ". Defaults to "mean".
            random_state (int, np.random.RandomState): seed for the random number_
            ↪ generator

        """
        if strategy not in ["mean", "median"]:
            raise ValueError("'strategy' parameter must equal either 'mean' or 'median'
            ↪ ")
        parameters = {"strategy": strategy}
        parameters.update(kwargs)

        self._prediction_value = None
        self._num_features = None
        super().__init__(parameters=parameters,
                         component_obj=None,
                         random_state=random_state)

    def fit(self, X, y=None):
        if y is None:
            raise ValueError("Cannot fit Baseline regressor if y is None")

        if not isinstance(y, pd.Series):
            y = pd.Series(y)

        if self.parameters["strategy"] == "mean":
            self._prediction_value = y.mean()
        elif self.parameters["strategy"] == "median":
            self._prediction_value = y.median()
        self._num_features = X.shape[1]
        return self
```

(continues on next page)

(continued from previous page)

```

def predict(self, X):
    return pd.Series([self._prediction_value] * len(X))

@property
def feature_importance(self):
    """Returns importance associated with each feature. Since baseline regressors
    ↪do not use input features to calculate predictions, returns an array of zeroes.

    Returns:
        np.array (float): an array of zeroes

    """
    return np.zeros(self._num_features)

```

Required fields

- name indicating a human-readable name.
- model_family - EvalML *model_family* that this component belongs to
- supported_problem_types - list of EvalML *problem_types* that this component supports

Model families and problem types include:

```

[8]: from evalml.model_family import ModelFamily
    from evalml.problem_types import ProblemTypes

print("Model Families:\n", [m.value for m in ModelFamily])
print("Problem Types:\n", [p.value for p in ProblemTypes])

Model Families:
['random_forest', 'xgboost', 'linear_model', 'catboost', 'extra_trees', 'baseline',
↪'none']
Problem Types:
['binary', 'multiclass', 'regression']

```

Required methods

- `__init__()` - the `__init__()` method of your estimator will need to call `super().__init__()` and pass three parameters in: a `parameters` dictionary holding the parameters to the component, the `component_obj`, and the `random_state` value.
- `fit()` - the `fit()` method is responsible for fitting your component on training data.
- `predict()` - after fitting a component, the `predict()` method will take in new data and predict new target values. Note: a component must call `fit()` before `predict()`.
- `feature_importance` - `feature_importance` is a *Python property* that returns a list of importances associated with each feature.

If your estimator handles classification problems it also requires an additional method:

- `predict_proba()` - this method predicts probability estimates for classification labels

Components Wrapping Third-Party Objects

The `component_obj` parameter is used for wrapping third-party objects and using them in component implementation. If you're using a `component_obj` you will need to define `__init__()` and pass in the relevant object that has also implemented the required methods mentioned above. However, if the `component_obj` does not follow EvalML component conventions, you may need to override methods as needed. Below is an example of EvalML's `LinearRegressor`.

```
[9]: from sklearn.linear_model import LinearRegression as SKLinearRegression

from evalml.model_family import ModelFamily
from evalml.pipelines.components.estimators import Estimator
from evalml.problem_types import ProblemTypes

class LinearRegressor(Estimator):
    """Linear Regressor."""
    name = "Linear Regressor"
    model_family = ModelFamily.LINEAR_MODEL
    supported_problem_types = [ProblemTypes.REGRESSION]

    def __init__(self, fit_intercept=True, normalize=False, n_jobs=-1, random_state=0,
→ **kwargs):
        parameters = {
            'fit_intercept': fit_intercept,
            'normalize': normalize,
            'n_jobs': n_jobs
        }
        parameters.update(kwargs)
        linear_regressor = SKLinearRegression(**parameters)
        super().__init__(parameters=parameters,
                        component_obj=linear_regressor,
                        random_state=random_state)

    @property
    def feature_importance(self):
        return self._component_obj.coef_
```

Hyperparameter Ranges for AutoML

`hyperparameter_ranges` is a dictionary mapping the parameter name (str) to an allowed range (SkOpt Space) for that parameter.

AutoML will perform a search over the allowed ranges for each parameter to select models which produce optimal performance within those ranges. AutoML gets the allowed ranges for each component from the component's `hyperparameter_ranges` class attribute. Any component parameter you add an entry for in `hyperparameter_ranges` will be included in the AutoML search. If parameters are omitted, AutoML will use the default value in all pipelines.

```
[10]: from sklearn.linear_model import LinearRegression as SKLinearRegression

from evalml.model_family import ModelFamily
from evalml.pipelines.components.estimators import Estimator
from evalml.problem_types import ProblemTypes

class LinearRegressor(Estimator):
    """Linear Regressor."""
```

(continues on next page)

(continued from previous page)

```

name = "Linear Regressor"
hyperparameter_ranges = {
    'fit_intercept': [True, False],
    'normalize': [True, False]
}
model_family = ModelFamily.LINEAR_MODEL
supported_problem_types = [ProblemTypes.REGRESSION]

def __init__(self, fit_intercept=True, normalize=False, n_jobs=-1, random_state=0,
→ **kwargs):
    parameters = {
        'fit_intercept': fit_intercept,
        'normalize': normalize,
        'n_jobs': n_jobs
    }
    parameters.update(kwargs)
    linear_regressor = SKLinearRegression(**parameters)
    super().__init__(parameters=parameters,
                     component_obj=linear_regressor,
                     random_state=random_state)

@property
def feature_importance(self):
    return self._component_obj.coef_

```

Expectations for Custom Classification Components

EvalML expects the following from custom classification component implementations:

- Classification targets will range from 0 to n-1 and are integers.
- For classification estimators, the order of `predict_proba`'s columns must match the order of the target, and the column names must be integers ranging from 0 to n-1

4.4 Pipelines

EvalML pipelines represent a sequence of operations to be applied to data, where each operation is either a data transformation or an ML modeling algorithm.

A pipeline class holds a combination of one or more components, which will be applied to new input data in sequence.

Each component and pipeline class supports a set of parameters which configure its behavior. The AutoML search process seeks to find the combination of pipeline structure and pipeline parameters which perform the best on the data.

4.4.1 Class Definition

Pipeline definitions must inherit from the proper pipeline base class, `RegressionPipeline`, `BinaryClassificationPipeline` or `MulticlassClassificationPipeline`. They must also include a `component_graph` list as a class variable containing the sequence of components to be fit and evaluated. Each component in the graph can be provided as either a string name or as a reference to the component class.

```
[1]: from evalml.pipelines import MulticlassClassificationPipeline

class CustomMulticlassClassificationPipeline(MulticlassClassificationPipeline):
    component_graph = ['Simple Imputer', 'Random Forest Classifier']
```

2020-08-06 20:29:33,926 featuretools - WARNING Featuretools failed to load plugin `nlp_primitives` from library `nlp_primitives`. For a full stack trace, set logging to `debug`.

/home/docs/checkouts/readthedocs.org/user_builds/feature-labs-inc-evalml/envs/v0.12.2/lib/python3.7/site-packages/evalml/pipelines/components/transformers/preprocessing/text_featurizer.py:31: RuntimeWarning: No text columns were given to TextFeaturizer, component will have no effect
 warnings.warn("No text columns were given to TextFeaturizer, component will have no effect", RuntimeWarning)

If you're using your own *custom components* you can refer to them like so:

```
[2]: from evalml.pipelines.components import Transformer

class NewTransformer(Transformer):
    name = 'New Transformer'
    hyperparameter_ranges = {
        "parameter_1": ['a', 'b', 'c']
    }

    def __init__(self, parameter_1, random_state):
        transformer = ThirdPartyTransformer(parameter_1)
        parameters = {"parameter_1": parameter_1}
        super().__init__(parameters=parameters,
                        component_obj=transformer,
                        random_state=random_state)

class CustomComponentMulticlassClassificationPipeline(MulticlassClassificationPipeline):
    component_graph = [NewTransformer, 'Random Forest Classifier']
```

4.4.2 Pipeline Usage

All pipelines define the following methods:

- `fit` fits each component on the provided training data, in order.
- `predict` computes the predictions of the component graph on the provided data.
- `score` computes the value of *an objective* on the provided data.

```
[3]: from evalml.demos import load_wine
X, y = load_wine()

pipeline = CustomMulticlassClassificationPipeline({})
pipeline.fit(X, y)
print(pipeline.predict(X))
print(pipeline.score(X, y, objectives=['log_loss_multi']))
```

```
0      class_0
1      class_0
2      class_0
```

(continues on next page)

(continued from previous page)

```

3      class_0
4      class_0
...
173     class_2
174     class_2
175     class_2
176     class_2
177     class_2
Length: 178, dtype: object
OrderedDict([('Log Loss Multiclass', 0.04132737017536148)])

```

4.4.3 Custom Name

By default, a pipeline class's name property is the result of adding spaces between each Pascal case capitalization in the class name. E.g. `LogisticRegressionPipeline.name` will return 'Logistic Regression Pipeline'. Therefore, we suggest custom pipelines use Pascal case for their class names.

If you'd like to override the pipeline classes name attribute so it isn't derived from the class name, you can set the `custom_name` attribute, like so:

```

[4]: from evalml.pipelines import MulticlassClassificationPipeline

class CustomPipeline(MulticlassClassificationPipeline):
    component_graph = ['Simple Imputer', 'One Hot Encoder', 'Logistic Regression_
↳Classifier']
    custom_name = 'A custom pipeline name'

print(CustomPipeline.name)

A custom pipeline name

```

4.4.4 Override Component Hyperparameter Ranges

To specify custom hyperparameter ranges, set the `custom_hyperparameters` property to be a dictionary where each key-value pair consists of a parameter name and range. AutoML will use this dictionary to override the hyperparameter ranges collected from each component in the component graph.

```

[5]: class CustomPipeline(MulticlassClassificationPipeline):
    component_graph = ['Simple Imputer', 'One Hot Encoder', 'Standard Scaler',
↳'Logistic Regression Classifier']

print("Without custom hyperparameters:")
print(CustomPipeline.hyperparameters)

class CustomPipeline(MulticlassClassificationPipeline):
    component_graph = ['Simple Imputer', 'One Hot Encoder', 'Standard Scaler',
↳'Logistic Regression Classifier']
    custom_hyperparameters = {
        'Simple Imputer': {
            'impute_strategy': ['most_frequent']
        }
    }

print()

```

(continues on next page)

(continued from previous page)

```
print("With custom hyperparameters:")
print(CustomPipeline.hyperparameters)
```

Without custom hyperparameters:

```
{'Simple Imputer': {'impute_strategy': ['mean', 'median', 'most_frequent']}, 'One Hot
↳Encoder': {}, 'Standard Scaler': {}, 'Logistic Regression Classifier': {'penalty':
↳['l2'], 'C': Real(low=0.01, high=10, prior='uniform', transform='identity')}
```

With custom hyperparameters:

```
{'Simple Imputer': {'impute_strategy': ['most_frequent']}, 'One Hot Encoder': {},
↳'Standard Scaler': {}, 'Logistic Regression Classifier': {'penalty': ['l2'], 'C':
↳Real(low=0.01, high=10, prior='uniform', transform='identity')}
```

To initialize our new custom pipeline class, we must pass in a `parameters` argument. If we want to use the defaults for each component, we can simply pass in an empty dictionary.

```
[6]: CustomPipeline(parameters={})
```

```
[6]: <__main__.CustomPipeline at 0x7eff29b9d9e8>
```

4.4.5 Pipeline Parameters

You can also pass in custom parameters. The parameters dictionary needs to be in the format of a two-layered dictionary where the first key-value pair is the component name and component parameters dictionary. The component parameters dictionary consists of a key value pair of parameter name and parameter values. An example will be shown below and component parameters can be found [here](#).

```
[7]: parameters = {
    'Simple Imputer': {
        'impute_strategy': 'mean'
    },
    'Logistic Regression Classifier': {
        'penalty': 'l2',
        'C': 1.0,
    }
}

cp = CustomPipeline(parameters=parameters, random_state=5)
```

4.4.6 Pipeline Description

You can call `.graph()` to see each component and its parameters. Each component takes in data and feeds it to the next.

```
[8]: cp.graph()
```

```
[8]: You can see a textual representation of the pipeline by calling .describe():
```

```
[9]: cp.describe()

*****
* Custom Pipeline *
```

(continues on next page)

(continued from previous page)

```

*****

Problem Type: Multiclass Classification
Model Family: Linear

Pipeline Steps
=====
1. Simple Imputer
   * impute_strategy : mean
   * fill_value : None
2. One Hot Encoder
   * top_n : 10
   * categories : None
   * drop : None
   * handle_unknown : ignore
   * handle_missing : error
3. Standard Scaler
4. Logistic Regression Classifier
   * penalty : l2
   * C : 1.0
   * n_jobs : -1

```

4.5 Model Understanding

Simply examining a model’s performance metrics is not enough to select a model and promote it for use in a production setting. While developing an ML algorithm, it is important to understand how the model behaves on the data, to examine the key factors influencing its predictions and to consider where it may be deficient. Determination of what “success” may mean for an ML project depends first and foremost on the user’s domain expertise.

EvalML includes a variety of tools for understanding models.

First, let’s train a pipeline on some data.

```

[1]: import evalml

class RFBinaryClassificationPipeline(evalml.pipelines.BinaryClassificationPipeline):
    component_graph = ['Simple Imputer', 'Random Forest Classifier']

X, y = evalml.demos.load_breast_cancer()

pipeline = RFBinaryClassificationPipeline({})
pipeline.fit(X, y)
print(pipeline.score(X, y, objectives=['log_loss_binary']))

2020-08-06 20:28:44,336 featuretools - WARNING      Featuretools failed to load plugin_

```

```
OrderedDict([('Log Loss Binary', 0.0384038280278762)])
```

4.5.1 Feature Importance

We can get the importance associated with each feature of the resulting pipeline

```
[2]: pipeline.feature_importance
[2]:
```

	feature	importance
0	worst perimeter	0.176488
1	worst concave points	0.125260
2	worst radius	0.124161
3	mean concave points	0.086443
4	worst area	0.072465
5	mean concavity	0.072320
6	mean perimeter	0.056685
7	mean area	0.049599
8	area error	0.037229
9	worst concavity	0.028181
10	mean radius	0.023294
11	radius error	0.019457
12	worst texture	0.014990
13	perimeter error	0.014103
14	mean texture	0.013618
15	worst compactness	0.011310
16	worst smoothness	0.011139
17	worst fractal dimension	0.008118
18	worst symmetry	0.007818
19	mean smoothness	0.006152
20	concave points error	0.005887
21	fractal dimension error	0.005059
22	concavity error	0.004510
23	smoothness error	0.004493
24	texture error	0.004476
25	mean compactness	0.004050
26	compactness error	0.003559
27	mean symmetry	0.003243
28	symmetry error	0.003124
29	mean fractal dimension	0.002768

We can also create a bar plot of the feature importances

```
[3]: pipeline.graph_feature_importance()
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.5.2 Permutation Importance

We can also compute and plot the permutation importance of the pipeline.

```
[4]: evalml.pipelines.calculate_permutation_importance(pipeline, X, y, 'log_loss_binary')
```

```
[4]:
```

	feature	importance
0	worst perimeter	0.078033
1	worst radius	0.074341
2	worst concave points	0.068313
3	worst area	0.067733
4	mean concave points	0.041261
5	worst concavity	0.037533
6	mean concavity	0.036664
7	area error	0.035838
8	mean perimeter	0.025783
9	mean area	0.025203
10	worst texture	0.016211
11	perimeter error	0.011738
12	mean texture	0.011716
13	radius error	0.010910
14	mean radius	0.010775
15	worst compactness	0.008322
16	worst smoothness	0.008281
17	mean smoothness	0.005707
18	worst symmetry	0.004454
19	worst fractal dimension	0.003889
20	concavity error	0.003858
21	compactness error	0.003572
22	concave points error	0.003449
23	mean compactness	0.003173
24	smoothness error	0.003172
25	fractal dimension error	0.002618
26	texture error	0.002533
27	mean fractal dimension	0.002228
28	symmetry error	0.002126
29	mean symmetry	0.001786

```
[5]: evalml.pipelines.graph_permutation_importance(pipeline, X, y, 'log_loss_binary')
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.5.3 Confusion Matrix

For binary or multiclass classification, we can view a [confusion matrix](#) of the classifier's predictions

```
[6]: y_pred = pipeline.predict(X)
evalml.pipelines.graph_utils.graph_confusion_matrix(y, y_pred)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.5.4 Precision-Recall Curve

For binary classification, we can view the precision-recall curve of the pipeline.

```
[7]: # get the predicted probabilities associated with the "true" label
y = y.map({'malignant': 0, 'benign': 1})
y_pred_proba = pipeline.predict_proba(X) ["benign"]
evalml.pipelines.graph_utils.graph_precision_recall_curve(y, y_pred_proba)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.5.5 ROC Curve

For binary and multiclass classification, we can view the [Receiver Operating Characteristic \(ROC\)](#) curve of the pipeline.

```
[8]: # get the predicted probabilities associated with the "benign" label
y_pred_proba = pipeline.predict_proba(X) ["benign"]
evalml.pipelines.graph_utils.graph_roc_curve(y, y_pred_proba)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.5.6 Explaining Individual Predictions

We can explain why the model made an individual prediction with the `explain_prediction` function. This will use the [Shapley Additive Explanations \(SHAP\)](#) algorithms to identify the top features that explain the predicted value.

This function can explain both classification and regression models - all you need to do is provide the pipeline, the input features (must correspond to one row of the input data) and the training data. The function will return a table that you can print summarizing the top 3 most positive and negative contributing features to the predicted value.

In the example below, we explain the prediction for the third data point in the data set. We see that the `worst concave points` feature increased the estimated probability that the tumor is malignant by 20% while the `worst radius` feature decreased the probability the tumor is malignant by 5%.

```
[9]: from evalml.pipelines.prediction_explanations import explain_prediction

table = explain_prediction(pipeline=pipeline, input_features=X.iloc[3:4],
                           training_data=X, include_shap_values=True)
print(table)
```

Positive Label

Feature Name	Contribution to Prediction	SHAP Value
worst concave points	++	0.200
mean concave points	+	0.110
mean concavity	+	0.080
worst area	-	-0.030
worst perimeter	-	-0.050
worst radius	-	-0.050

The interpretation of the table is the same for regression problems - but the SHAP value now corresponds to the change in the estimated value of the dependent variable rather than a change in probability. For multiclass classification problems, a table will be output for each possible class.

This functionality is currently **not supported** for **XGBoost** models or **CatBoost multiclass** classifiers.

4.6 Data Checks

EvalML provides data checks to help guide you in achieving the highest performing model. These utility functions help deal with problems such as overfitting, abnormal data, and missing data. These data checks can be found under `evalml/data_checks`. Below we will cover examples such as abnormal and missing data data checks.

4.6.1 Missing Data

Missing data or rows with NaN values provide many challenges for machine learning pipelines. In the worst case, many algorithms simply will not run with missing data! EvalML pipelines contain imputation *components* to ensure that doesn't happen. Imputation works by approximating missing values with existing values. However, if a column contains a high number of missing values, a large percentage of the column would be approximated by a small percentage. This could potentially create a column without useful information for machine learning pipelines. By using the `HighlyNullDataCheck()` data check, EvalML will alert you to this potential problem by returning the columns that pass the missing values threshold.

```
[1]: import numpy as np
import pandas as pd

from evalml.data_checks import HighlyNullDataCheck

X = pd.DataFrame([[1, 2, 3],
                  [0, 4, np.nan],
                  [1, 4, np.nan],
                  [9, 4, np.nan],
                  [8, 6, np.nan]])

null_check = HighlyNullDataCheck(pct_null_threshold=0.8)

for message in null_check.validate(X):
    print(message.message)

2020-08-06 20:28:36,267 featuretools - WARNING      Featuretools failed to load plugin_
↳ nlp_primitives from library nlp_primitives. For a full stack trace, set logging to _
↳ debug.
Column '2' is 80.0% or more null

/home/docs/checkouts/readthedocs.org/user_builds/feature-labs-inc-evalml/envs/v0.12.2/
↳ lib/python3.7/site-packages/evalml/pipelines/components/transformers/preprocessing/
↳ text_featurizer.py:31: RuntimeWarning: No text columns were given to TextFeaturizer,
↳ component will have no effect
warnings.warn("No text columns were given to TextFeaturizer, component will have no_
↳ effect", RuntimeWarning)
```

4.6.2 Abnormal Data

EvalML provides two data checks to check for abnormal data: `OutliersDataCheck()` and `IDColumnsDataCheck()`.

ID Columns

ID columns in your dataset provide little to no benefit to a machine learning pipeline as the pipeline cannot extrapolate useful information from unique identifiers. Thus, `IDColumnsDataCheck()` reminds you if these columns exist. In the given example, 'user_number' and 'id' columns are both identified as potentially being unique identifiers that should be removed.

```
[2]: from evalml.data_checks import IDColumnsDataCheck

X = pd.DataFrame([[0, 53, 6325, 5], [1, 90, 6325, 10], [2, 90, 18, 20]], columns=['user_
↪number', 'cost', 'revenue', 'id'])
id_col_check = IDColumnsDataCheck(id_threshold=0.9)

for message in id_col_check.validate(X):
    print(message.message)

Column 'id' is 90.0% or more likely to be an ID column
Column 'user_number' is 90.0% or more likely to be an ID column
```

4.6.3 Outliers

Outliers are observations that differ significantly from other observations in the same sample. Many machine learning pipelines suffer in performance if outliers are not dropped from the training set as they are not representative of the data. `OutliersDataCheck()` uses Isolation Forests to notify you if a sample can be considered an outlier.

Below we generate a random dataset with some outliers.

```
[3]: data = np.random.randn(100, 100)
X = pd.DataFrame(data=data)

# generate some outliers in rows 3, 25, 55, and 72
X.iloc[3, :] = pd.Series(np.random.randn(100) * 10)
X.iloc[25, :] = pd.Series(np.random.randn(100) * 20)
X.iloc[55, :] = pd.Series(np.random.randn(100) * 100)
X.iloc[72, :] = pd.Series(np.random.randn(100) * 100)
```

We then utilize `OutliersDataCheck()` to rediscover these outliers.

```
[4]: from evalml.data_checks import OutliersDataCheck

outliers_check = OutliersDataCheck()

for message in outliers_check.validate(X):
    print(message.message)

Row '3' is likely to have outlier data
Row '25' is likely to have outlier data
Row '55' is likely to have outlier data
Row '72' is likely to have outlier data
```

4.6.4 Writing Your Own Data Check

If you would prefer to write your own data check, you can do so by extending the `DataCheck` class and implementing the `validate(self, X, y)` class method. Below, we've created a new `DataCheck`, `ZeroVarianceDataCheck`.

```
[5]: from evalml.data_checks import DataCheck
from evalml.data_checks.data_check_message import DataCheckError

class ZeroVarianceDataCheck(DataCheck):
    def validate(self, X, y):
        if not isinstance(X, pd.DataFrame):
            X = pd.DataFrame(X)
        warning_msg = "Column '{}' has zero variance"
        return [DataCheckError(warning_msg.format(column), self.name) for column in X.
        ↪ columns if len(X[column].unique()) == 1]
```

4.7 Utilities

4.7.1 Configuring Logging

EvalML uses the [standard python logging package](#). By default, EvalML will log INFO-level logs and higher (warnings, errors and critical) to stdout, and will log everything to `evalml_debug.log` in the current working directory.

If you want to change the location of the logfile, before import, set the `EVALML_LOG_FILE` environment variable to specify a filename within an existing directory in which you have write permission. If you want to disable logging to the logfile, set `EVALML_LOG_FILE` to be empty. If the environment variable is set to an invalid location, EvalML will print a warning message to stdout and will not create a log file.

4.8 FAQ

4.8.1 Q: What is the difference between EvalML and other AutoML libraries?

EvalML optimizes machine learning pipelines on *custom practical objectives* instead of vague machine learning loss functions so that it will find the best pipelines for your specific needs. Furthermore, EvalML *pipelines* are able to take in all kinds of data (missing values, categorical, etc.) as long as the data are in a single table. EvalML also allows you to build your own pipelines with existing or custom components so you can have more control over the AutoML process. Moreover, EvalML also provides you with support in the form of *data checks* to ensure that you are aware of potential issues your data may cause with machine learning algorithms.

4.8.2 Q: How does EvalML handle missing values?

EvalML contains imputation components in its pipelines so that missing values are taken care of. EvalML optimizes over different types of imputation to search for the best possible pipeline. You can find more information about components [here](#) and in the API reference [here](#).

4.8.3 Q: How does EvalML handle categorical encoding?

EvalML provides a *one-hot-encoding component* in its pipelines for categorical variables. EvalML plans to support other encoders in the future.

4.8.4 Q: How does EvalML handle feature selection?

EvalML currently utilizes scikit-learn's [SelectFromModel](#) with a Random Forest classifier/regressor to handle feature selection. EvalML plans on supporting more feature selectors in the future. You can find more information in the API reference [here](#).

4.8.5 Q: How is feature importance calculated?

Feature importance depends on the estimator used. Variable coefficients are used for regression-based estimators (Logistic Regression and Linear Regression) and Gini importance is used for tree-based estimators (Random Forest and XGBoost).

4.8.6 Q: How does hyperparameter tuning work?

EvalML tunes hyperparameters for its pipelines through Bayesian optimization. In the future we plan to support more optimization techniques such as random search.

4.8.7 Q: Can I create my own objective metric?

Yes you can! You can *create your own custom objective* so that EvalML optimizes the best model for your needs.

4.8.8 Q: How does EvalML avoid overfitting?

EvalML provides [data checks](#) to combat overfitting. Such data checks include detecting label leakage, unstable pipelines, hold-out datasets and cross validation. EvalML defaults to using Stratified K-Fold cross-validation for classification problems and K-Fold cross-validation for regression problems but allows you to utilize your own cross-validation methods as well.

4.8.9 Q: Can I create my own pipeline for EvalML?

Yes! EvalML allows you to create *custom pipelines* using modular components. This allows you to customize EvalML pipelines for your own needs or for AutoML.

4.8.10 Q: Does EvalML work with X algorithm?

EvalML is constantly improving and adding new components and will allow your own algorithms to be used as components in our pipelines.

API REFERENCE

5.1 Demo Datasets

<code>load_fraud</code>	Load credit card fraud dataset.
<code>load_wine</code>	Load wine dataset.
<code>load_breast_cancer</code>	Load breast cancer dataset.
<code>load_diabetes</code>	Load diabetes dataset.

5.1.1 `evalml.demos.load_fraud`

`evalml.demos.load_fraud(n_rows=None, verbose=True)`

Load credit card fraud dataset. The fraud dataset can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – number of rows from the dataset to return
- **verbose** (*bool*) – whether to print information about features and labels

Returns X, y

Return type pd.DataFrame, pd.Series

5.1.2 `evalml.demos.load_wine`

`evalml.demos.load_wine()`

Load wine dataset. Multiclass problem

Returns X, y

Return type pd.DataFrame, pd.Series

5.1.3 `evalml.demos.load_breast_cancer`

`evalml.demos.load_breast_cancer()`

Load breast cancer dataset. Multiclass problem

Returns X, y

Return type pd.DataFrame, pd.Series

5.1.4 evalml.demos.load_diabetes

`evalml.demos.load_diabetes()`
Load diabetes dataset. Regression problem

Returns `X, y`

Return type `pd.DataFrame, pd.Series`

5.2 Preprocessing

Utilities to preprocess data before using evalml.

<code>drop_nan_target_rows</code>	Drops rows in <code>X</code> and <code>y</code> when row in the target <code>y</code> has a value of <code>NaN</code> .
<code>label_distribution</code>	Get the label distributions.
<code>load_data</code>	Load features and labels from file.
<code>number_of_features</code>	Get the number of features for specific dtypes.
<code>split_data</code>	Splits data into train and test sets.

5.2.1 evalml.preprocessing.drop_nan_target_rows

`evalml.preprocessing.drop_nan_target_rows(X, y)`
Drops rows in `X` and `y` when row in the target `y` has a value of `NaN`.

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series`) – Target values

Returns Transformed `X` (and `y`, if passed in) with rows that had a `NaN` value removed.

Return type `pd.DataFrame`

5.2.2 evalml.preprocessing.label_distribution

`evalml.preprocessing.label_distribution(labels)`
Get the label distributions.

Parameters **labels** (`pd.Series`) – Label values

Returns Label values and their frequency distribution as percentages.

Return type `pd.Series`

5.2.3 evalml.preprocessing.load_data

`evalml.preprocessing.load_data(path, index, label, n_rows=None, drop=None, verbose=True, **kwargs)`

Load features and labels from file.

Parameters

- **path** (`str`) – Path to file or a `http/ftp/s3` URL

- **index** (*str*) – Column for index
- **label** (*str*) – Column for labels
- **n_rows** (*int*) – Number of rows to return
- **drop** (*list*) – List of columns to drop
- **verbose** (*bool*) – If True, prints information about features and labels

Returns features and labels

Return type `pd.DataFrame`, `pd.Series`

5.2.4 `evalml.preprocessing.number_of_features`

`evalml.preprocessing.number_of_features` (*dtypes*)

Get the number of features for specific dtypes.

Parameters **dtypes** (*pd.Series*) – dtypes to get the number of features for

Returns dtypes and the number of features for each input type

Return type `pd.Series`

5.2.5 `evalml.preprocessing.split_data`

`evalml.preprocessing.split_data` (*X*, *y*, *regression=False*, *test_size=0.2*, *random_state=None*)

Splits data into train and test sets.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [*n_samples*, *n_features*]
- **y** (*pd.Series*) – labels of length [*n_samples*]
- **regression** (*bool*) – if true, do not use stratified split
- **test_size** (*float*) – percent of train set to holdout for testing
- **random_state** (*int*, *np.random.RandomState*) – seed for the random number generator

Returns features and labels each split into train and test sets

Return type `pd.DataFrame`, `pd.DataFrame`, `pd.Series`, `pd.Series`

5.3 AutoML

5.3.1 AutoML Search Classes

AutoMLSearch

Automated Pipeline search.

evalml automl AutoMLSearch

evalml.automl.automl_search.AutoMLSearch

```
class evalml.automl.AutoMLSearch(problem_type=None, objective='auto',
                                max_pipelines=None, max_time=None, pa-
                                tience=None, tolerance=None, data_split=None, al-
                                lowed_pipelines=None, allowed_model_families=None,
                                start_iteration_callback=None, add_result_callback=None,
                                additional_objectives=None, random_state=0,
                                n_jobs=-1, tuner_class=None, verbose=True, opti-
                                mize_thresholds=False)
```

Automated Pipeline search.

Methods

<code>__init__</code>	Automated pipeline search
<code>add_to_rankings</code>	Fits and evaluates a given pipeline then adds the re- sults to the automl rankings with the requirement that automl search has been run.
<code>describe_pipeline</code>	Describe a pipeline
<code>get_pipeline</code>	Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initial- ized with the parameters used to train that pipeline during automl search.
<code>load</code>	Loads AutoML object at file path
<code>save</code>	Saves AutoML object at file path
<code>search</code>	Find the best pipeline for the data set.

evalml.automl.AutoMLSearch.__init__

```
AutoMLSearch.__init__(problem_type=None, objective='auto', max_pipelines=None,
                       max_time=None, patience=None, tolerance=None, data_split=None,
                       allowed_pipelines=None, allowed_model_families=None,
                       start_iteration_callback=None, add_result_callback=None,
                       additional_objectives=None, random_state=0, n_jobs=-1,
                       tuner_class=None, verbose=True, optimize_thresholds=False)
```

Automated pipeline search

Parameters

- **problem_type** (*str* or *ProblemTypes*) – Choice of ‘regression’, ‘binary’, or ‘multiclass’, depending on the desired problem type.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. When set to auto, chooses: LogLossBinary for binary classification problems, LogLossMulticlass for multiclass classification problems, and R2 for regression problems.
- **max_pipelines** (*int*) – Maximum number of pipelines to search. If max_pipelines and max_time is not set, then max_pipelines will default to max_pipelines of 5.
- **max_time** (*int*, *str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed. Setting this field will cause allowed_model_families to be ignored.
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run evalml.pipelines.components.utils.allowed_model_families(“binary”) to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if allowed_pipelines is provided, this parameter will be ignored.
- **data_split** (*sklearn.model_selection.BaseCrossValidator*) – data splitting method to use. Defaults to StratifiedKFold.
- **tuner_class** – the tuner class to use. Defaults to scikit-optimize tuner
- **start_iteration_callback** (*callable*) – function called before each pipeline training iteration. Passed two parameters: pipeline_class, parameters.
- **add_result_callback** (*callable*) – function called after each pipeline training iteration. Passed two parameters: results, trained_pipeline.
- **additional_objectives** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.
- **n_jobs** (*int* or *None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs below -1, (n_cpus + 1 + n_jobs) are used.
- **verbose** (*boolean*) – If True, turn verbosity on. Defaults to True

evalml.automl.AutoMLSearch.add_to_rankings

`AutoMLSearch.add_to_rankings(pipeline, X, y)`

Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run. Please use the same data as previous runs of automl search. If pipeline already exists in rankings this method will return *None*.

Parameters

- **pipeline** (`PipelineBase`) – pipeline to train and evaluate.
- **x** (`pd.DataFrame`) – the input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – the target training labels of length `[n_samples]`.

evalml automl.AutoMLSearch.describe_pipeline

`AutoMLSearch.describe_pipeline(pipeline_id, return_dict=False)`

Describe a pipeline

Parameters

- **pipeline_id** (`int`) – pipeline to describe
- **return_dict** (`bool`) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

evalml automl.AutoMLSearch.get_pipeline

`AutoMLSearch.get_pipeline(pipeline_id, random_state=0)`

Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.

Parameters

- **pipeline_id** (`int`) – pipeline to retrieve
- **random_state** (`int`, `np.random.RandomState`) – The random seed/state. Defaults to 0.

Returns untrained pipeline instance associated with the provided ID

Return type *PipelineBase*

evalml automl.AutoMLSearch.load

static `AutoMLSearch.load(file_path)`

Loads AutoML object at file path

Parameters **file_path** (`str`) – location to find file to load

Returns AutoSearchBase object

evalml automl.AutoMLSearch.save

`AutoMLSearch.save(file_path, pickle_protocol=4)`

Saves AutoML object at file path

Parameters

- **file_path** (`str`) – location to save file

- `pickle_protocol` (*int*) – the pickle data stream format.

Returns None

`evalml automl AutoMLSearch.search`

`AutoMLSearch.search(X, y, data_checks='auto', feature_types=None, show_iteration_plot=True)`

Find the best pipeline for the data set.

Parameters

- **X** (*pd.DataFrame*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]
- **feature_types** (*list, optional*) – list of feature types, either numerical or categorical. Categorical features will automatically be encoded
- **show_iteration_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.
- **data_checks** (*DataChecks, list(Datacheck), str, None*) – A collection of data checks to run before automl search. If data checks produce any errors, an exception will be thrown before the search begins. If “disabled” or None, no data checks will be done. If set to “auto”, DefaultDataChecks will be done. Default value is set to “auto”.

Returns self

Attributes

<code>best_pipeline</code>	Returns an untrained instance of the best pipeline and parameters found during automl search.
<code>data_check_results</code>	
<code>full_rankings</code>	Returns a pandas.DataFrame with scoring results from all pipelines searched
<code>has_searched</code>	Returns <i>True</i> if search has been ran and <i>False</i> if not
<code>rankings</code>	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.
<code>results</code>	Class that allows access to a copy of the results from <i>automl_search</i> .

5.3.2 AutoML Algorithm Classes

<i>AutoMLAlgorithm</i>	Base class for the automl algorithms which power evalml.
<i>IterativeAlgorithm</i>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

evalml.automl.automl_algorithm.AutoMLAlgorithm

```

class evalml.automl.automl_algorithm.AutoMLAlgorithm(allowed_pipelines=None,
                                                    max_pipelines=None,
                                                    tuner_class=None,      ran-
                                                    dom_state=0)

```

Base class for the automl algorithms which power evalml.

Methods

<code>__init__</code>	This class represents an automated machine learning (AutoML) algorithm.
<code>add_result</code>	Register results from evaluating a pipeline
<code>next_batch</code>	Get the next batch of pipelines to evaluate

evalml.automl.automl_algorithm.AutoMLAlgorithm.__init__

```

AutoMLAlgorithm.__init__(allowed_pipelines=None, max_pipelines=None, tuner_class=None,
                        random_state=0)

```

This class represents an automated machine learning (AutoML) algorithm. It encapsulates the decision-making logic behind an automl search, by both deciding which pipelines to evaluate next and by deciding what set of parameters to configure the pipeline with.

To use this interface, you must define a `next_batch` method which returns the next group of pipelines to evaluate on the training data. That method may access state and results recorded from the previous batches, although that information is not tracked in a general way in this base class. Overriding `add_result` is a convenient way to record pipeline evaluation info if necessary.

Parameters

- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **max_pipelines** (*int*) – The maximum number of pipelines to be evaluated.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.automl.automl_algorithm.AutoMLAlgorithm.add_result

`AutoMLAlgorithm.add_result(score_to_minimize, pipeline)`

Register results from evaluating a pipeline

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.

evalml.automl.automl_algorithm.AutoMLAlgorithm.next_batch

`AutoMLAlgorithm.next_batch()`

Get the next batch of pipelines to evaluate

Returns a list of instances of *PipelineBase* subclasses, ready to be trained and evaluated.

Return type *list(PipelineBase)*

Attributes

<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

evalml.automl.automl_algorithm.IterativeAlgorithm

```

class evalml.automl.automl_algorithm.IterativeAlgorithm(allowed_pipelines=None,
                                                         max_pipelines=None,
                                                         tuner_class=None,
                                                         random_state=0,
                                                         pipelines_per_batch=5,
                                                         n_jobs=-1,          num-
                                                         ber_features=None)

```

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Methods

<code>__init__</code>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.
<code>add_result</code>	Register results from evaluating a pipeline
<code>next_batch</code>	Get the next batch of pipelines to evaluate

`evalml.automl.automl_algorithm.IterativeAlgorithm.__init__`

`IterativeAlgorithm.__init__` (*allowed_pipelines=None*, *max_pipelines=None*,
tuner_class=None, *random_state=0*, *pipelines_per_batch=5*,
n_jobs=-1, *number_features=None*)

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Parameters

- **`allowed_pipelines`** (*list (class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **`max_pipelines`** (*int*) – The maximum number of pipelines to be evaluated.
- **`tuner_class`** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **`random_state`** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.
- **`pipelines_per_batch`** (*int*) – the number of pipelines to be evaluated in each batch, after the first batch.
- **`n_jobs`** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines.
- **`number_features`** (*int*) – The number of columns in the input features.

`evalml.automl.automl_algorithm.IterativeAlgorithm.add_result`

`IterativeAlgorithm.add_result` (*score_to_minimize, pipeline*)

Register results from evaluating a pipeline

Parameters

- **`score_to_minimize`** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **`pipeline`** (*PipelineBase*) – The trained pipeline object which was used to compute the score.

`evalml.automl.automl_algorithm.IterativeAlgorithm.next_batch`

`IterativeAlgorithm.next_batch` ()

Get the next batch of pipelines to evaluate

Returns a list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list(*PipelineBase*)

Attributes

<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

5.4 Pipelines

5.4.1 Pipeline Base Classes

<i>PipelineBase</i>	Base class for all pipelines.
<i>ClassificationPipeline</i>	Pipeline subclass for all classification pipelines.
<i>BinaryClassificationPipeline</i>	Pipeline subclass for all binary classification pipelines.
<i>MulticlassClassificationPipeline</i>	Pipeline subclass for all multiclass classification pipelines.
<i>RegressionPipeline</i>	Pipeline subclass for all regression pipelines.

evalml.pipelines.PipelineBase

class evalml.pipelines.**PipelineBase** (*parameters*, *random_state=0*)

Base class for all pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a model
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph

Continued on next page

Table 12 – continued from previous page

<code>graph_feature_importance</code>	Generate a bar graph of the pipeline’s feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

`evalml.pipelines.PipelineBase.__init__`

`PipelineBase.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.PipelineBase.clone`

`PipelineBase.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

`evalml.pipelines.PipelineBase.describe`

`PipelineBase.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.PipelineBase.fit`

`PipelineBase.fit(X, y)`

Build a model

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.PipelineBase.get_component

`PipelineBase.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.PipelineBase.graph

`PipelineBase.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.PipelineBase.graph_feature_importance

`PipelineBase.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.PipelineBase.load

static `PipelineBase.load(file_path)`

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.PipelineBase.predict

`PipelineBase.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.PipelineBase.save

PipelineBase.**save** (*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns *None*

evalml.pipelines.PipelineBase.score

PipelineBase.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.ClassificationPipeline

class *evalml.pipelines.ClassificationPipeline* (*parameters*, *random_state=0*)

Pipeline subclass for all classification pipelines.

Methods

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
-----------------------	---

Continued on next page

Table 13 – continued from previous page

<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ClassificationPipeline.__init__

`ClassificationPipeline.__init__(parameters, random_state=0)`

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ClassificationPipeline.clone

`ClassificationPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.ClassificationPipeline.describe

`ClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.ClassificationPipeline.fit`

`ClassificationPipeline.fit(X, y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns `self`

`evalml.pipelines.ClassificationPipeline.get_component`

`ClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type `Component`

`evalml.pipelines.ClassificationPipeline.graph`

`ClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to `None` (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type `graphviz.Digraph`

`evalml.pipelines.ClassificationPipeline.graph_feature_importance`

`ClassificationPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their corresponding importance

`evalml.pipelines.ClassificationPipeline.load`

static `ClassificationPipeline.load(file_path)`

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns `PipelineBase` object

evalml.pipelines.ClassificationPipeline.predict

`ClassificationPipeline.predict` (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.ClassificationPipeline.predict_proba

`ClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.ClassificationPipeline.save

`ClassificationPipeline.save` (*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns *None*

evalml.pipelines.ClassificationPipeline.score

`ClassificationPipeline.score` (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.BinaryClassificationPipeline

class evalml.pipelines.**BinaryClassificationPipeline** (*parameters*, *random_state=0*)
 Pipeline subclass for all binary classification pipelines.

Methods

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.BinaryClassificationPipeline.__init__

BinaryClassificationPipeline.**__init__** (*parameters*, *random_state=0*)
 Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or ComponentBase subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.BinaryClassificationPipeline.clone

BinaryClassificationPipeline.**clone** (*random_state=0*)
 Constructs a new pipeline with the same parameters and components.

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

`evalml.pipelines.BinaryClassificationPipeline.describe`

`BinaryClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.BinaryClassificationPipeline.fit`

`BinaryClassificationPipeline.fit(X, y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

`evalml.pipelines.BinaryClassificationPipeline.get_component`

`BinaryClassificationPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.BinaryClassificationPipeline.graph`

`BinaryClassificationPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.BinaryClassificationPipeline.graph_feature_importance`

`BinaryClassificationPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importance

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their corresponding importance

`evalml.pipelines.BinaryClassificationPipeline.load`

static `BinaryClassificationPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` object

`evalml.pipelines.BinaryClassificationPipeline.predict`

`BinaryClassificationPipeline.predict` (*X, objective=None*)

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.BinaryClassificationPipeline.predict_proba`

`BinaryClassificationPipeline.predict_proba` (*X*)

Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.BinaryClassificationPipeline.save`

`BinaryClassificationPipeline.save` (*file_path, pickle_protocol=4*)

Saves pipeline at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns `None`

evalml.pipelines.BinaryClassificationPipeline.score

BinaryClassificationPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.MulticlassClassificationPipeline

class evalml.pipelines.**MulticlassClassificationPipeline** (*parameters*, *random_state=0*)

Pipeline subclass for all multiclass classification pipelines.

Methods

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.MulticlassClassificationPipeline.__init__

MulticlassClassificationPipeline.**__init__** (*parameters*, *random_state=0*)

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: `component_graph` (*list*): List of components in order. Accepts strings or

ComponentBase subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.MulticlassClassificationPipeline.clone

`MulticlassClassificationPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.MulticlassClassificationPipeline.describe

`MulticlassClassificationPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.MulticlassClassificationPipeline.fit

`MulticlassClassificationPipeline.fit(X,y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.MulticlassClassificationPipeline.get_component

`MulticlassClassificationPipeline.get_component(name)`

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.MulticlassClassificationPipeline.graph

MulticlassClassificationPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.MulticlassClassificationPipeline.graph_feature_importance

MulticlassClassificationPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.MulticlassClassificationPipeline.load

static MulticlassClassificationPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.MulticlassClassificationPipeline.predict

MulticlassClassificationPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.MulticlassClassificationPipeline.predict_proba

MulticlassClassificationPipeline.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.MulticlassClassificationPipeline.save`

`MulticlassClassificationPipeline.save` (*file_path*, *pickle_protocol=4*)
Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns `None`

`evalml.pipelines.MulticlassClassificationPipeline.score`

`MulticlassClassificationPipeline.score` (*X*, *y*, *objectives*)
Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – true labels of length `[n_samples]`
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type `dict`

`evalml.pipelines.RegressionPipeline`

class `evalml.pipelines.RegressionPipeline` (*parameters*, *random_state=0*)
Pipeline subclass for all regression pipelines.

Methods

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters

Continued on next page

Table 16 – continued from previous page

<code>fit</code>	Build a regression model.
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline’s feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.RegressionPipeline.__init__

`RegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.RegressionPipeline.clone

`RegressionPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.RegressionPipeline.describe

`RegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.RegressionPipeline.fit`

`RegressionPipeline.fit` (*X*, *y*)

Build a regression model.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [*n_samples*, *n_features*]
- **y** (*pd.Series*) – the target training labels of length [*n_samples*]

Returns `self`

`evalml.pipelines.RegressionPipeline.get_component`

`RegressionPipeline.get_component` (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.RegressionPipeline.graph`

`RegressionPipeline.graph` (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to `None` (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type `graphviz.Digraph`

`evalml.pipelines.RegressionPipeline.graph_feature_importance`

`RegressionPipeline.graph_feature_importance` (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their corresponding importance

`evalml.pipelines.RegressionPipeline.load`

static `RegressionPipeline.load` (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.RegressionPipeline.predict

RegressionPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.RegressionPipeline.save

RegressionPipeline.**save** (*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.RegressionPipeline.score

RegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type *dict*

5.4.2 Classification Pipelines

<i>BaselineBinaryPipeline</i>	Baseline Pipeline for binary classification.
<i>BaselineMulticlassPipeline</i>	Baseline Pipeline for multiclass classification.
<i>ModeBaselineBinaryPipeline</i>	Mode Baseline Pipeline for binary classification.
<i>ModeBaselineMulticlassPipeline</i>	Mode Baseline Pipeline for multiclass classification.

evalml.pipelines.BaselineBinaryPipeline

```

class evalml.pipelines.BaselineBinaryPipeline(parameters, random_state=0)
    Baseline Pipeline for binary classification.

    name = 'Baseline Classification Pipeline'
    custom_name = 'Baseline Classification Pipeline'
    summary = 'Baseline Classifier'
    component_graph = ['Baseline Classifier']
    problem_type = 'binary'
    model_family = 'baseline'
    hyperparameters = {'Baseline Classifier': {}}
    custom_hyperparameters = None
    default_parameters = {'Baseline Classifier': {'strategy': 'mode'}}

```

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.BaselineBinaryPipeline.__init__

BaselineBinaryPipeline.__init__(parameters, random_state=0)

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: component_graph (list): List of components in order. Accepts strings or ComponentBase subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.BaselineBinaryPipeline.clone

BaselineBinaryPipeline.clone(random_state=0)

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a RandomState instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.BaselineBinaryPipeline.describe

BaselineBinaryPipeline.describe()

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if return_dict is True, else None

Return type dict

evalml.pipelines.BaselineBinaryPipeline.fit

BaselineBinaryPipeline.fit(X, y)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.BaselineBinaryPipeline.get_component

BaselineBinaryPipeline.**get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.BaselineBinaryPipeline.graph

BaselineBinaryPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.BaselineBinaryPipeline.graph_feature_importance

BaselineBinaryPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.BaselineBinaryPipeline.load

static BaselineBinaryPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.BaselineBinaryPipeline.predict

BaselineBinaryPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.BaselineBinaryPipeline.predict_proba`BaselineBinaryPipeline.predict_proba(X)`

Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.BaselineBinaryPipeline.save`BaselineBinaryPipeline.save(file_path, pickle_protocol=4)`

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.BaselineBinaryPipeline.score`BaselineBinaryPipeline.score(X, y, objectives)`

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

evalml.pipelines.BaselineMulticlassPipeline

```
class evalml.pipelines.BaselineMulticlassPipeline(parameters, random_state=0)
```

Baseline Pipeline for multiclass classification.

```
name = 'Baseline Multiclass Classification Pipeline'
```

```
custom_name = 'Baseline Multiclass Classification Pipeline'
```

```
summary = 'Baseline Classifier'
```

```
component_graph = ['Baseline Classifier']
```

```
problem_type = 'multiclass'
model_family = 'baseline'
hyperparameters = {'Baseline Classifier': {}}
custom_hyperparameters = None
default_parameters = {'Baseline Classifier': {'strategy': 'mode'}}
```

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.BaselineMulticlassPipeline.__init__`

`BaselineMulticlassPipeline.__init__(parameters, random_state=0)`

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, `np.random.RandomState`) – The random seed/state. Defaults to 0.

evalml.pipelines.BaselineMulticlassPipeline.clone

`BaselineMulticlassPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.BaselineMulticlassPipeline.describe

`BaselineMulticlassPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

evalml.pipelines.BaselineMulticlassPipeline.fit

`BaselineMulticlassPipeline.fit(X, y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.BaselineMulticlassPipeline.get_component

`BaselineMulticlassPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.BaselineMulticlassPipeline.graph

`BaselineMulticlassPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.BaselineMulticlassPipeline.graph_feature_importance`

`BaselineMulticlassPipeline.graph_feature_importance` (*show_all_features=False*)
Generate a bar graph of the pipeline's feature importance

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their corresponding importance

`evalml.pipelines.BaselineMulticlassPipeline.load`

static `BaselineMulticlassPipeline.load` (*file_path*)
Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` object

`evalml.pipelines.BaselineMulticlassPipeline.predict`

`BaselineMulticlassPipeline.predict` (*X, objective=None*)
Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.BaselineMulticlassPipeline.predict_proba`

`BaselineMulticlassPipeline.predict_proba` (*X*)
Make probability estimates for labels.

Parameters `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.BaselineMulticlassPipeline.save`

`BaselineMulticlassPipeline.save` (*file_path, pickle_protocol=4*)
Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.BaselineMulticlassPipeline.score

`BaselineMulticlassPipeline.score(X, y, objectives)`
Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ModeBaselineBinaryPipeline

```

class evalml.pipelines.ModeBaselineBinaryPipeline(parameters, random_state=0)
    Mode Baseline Pipeline for binary classification.

    name = 'Mode Baseline Binary Classification Pipeline'
    custom_name = 'Mode Baseline Binary Classification Pipeline'
    summary = 'Baseline Classifier'
    component_graph = ['Baseline Classifier']
    problem_type = 'binary'
    model_family = 'baseline'
    hyperparameters = {'Baseline Classifier': {}}
    custom_hyperparameters = {'strategy': ['mode']}
    default_parameters = {'Baseline Classifier': {'strategy': 'mode'}}
  
```

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline
<code>threshold</code>	

Methods:

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

evalml.pipelines.ModeBaselineBinaryPipeline.__init__

ModeBaselineBinaryPipeline.__init__(parameters, random_state=0)

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: component_graph (list): List of components in order. Accepts strings or ComponentBase subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.ModeBaselineBinaryPipeline.clone

ModeBaselineBinaryPipeline.clone(random_state=0)

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a RandomState instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

evalml.pipelines.ModeBaselineBinaryPipeline.describe

ModeBaselineBinaryPipeline.describe()

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline.
Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.ModeBaselineBinaryPipeline.fit`

`ModeBaselineBinaryPipeline.fit(X, y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

`evalml.pipelines.ModeBaselineBinaryPipeline.get_component`

`ModeBaselineBinaryPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.ModeBaselineBinaryPipeline.graph`

`ModeBaselineBinaryPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.ModeBaselineBinaryPipeline.graph_feature_importance`

`ModeBaselineBinaryPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importance

Parameters `show_all_features` (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.ModeBaselineBinaryPipeline.load

static ModeBaselineBinaryPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.ModeBaselineBinaryPipeline.predict

ModeBaselineBinaryPipeline.**predict** (*X*, *objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.ModeBaselineBinaryPipeline.predict_proba

ModeBaselineBinaryPipeline.**predict_proba** (*X*)

Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.ModeBaselineBinaryPipeline.save

ModeBaselineBinaryPipeline.**save** (*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.ModeBaselineBinaryPipeline.score

ModeBaselineBinaryPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.ModeBaselineMulticlassPipeline

```

class evalml.pipelines.ModeBaselineMulticlassPipeline(parameters,          ran-
                                                         dom_state=0)
    Mode Baseline Pipeline for multiclass classification.

    name = 'Mode Baseline Multiclass Classification Pipeline'
    custom_name = 'Mode Baseline Multiclass Classification Pipeline'
    summary = 'Baseline Classifier'
    component_graph = ['Baseline Classifier']
    problem_type = 'multiclass'
    model_family = 'baseline'
    hyperparameters = {'Baseline Classifier': {}}
    custom_hyperparameters = {'strategy': ['mode']}
    default_parameters = {'Baseline Classifier': {'strategy': 'mode'}}
  
```

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning classification pipeline made out of transformers and a classifier.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a classification model. For string and categorical targets, classes are sorted
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance

Continued on next page

Table 25 – continued from previous page

<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on objectives

`evalml.pipelines.ModeBaselineMulticlassPipeline.__init__`

`ModeBaselineMulticlassPipeline.__init__(parameters, random_state=0)`

Machine learning classification pipeline made out of transformers and a classifier.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{ }` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.ModeBaselineMulticlassPipeline.clone`

`ModeBaselineMulticlassPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

`evalml.pipelines.ModeBaselineMulticlassPipeline.describe`

`ModeBaselineMulticlassPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.ModeBaselineMulticlassPipeline.fit`

`ModeBaselineMulticlassPipeline.fit(X, y)`

Build a classification model. For string and categorical targets, classes are sorted by `sorted(set(y))` and then are mapped to values between 0 and `n_classes-1`.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.ModeBaselineMulticlassPipeline.get_component

ModeBaselineMulticlassPipeline.**get_component** (*name*)

Returns component by name

Parameters **name** (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.ModeBaselineMulticlassPipeline.graph

ModeBaselineMulticlassPipeline.**graph** (*filepath=None*)

Generate an image representing the pipeline graph

Parameters **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.ModeBaselineMulticlassPipeline.graph_feature_importance

ModeBaselineMulticlassPipeline.**graph_feature_importance** (*show_all_features=False*)

Generate a bar graph of the pipeline's feature importance

Parameters **show_all_features** (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.ModeBaselineMulticlassPipeline.load

static ModeBaselineMulticlassPipeline.**load** (*file_path*)

Loads pipeline at file path

Parameters **file_path** (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.ModeBaselineMulticlassPipeline.predict

ModeBaselineMulticlassPipeline.**predict** (*X, objective=None*)

Make predictions using selected features.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **objective** (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.ModeBaselineMulticlassPipeline.predict_proba

ModeBaselineMulticlassPipeline.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.ModeBaselineMulticlassPipeline.save

ModeBaselineMulticlassPipeline.**save**(*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns *None*

evalml.pipelines.ModeBaselineMulticlassPipeline.score

ModeBaselineMulticlassPipeline.**score**(*X*, *y*, *objectives*)

Evaluate model performance on objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – list of objectives to score

Returns ordered dictionary of objective scores

Return type *dict*

5.4.3 Regression Pipelines

<i>BaselineRegressionPipeline</i>	Baseline Pipeline for regression problems.
<i>MeanBaselineRegressionPipeline</i>	Baseline Pipeline for regression problems.

evalml.pipelines.BaselineRegressionPipeline

```

class evalml.pipelines.BaselineRegressionPipeline (parameters, random_state=0)
    Baseline Pipeline for regression problems.

    name = 'Baseline Regression Pipeline'
    custom_name = None
    summary = 'Baseline Regressor'
    component_graph = ['Baseline Regressor']
    problem_type = 'regression'
    model_family = 'baseline'
    hyperparameters = {'Baseline Regressor': {}}
    custom_hyperparameters = None
    default_parameters = {'Baseline Regressor': {'strategy': 'mean'}}
  
```

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a regression model.
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

`evalml.pipelines.BaselineRegressionPipeline.__init__`

`BaselineRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

`evalml.pipelines.BaselineRegressionPipeline.clone`

`BaselineRegressionPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

`evalml.pipelines.BaselineRegressionPipeline.describe`

`BaselineRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.BaselineRegressionPipeline.fit`

`BaselineRegressionPipeline.fit(X, y)`

Build a regression model.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*) – the target training labels of length `[n_samples]`

Returns self

evalml.pipelines.BaselineRegressionPipeline.get_component

`BaselineRegressionPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

evalml.pipelines.BaselineRegressionPipeline.graph

`BaselineRegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

evalml.pipelines.BaselineRegressionPipeline.graph_feature_importance

`BaselineRegressionPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importance

Parameters `show_all_features` (*bool, optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns plotly.Figure, a bar graph showing features and their corresponding importance

evalml.pipelines.BaselineRegressionPipeline.load

static `BaselineRegressionPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns PipelineBase object

evalml.pipelines.BaselineRegressionPipeline.predict

`BaselineRegressionPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame or np.array*) – data of shape [n_samples, n_features]
- `objective` (*Object or string*) – the objective to use to make predictions

Returns estimated labels

Return type pd.Series

evalml.pipelines.BaselineRegressionPipeline.save

BaselineRegressionPipeline.**save** (*file_path*, *pickle_protocol=4*)

Saves pipeline at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.BaselineRegressionPipeline.score

BaselineRegressionPipeline.**score** (*X*, *y*, *objectives*)

Evaluate model performance on current and additional objectives

Parameters

- **X** (*pd.DataFrame* or *np.array*) – data of shape [n_samples, n_features]
- **y** (*pd.Series*) – true labels of length [n_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type dict

evalml.pipelines.MeanBaselineRegressionPipeline

```
class evalml.pipelines.MeanBaselineRegressionPipeline (parameters, random_state=0)
```

Baseline Pipeline for regression problems.

name = 'Mean Baseline Regression Pipeline'

custom_name = None

summary = 'Baseline Regressor'

component_graph = ['Baseline Regressor']

problem_type = 'regression'

model_family = 'baseline'

hyperparameters = {'Baseline Regressor': {}}

custom_hyperparameters = {'strategy': ['mean']}

default_parameters = {'Baseline Regressor': {'strategy': 'mean'}}

Instance attributes

<code>feature_importance</code>	Return importance associated with each feature.
<code>parameters</code>	Returns parameter dictionary for this pipeline

Methods:

<code>__init__</code>	Machine learning pipeline made out of transformers and a estimator.
<code>clone</code>	Constructs a new pipeline with the same parameters and components.
<code>describe</code>	Outputs pipeline details including component parameters
<code>fit</code>	Build a regression model.
<code>get_component</code>	Returns component by name
<code>graph</code>	Generate an image representing the pipeline graph
<code>graph_feature_importance</code>	Generate a bar graph of the pipeline's feature importance
<code>load</code>	Loads pipeline at file path
<code>predict</code>	Make predictions using selected features.
<code>save</code>	Saves pipeline at file path
<code>score</code>	Evaluate model performance on current and additional objectives

evalml.pipelines.MeanBaselineRegressionPipeline.__init__

`MeanBaselineRegressionPipeline.__init__(parameters, random_state=0)`

Machine learning pipeline made out of transformers and a estimator.

Required Class Variables: `component_graph` (list): List of components in order. Accepts strings or `ComponentBase` subclasses in the list

Parameters

- **parameters** (*dict*) – dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary `{}` implies using all default values for component parameters.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.pipelines.MeanBaselineRegressionPipeline.clone

`MeanBaselineRegressionPipeline.clone(random_state=0)`

Constructs a new pipeline with the same parameters and components.

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this pipeline with identical parameters and components

`evalml.pipelines.MeanBaselineRegressionPipeline.describe`

`MeanBaselineRegressionPipeline.describe()`

Outputs pipeline details including component parameters

Parameters `return_dict` (*bool*) – If True, return dictionary of information about pipeline.
Defaults to false

Returns dictionary of all component parameters if `return_dict` is True, else None

Return type dict

`evalml.pipelines.MeanBaselineRegressionPipeline.fit`

`MeanBaselineRegressionPipeline.fit(X, y)`

Build a regression model.

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.MeanBaselineRegressionPipeline.get_component`

`MeanBaselineRegressionPipeline.get_component(name)`

Returns component by name

Parameters `name` (*str*) – name of component

Returns component to return

Return type Component

`evalml.pipelines.MeanBaselineRegressionPipeline.graph`

`MeanBaselineRegressionPipeline.graph(filepath=None)`

Generate an image representing the pipeline graph

Parameters `filepath` (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns Graph object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Digraph

`evalml.pipelines.MeanBaselineRegressionPipeline.graph_feature_importance`

`MeanBaselineRegressionPipeline.graph_feature_importance(show_all_features=False)`

Generate a bar graph of the pipeline's feature importance

Parameters `show_all_features` (*bool*, *optional*) – If true, graph features with an importance value of zero. Defaults to false.

Returns `plotly.Figure`, a bar graph showing features and their corresponding importance

`evalml.pipelines.MeanBaselineRegressionPipeline.load`

static `MeanBaselineRegressionPipeline.load(file_path)`

Loads pipeline at file path

Parameters `file_path` (*str*) – location to load file

Returns `PipelineBase` object

`evalml.pipelines.MeanBaselineRegressionPipeline.predict`

`MeanBaselineRegressionPipeline.predict(X, objective=None)`

Make predictions using selected features.

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `objective` (*Object* or *string*) – the objective to use to make predictions

Returns estimated labels

Return type `pd.Series`

`evalml.pipelines.MeanBaselineRegressionPipeline.save`

`MeanBaselineRegressionPipeline.save(file_path, pickle_protocol=4)`

Saves pipeline at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns `None`

`evalml.pipelines.MeanBaselineRegressionPipeline.score`

`MeanBaselineRegressionPipeline.score(X, y, objectives)`

Evaluate model performance on current and additional objectives

Parameters

- `X` (*pd.DataFrame* or *np.array*) – data of shape `[n_samples, n_features]`
- `y` (*pd.Series*) – true labels of length `[n_samples]`
- `objectives` (*list*) – Non-empty list of objectives to score on

Returns ordered dictionary of objective scores

Return type `dict`

5.4.4 Pipeline Graph Utils

<code>precision_recall_curve</code>	Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.
<code>graph_precision_recall_curve</code>	Generate and display a precision-recall plot.
<code>roc_curve</code>	Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve.
<code>graph_roc_curve</code>	Generate and display a Receiver Operating Characteristic (ROC) plot.
<code>confusion_matrix</code>	Confusion matrix for binary and multiclass classification.
<code>normalize_confusion_matrix</code>	Normalizes a confusion matrix.
<code>graph_confusion_matrix</code>	Generate and display a confusion matrix plot.
<code>calculate_permutation_importance</code>	Calculates permutation importance for features.
<code>graph_permutation_importance</code>	Generate a bar graph of the pipeline's permutation importance.

evalml.pipelines.precision_recall_curve

evalml.pipelines.**precision_recall_curve**(*y_true*, *y_pred_proba*)

Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.

Returns

Dictionary containing metrics used to generate a precision-recall plot, with the following keys:

- *precision*: Precision values.
- *recall*: Recall values.
- *thresholds*: Threshold values used to produce the precision and recall.
- *auc_score*: The area under the ROC curve.

Return type list

evalml.pipelines.graph_precision_recall_curve

evalml.pipelines.**graph_precision_recall_curve**(*y_true*, *y_pred_proba*, *title_addition=None*)

Generate and display a precision-recall plot.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.

- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.
- **title_addition** (*str* or *None*) – if not *None*, append to plot title. Default *None*.

Returns *plotly*.Figure representing the precision-recall plot generated

evalml.pipelines.roc_curve

`evalml.pipelines.roc_curve(y_true, y_pred_proba)`

Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a classifier, before thresholding has been applied. Note that 1 dimensional input is expected.

Returns

Dictionary containing metrics used to generate an ROC plot, with the following keys:

- *fpr_rate*: False positive rate.
- *tpr_rate*: True positive rate.
- *threshold*: Threshold values used to produce each pair of true/false positive rates.
- *auc_score*: The area under the ROC curve.

Return type dict

evalml.pipelines.graph_roc_curve

`evalml.pipelines.graph_roc_curve(y_true, y_pred_proba, custom_class_names=None, title_addition=None)`

Generate and display a Receiver Operating Characteristic (ROC) plot.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true labels.
- **y_pred_proba** (*pd.Series* or *np.array*) – predictions from a classifier, before thresholding has been applied. Note this should be a one dimensional array with the predicted probability for the “true” label in the binary case.
- **custom_class_labels** (*list* or *None*) – if not *None*, custom labels for classes. Default *None*.
- **title_addition** (*str* or *None*) – if not *None*, append to plot title. Default *None*.

Returns *plotly*.Figure representing the ROC plot generated

evalml.pipelines.confusion_matrix

`evalml.pipelines.confusion_matrix(y_true, y_predicted, normalize_method='true')`

Confusion matrix for binary and multiclass classification.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred** (*pd.Series* or *np.array*) – predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: ‘true’ to normalize by row, ‘pred’ to normalize by column, or ‘all’ to normalize by all values. Defaults to ‘true’.

Returns confusion matrix

Return type *np.array*

`evalml.pipelines.normalize_confusion_matrix`

`evalml.pipelines.normalize_confusion_matrix(conf_mat, normalize_method='true')`
Normalizes a confusion matrix.

Parameters

- **conf_mat** (*pd.DataFrame* or *np.array*) – confusion matrix to normalize.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: ‘true’ to normalize by row, ‘pred’ to normalize by column, or ‘all’ to normalize by all values. Defaults to ‘true’.

Returns A normalized version of the input confusion matrix.

`evalml.pipelines.graph_confusion_matrix`

`evalml.pipelines.graph_confusion_matrix(y_true, y_pred, normalize_method='true', title_addition=None)`

Generate and display a confusion matrix plot.

If *normalize_method* is set, hover text will show raw count, otherwise hover text will show count normalized with method ‘true’.

Parameters

- **y_true** (*pd.Series* or *np.array*) – true binary labels.
- **y_pred** (*pd.Series* or *np.array*) – predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: ‘true’ to normalize by row, ‘pred’ to normalize by column, or ‘all’ to normalize by all values. Defaults to ‘true’.
- **title_addition** (*str* or *None*) – if not None, append to plot title. Default None.

Returns *plotly.Figure* representing the confusion matrix plot generated

`evalml.pipelines.calculate_permutation_importance`

`evalml.pipelines.calculate_permutation_importance(pipeline, X, y, objective, n_repeats=5, n_jobs=None, random_state=0)`

Calculates permutation importance for features.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – fitted pipeline

- **x** (*pd.DataFrame*) – the input data used to score and compute permutation importance
- **y** (*pd.Series*) – the target labels
- **objective** (*str*, *ObjectiveBase*) – objective to score on
- **n_repeats** (*int*) – Number of times to permute a feature. Defaults to 5.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For *n_jobs* below -1, (*n_cpus* + 1 + *n_jobs*) are used.
- **random_state** (*int*, *np.random.RandomState*) – The random seed/state. Defaults to 0.

Returns Mean feature importance scores over 5 shuffles.

evalml.pipelines.graph_permutation_importance

`evalml.pipelines.graph_permutation_importance(pipeline, X, y, objective, show_all_features=False)`

Generate a bar graph of the pipeline's permutation importance.

Parameters

- **pipeline** (*PipelineBase or subclass*) – Fitted pipeline
- **x** (*pd.DataFrame*) – The input data used to score and compute permutation importance
- **y** (*pd.Series*) – The target labels
- **objective** (*str*, *ObjectiveBase*) – Objective to score on
- **show_all_features** (*bool, optional*) – If True, graph features with a permutation importance value of zero. Defaults to False.

Returns *plotly.Figure*, a bar graph showing features and their respective permutation importance.

5.4.5 Pipeline Utils

<code>make_pipeline</code>	Given input data, target data, an estimator class and the problem type,
----------------------------	---

evalml.pipelines.utils.make_pipeline

`evalml.pipelines.utils.make_pipeline(X, y, estimator, problem_type)`

Given input data, target data, an estimator class and the problem type, generates a pipeline class with a preprocessing chain which was recommended based on the inputs. The pipeline will be a subclass of the appropriate pipeline base class for the specified *problem_type*.

Parameters

- **x** (*pd.DataFrame*) – the input data of shape [*n_samples*, *n_features*]
- **y** (*pd.Series*) – the target labels of length [*n_samples*]
- **estimator** (*Estimator*) – estimator for pipeline
- **problem_type** – problem type for pipeline to generate

5.5 Components

5.5.1 Component Base Classes

Components represent a step in a pipeline.

<i>ComponentBase</i>	Base class for all components.
<i>Transformer</i>	A component that may or may not need fitting that transforms data.
<i>Estimator</i>	A component that fits and predicts given data.

evalml.pipelines.components.ComponentBase

```
class evalml.pipelines.components.ComponentBase (parameters=None, component_obj=None, random_state=0,
                                                    **kwargs)
```

Base class for all components.

Methods

<i>__init__</i>	Initialize self.
<i>clone</i>	Constructs a new component with the same parameters
<i>describe</i>	Describe a component and its parameters
<i>fit</i>	Fits component to data
<i>load</i>	Loads component at file path
<i>save</i>	Saves component at file path

evalml.pipelines.components.ComponentBase.__init__

```
ComponentBase.__init__ (parameters=None, component_obj=None, random_state=0,
                        **kwargs)
```

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.ComponentBase.clone

```
ComponentBase.clone (random_state=0)
```

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.ComponentBase.describe`

`ComponentBase.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.ComponentBase.fit`

`ComponentBase.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.ComponentBase.load`

static `ComponentBase.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns `ComponentBase` object

`evalml.pipelines.components.ComponentBase.save`

`ComponentBase.save` (*file_path, pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.Transformer

```
class evalml.pipelines.components.Transformer (parameters=None, component_obj=None, random_state=0, **kwargs)
```

A component that may or may not need fitting that transforms data. These components are used before an estimator.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Transformer component.

Methods

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X

evalml.pipelines.components.Transformer.__init__

```
Transformer.__init__ (parameters=None, component_obj=None, random_state=0, **kwargs)  
Initialize self. See help(type(self)) for accurate signature.
```

evalml.pipelines.components.Transformer.clone

```
Transformer.clone (random_state=0)  
Constructs a new component with the same parameters
```

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a RandomState instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.Transformer.describe`Transformer.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary**Return type** None or dict**evalml.pipelines.components.Transformer.fit**`Transformer.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.components.Transformer.fit_transform**`Transformer.fit_transform` (*X, y=None*)

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.DataFrame*) – Labels to fit and transform

Returns Transformed X**Return type** pd.DataFrame**evalml.pipelines.components.Transformer.load****static** `Transformer.load` (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file**Returns** ComponentBase object

evalml.pipelines.components.Transformer.save

`Transformer.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.Transformer.transform

`Transformer.transform(X, y=None)`

Transforms data X

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.Estimator

```
class evalml.pipelines.components.Estimator (parameters=None, component_obj=None,  
                                             random_state=0, **kwargs)
```

A component that fits and predicts given data.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component.

Methods

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data

Continued on next page

Table 36 – continued from previous page

<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.Estimator.__init__

`Estimator.__init__(parameters=None, component_obj=None, random_state=0, **kwargs)`
 Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.Estimator.clone

`Estimator.clone(random_state=0)`
 Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.Estimator.describe

`Estimator.describe(print_name=False, return_dict=False)`
 Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.Estimator.fit

`Estimator.fit(X, y=None)`
 Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.Estimator.load

static `Estimator.load(file_path)`
 Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.Estimator.predict`

`Estimator.predict` (*X*)

Make predictions using selected features.

Parameters `X` (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

`evalml.pipelines.components.Estimator.predict_proba`

`Estimator.predict_proba` (*X*)

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

`evalml.pipelines.components.Estimator.save`

`Estimator.save` (*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns None

5.5.2 Component Utils

<code>allowed_model_families</code>	List the model types allowed for a particular problem type.
<code>get_estimators</code>	Returns the estimators allowed for a particular problem type.

`evalml.pipelines.components.utils.allowed_model_families`

`evalml.pipelines.components.utils.allowed_model_families` (*problem_type*)

List the model types allowed for a particular problem type.

Parameters `problem_types` (*ProblemTypes* or *str*) – binary, multiclass, or regression

Returns a list of model families

Return type *list[ModelFamily]*

evalml.pipelines.components.utils.get_estimators

`evalml.pipelines.components.utils.get_estimators` (*problem_type*,
model_families=None)

Returns the estimators allowed for a particular problem type.

Can also optionally filter by a list of model types.

Parameters

- **problem_type** (`ProblemTypes` or `str`) – problem type to filter for
- **model_families** (`list[ModelFamily]` or `list[str]`) – model families to filter for

Returns a list of estimator subclasses

Return type `list[class]`

5.5.3 Transformers

Transformers are components that take in data as input and output transformed data.

<i>DropColumns</i>	Drops specified columns in input data.
<i>SelectColumns</i>	Selects specified columns in input data.
<i>OneHotEncoder</i>	One-hot encoder to encode non-numeric data.
<i>PerColumnImputer</i>	Imputes missing data according to a specified imputation strategy per column
<i>Imputer</i>	Imputes missing data according to a specified imputation strategy.
<i>SimpleImputer</i>	Imputes missing data according to a specified imputation strategy.
<i>StandardScaler</i>	Standardize features: removes mean and scales to unit variance.
<i>RFRegressorSelectFromModel</i>	Selects top features based on importance weights using a Random Forest regressor.
<i>RFClassifierSelectFromModel</i>	Selects top features based on importance weights using a Random Forest classifier.
<i>DropNullColumns</i>	Transformer to drop features whose percentage of NaN values exceeds a specified threshold
<i>DateTimeFeaturizer</i>	Transformer that can automatically featurize DateTime columns.
<i>TextFeaturizer</i>	Transformer that can automatically featurize text columns.

evalml.pipelines.components.DropColumns

```

graph LR
    abcABC --> evalml_pipelines_components_component_base_ComponentBase[evalml.pipelines.components.component_base.ComponentBase]
    evalml_pipelines_components_component_base_ComponentBase --> evalml_pipelines_components_transformers_transformer_Transformer[evalml.pipelines.components.transformers.transformer.Transformer]
    evalml_pipelines_components_transformers_transformer_Transformer --> evalml_pipelines_components_transformers_column_selectors_ColumnSelector[evalml.pipelines.components.transformers.column_selectors.ColumnSelector]
    evalml_pipelines_components_transformers_column_selectors_ColumnSelector --> evalml_pipelines_components_transformers_column_selectors_ColumnSelector
  
```

class `evalml.pipelines.components.DropColumns` (*columns=None*, *random_state=0*,
***kwargs*)

Drops specified columns in input data.

```
name = 'Drop Columns Transformer'
model_family = 'none'
hyperparameter_ranges = {}
default_parameters = {'columns': None}
```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer that drops specified columns in input data.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	'Fits' the transformer by checking if the column names are present in the dataset.
<code>fit_transform</code>	Fit transformer to data, then transform data.
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by dropping columns.

`evalml.pipelines.components.DropColumns.__init__`

`DropColumns.__init__(columns=None, random_state=0, **kwargs)`

Initializes an transformer that drops specified columns in input data.

Parameters `columns` (*list (string)*) – List of column names, used to determine which columns to drop.

`evalml.pipelines.components.DropColumns.clone`

`DropColumns.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.DropColumns.describe`

`DropColumns.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.DropColumns.fit

`DropColumns.fit(X, y=None)`

'Fits' the transformer by checking if the column names are present in the dataset.

Parameters

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series, optional*) – Targets.

Returns None.

evalml.pipelines.components.DropColumns.fit_transform

`DropColumns.fit_transform(X, y=None)`

Fit transformer to data, then transform data.

Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series, optional*) – Targets.

Returns Transformed X.

Return type pd.DataFrame

evalml.pipelines.components.DropColumns.load

static `DropColumns.load(file_path)`

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.DropColumns.save

`DropColumns.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.DropColumns.transform

`DropColumns.transform(X, y=None)`
 Transforms data X by dropping columns.

Parameters

- **X** (`pd.DataFrame`) – Data to transform.
- **y** (`pd.Series`, *optional*) – Targets.

Returns Transformed X.

Return type `pd.DataFrame`

evalml.pipelines.components.SelectColumns

```
class evalml.pipelines.components.SelectColumns (columns=None, random_state=0,
                                              **kwargs)
```

Selects specified columns in input data.

name = 'Select Columns Transformer'

model_family = 'none'

hyperparameter_ranges = {}

default_parameters = {'columns': None}

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer that drops specified columns in input data.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	'Fits' the transformer by checking if the column names are present in the dataset.
<code>fit_transform</code>	Fit transformer to data, then transform data.
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by selecting columns.

evalml.pipelines.components.SelectColumns.__init__

`SelectColumns.__init__(columns=None, random_state=0, **kwargs)`

Initializes an transformer that drops specified columns in input data.

Parameters **columns** (*list (string)*) – List of column names, used to determine which columns to drop.

evalml.pipelines.components.SelectColumns.clone

`SelectColumns.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.SelectColumns.describe

`SelectColumns.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.SelectColumns.fit

`SelectColumns.fit(X, y=None)`

‘Fits’ the transformer by checking if the column names are present in the dataset.

Parameters

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series, optional*) – Targets.

Returns None.

evalml.pipelines.components.SelectColumns.fit_transform

`SelectColumns.fit_transform(X, y=None)`

Fit transformer to data, then transform data.

Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series, optional*) – Targets.

Returns Transformed X.

Return type `pd.DataFrame`

`evalml.pipelines.components.SelectColumns.load`

static `SelectColumns.load(file_path)`

Loads component at file path

Parameters `file_path(str)` – location to load file

Returns `ComponentBase` object

`evalml.pipelines.components.SelectColumns.save`

`SelectColumns.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- `file_path(str)` – location to save file
- `pickle_protocol(int)` – the pickle data stream format.

Returns `None`

`evalml.pipelines.components.SelectColumns.transform`

`SelectColumns.transform(X, y=None)`

Transforms data X by selecting columns.

Parameters

- `X(pd.DataFrame)` – Data to transform.
- `y(pd.Series, optional)` – Targets.

Returns Transformed X.

Return type `pd.DataFrame`

`evalml.pipelines.components.OneHotEncoder`

```
class evalml.pipelines.components.OneHotEncoder(top_n=10, categories=None,  
                                                drop=None, handle_unknown='ignore',  
                                                handle_missing='error', random_state=0,  
                                                **kwargs)
```

One-hot encoder to encode non-numeric data.

name = 'One Hot Encoder'

```

model_family = 'none'
hyperparameter_ranges = {}
default_parameters = {'categories': None, 'drop': None, 'handle_missing': 'error',

```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer that encodes categorical features in a one-hot numeric array.”
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>get_feature_names</code>	Returns names of transformed and added columns
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	One-hot encode the input DataFrame.

evalml.pipelines.components.OneHotEncoder.__init__

```

OneHotEncoder.__init__(top_n=10, categories=None, drop=None, handle_unknown='ignore',
                        handle_missing='error', random_state=0, **kwargs)

```

Initializes an transformer that encodes categorical features in a one-hot numeric array.”

Parameters

- **top_n** (*int*) – Number of categories per column to encode. If *None*, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “auto” if *top_n* is not *None*. Defaults to *None*.
- **drop** (*string*) – Method (“first” or “if_binary”) to use to drop one category per feature. Can also be a list specifying which method to use for each feature. Defaults to *None*.
- **handle_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top_n* or *categories* is used to limit the number of categories per column, this must be “ignore”. Defaults to “ignore”.
- **handle_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “as_category” and NaN values are within the *n* most frequent, “nan” values will be encoded as their own column. If this is set to “error”, any missing values encountered will raise an error. Defaults to “error”.

`evalml.pipelines.components.OneHotEncoder.clone`

`OneHotEncoder.clone (random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.OneHotEncoder.describe`

`OneHotEncoder.describe (print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- `print_name` (*bool*, *optional*) – whether to print name of component
- `return_dict` (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.OneHotEncoder.fit`

`OneHotEncoder.fit (X, y=None)`

Fits component to data

Parameters

- `X` (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- `y` (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.OneHotEncoder.fit_transform`

`OneHotEncoder.fit_transform (X, y=None)`

Fits on X and transforms X

Parameters

- `X` (*pd.DataFrame*) – Data to fit and transform
- `y` (*pd.DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.OneHotEncoder.get_feature_names`OneHotEncoder.get_feature_names()`

Returns names of transformed and added columns

Returns list of feature names not including dropped features**Return type** list**evalml.pipelines.components.OneHotEncoder.load****static** `OneHotEncoder.load(file_path)`

Loads component at file path

Parameters `file_path` (*str*) – location to load file**Returns** ComponentBase object**evalml.pipelines.components.OneHotEncoder.save**`OneHotEncoder.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns None**evalml.pipelines.components.OneHotEncoder.transform**`OneHotEncoder.transform(X, y=None)`

One-hot encode the input DataFrame.

Parameters

- `X` (*pd.DataFrame*) – Dataframe of features.
- `y` (*pd.Series*) – Ignored.

Returns Transformed dataframe, where each categorical feature has been encoded into numerical columns using one-hot encoding.**evalml.pipelines.components.PerColumnImputer**

```
class evalml.pipelines.components.PerColumnImputer(impute_strategies=None,
                                                    default_impute_strategy='most_frequent',
                                                    random_state=0, **kwargs)
```

Imputes missing data according to a specified imputation strategy per column

```

name = 'Per Column Imputer'
model_family = 'none'
hyperparameter_ranges = {}
default_parameters = {'default_impute_strategy': 'most_frequent', 'impute_strategies':

```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes a transformer that imputes missing data according to the specified imputation strategy per column.”
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits imputers on data X
<code>fit_transform</code>	Fits imputer on data X then imputes missing values in X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by imputing missing values

`evalml.pipelines.components.PerColumnImputer.__init__`

`PerColumnImputer.__init__(impute_strategies=None, default_impute_strategy='most_frequent', random_state=0, **kwargs)`

Initializes a transformer that imputes missing data according to the specified imputation strategy per column.”

Parameters

- **`impute_strategies`** (*dict*) – Column and {“impute_strategy”: strategy, “fill_value”:value} pairings. Valid values for impute strategy include “mean”, “median”, “most_frequent”, “constant” for numerical data, and “most_frequent”, “constant” for object data types. Defaults to “most_frequent” for all columns.

When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. Defaults to 0 when imputing numerical data and “missing_value” for strings or object data types.

- **`default_impute_strategy`** (*str*) – Impute strategy to fall back on when none is provided for a certain column. Valid values include “mean”, “median”, “most_frequent”, “constant” for numerical data, and “most_frequent”, “constant” for object data types. Defaults to “most_frequent”

evalml.pipelines.components.PerColumnImputer.clone

`PerColumnImputer.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.PerColumnImputer.describe

`PerColumnImputer.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- `print_name` (*bool*, *optional*) – whether to print name of component
- `return_dict` (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.PerColumnImputer.fit

`PerColumnImputer.fit(X, y=None)`

Fits imputers on data X

Parameters

- `X` (*pd.DataFrame*) – Data to fit
- `y` (*pd.Series*, *optional*) – Input Labels

Returns self

evalml.pipelines.components.PerColumnImputer.fit_transform

`PerColumnImputer.fit_transform(X, y=None)`

Fits imputer on data X then imputes missing values in X

Parameters

- `X` (*pd.DataFrame*) – Data to fit and transform
- `y` (*pd.Series*) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.PerColumnImputer.load

static PerColumnImputer.load(*file_path*)

Loads component at file path

Parameters *file_path* (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.PerColumnImputer.save

PerColumnImputer.save(*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- *file_path* (*str*) – location to save file
- *pickle_protocol* (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.PerColumnImputer.transform

PerColumnImputer.transform(*X*, *y=None*)

Transforms data X by imputing missing values

Parameters

- *X* (*pd.DataFrame*) – Data to transform
- *y* (*pd.Series*, *optional*) – Input Labels

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.Imputer

```

class evalml.pipelines.components.Imputer(categorical_impute_strategy='most_frequent',
                                           numeric_impute_strategy='mean',
                                           fill_value=None, random_state=0, **kwargs)

```

Imputes missing data according to a specified imputation strategy.

name = 'Imputer'

model_family = 'none'

hyperparameter_ranges = {'categorical_impute_strategy': ['most_frequent'], 'numeric_impute_strategy': ['mean']}

default_parameters = {'categorical_impute_strategy': 'most_frequent', 'fill_value': None}

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer that imputes missing data according to the specified imputation strategy.”
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits imputer to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by imputing missing values

`evalml.pipelines.components.Imputer.__init__`

`Imputer.__init__(categorical_impute_strategy='most_frequent', numeric_impute_strategy='mean', fill_value=None, random_state=0, **kwargs)`
 Initializes an transformer that imputes missing data according to the specified imputation strategy.”

Parameters

- **`categorical_impute_strategy`** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most_frequent” and “constant”.
- **`numeric_impute_strategy`** (*string*) – Impute strategy to use for numeric dtypes. Valid values include “mean”, “median”, “most_frequent”, and “constant”.
- **`fill_value`** (*string*) – When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. Defaults to 0 when imputing data and “missing_value” for strings or object data types.

`evalml.pipelines.components.Imputer.clone`

`Imputer.clone(random_state=0)`
 Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.Imputer.describe`

`Imputer.describe(print_name=False, return_dict=False)`
 Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.Imputer.fit

`Imputer.fit(X, y=None)`

Fits imputer to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.Imputer.fit_transform

`Imputer.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd. DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.Imputer.load

`static Imputer.load(file_path)`

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.Imputer.save

`Imputer.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.Imputer.transform`Imputer.transform(X, y=None)`

Transforms data X by imputing missing values

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series`, *optional*) – Input Labels

Returns Transformed X**Return type** `pd.DataFrame`**evalml.pipelines.components.SimpleImputer**

```

class evalml.pipelines.components.SimpleImputer(impute_strategy='most_frequent',
                                                  fill_value=None,    random_state=0,
                                                  **kwargs)

    Imputes missing data according to a specified imputation strategy.

    name = 'Simple Imputer'
    model_family = 'none'
    hyperparameter_ranges = {'impute_strategy': ['mean', 'median', 'most_frequent']}
    default_parameters = {'fill_value': None, 'impute_strategy': 'most_frequent'}
  
```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer that imputes missing data according to the specified imputation strategy.”
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits imputer to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by imputing missing values

`evalml.pipelines.components.SimpleImputer.__init__`

`SimpleImputer.__init__(impute_strategy='most_frequent', fill_value=None, random_state=0, **kwargs)`

Initializes an transformer that imputes missing data according to the specified imputation strategy.”

Parameters

- **impute_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most_frequent”, “constant” for numerical data, and “most_frequent”, “constant” for object data types.
- **fill_value** (*string*) – When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. Defaults to 0 when imputing numerical data and “missing_value” for strings or object data types.

`evalml.pipelines.components.SimpleImputer.clone`

`SimpleImputer.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.SimpleImputer.describe`

`SimpleImputer.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.SimpleImputer.fit`

`SimpleImputer.fit(X, y=None)`

Fits imputer to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.SimpleImputer.fit_transform

`SimpleImputer.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (`pd.DataFrame`) – Data to fit and transform
- **y** (`pd.DataFrame`) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.SimpleImputer.load

static `SimpleImputer.load(file_path)`

Loads component at file path

Parameters **file_path** (`str`) – location to load file

Returns ComponentBase object

evalml.pipelines.components.SimpleImputer.save

`SimpleImputer.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (`str`) – location to save file
- **pickle_protocol** (`int`) – the pickle data stream format.

Returns None

evalml.pipelines.components.SimpleImputer.transform

`SimpleImputer.transform(X, y=None)`

Transforms data X by imputing missing values

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series, optional`) – Input Labels

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.StandardScaler

```
class evalml.pipelines.components.StandardScaler (random_state=0, **kwargs)
    Standardize features: removes mean and scales to unit variance.

    name = 'Standard Scaler'
    model_family = 'none'
    hyperparameter_ranges = {}
    default_parameters = {}
```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X

`evalml.pipelines.components.StandardScaler.__init__`

`StandardScaler.__init__` (*random_state=0, **kwargs*)
Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.StandardScaler.clone`

`StandardScaler.clone` (*random_state=0*)
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.StandardScaler.describe`

`StandardScaler.describe` (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- `print_name` (*bool, optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.StandardScaler.fit

`StandardScaler.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.StandardScaler.fit_transform

`StandardScaler.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd. DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.StandardScaler.load

static `StandardScaler.load(file_path)`

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.StandardScaler.save

`StandardScaler.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.StandardScaler.transform

`StandardScaler.transform(X, y=None)`

Transforms data X

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type *pd.DataFrame*

evalml.pipelines.components.RFRegressorSelectFromModel

```

class evalml.pipelines.components.RFRegressorSelectFromModel (number_features=None,
                                                                n_estimators=10,
                                                                max_depth=None,
                                                                per-
                                                                cent_features=0.5,
                                                                threshold=-inf,
                                                                n_jobs=-1,    ran-
                                                                dom_state=0,
                                                                **kwargs)
  
```

Selects top features based on importance weights using a Random Forest regressor.

name = 'RF Regressor Select From Model'

model_family = 'none'

hyperparameter_ranges = {'percent_features': Real(low=0.01, high=1, prior='uniform',

default_parameters = {'max_depth': None, 'n_estimators': 10, 'n_jobs': -1, 'number_

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data

Continued on next page

Table 54 – continued from previous page

<code>fit_transform</code>	Fits feature selector on data X then transforms X by selecting features
<code>get_names</code>	Get names of selected features.
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by selecting features

`evalml.pipelines.components.RFRegressorSelectFromModel.__init__`

`RFRegressorSelectFromModel.__init__(number_features=None, n_estimators=10, max_depth=None, percent_features=0.5, threshold=-inf, n_jobs=-1, random_state=0, **kwargs)`

Initialize self. See help(type(self)) for accurate signature.

`evalml.pipelines.components.RFRegressorSelectFromModel.clone`

`RFRegressorSelectFromModel.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.RFRegressorSelectFromModel.describe`

`RFRegressorSelectFromModel.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.RFRegressorSelectFromModel.fit`

`RFRegressorSelectFromModel.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RFRegressorSelectFromModel.fit_transform

`RFRegressorSelectFromModel.fit_transform(X, y=None)`

Fits feature selector on data X then transforms X by selecting features

Parameters

- **X** (`pd.DataFrame`) – Data to fit and transform
- **y** (`pd.Series`) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.RFRegressorSelectFromModel.get_names

`RFRegressorSelectFromModel.get_names()`

Get names of selected features.

Returns list of the names of features selected

evalml.pipelines.components.RFRegressorSelectFromModel.load

static `RFRegressorSelectFromModel.load(file_path)`

Loads component at file path

Parameters **file_path** (`str`) – location to load file

Returns `ComponentBase` object

evalml.pipelines.components.RFRegressorSelectFromModel.save

`RFRegressorSelectFromModel.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (`str`) – location to save file
- **pickle_protocol** (`int`) – the pickle data stream format.

Returns `None`

evalml.pipelines.components.RFRegressorSelectFromModel.transform

`RFRegressorSelectFromModel.transform(X, y=None)`

Transforms data X by selecting features

Parameters

- **X** (`pd.DataFrame`) – Data to transform
- **y** (`pd.Series`, *optional*) – Input Labels

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.RFClassifierSelectFromModel

```

class evalml.pipelines.components.RFClassifierSelectFromModel (number_features=None,
                                                                n_estimators=10,
                                                                max_depth=None,
                                                                per-
                                                                cent_features=0.5,
                                                                threshold=-inf,
                                                                n_jobs=-1,  ran-
                                                                dom_state=0,
                                                                **kwargs)

```

Selects top features based on importance weights using a Random Forest classifier.

```
name = 'RF Classifier Select From Model'
```

```
model_family = 'none'
```

```
hyperparameter_ranges = {'percent_features': Real(low=0.01, high=1, prior='uniform',
```

```
default_parameters = {'max_depth': None, 'n_estimators': 10, 'n_jobs': -1, 'number_
```

Instance attributes

parameters	Returns the parameters which were used to initialize the component
------------	--

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits feature selector on data X then transforms X by selecting features
<code>get_names</code>	Get names of selected features.
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by selecting features

evalml.pipelines.components.RFClassifierSelectFromModel.__init__

```

RFClassifierSelectFromModel.__init__(number_features=None,      n_estimators=10,
                                     max_depth=None,             percent_features=0.5,
                                     threshold=-inf,  n_jobs=-1,  random_state=0,
                                     **kwargs)

```

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.RFClassifierSelectFromModel.clone

`RFClassifierSelectFromModel.clone (random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.RFClassifierSelectFromModel.describe

`RFClassifierSelectFromModel.describe (print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- `print_name` (*bool*, *optional*) – whether to print name of component
- `return_dict` (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.RFClassifierSelectFromModel.fit

`RFClassifierSelectFromModel.fit (X, y=None)`

Fits component to data

Parameters

- `X` (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- `y` (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.RFClassifierSelectFromModel.fit_transform

`RFClassifierSelectFromModel.fit_transform (X, y=None)`

Fits feature selector on data X then transforms X by selecting features

Parameters

- `X` (*pd.DataFrame*) – Data to fit and transform
- `y` (*pd.Series*) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

evalml.pipelines.components.RFClassifierSelectFromModel.get_names

`RFClassifierSelectFromModel.get_names()`

Get names of selected features.

Returns list of the names of features selected

evalml.pipelines.components.RFClassifierSelectFromModel.load

static `RFClassifierSelectFromModel.load(file_path)`

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.RFClassifierSelectFromModel.save

`RFClassifierSelectFromModel.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.RFClassifierSelectFromModel.transform

`RFClassifierSelectFromModel.transform(X, y=None)`

Transforms data X by selecting features

Parameters

- `X` (*pd.DataFrame*) – Data to transform
- `y` (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type *pd.DataFrame*

evalml.pipelines.components.DropNullColumns

```

class evalml.pipelines.components.DropNullColumns (pct_null_threshold=1.0,      ran-
                                                    dom_state=0, **kwargs)
    Transformer to drop features whose percentage of NaN values exceeds a specified threshold

    name = 'Drop Null Columns Transformer'
  
```

```
model_family = 'none'
hyperparameter_ranges = {}
default_parameters = {'pct_null_threshold': 1.0}
```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initializes an transformer to drop features whose percentage of NaN values exceeds a specified threshold.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by dropping columns that exceed the threshold of null values.

`evalml.pipelines.components.DropNullColumns.__init__`

`DropNullColumns.__init__(pct_null_threshold=1.0, random_state=0, **kwargs)`

Initializes an transformer to drop features whose percentage of NaN values exceeds a specified threshold.

Parameters `pct_null_threshold` (*float*) – The percentage of NaN values in an input feature to drop. Must be a value between [0, 1] inclusive. If equal to 0.0, will drop columns with any null values. If equal to 1.0, will drop columns with all null values. Defaults to 0.95.

`evalml.pipelines.components.DropNullColumns.clone`

`DropNullColumns.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.DropNullColumns.describe`

`DropNullColumns.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- `print_name` (*bool, optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.DropNullColumns.fit

`DropNullColumns.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.DropNullColumns.fit_transform

`DropNullColumns.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.DropNullColumns.load

static `DropNullColumns.load(file_path)`

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.DropNullColumns.save

`DropNullColumns.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.DropNullColumns.transform

`DropNullColumns.transform(X, y=None)`

Transforms data X by dropping columns that exceed the threshold of null values. :param X: Data to transform :type X: pd.DataFrame :param y: Targets :type y: pd.Series, optional

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.DateTimeFeaturizer

class evalml.pipelines.components.DateTimeFeaturizer (*features_to_extract=None, random_state=0, **kwargs*)

Transformer that can automatically featurize DateTime columns.

name = 'DateTime Featurization Component'

model_family = 'none'

hyperparameter_ranges = {}

default_parameters = {'features_to_extract': ['year', 'month', 'day_of_week', 'hour']}

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Extracts features from DateTime columns
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns

evalml.pipelines.components.DateTimeFeaturizer.__init__

`DateTimeFeaturizer.__init__(features_to_extract=None, random_state=0, **kwargs)`

Extracts features from DateTime columns

Parameters

- **features_to_extract** (*list*) – list of features to extract. Valid options include “year”, “month”, “day_of_week”, “hour”.
- **random_state** (*int, np.random.RandomState*) – Seed for the random number generator.

evalml.pipelines.components.DateTimeFeaturizer.clone

`DateTimeFeaturizer.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.DateTimeFeaturizer.describe

`DateTimeFeaturizer.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.DateTimeFeaturizer.fit

`DateTimeFeaturizer.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.DateTimeFeaturizer.fit_transform

`DateTimeFeaturizer.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd. DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type `pd.DataFrame`

`evalml.pipelines.components.DateTimeFeaturizer.load`

static `DateTimeFeaturizer.load(file_path)`

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns `ComponentBase` object

`evalml.pipelines.components.DateTimeFeaturizer.save`

`DateTimeFeaturizer.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns `None`

`evalml.pipelines.components.DateTimeFeaturizer.transform`

`DateTimeFeaturizer.transform(X, y=None)`

Transforms data X by creating new features using existing `DateTime` columns, and then dropping those `DateTime` columns

Parameters

- `X` (*pd.DataFrame*) – Data to transform
- `y` (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type `pd.DataFrame`

`evalml.pipelines.components.TextFeaturizer`

class `evalml.pipelines.components.TextFeaturizer` (*text_columns=None, ran-*
*dom_state=0, **kwargs*)

Transformer that can automatically featurize text columns.

`name = 'Text Featurization Component'`

`model_family = 'none'`

`hyperparameter_ranges = {}`

```
default_parameters = {'text_columns': []}
```

Instance attributes

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Extracts features from text columns using feature-tools' nlp_primitives
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>fit_transform</code>	Fits on X and transforms X
<code>load</code>	Loads component at file path
<code>save</code>	Saves component at file path
<code>transform</code>	Transforms data X by creating new features using existing text columns

`evalml.pipelines.components.TextFeaturizer.__init__`

`TextFeaturizer.__init__(text_columns=None, random_state=0, **kwargs)`

Extracts features from text columns using featuretools' nlp_primitives

Parameters

- **text_columns** (*list*) – list of *pd.DataFrame* column names that contain text.
- **random_state** (*int*, *np.random.RandomState*) – Seed for the random number generator.

`evalml.pipelines.components.TextFeaturizer.clone`

`TextFeaturizer.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a *RandomState* instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.TextFeaturizer.describe`

`TextFeaturizer.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.TextFeaturizer.fit

`TextFeaturizer.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.TextFeaturizer.fit_transform

`TextFeaturizer.fit_transform(X, y=None)`

Fits on X and transforms X

Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd. DataFrame*) – Labels to fit and transform

Returns Transformed X

Return type pd.DataFrame

evalml.pipelines.components.TextFeaturizer.load

static `TextFeaturizer.load(file_path)`

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.TextFeaturizer.save

`TextFeaturizer.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.TextFeaturizer.transform

TextFeaturizer.**transform**(X, y=None)

Transforms data X by creating new features using existing text columns

Parameters

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Input Labels

Returns Transformed X

Return type *pd.DataFrame*

5.5.4 Estimators**Classifiers**

Classifiers are components that output a predicted class label.

<i>CatBoostClassifier</i>	CatBoost Classifier, a classifier that uses gradient-boosting on decision trees.
<i>ElasticNetClassifier</i>	Elastic Net Classifier.
<i>ExtraTreesClassifier</i>	Extra Trees Classifier.
<i>RandomForestClassifier</i>	Random Forest Classifier.
<i>LogisticRegressionClassifier</i>	Logistic Regression Classifier.
<i>XGBoostClassifier</i>	XGBoost Classifier.
<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.

evalml.pipelines.components.CatBoostClassifier

```
class evalml.pipelines.components.CatBoostClassifier(n_estimators=10, eta=0.03,
                                                    max_depth=6,          boot-
                                                    strap_type=None,        ran-
                                                    dom_state=0, **kwargs)
```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

```
name = 'CatBoost Classifier'
```

```
model_family = 'catboost'
```

```
supported_problem_types = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS:
```

```
hyperparameter_ranges = {'eta': Real(low=1e-06, high=1, prior='uniform', transform='i
```

```
default_parameters = {'bootstrap_type': None, 'eta': 0.03, 'max_depth': 6, 'n_estim
```

Instance attributes

SEED_MAX	
SEED_MIN	
feature_importance	Return an attribute of instance, which is of type owner.
parameters	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

`evalml.pipelines.components.CatBoostClassifier.__init__`

`CatBoostClassifier.__init__(n_estimators=10, eta=0.03, max_depth=6, bootstrap_type=None, random_state=0, **kwargs)`
Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.CatBoostClassifier.clone`

`CatBoostClassifier.clone(random_state=0)`
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.CatBoostClassifier.describe`

`CatBoostClassifier.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.CatBoostClassifier.fit**CatBoostClassifier.fit** (*X*, *y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [*n_samples*, *n_features*]
- **y** (*pd.Series*, *optional*) – the target training labels of length [*n_samples*]

Returns *self***evalml.pipelines.components.CatBoostClassifier.load****static CatBoostClassifier.load** (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file**Returns** ComponentBase object**evalml.pipelines.components.CatBoostClassifier.predict****CatBoostClassifier.predict** (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features**Returns** estimated labels**Return type** *pd.Series***evalml.pipelines.components.CatBoostClassifier.predict_proba****CatBoostClassifier.predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features**Returns** probability estimates**Return type** *pd.DataFrame***evalml.pipelines.components.CatBoostClassifier.save****CatBoostClassifier.save** (*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns *None*

evalml.pipelines.components.ElasticNetClassifier

```

class evalml.pipelines.components.ElasticNetClassifier(alpha=0.5, l1_ratio=0.5,
                                                    n_jobs=-1, max_iter=1000,
                                                    random_state=0,
                                                    **kwargs)

```

Elastic Net Classifier.

```
name = 'Elastic Net Classifier'
```

```
model_family = 'linear_model'
```

```
supported_problem_types = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS: 'multiclass'>]
```

```
hyperparameter_ranges = {'alpha': Real(low=0, high=1, prior='uniform', transform='identity'),
```

```
default_parameters = {'alpha': 0.5, 'l1_ratio': 0.5, 'max_iter': 1000, 'n_jobs': -1, 'random_state': 0, **kwargs}
```

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.ElasticNetClassifier.__init__

```
ElasticNetClassifier.__init__(alpha=0.5, l1_ratio=0.5, n_jobs=-1, max_iter=1000, random_state=0, **kwargs)
```

Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.ElasticNetClassifier.clone

```
ElasticNetClassifier.clone(random_state=0)
```

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.ElasticNetClassifier.describe`

`ElasticNetClassifier.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.ElasticNetClassifier.fit`

`ElasticNetClassifier.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.ElasticNetClassifier.load`

static `ElasticNetClassifier.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.ElasticNetClassifier.predict`

`ElasticNetClassifier.predict` (*X*)

Make predictions using selected features.

Parameters `X` (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.ElasticNetClassifier.predict_proba

ElasticNetClassifier.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.ElasticNetClassifier.save

ElasticNetClassifier.**save**(*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.ExtraTreesClassifier

```
abc.ABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.classifiers.et_classifier.ExtraTreesClassifier
```

```
class evalml.pipelines.components.ExtraTreesClassifier (n_estimators=100,
                                                         max_features='auto',
                                                         max_depth=6,
                                                         min_samples_split=2,
                                                         min_weight_fraction_leaf=0.0,
                                                         n_jobs=-1,
                                                         random_state=0, **kwargs)
```

Extra Trees Classifier.

name = 'Extra Trees Classifier'

model_family = 'extra_trees'

supported_problem_types = [*<ProblemTypes.BINARY: 'binary'>*, *<ProblemTypes.MULTICLASS:*

hyperparameter_ranges = {'max_depth': *Integer(low=4, high=10, prior='uniform', transf*

default_parameters = {'max_depth': 6, 'max_features': 'auto', 'min_samples_split':

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
---------------------------------	--

Continued on next page

Table 68 – continued from previous page

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.ExtraTreesClassifier.__init__

`ExtraTreesClassifier.__init__(n_estimators=100, max_features='auto', max_depth=6, min_samples_split=2, min_weight_fraction_leaf=0.0, n_jobs=-1, random_state=0, **kwargs)`

Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.ExtraTreesClassifier.clone

`ExtraTreesClassifier.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.ExtraTreesClassifier.describe

`ExtraTreesClassifier.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.ExtraTreesClassifier.fit

`ExtraTreesClassifier.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, optional) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.components.ExtraTreesClassifier.load****static** ExtraTreesClassifier.**load**(*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file**Returns** ComponentBase object**evalml.pipelines.components.ExtraTreesClassifier.predict**ExtraTreesClassifier.**predict**(*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features**Returns** estimated labels**Return type** pd.Series**evalml.pipelines.components.ExtraTreesClassifier.predict_proba**ExtraTreesClassifier.**predict_proba**(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features**Returns** probability estimates**Return type** pd.DataFrame**evalml.pipelines.components.ExtraTreesClassifier.save**ExtraTreesClassifier.**save**(*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.RandomForestClassifier

```

class evalml.pipelines.components.RandomForestClassifier(n_estimators=100,
                                                         max_depth=6, n_jobs=-1,
                                                         random_state=0,
                                                         **kwargs)

    Random Forest Classifier.

    name = 'Random Forest Classifier'
    model_family = 'random_forest'
    supported_problem_types = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS:

evalml.pipelines.components.RandomForestClassifier.__init__

```

RandomForestClassifier.__init__(n_estimators=100, max_depth=6, n_jobs=-1, random_state=0, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.
  
```

evalml.pipelines.components.RandomForestClassifier.clone

```

RandomForestClassifier.clone(random_state=0)
    Constructs a new component with the same parameters
  
```

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.RandomForestClassifier.describe`

`RandomForestClassifier.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.RandomForestClassifier.fit`

`RandomForestClassifier.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.RandomForestClassifier.load`

static `RandomForestClassifier.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.RandomForestClassifier.predict`

`RandomForestClassifier.predict` (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.components.RandomForestClassifier.predict_proba

`RandomForestClassifier.predict_proba(X)`

Make probability estimates for labels.

Parameters *X* (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.components.RandomForestClassifier.save

`RandomForestClassifier.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.LogisticRegressionClassifier

```
abc.ABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.classifiers.logistic_regression.LogisticRegressionClassifier
```

```
class evalml.pipelines.components.LogisticRegressionClassifier(penalty='l2',
                                                                C=1.0,
                                                                n_jobs=-1, random_state=0,
                                                                **kwargs)
```

Logistic Regression Classifier.

name = 'Logistic Regression Classifier'

model_family = 'linear_model'

supported_problem_types = [`<ProblemTypes.BINARY: 'binary'>`, `<ProblemTypes.MULTICLASS:`

`hyperparameter_ranges` = {'C': `Real(low=0.01, high=10, prior='uniform', transform='iden`

`default_parameters` = {'C': 1.0, 'n_jobs': -1, 'penalty': 'l2'}

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.LogisticRegressionClassifier.__init__

`LogisticRegressionClassifier.__init__(penalty='l2', C=1.0, n_jobs=-1, random_state=0, **kwargs)`
Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.LogisticRegressionClassifier.clone

`LogisticRegressionClassifier.clone(random_state=0)`
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.LogisticRegressionClassifier.describe

`LogisticRegressionClassifier.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.LogisticRegressionClassifier.fit

`LogisticRegressionClassifier.fit(X, y=None)`
Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]

- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.LogisticRegressionClassifier.load

static LogisticRegressionClassifier.**load** (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.LogisticRegressionClassifier.predict

LogisticRegressionClassifier.**predict** (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.LogisticRegressionClassifier.predict_proba

LogisticRegressionClassifier.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.LogisticRegressionClassifier.save

LogisticRegressionClassifier.**save** (*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.XGBoostClassifier

```
class evalml.pipelines.components.XGBoostClassifier(eta=0.1, max_depth=6,
                                                    min_child_weight=1,
                                                    n_estimators=100, random_state=0, **kwargs)

XGBoost Classifier.

name = 'XGBoost Classifier'
model_family = 'xgboost'
supported_problem_types = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS:
hyperparameter_ranges = {'eta': Real(low=1e-06, high=1, prior='uniform', transform='i
default_parameters = {'eta': 0.1, 'max_depth': 6, 'min_child_weight': 1, 'n_estimat
```

Instance attributes

SEED_MAX	
SEED_MIN	
feature_importance	Return an attribute of instance, which is of type owner.
parameters	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.XGBoostClassifier.__init__

`XGBoostClassifier.__init__(eta=0.1, max_depth=6, min_child_weight=1, n_estimators=100, random_state=0, **kwargs)`
Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.XGBoostClassifier.clone

`XGBoostClassifier.clone(random_state=0)`
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.XGBoostClassifier.describe`XGBoostClassifier.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary**Return type** None or dict**evalml.pipelines.components.XGBoostClassifier.fit**`XGBoostClassifier.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self**evalml.pipelines.components.XGBoostClassifier.load****static** `XGBoostClassifier.load` (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file**Returns** ComponentBase object**evalml.pipelines.components.XGBoostClassifier.predict**`XGBoostClassifier.predict` (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features**Returns** estimated labels**Return type** pd.Series**evalml.pipelines.components.XGBoostClassifier.predict_proba**`XGBoostClassifier.predict_proba` (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features**Returns** probability estimates

Return type `pd.DataFrame`

`evalml.pipelines.components.XGBoostClassifier.save`

`XGBoostClassifier.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns `None`

`evalml.pipelines.components.BaselineClassifier`

```
class evalml.pipelines.components.BaselineClassifier (strategy='mode',          ran-  
                                                    dom_state=0, **kwargs)
```

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

```
name = 'Baseline Classifier'
```

```
model_family = 'baseline'
```

```
supported_problem_types = [<ProblemTypes.BINARY: 'binary'>, <ProblemTypes.MULTICLASS:
```

```
hyperparameter_ranges = {}
```

```
default_parameters = {'strategy': 'mode'}
```

Instance attributes

<code>classes_</code>	Returns class labels.
<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Baseline classifier that uses a simple strategy to make predictions.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters

<i>fit</i>	Fits component to data
<i>load</i>	Loads component at file path
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path

`evalml.pipelines.components.BaselineClassifier.__init__`

`BaselineClassifier.__init__(strategy='mode', random_state=0, **kwargs)`

Baseline classifier that uses a simple strategy to make predictions.

Parameters

- **strategy** (*str*) – method used to predict. Valid options are “mode”, “random” and “random_weighted”. Defaults to “mode”.
- **random_state** (*int*, *np.random.RandomState*) – seed for the random number generator

`evalml.pipelines.components.BaselineClassifier.clone`

`BaselineClassifier.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters **random_state** (*int*) – the value to seed the random state with. Can also be a *RandomState* instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.BaselineClassifier.describe`

`BaselineClassifier.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.BaselineClassifier.fit`

`BaselineClassifier.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.BaselineClassifier.load`

static `BaselineClassifier.load(file_path)`

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.BaselineClassifier.predict`

`BaselineClassifier.predict(X)`

Make predictions using selected features.

Parameters `X` (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

`evalml.pipelines.components.BaselineClassifier.predict_proba`

`BaselineClassifier.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

`evalml.pipelines.components.BaselineClassifier.save`

`BaselineClassifier.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- `file_path` (*str*) – location to save file
- `pickle_protocol` (*int*) – the pickle data stream format.

Returns None

Regressors

Regressors are components that output a predicted target value.

<i>CatBoostRegressor</i>	CatBoost Regressor, a regressor that uses gradient-boosting on decision trees.
<i>ElasticNetRegressor</i>	Elastic Net Regressor.
<i>LinearRegressor</i>	Linear Regressor.

Continued on next page

Table 78 – continued from previous page

<i>ExtraTreesRegressor</i>	Extra Trees Regressor.
<i>RandomForestRegressor</i>	Random Forest Regressor.
<i>XGBoostRegressor</i>	XGBoost Regressor.
<i>BaselineRegressor</i>	Regressor that predicts using the specified strategy.

evalml.pipelines.components.CatBoostRegressor

```

class evalml.pipelines.components.CatBoostRegressor(n_estimators=10,      eta=0.03,
                                                    max_depth=6,          boot-
                                                    strap_type=None,       ran-
                                                    dom_state=0, **kwargs)

```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

```
name = 'CatBoost Regressor'
```

```
model_family = 'catboost'
```

```
supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
```

```
hyperparameter_ranges = {'eta': Real(low=1e-06, high=1, prior='uniform', transform='i
```

```
default_parameters = {'bootstrap_type': None, 'eta': 0.03, 'max_depth': 6, 'n_estim
```

Instance attributes

SEED_MAX	
SEED_MIN	
feature_importance	Return an attribute of instance, which is of type owner.
parameters	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Build a model
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.CatBoostRegressor.__init__

`CatBoostRegressor.__init__` (*n_estimators=10, eta=0.03, max_depth=6, bootstrap_type=None, random_state=0, **kwargs*)
Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.CatBoostRegressor.clone

`CatBoostRegressor.clone` (*random_state=0*)
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.CatBoostRegressor.describe

`CatBoostRegressor.describe` (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- `print_name` (*bool, optional*) – whether to print name of component
- `return_dict` (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.CatBoostRegressor.fit

`CatBoostRegressor.fit` (*X, y=None*)
Build a model

Parameters

- `X` (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- `y` (*pd.Series*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.CatBoostRegressor.load

static `CatBoostRegressor.load` (*file_path*)
Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.CatBoostRegressor.predict`CatBoostRegressor.predict(X)`

Make predictions using selected features.

Parameters `X` (`pd.DataFrame`) – features**Returns** estimated labels**Return type** `pd.Series`**evalml.pipelines.components.CatBoostRegressor.predict_proba**`CatBoostRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (`pd.DataFrame`) – features**Returns** probability estimates**Return type** `pd.DataFrame`**evalml.pipelines.components.CatBoostRegressor.save**`CatBoostRegressor.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (`str`) – location to save file
- **pickle_protocol** (`int`) – the pickle data stream format.

Returns `None`**evalml.pipelines.components.ElasticNetRegressor**

```

abcABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.regressors.elasticnet_regressor.ElasticNetRegressor

```

```

class evalml.pipelines.components.ElasticNetRegressor(alpha=0.5, l1_ratio=0.5,
max_iter=1000, normalize=False, random_state=0,
**kwargs)

```

Elastic Net Regressor.

`name = 'Elastic Net Regressor'``model_family = 'linear_model'``supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]``hyperparameter_ranges = {'alpha': Real(low=0, high=1, prior='uniform', transform='identity')}``default_parameters = {'alpha': 0.5, 'l1_ratio': 0.5, 'max_iter': 1000, 'normalize': False}`

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

`evalml.pipelines.components.ElasticNetRegressor.__init__`

`ElasticNetRegressor.__init__` (*alpha=0.5, l1_ratio=0.5, max_iter=1000, normalize=False, random_state=0, **kwargs*)
Initialize self. See `help(type(self))` for accurate signature.

`evalml.pipelines.components.ElasticNetRegressor.clone`

`ElasticNetRegressor.clone` (*random_state=0*)
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.ElasticNetRegressor.describe`

`ElasticNetRegressor.describe` (*print_name=False, return_dict=False*)
Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.ElasticNetRegressor.fit

`ElasticNetRegressor.fit` (*X*, *y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, optional) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.ElasticNetRegressor.load

static `ElasticNetRegressor.load` (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.ElasticNetRegressor.predict

`ElasticNetRegressor.predict` (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type *pd.Series*

evalml.pipelines.components.ElasticNetRegressor.predict_proba

`ElasticNetRegressor.predict_proba` (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type *pd.DataFrame*

evalml.pipelines.components.ElasticNetRegressor.save

`ElasticNetRegressor.save` (*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.LinearRegressor

```
class evalml.pipelines.components.LinearRegressor (fit_intercept=True, normalize=False, n_jobs=-1, random_state=0, **kwargs)

    Linear Regressor.

    name = 'Linear Regressor'
    model_family = 'linear_model'
    supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
    hyperparameter_ranges = {'fit_intercept': [True, False], 'normalize': [True, False]}
    default_parameters = {'fit_intercept': True, 'n_jobs': -1, 'normalize': False}
```

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.LinearRegressor.__init__

```
LinearRegressor.__init__ (fit_intercept=True, normalize=False, n_jobs=-1, random_state=0, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.
```

evalml.pipelines.components.LinearRegressor.clone

```
LinearRegressor.clone (random_state=0)
    Constructs a new component with the same parameters
```

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.LinearRegressor.describe`

`LinearRegressor.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.LinearRegressor.fit`

`LinearRegressor.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.LinearRegressor.load`

static `LinearRegressor.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.LinearRegressor.predict`

`LinearRegressor.predict` (*X*)

Make predictions using selected features.

Parameters `X` (*pd.DataFrame*) – features

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.components.LinearRegressor.predict_proba

`LinearRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.components.LinearRegressor.save

`LinearRegressor.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (`str`) – location to save file
- **pickle_protocol** (`int`) – the pickle data stream format.

Returns `None`

evalml.pipelines.components.ExtraTreesRegressor

```

abc.ABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.regressors.et_regressor.ExtraTreesRegressor

```

```

class evalml.pipelines.components.ExtraTreesRegressor(n_estimators=100,
                                                       max_features='auto',
                                                       max_depth=6,
                                                       min_samples_split=2,
                                                       min_weight_fraction_leaf=0.0,
                                                       n_jobs=-1, random_state=0,
                                                       **kwargs)

```

Extra Trees Regressor.

name = 'Extra Trees Regressor'

model_family = 'extra_trees'

supported_problem_types = [`<ProblemTypes.REGRESSION: 'regression'>`]

hyperparameter_ranges = {'max_depth': `Integer(low=4, high=10, prior='uniform', transf`

default_parameters = {'max_depth': 6, 'max_features': 'auto', 'min_samples_split':

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
---------------------------------	--

Continued on next page

Table 85 – continued from previous page

<code>parameters</code>	Returns the parameters which were used to initialize the component
-------------------------	--

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.ExtraTreesRegressor.__init__

`ExtraTreesRegressor.__init__(n_estimators=100, max_features='auto', max_depth=6, min_samples_split=2, min_weight_fraction_leaf=0.0, n_jobs=-1, random_state=0, **kwargs)`

Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.ExtraTreesRegressor.clone

`ExtraTreesRegressor.clone(random_state=0)`

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.ExtraTreesRegressor.describe

`ExtraTreesRegressor.describe(print_name=False, return_dict=False)`

Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.ExtraTreesRegressor.fit

`ExtraTreesRegressor.fit(X, y=None)`

Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.ExtraTreesRegressor.load

static ExtraTreesRegressor.**load** (*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.ExtraTreesRegressor.predict

ExtraTreesRegressor.**predict** (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.ExtraTreesRegressor.predict_proba

ExtraTreesRegressor.**predict_proba** (*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.ExtraTreesRegressor.save

ExtraTreesRegressor.**save** (*file_path*, *pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.RandomForestRegressor

```

class evalml.pipelines.components.RandomForestRegressor (n_estimators=100,
                                                         max_depth=6, n_jobs=-
1, random_state=0,
                                                         **kwargs)

    Random Forest Regressor.

    name = 'Random Forest Regressor'
    model_family = 'random_forest'
    supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
    hyperparameter_ranges = {'max_depth': Integer(low=1, high=32, prior='uniform', transf
    default_parameters = {'max_depth': 6, 'n_estimators': 100, 'n_jobs': -1}

```

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.RandomForestRegressor.__init__

`RandomForestRegressor.__init__(n_estimators=100, max_depth=6, n_jobs=-1, random_state=0, **kwargs)`
 Initialize self. See `help(type(self))` for accurate signature.

evalml.pipelines.components.RandomForestRegressor.clone

`RandomForestRegressor.clone(random_state=0)`
 Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.RandomForestRegressor.describe`

`RandomForestRegressor.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.RandomForestRegressor.fit`

`RandomForestRegressor.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.RandomForestRegressor.load`

static `RandomForestRegressor.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.RandomForestRegressor.predict`

`RandomForestRegressor.predict` (*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type `pd.Series`

evalml.pipelines.components.RandomForestRegressor.predict_proba

`RandomForestRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters *X* (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.components.RandomForestRegressor.save

`RandomForestRegressor.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.XGBoostRegressor

```
abc.ABC → evalml.pipelines.components.component_base.ComponentBase → evalml.pipelines.components.estimators.estimator.Estimator → evalml.pipelines.components.estimators.regressors.xgboost_regressor.XGBoostRegressor
```

```
class evalml.pipelines.components.XGBoostRegressor(eta=0.1, max_depth=6,
                                                    min_child_weight=1,
                                                    n_estimators=100, random_state=0, **kwargs)
    XGBoost Regressor.

    name = 'XGBoost Regressor'
    model_family = 'xgboost'
    supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
    hyperparameter_ranges = {'eta': Real(low=1e-06, high=1, prior='uniform', transform='i
    default_parameters = {'eta': 0.1, 'max_depth': 6, 'min_child_weight': 1, 'n_estimat
```

Instance attributes

SEED_MAX	
SEED_MIN	
feature_importance	Return an attribute of instance, which is of type owner.
parameters	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Initialize self.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.XGBoostRegressor.__init__

`XGBoostRegressor.__init__(eta=0.1, max_depth=6, min_child_weight=1, n_estimators=100, random_state=0, **kwargs)`
Initialize self. See help(type(self)) for accurate signature.

evalml.pipelines.components.XGBoostRegressor.clone

`XGBoostRegressor.clone(random_state=0)`
Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

evalml.pipelines.components.XGBoostRegressor.describe

`XGBoostRegressor.describe(print_name=False, return_dict=False)`
Describe a component and its parameters

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

evalml.pipelines.components.XGBoostRegressor.fit

`XGBoostRegressor.fit(X, y=None)`
Fits component to data

Parameters

- **X** (*pd.DataFrame* or *np.array*) – the input training data of shape [n_samples, n_features]

- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

evalml.pipelines.components.XGBoostRegressor.load

static XGBoostRegressor.load(*file_path*)

Loads component at file path

Parameters **file_path** (*str*) – location to load file

Returns ComponentBase object

evalml.pipelines.components.XGBoostRegressor.predict

XGBoostRegressor.predict(*X*)

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.XGBoostRegressor.predict_proba

XGBoostRegressor.predict_proba(*X*)

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – features

Returns probability estimates

Return type pd.DataFrame

evalml.pipelines.components.XGBoostRegressor.save

XGBoostRegressor.save(*file_path, pickle_protocol=4*)

Saves component at file path

Parameters

- **file_path** (*str*) – location to save file
- **pickle_protocol** (*int*) – the pickle data stream format.

Returns None

evalml.pipelines.components.BaselineRegressor

```
class evalml.pipelines.components.BaselineRegressor (strategy='mean', random_state=0, **kwargs)
```

Regressor that predicts using the specified strategy.

This is useful as a simple baseline regressor to compare with other regressors.

```
name = 'Baseline Regressor'
```

```
model_family = 'baseline'
```

```
supported_problem_types = [<ProblemTypes.REGRESSION: 'regression'>]
```

```
hyperparameter_ranges = {}
```

```
default_parameters = {'strategy': 'mean'}
```

Instance attributes

<code>feature_importance</code>	Return an attribute of instance, which is of type owner.
<code>parameters</code>	Returns the parameters which were used to initialize the component

Methods:

<code>__init__</code>	Baseline regressor that uses a simple strategy to make predictions.
<code>clone</code>	Constructs a new component with the same parameters
<code>describe</code>	Describe a component and its parameters
<code>fit</code>	Fits component to data
<code>load</code>	Loads component at file path
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path

evalml.pipelines.components.BaselineRegressor.__init__

```
BaselineRegressor.__init__ (strategy='mean', random_state=0, **kwargs)
```

Baseline regressor that uses a simple strategy to make predictions.

Parameters

- **strategy** (*str*) – method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random_state** (*int, np.random.RandomState*) – seed for the random number generator

evalml.pipelines.components.BaselineRegressor.clone

```
BaselineRegressor.clone (random_state=0)
```

Constructs a new component with the same parameters

Parameters `random_state` (*int*) – the value to seed the random state with. Can also be a `RandomState` instance. Defaults to 0.

Returns A new instance of this component with identical parameters

`evalml.pipelines.components.BaselineRegressor.describe`

`BaselineRegressor.describe` (*print_name=False, return_dict=False*)

Describe a component and its parameters

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns prints and returns dictionary

Return type None or dict

`evalml.pipelines.components.BaselineRegressor.fit`

`BaselineRegressor.fit` (*X, y=None*)

Fits component to data

Parameters

- **X** (*pd.DataFrame or np.array*) – the input training data of shape [n_samples, n_features]
- **y** (*pd.Series, optional*) – the target training labels of length [n_samples]

Returns self

`evalml.pipelines.components.BaselineRegressor.load`

static `BaselineRegressor.load` (*file_path*)

Loads component at file path

Parameters `file_path` (*str*) – location to load file

Returns ComponentBase object

`evalml.pipelines.components.BaselineRegressor.predict`

`BaselineRegressor.predict` (*X*)

Make predictions using selected features.

Parameters `X` (*pd.DataFrame*) – features

Returns estimated labels

Return type pd.Series

evalml.pipelines.components.BaselineRegressor.predict_proba

`BaselineRegressor.predict_proba(X)`

Make probability estimates for labels.

Parameters `X` (`pd.DataFrame`) – features

Returns probability estimates

Return type `pd.DataFrame`

evalml.pipelines.components.BaselineRegressor.save

`BaselineRegressor.save(file_path, pickle_protocol=4)`

Saves component at file path

Parameters

- **file_path** (`str`) – location to save file
- **pickle_protocol** (`int`) – the pickle data stream format.

Returns None

5.6 Prediction Explanations

explain_prediction

Creates table summarizing the top_k positive and top_k negative contributing features to the prediction of a single datapoint.

5.6.1 evalml.pipelines.prediction_explanations.explain_prediction

`evalml.pipelines.prediction_explanations.explain_prediction(pipeline, input_features, top_k=3, training_data=None, include_shap_values=False)`

Creates table summarizing the top_k positive and top_k negative contributing features to the prediction of a single datapoint.

XGBoost models and CatBoost multiclass classifiers are not currently supported.

Parameters

- **pipeline** (`PipelineBase`) – Fitted pipeline whose predictions we want to explain with SHAP.
- **input_features** (`pd.DataFrame`) – Dataframe of features - needs to correspond to data the pipeline was fit on.
- **top_k** (`int`) – How many of the highest/lowest features to include in the table.
- **training_data** (`pd.DataFrame`) – Training data the pipeline was fit on. This is required for non-tree estimators because we need a sample of training data for the KernelSHAP algorithm.

- **include_shap_values** (*bool*) – Whether the SHAP values should be included in an extra column in the output.

Returns Table

Return type str

5.7 Objective Functions

5.7.1 Objective Base Classes

<i>ObjectiveBase</i>	Base class for all objectives.
<i>BinaryClassificationObjective</i>	Base class for all binary classification objectives.
<i>MulticlassClassificationObjective</i>	Base class for all multiclass classification objectives.
<i>RegressionObjective</i>	Base class for all regression objectives.

evalml.objectives.ObjectiveBase

class evalml.objectives.**ObjectiveBase**
Base class for all objectives.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.ObjectiveBase.objective_function

classmethod ObjectiveBase.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (pd.Series): predicted values of length [n_samples] *y_true* (pd.Series): actual class labels of length [n_samples] *X* (pd.DataFrame or np.array): extra data of shape

[n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.ObjectiveBase.score

ObjectiveBase.**score**(y_true, y_predicted, X=None)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.ObjectiveBase.validate_inputs

ObjectiveBase.**validate_inputs**(y_true, y_predicted)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.BinaryClassificationObjective

class evalml.objectives.BinaryClassificationObjective

Base class for all binary classification objectives.

problem_type (ProblemTypes): Type of problem this objective is. Set to ProblemTypes.BINARY.

can_optimize_threshold (bool): Determines if threshold used by objective can be optimized or not.

Methods

decision_function

Apply a learned threshold to predicted probabilities to get predicted classes.

Continued on next page

Table 96 – continued from previous page

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.BinaryClassificationObjective.decision_function`

`BinaryClassificationObjective.decision_function` (*ypred_proba*, *threshold=0.5*,
X=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

`evalml.objectives.BinaryClassificationObjective.objective_function`

classmethod `BinaryClassificationObjective.objective_function` (*y_true*,
y_predicted,
X=None)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.BinaryClassificationObjective.optimize_threshold`

`BinaryClassificationObjective.optimize_threshold` (*ypred_proba*, *y_true*, *X=None*)
Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.BinaryClassificationObjective.score`

`BinaryClassificationObjective.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

`evalml.objectives.BinaryClassificationObjective.validate_inputs`

`BinaryClassificationObjective.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [n_samples]
- **y_true** (`pd.Series`) – actual class labels of length [n_samples]

Returns None

`evalml.objectives.MulticlassClassificationObjective`

`class evalml.objectives.MulticlassClassificationObjective`

Base class for all multiclass classification objectives.

problem_type (`ProblemTypes`): Type of problem this objective is. Set to `ProblemTypes.MULTICLASS`.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.MulticlassClassificationObjective.objective_function

classmethod `MulticlassClassificationObjective.objective_function` (*y_true*,
y_predicted,
X=None)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`): predicted values of length [*n_samples*] *y_true* (`pd.Series`): actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MulticlassClassificationObjective.score

`MulticlassClassificationObjective.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [*n_samples*]
- **y_true** (`pd.Series`) – actual class labels of length [*n_samples*]
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.MulticlassClassificationObjective.validate_inputs

`MulticlassClassificationObjective.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length [*n_samples*]
- **y_true** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.RegressionObjective

class `evalml.objectives.RegressionObjective`
 Base class for all regression objectives.

`problem_type` (ProblemTypes): Type of problem this objective is. Set to ProblemTypes.REGRESSION.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.RegressionObjective.objective_function`

classmethod `RegressionObjective.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (pd.Series): predicted values of length [n_samples] *y_true* (pd.Series): actual class labels of length [n_samples] *X* (pd.DataFrame or np.array): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.RegressionObjective.score`

`RegressionObjective.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (pd.Series) – predicted values of length [n_samples]
- ***y_true*** (pd.Series) – actual class labels of length [n_samples]
- ***X*** (pd.DataFrame or np.array) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

`evalml.objectives.RegressionObjective.validate_inputs`

`RegressionObjective.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (pd.Series) – predicted values of length [n_samples]
- ***y_true*** (pd.Series) – actual class labels of length [n_samples]

Returns None

5.7.2 Domain-Specific Objectives

<i>FraudCost</i>	Score the percentage of money lost of the total transaction amount process due to fraud.
<i>LeadScoring</i>	Lead scoring.

evalml.objectives.FraudCost

```

class evalml.objectives.FraudCost (retry_percentage=0.5,          interchange_fee=0.02,
                                   fraud_payout_percentage=1.0, amount_col='amount')
    Score the percentage of money lost of the total transaction amount process due to fraud.
  
```

Methods

<i>__init__</i>	Create instance of FraudCost
<i>decision_function</i>	Determine if a transaction is fraud given predicted probabilities, threshold, and dataframe with transaction amount.
<i>objective_function</i>	Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.FraudCost.__init__

```

FraudCost.__init__(retry_percentage=0.5, interchange_fee=0.02, fraud_payout_percentage=1.0,
                   amount_col='amount')
    Create instance of FraudCost
  
```

Parameters

- **retry_percentage** (*float*) – What percentage of customers that will retry a transaction if it is declined. Between 0 and 1. Defaults to .5
- **interchange_fee** (*float*) – How much of each successful transaction you can collect. Between 0 and 1. Defaults to .02
- **fraud_payout_percentage** (*float*) – Percentage of fraud you will not be able to collect. Between 0 and 1. Defaults to 1.0
- **amount_col** (*str*) – Name of column in data that contains the amount. Defaults to “amount”

`evalml.objectives.FraudCost.decision_function`

`FraudCost.decision_function` (*ypred_proba*, *threshold=0.0*, *X=None*)

Determine if a transaction is fraud given predicted probabilities, threshold, and dataframe with transaction amount.

Parameters

- **ypred_proba** (*pd.Series*) – Predicted probabilities
- **X** (*pd.DataFrame*) – Dataframe containing transaction amount
- **threshold** (*float*) – Dollar threshold to determine if transaction is fraud

Returns Series of predicted fraud labels using X and threshold

Return type *pd.Series*

`evalml.objectives.FraudCost.objective_function`

`FraudCost.objective_function` (*y_true*, *y_predicted*, *X*)

Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.

Parameters

- **y_predicted** (*pd.Series*) – predicted fraud labels
- **y_true** (*pd.Series*) – true fraud labels
- **X** (*pd.DataFrame*) – dataframe with transaction amounts

Returns amount lost to fraud per transaction

Return type *float*

`evalml.objectives.FraudCost.optimize_threshold`

`FraudCost.optimize_threshold` (*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.FraudCost.score`

`FraudCost.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **x** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.FraudCost.validate_inputs

`FraudCost.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.LeadScoring

class evalml.objectives.LeadScoring(*true_positives=1, false_positives=-1*)

Lead scoring.

Methods

<code>__init__</code>	Create instance.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Calculate the profit per lead.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.LeadScoring.__init__

`LeadScoring.__init__(true_positives=1, false_positives=-1)`

Create instance.

Parameters

- **true_positives** (*int*) – reward for a true positive
- **false_positives** (*int*) – cost for a false positive. Should be negative.

evalml.objectives.LeadScoring.decision_function

LeadScoring.**decision_function**(ypred_proba, threshold=0.5, X=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.LeadScoring.objective_function

LeadScoring.**objective_function**(y_true, y_predicted, X=None)

Calculate the profit per lead.

Parameters

- **y_predicted** (*pd.Series*) – predicted labels
- **y_true** (*pd.Series*) – true labels
- **X** (*pd.DataFrame*) – None, not used.

Returns profit per lead

Return type float

evalml.objectives.LeadScoring.optimize_threshold

LeadScoring.**optimize_threshold**(ypred_proba, y_true, X=None)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.LeadScoring.score

LeadScoring.**score**(y_true, y_predicted, X=None)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]

- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.LeadScoring.validate_inputs

LeadScoring.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

5.7.3 Classification Objectives

<i>AccuracyBinary</i>	Accuracy score for binary classification.
<i>AccuracyMulticlass</i>	Accuracy score for multiclass classification.
<i>AUC</i>	AUC score for binary classification.
<i>AUCMacro</i>	AUC score for multiclass classification using macro averaging.
<i>AUCMicro</i>	AUC score for multiclass classification using micro averaging.
<i>AUCWeighted</i>	AUC Score for multiclass classification using weighted averaging.
<i>BalancedAccuracyBinary</i>	Balanced accuracy score for binary classification.
<i>BalancedAccuracyMulticlass</i>	Balanced accuracy score for multiclass classification.
<i>F1</i>	F1 score for binary classification.
<i>F1Micro</i>	F1 score for multiclass classification using micro averaging.
<i>F1Macro</i>	F1 score for multiclass classification using macro averaging.
<i>F1Weighted</i>	F1 score for multiclass classification using weighted averaging.
<i>LogLossBinary</i>	Log Loss for binary classification.
<i>LogLossMulticlass</i>	Log Loss for multiclass classification.
<i>MCCBinary</i>	Matthews correlation coefficient for binary classification.
<i>MCCMulticlass</i>	Matthews correlation coefficient for multiclass classification.
<i>Precision</i>	Precision score for binary classification.
<i>PrecisionMicro</i>	Precision score for multiclass classification using micro averaging.
<i>PrecisionMacro</i>	Precision score for multiclass classification using macro averaging.
<i>PrecisionWeighted</i>	Precision score for multiclass classification using weighted averaging.

Continued on next page

Table 102 – continued from previous page

<i>Recall</i>	Recall score for binary classification.
<i>RecallMicro</i>	Recall score for multiclass classification using micro averaging.
<i>RecallMacro</i>	Recall score for multiclass classification using macro averaging.
<i>RecallWeighted</i>	Recall score for multiclass classification using weighted averaging.

evalml.objectives.AccuracyBinary

class evalml.objectives.**AccuracyBinary**
 Accuracy score for binary classification.

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AccuracyBinary.decision_function

AccuracyBinary.**decision_function** (*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.AccuracyBinary.objective_function

AccuracyBinary.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.AccuracyBinary.optimize_threshold`

`AccuracyBinary.optimize_threshold(y_pred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- `y_pred_proba` (`list`) – The classifier’s predicted probabilities
- `y_true` (`list`) – The ground truth for the predictions.
- `X` (`pd.DataFrame`, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.AccuracyBinary.score`

`AccuracyBinary.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- `y_predicted` (`pd.Series`) – predicted values of length `[n_samples]`
- `y_true` (`pd.Series`) – actual class labels of length `[n_samples]`
- `X` (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.AccuracyBinary.validate_inputs`

`AccuracyBinary.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- `y_predicted` (`pd.Series`) – predicted values of length `[n_samples]`
- `y_true` (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.AccuracyMulticlass

class evalml.objectives.**AccuracyMulticlass**
Accuracy score for multiclass classification.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AccuracyMulticlass.objective_function

AccuracyMulticlass.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AccuracyMulticlass.score

AccuracyMulticlass.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.AccuracyMulticlass.validate_inputs

AccuracyMulticlass.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AUC

class evalml.objectives.**AUC**
AUC score for binary classification.

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUC.decision_function

AUC.**decision_function**(*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.AUC.objective_function

`AUC.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUC.optimize_threshold

`AUC.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- `ypred_proba` (`list`) – The classifier’s predicted probabilities
- `y_true` (`list`) – The ground truth for the predictions.
- `X` (`pd.DataFrame`, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.AUC.score

`AUC.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- `y_predicted` (`pd.Series`) – predicted values of length `[n_samples]`
- `y_true` (`pd.Series`) – actual class labels of length `[n_samples]`
- `X` (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.AUC.validate_inputs

`AUC.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- `y_predicted` (`pd.Series`) – predicted values of length `[n_samples]`
- `y_true` (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.AUCMacro

class evalml.objectives.**AUCMacro**
 AUC score for multiclass classification using macro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUCMacro.objective_function

`AUCMacro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUCMacro.score

`AUCMacro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.AUCMacro.validate_inputs

AUCMacro.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AUCMicro

class evalml.objectives.**AUCMicro**

AUC score for multiclass classification using micro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUCMicro.objective_function

AUCMicro.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUCMicro.score

AUCMicro.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.AUCMicro.validate_inputs

`AUCMicro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.AUCWeighted

class evalml.objectives.AUCWeighted

AUC Score for multiclass classification using weighted averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.AUCWeighted.objective_function

`AUCWeighted.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*): predicted values of length [n_samples] **y_true** (*pd.Series*): actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.AUCWeighted.score

AUCWeighted.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.AUCWeighted.validate_inputs

AUCWeighted.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.BalancedAccuracyBinary

class evalml.objectives.BalancedAccuracyBinary

Balanced accuracy score for binary classification.

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.BalancedAccuracyBinary.decision_function

BalancedAccuracyBinary.**decision_function**(*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.BalancedAccuracyBinary.objective_function

BalancedAccuracyBinary.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.BalancedAccuracyBinary.optimize_threshold

BalancedAccuracyBinary.**optimize_threshold**(*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.BalancedAccuracyBinary.score

BalancedAccuracyBinary.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.BalancedAccuracyBinary.validate_inputs

BalancedAccuracyBinary.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.BalancedAccuracyMulticlass

class evalml.objectives.BalancedAccuracyMulticlass

Balanced accuracy score for multiclass classification.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.BalancedAccuracyMulticlass.objective_function

BalancedAccuracyMulticlass.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.BalancedAccuracyMulticlass.score

BalancedAccuracyMulticlass.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.BalancedAccuracyMulticlass.validate_inputs

BalancedAccuracyMulticlass.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1

class evalml.objectives.**F1**
F1 score for binary classification.

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1.decision_function

F1.decision_function (*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.F1.objective_function

F1.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1.optimize_threshold

F1.optimize_threshold (*ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.F1.score

F1.score (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]

- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.F1.validate_inputs

F1.validate_inputs (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1Micro

class evalml.objectives.F1Micro

F1 score for multiclass classification using micro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1Micro.objective_function

F1Micro.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1Micro.score

`F1Micro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.F1Micro.validate_inputs

`F1Micro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.F1Macro

class evalml.objectives.F1Macro

F1 score for multiclass classification using macro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.F1Macro.objective_function

`F1Macro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.F1Macro.score`

`F1Macro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.F1Macro.validate_inputs`

`F1Macro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

`evalml.objectives.F1Weighted`

class `evalml.objectives.F1Weighted`

F1 score for multiclass classification using weighted averaging.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.F1Weighted.objective_function

`F1Weighted.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`): predicted values of length [*n_samples*] *y_true* (`pd.Series`): actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.F1Weighted.score

`F1Weighted.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.F1Weighted.validate_inputs

`F1Weighted.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.LogLossBinary

class evalml.objectives.LogLossBinary
Log Loss for binary classification.

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.LogLossBinary.decision_function

LogLossBinary.**decision_function** (*ypred_proba*, *threshold=0.5*, *X=None*)
Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.LogLossBinary.objective_function

LogLossBinary.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.LogLossBinary.optimize_threshold`

`LogLossBinary.optimize_threshold(ypred_proba, y_true, X=None)`
Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

`evalml.objectives.LogLossBinary.score`

`LogLossBinary.score(y_true, y_predicted, X=None)`
Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

`evalml.objectives.LogLossBinary.validate_inputs`

`LogLossBinary.validate_inputs(y_true, y_predicted)`
Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

`evalml.objectives.LogLossMulticlass`

class `evalml.objectives.LogLossMulticlass`
Log Loss for multiclass classification.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.LogLossMulticlass.objective_function

`LogLossMulticlass.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.LogLossMulticlass.score

`LogLossMulticlass.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.LogLossMulticlass.validate_inputs

`LogLossMulticlass.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.MCCBinary

class evalml.objectives.MCCBinary
 Matthews correlation coefficient for binary classification.

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.MCCBinary.decision_function

MCCBinary.**decision_function**(*ypred_proba*, *threshold=0.5*, *X=None*)
 Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.MCCBinary.objective_function

MCCBinary.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MCCBinary.optimize_threshold

`MCCBinary.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.MCCBinary.score

`MCCBinary.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MCCBinary.validate_inputs

`MCCBinary.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MCCMulticlass

class evalml.objectives.MCCMulticlass

Matthews correlation coefficient for multiclass classification.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.MCCMulticlass.objective_function`

`MCCMulticlass.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.MCCMulticlass.score`

`MCCMulticlass.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.MCCMulticlass.validate_inputs`

`MCCMulticlass.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

evalml.objectives.Precision

class evalml.objectives.Precision
Precision score for binary classification.

Methods

<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

evalml.objectives.Precision.decision_function

Precision.**decision_function** (*ypred_proba*, *threshold=0.5*, *X=None*)
Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.Precision.objective_function

Precision.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.Precision.optimize_threshold

`Precision.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.Precision.score

`Precision.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame or np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.Precision.validate_inputs

`Precision.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.PrecisionMicro

class evalml.objectives.PrecisionMicro

Precision score for multiclass classification using micro averaging.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.PrecisionMicro.objective_function`

`PrecisionMicro.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`): predicted values of length [*n_samples*] *y_true* (`pd.Series`): actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.PrecisionMicro.score`

`PrecisionMicro.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

`evalml.objectives.PrecisionMicro.validate_inputs`

`PrecisionMicro.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.PrecisionMacro

class evalml.objectives.PrecisionMacro

Precision score for multiclass classification using macro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.PrecisionMacro.objective_function

PrecisionMacro.**objective_function**(*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.PrecisionMacro.score

PrecisionMacro.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.PrecisionMacro.validate_inputs

PrecisionMacro.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.PrecisionWeighted

class evalml.objectives.**PrecisionWeighted**

Precision score for multiclass classification using weighted averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.PrecisionWeighted.objective_function

PrecisionWeighted.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.PrecisionWeighted.score

PrecisionWeighted.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **x** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.PrecisionWeighted.validate_inputs

PrecisionWeighted.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.Recall

class evalml.objectives.Recall

Recall score for binary classification.

Methods

<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.Recall.decision_function

Recall.**decision_function** (*ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities

- **threshold** (*float, optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns predictions

evalml.objectives.Recall.objective_function

`Recall.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (*pd.Series*): predicted values of length `[n_samples]` `y_true` (*pd.Series*): actual class labels of length `[n_samples]` `X` (*pd.DataFrame* or *np.array*): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.Recall.optimize_threshold

`Recall.optimize_threshold(ypred_proba, y_true, X=None)`

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*list*) – The classifier’s predicted probabilities
- **y_true** (*list*) – The ground truth for the predictions.
- **X** (*pd.DataFrame, optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective

evalml.objectives.Recall.score

`Recall.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length `[n_samples]`
- **y_true** (*pd.Series*) – actual class labels of length `[n_samples]`
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.Recall.validate_inputs

`Recall.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RecallMicro

class evalml.objectives.RecallMicro

Recall score for multiclass classification using micro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RecallMicro.objective_function

`RecallMicro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: y_predicted (*pd.Series*): predicted values of length [n_samples] y_true (*pd.Series*): actual class labels of length [n_samples] X (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RecallMicro.score

`RecallMicro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.RecallMicro.validate_inputs

`RecallMicro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RecallMacro

class evalml.objectives.RecallMacro

Recall score for multiclass classification using macro averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RecallMacro.objective_function

`RecallMacro.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*): predicted values of length [n_samples] **y_true** (*pd.Series*): actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RecallMacro.score

`RecallMacro.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.RecallMacro.validate_inputs

`RecallMacro.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RecallWeighted

class `evalml.objectives.RecallWeighted`

Recall score for multiclass classification using weighted averaging.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RecallWeighted.objective_function

`RecallWeighted.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.RecallWeighted.score`

`RecallWeighted.score` (`y_true`, `y_predicted`, `X=None`)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`
- **`X`** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

`evalml.objectives.RecallWeighted.validate_inputs`

`RecallWeighted.validate_inputs` (`y_true`, `y_predicted`)

Validates the input based on a few simple checks.

Parameters

- **`y_predicted`** (`pd.Series`) – predicted values of length `[n_samples]`
- **`y_true`** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

5.7.4 Regression Objectives

<i>R2</i>	Coefficient of determination for regression.
<i>MAE</i>	Mean absolute error for regression.
<i>MSE</i>	Mean squared error for regression.
<i>MeanSquaredLogError</i>	Mean squared log error for regression.
<i>MedianAE</i>	Median absolute error for regression.
<i>MaxError</i>	Maximum residual error for regression.
<i>ExpVariance</i>	Explained variance score for regression.
<i>RootMeanSquaredError</i>	Root mean squared error for regression.
<i>RootMeanSquaredLogError</i>	Root mean squared log error for regression.

evalml.objectives.R2

class evalml.objectives.R2
Coefficient of determination for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.R2.objective_function

R2.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.R2.score

R2.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.R2.validate_inputs

R2.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MAE

class evalml.objectives.MAE

Mean absolute error for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MAE.objective_function

MAE.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MAE.score

MAE.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.MAE.validate_inputs

MAE.validate_inputs (*y_true*, *y_predicted*)
Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.MSE

class evalml.objectives.**MSE**
Mean squared error for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MSE.objective_function

MSE.objective_function (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MSE.score**MSE.score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score**evalml.objectives.MSE.validate_inputs****MSE.validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None**evalml.objectives.MeanSquaredLogError****class** evalml.objectives.**MeanSquaredLogError**

Mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

`evalml.objectives.MeanSquaredLogError.objective_function`

`MeanSquaredLogError.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`): predicted values of length [*n_samples*] *y_true* (`pd.Series`): actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.MeanSquaredLogError.score`

`MeanSquaredLogError.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

`evalml.objectives.MeanSquaredLogError.validate_inputs`

`MeanSquaredLogError.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

`evalml.objectives.MedianAE`

class `evalml.objectives.MedianAE`
Median absolute error for regression.

Methods

<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

`evalml.objectives.MedianAE.objective_function`

`MedianAE.objective_function` (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (`pd.Series`): predicted values of length [*n_samples*] *y_true* (`pd.Series`): actual class labels of length [*n_samples*] *X* (`pd.DataFrame` or `np.array`): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

`evalml.objectives.MedianAE.score`

`MedianAE.score` (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]
- ***X*** (`pd.DataFrame` or `np.array`) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

`evalml.objectives.MedianAE.validate_inputs`

`MedianAE.validate_inputs` (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- ***y_predicted*** (`pd.Series`) – predicted values of length [*n_samples*]
- ***y_true*** (`pd.Series`) – actual class labels of length [*n_samples*]

Returns None

evalml.objectives.MaxError

class evalml.objectives.MaxError
Maximum residual error for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.MaxError.objective_function

MaxError.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [*n_samples*] *y_true* (*pd.Series*): actual class labels of length [*n_samples*] *X* (*pd.DataFrame* or *np.array*): extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.MaxError.score

MaxError.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [*n_samples*]
- **y_true** (*pd.Series*) – actual class labels of length [*n_samples*]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [*n_samples*, *n_features*] necessary to calculate score

Returns score

evalml.objectives.MaxError.validate_inputs

MaxError.**validate_inputs** (*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.ExpVariance

class evalml.objectives.**ExpVariance**

Explained variance score for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.ExpVariance.objective_function

ExpVariance.**objective_function** (*y_true*, *y_predicted*, *X=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: *y_predicted* (*pd.Series*): predicted values of length [n_samples] *y_true* (*pd.Series*): actual class labels of length [n_samples] *X* (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.ExpVariance.score

ExpVariance.**score** (*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.ExpVariance.validate_inputs

`ExpVariance.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RootMeanSquaredError

class `evalml.objectives.RootMeanSquaredError`

Root mean squared error for regression.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RootMeanSquaredError.objective_function

`RootMeanSquaredError.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: **y_predicted** (*pd.Series*): predicted values of length [n_samples] **y_true** (*pd.Series*): actual class labels of length [n_samples] **X** (*pd.DataFrame* or *np.array*): extra data of shape [n_samples, n_features] necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RootMeanSquaredError.score

RootMeanSquaredError.**score**(*y_true*, *y_predicted*, *X=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]
- **X** (*pd.DataFrame* or *np.array*) – extra data of shape [n_samples, n_features] necessary to calculate score

Returns score

evalml.objectives.RootMeanSquaredError.validate_inputs

RootMeanSquaredError.**validate_inputs**(*y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*) – predicted values of length [n_samples]
- **y_true** (*pd.Series*) – actual class labels of length [n_samples]

Returns None

evalml.objectives.RootMeanSquaredLogError

class evalml.objectives.**RootMeanSquaredLogError**

Root mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError.

Methods

<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

evalml.objectives.RootMeanSquaredLogError.objective_function

`RootMeanSquaredLogError.objective_function(y_true, y_predicted, X=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric

Arguments: `y_predicted` (`pd.Series`): predicted values of length `[n_samples]` `y_true` (`pd.Series`): actual class labels of length `[n_samples]` `X` (`pd.DataFrame` or `np.array`): extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns numerical value used to calculate score

evalml.objectives.RootMeanSquaredLogError.score

`RootMeanSquaredLogError.score(y_true, y_predicted, X=None)`

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`
- **X** (`pd.DataFrame` or `np.array`) – extra data of shape `[n_samples, n_features]` necessary to calculate score

Returns score

evalml.objectives.RootMeanSquaredLogError.validate_inputs

`RootMeanSquaredLogError.validate_inputs(y_true, y_predicted)`

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (`pd.Series`) – predicted values of length `[n_samples]`
- **y_true** (`pd.Series`) – actual class labels of length `[n_samples]`

Returns None

5.8 Problem Types

ProblemTypes

Enum for type of machine learning problem: BINARY, MULTICLASS, or REGRESSION.

5.8.1 evalml.problem_types.ProblemTypes

class evalml.problem_types.**ProblemTypes**

Enum for type of machine learning problem: BINARY, MULTICLASS, or REGRESSION.

handle_problem_types

Handles problem_type by either returning the ProblemTypes or converting from a str.

5.8.2 evalml.problem_types.handle_problem_types

evalml.problem_types.**handle_problem_types** (*problem_type*)

Handles problem_type by either returning the ProblemTypes or converting from a str.

Parameters *problem_type* (*str* or *ProblemTypes*) – problem type that needs to be handled

Returns ProblemTypes

5.9 Model Family

ModelFamily

Enum for family of machine learning models.

5.9.1 evalml.model_family.ModelFamily

class evalml.model_family.**ModelFamily**

Enum for family of machine learning models.

<code>handle_model_family</code>	Handles <code>model_family</code> by either returning the <code>ModelFamily</code> or converting from a <code>str</code> :param <code>model_family</code> : model type that needs to be handled :type <code>model_family</code> : <code>str</code> or <code>ModelFamily</code>
----------------------------------	--

5.9.2 `evalml.model_family.handle_model_family`

`evalml.model_family.handle_model_family(model_family)`
Handles `model_family` by either returning the `ModelFamily` or converting from a `str` :param `model_family`: model type that needs to be handled :type `model_family`: `str` or `ModelFamily`
Returns `ModelFamily`

5.10 Tuners

<code>Tuner</code>	Defines API for Tuners.
<code>SKOptTuner</code>	Bayesian Optimizer.
<code>GridSearchTuner</code>	Grid Search Optimizer.
<code>RandomSearchTuner</code>	Random Search Optimizer.

5.10.1 `evalml.tuners.Tuner`

class `evalml.tuners.Tuner` (`pipeline_hyperparameter_ranges`, `random_state=0`)
Defines API for Tuners.

Tuners implement different strategies for sampling from a search space. They’re used in EvalML to search the space of pipeline hyperparameters.

Methods

<code>__init__</code>	Base Tuner class
-----------------------	------------------

Continued on next page

Table 142 – continued from previous page

<i>add</i>	Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.
<i>is_search_space_exhausted</i>	Optional.
<i>propose</i>	Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

evalml.tuners.Tuner.__init__

`Tuner.__init__(pipeline_hyperparameter_ranges, random_state=0)`
Base Tuner class

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **random_state** (*int*, *np.random.RandomState*) – The random state

evalml.tuners.Tuner.add

`Tuner.add(pipeline_parameters, score)`

Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

Returns None

evalml.tuners.Tuner.is_search_space_exhausted

`Tuner.is_search_space_exhausted()`

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

Returns Returns true if all possible parameters in a search space has been scored.

Return type bool

evalml.tuners.Tuner.propose

`Tuner.propose()`

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

Returns proposed pipeline parameters

Return type dict

5.10.2 evalml.tuners.SKOptTuner

class evalml.tuners.**SKOptTuner** (*pipeline_hyperparameter_ranges*, *random_state=0*)
Bayesian Optimizer.

Methods

<code>__init__</code>	Init SKOptTuner
<code>add</code>	Add score to sample
<code>is_search_space_exhausted</code>	Optional.
<code>propose</code>	Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

evalml.tuners.SKOptTuner.__init__

SKOptTuner.**__init__** (*pipeline_hyperparameter_ranges*, *random_state=0*)
Init SKOptTuner

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **random_state** (*int*, *np.random.RandomState*) – The random state

evalml.tuners.SKOptTuner.add

SKOptTuner.**add** (*pipeline_parameters*, *score*)
Add score to sample

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

Returns None

evalml.tuners.SKOptTuner.is_search_space_exhausted

SKOptTuner.**is_search_space_exhausted** ()
Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

Returns Returns true if all possible parameters in a search space has been scored.

Return type bool

evalml.tuners.SKOptTuner.propose

SKOptTuner.**propose**()

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

Returns proposed pipeline parameters

Return type dict

5.10.3 evalml.tuners.GridSearchTuner

class evalml.tuners.**GridSearchTuner**(*pipeline_hyperparameter_ranges*, *n_points=10*, *random_state=0*)
Grid Search Optimizer.

Example

```

>>> tuner = GridSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': [
↪ 'a', 'b', 'c']}}, n_points=5)
>>> proposal = tuner.propose()
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 0.0, 'param b': 'a'}
  
```

Methods

<code>__init__</code>	Generate all of the possible points to search for in the grid
<code>add</code>	Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.
<code>is_search_space_exhausted</code>	Checks if it is possible to generate a set of valid parameters.
<code>propose</code>	Returns parameters from <code>_grid_points</code> iterations

evalml.tuners.GridSearchTuner.__init__

GridSearchTuner.**__init__**(*pipeline_hyperparameter_ranges*, *n_points=10*, *random_state=0*)
Generate all of the possible points to search for in the grid

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **n_points** – The number of points to sample from along each dimension defined in the *space* argument
- **random_state** – Unused in this class

evalml.tuners.GridSearchTuner.add

`GridSearchTuner.add(pipeline_parameters, score)`

Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

evalml.tuners.GridSearchTuner.is_search_space_exhausted

`GridSearchTuner.is_search_space_exhausted()`

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

Raises `NoParamsException` – If a search space is exhausted, then this exception is thrown.

Returns If no more valid parameters exists in the search space, return false.

Return type bool

evalml.tuners.GridSearchTuner.propose

`GridSearchTuner.propose()`

Returns parameters from `_grid_points` iterations

If all possible combinations of parameters have been scored, then `NoParamsException` is raised.

Returns proposed pipeline parameters

Return type dict

5.10.4 evalml.tuners.RandomSearchTuner

```
class evalml.tuners.RandomSearchTuner (pipeline_hyperparameter_ranges, random_state=0, with_replacement=False, replacement_max_attempts=10)
```

Random Search Optimizer.

Example

```
>>> tuner = RandomSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': ['a', 'b', 'c']}}, random_state=42)
>>> proposal = tuner.propose()
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 3.7454011884736254, 'param b': 'c'}
```

Methods

<code>__init__</code>	Sets up check for duplication if needed.
<code>add</code>	Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.
<code>is_search_space_exhausted</code>	Checks if it is possible to generate a set of valid parameters.
<code>propose</code>	Generate a unique set of parameters.

evalml.tuners.RandomSearchTuner.__init__

```
RandomSearchTuner.__init__ (pipeline_hyperparameter_ranges, random_state=0, with_replacement=False, replacement_max_attempts=10)
```

Sets up check for duplication if needed.

Parameters

- **pipeline_hyperparameter_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **random_state** – Unused in this class
- **with_replacement** – If false, only unique hyperparameters will be shown
- **replacement_max_attempts** – The maximum number of tries to get a unique set of random parameters. Only used if tuner is initialized with `with_replacement=True`

evalml.tuners.RandomSearchTuner.add

```
RandomSearchTuner.add (pipeline_parameters, score)
```

Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.

Parameters

- **pipeline_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

evalml.tuners.RandomSearchTuner.is_search_space_exhausted

`RandomSearchTuner.is_search_space_exhausted()`

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

Raises `NoParamsException` – If a search space is exhausted, then this exception is thrown.

Returns If no more valid parameters exists in the search space, return false.

Return type bool

evalml.tuners.RandomSearchTuner.propose

`RandomSearchTuner.propose()`

Generate a unique set of parameters.

If tuner was initialized with `with_replacement=True` and the tuner is unable to generate a unique set of parameters after `replacement_max_attempts` tries, then `NoParamsException` is raised.

Returns proposed pipeline parameters

Return type dict

5.11 Data Checks

5.11.1 Data Check Classes

<i>DataCheck</i>	Base class for all data checks.
<i>InvalidTargetDataCheck</i>	Checks if the target labels contain missing or invalid data.
<i>HighlyNullDataCheck</i>	Checks if there are any highly-null columns in the input.
<i>IDColumnsDataCheck</i>	Check if any of the features are likely to be ID columns.
<i>LabelLeakageDataCheck</i>	Check if any of the features are highly correlated with the target.
<i>OutliersDataCheck</i>	Checks if there are any outliers in input data by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies.
<i>NoVarianceDataCheck</i>	Check if any of the features or labels have no variance.

evalml.data_checks.DataCheck

class evalml.data_checks.DataCheck

Base class for all data checks. Data checks are a set of heuristics used to determine if there are problems with input data.

name = 'DataCheck'

Instance attributes

Methods:

<i>validate</i>	Inspects and validates the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.
-----------------	--

evalml.data_checks.DataCheck.validate

DataCheck.**validate** (*X*, *y=None*)

Inspects and validates the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – the input data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – the target data of length [n_samples]

Returns list of DataCheckError and DataCheckWarning objects

Return type list (*DataCheckMessage*)

evalml.data_checks.InvalidTargetDataCheck

class evalml.data_checks.InvalidTargetDataCheck

Checks if the target labels contain missing or invalid data.

name = 'InvalidTargetDataCheck'

Instance attributes

Methods:

<code>validate</code>	Checks if the target labels contain missing or invalid data.
-----------------------	--

`evalml.data_checks.InvalidTargetDataCheck.validate`

`InvalidTargetDataCheck.validate(X, y)`
Checks if the target labels contain missing or invalid data.

Parameters

- **X** (`pd.DataFrame`, `pd.Series`, `np.array`, `list`) – Features. Ignored.
- **y** – Target labels to check for invalid data.

Returns list with `DataCheckErrors` if any invalid data is found in target labels.

Return type list (`DataCheckError`)

Example

```
>>> X = pd.DataFrame({})
>>> y = pd.Series([0, 1, None, None])
>>> target_check = InvalidTargetDataCheck()
>>> assert target_check.validate(X, y) == [DataCheckError("2 row(s) (50.0%)
of target values are null", "InvalidTargetDataCheck")]
```

`evalml.data_checks.HighlyNullDataCheck`

class `evalml.data_checks.HighlyNullDataCheck` (`pct_null_threshold=0.95`)

Checks if there are any highly-null columns in the input.

name = `'HighlyNullDataCheck'`

Instance attributes

Methods:

<code>__init__</code>	Checks if there are any highly-null columns in the input.
<code>validate</code>	Checks if there are any highly-null columns in the input.

evalml.data_checks.HighlyNullDataCheck.__init__

`HighlyNullDataCheck.__init__(pct_null_threshold=0.95)`

Checks if there are any highly-null columns in the input.

Parameters `pct_null_threshold` (*float*) – If the percentage of NaN values in an input feature exceeds this amount, that feature will be considered highly-null. Defaults to 0.95.

evalml.data_checks.HighlyNullDataCheck.validate

`HighlyNullDataCheck.validate(X, y=None)`

Checks if there are any highly-null columns in the input.

Parameters

- `X` (*pd.DataFrame, pd.Series, np.array, list*) – features
- `y` – Ignored.

Returns list with a `DataCheckWarning` if there are any highly-null columns.

Return type list (*DataCheckWarning*)

Example

```
>>> df = pd.DataFrame({
...     'lots_of_null': [None, None, None, None, 5],
...     'no_null': [1, 2, 3, 4, 5]
... })
>>> null_check = HighlyNullDataCheck(pct_null_threshold=0.8)
>>> assert null_check.validate(df) == [DataCheckWarning("Column 'lots_of_null"
↪ ' is 80.0% or more null", "HighlyNullDataCheck")]
```

evalml.data_checks.IDColumnsDataCheck

class `evalml.data_checks.IDColumnsDataCheck(id_threshold=1.0)`

Check if any of the features are likely to be ID columns.

name = 'IDColumnsDataCheck'

Instance attributes**Methods:**

<code>__init__</code>	Check if any of the features are likely to be ID columns.
<code>validate</code>	Check if any of the features are likely to be ID columns.

`evalml.data_checks.IDColumnsDataCheck.__init__`

`IDColumnsDataCheck.__init__(id_threshold=1.0)`

Check if any of the features are likely to be ID columns.

Parameters `id_threshold` (*float*) – the probability threshold to be considered an ID column. Defaults to 1.0.

`evalml.data_checks.IDColumnsDataCheck.validate`

`IDColumnsDataCheck.validate(X, y=None)`

Check if any of the features are likely to be ID columns. Currently performs these simple checks:

- column name is “id”
- column name ends in “_id”
- column contains all unique values (and is not float / boolean)

Parameters

- `X` (*pd.DataFrame*) – The input features to check
- `threshold` (*float*) – the probability threshold to be considered an ID column. Defaults to 1.0

Returns A dictionary of features with column name or index and their probability of being ID columns

Example

```
>>> df = pd.DataFrame({
...     'df_id': [0, 1, 2, 3, 4],
...     'x': [10, 42, 31, 51, 61],
...     'y': [42, 54, 12, 64, 12]
... })
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [DataCheckWarning("Column 'df_id' is
↳ 100.0% or more likely to be an ID column", "IDColumnsDataCheck")]
```

`evalml.data_checks.LabelLeakageDataCheck`

class evalml.data_checks.LabelLeakageDataCheck (*pct_corr_threshold=0.95*)

Check if any of the features are highly correlated with the target.

name = 'LabelLeakageDataCheck'

Instance attributes

Methods:

<code>__init__</code>	Check if any of the features are highly correlated with the target.
<code>validate</code>	Check if any of the features are highly correlated with the target.

evalml.data_checks.LabelLeakageDataCheck.__init__

LabelLeakageDataCheck.**__init__** (*pct_corr_threshold=0.95*)

Check if any of the features are highly correlated with the target.

Currently only supports binary and numeric targets and features.

Parameters **pct_corr_threshold** (*float*) – The correlation threshold to be considered leakage. Defaults to 0.95.

evalml.data_checks.LabelLeakageDataCheck.validate

LabelLeakageDataCheck.**validate** (*X, y*)

Check if any of the features are highly correlated with the target.

Currently only supports binary and numeric targets and features.

Parameters

- **X** (*pd.DataFrame*) – The input features to check
- **y** (*pd.Series*) – The labels

Returns list with a DataCheckWarning if there is label leakage detected.

Return type list (*DataCheckWarning*)

Example

```
>>> X = pd.DataFrame({
...     'leak': [10, 42, 31, 51, 61],
...     'x': [42, 54, 12, 64, 12],
...     'y': [12, 5, 13, 74, 24],
... })
>>> y = pd.Series([10, 42, 31, 51, 40])
>>> label_leakage_check = LabelLeakageDataCheck(pct_corr_threshold=0.8)
>>> assert label_leakage_check.validate(X, y) == [DataCheckWarning("Column
↪ 'leak' is 80.0% or more correlated with the target", "LabelLeakageDataCheck
↪ ")]
```

evalml.data_checks.OutliersDataCheck

class evalml.data_checks.OutliersDataCheck (*random_state=0*)

Checks if there are any outliers in input data by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies. Indices with score anomalies are considered outliers.

name = 'OutliersDataCheck'

Instance attributes

—

Methods:

<code>__init__</code>	Checks if there are any outliers in the input data.
<code>validate</code>	Checks if there are any outliers in a dataframe by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies.

evalml.data_checks.OutliersDataCheck.__init__

OutliersDataCheck.**__init__** (*random_state=0*)

Checks if there are any outliers in the input data.

Parameters **random_state** (*int, np.random.RandomState*) – The random seed/state. Defaults to 0.

evalml.data_checks.OutliersDataCheck.validate

OutliersDataCheck.**validate** (*X, y=None*)

Checks if there are any outliers in a dataframe by using an Isolation Forest to obtain the anomaly score of each index and then using IQR to determine score anomalies. Indices with score anomalies are considered outliers.

Parameters

- **X** (*pd.DataFrame*) – features
- **y** – Ignored.

Returns A set of indices that may have outlier data.

Example

```
>>> df = pd.DataFrame({
...     'x': [1, 2, 3, 40, 5],
...     'y': [6, 7, 8, 990, 10],
...     'z': [-1, -2, -3, -1201, -4]
... })
>>> outliers_check = OutliersDataCheck()
>>> assert outliers_check.validate(df) == [DataCheckWarning("Row '3' is_
↳likely to have outlier data", "OutliersDataCheck")]
```

evalml.data_checks.NoVarianceDataCheck

class evalml.data_checks.NoVarianceDataCheck (*count_nan_as_value=False*)

Check if any of the features or labels have no variance.

name = 'NoVarianceDataCheck'

Instance attributes

Methods:

<code>__init__</code>	Check if any of the features or labels have no variance.
<code>validate</code>	Check if any of the features or if the labels have no variance (1 unique value).

evalml.data_checks.NoVarianceDataCheck.__init__

NoVarianceDataCheck.**__init__** (*count_nan_as_value=False*)

Check if any of the features or labels have no variance.

Parameters **count_nan_as_value** (*bool*) – If True, missing values will be counted as their own unique value. If set to True, a feature that has one unique value and all other data is missing, a DataCheckWarning will be returned instead of an error. Defaults to False.

evalml.data_checks.NoVarianceDataCheck.validate

NoVarianceDataCheck.**validate** (*X, y*)

Check if any of the features or if the labels have no variance (1 unique value).

Parameters

- **x** (*pd.DataFrame*) – The input features.
- **y** (*pd.Series*) – The labels.

Returns list (*DataCheckWarning* or *DataCheckError*), list of warnings/errors corresponding to features or labels with no variance.

<i>DataChecks</i>	A collection of data checks.
<i>DefaultDataChecks</i>	A collection of basic data checks that is used by AutoML by default.

evalml.data_checks.DataChecks

evalml.data_checks.data_checks.DataChecks

class evalml.data_checks.DataChecks (*data_checks=None*)
A collection of data checks.

Methods

<i>__init__</i>	A collection of data checks.
<i>validate</i>	Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

evalml.data_checks.DataChecks.__init__

DataChecks.**__init__** (*data_checks=None*)
A collection of data checks.

Parameters **data_checks** (*list* (*DataCheck*)) – list of DataCheck objects

evalml.data_checks.DataChecks.validate

DataChecks.**validate** (*X*, *y=None*)
Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – the input data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target labels of length [n_samples]

Returns list containing *DataCheckMessage* objects

Return type list (*DataCheckMessage*)

evalml.data_checks.DefaultDataChecks

evalml.data_checks.data_checks.DataChecks

evalml.data_checks.default_data_checks.DefaultDataChecks

class evalml.data_checks.DefaultDataChecks (*data_checks=None*)

A collection of basic data checks that is used by AutoML by default.

Includes *HighlyNullDataCheck*, *IDColumnsDataCheck*, *LabelLeakageDataCheck*, *InvalidTargetDataCheck*, and *NoVarianceDataCheck*.

Methods

<code>__init__</code>	A collection of basic data checks.
<code>validate</code>	Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

evalml.data_checks.DefaultDataChecks.__init__

DefaultDataChecks.**__init__** (*data_checks=None*)

A collection of basic data checks.

Parameters **data_checks** (*list (DataCheck)*) – Ignored.

evalml.data_checks.DefaultDataChecks.validate

DefaultDataChecks.**validate** (*X, y=None*)

Inspects and validates the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – the input data of shape [n_samples, n_features]
- **y** (*pd.Series*) – the target labels of length [n_samples]

Returns list containing *DataCheckMessage* objects

Return type list (*DataCheckMessage*)

5.11.2 Data Check Messages

<i>DataCheckMessage</i>	Base class for all DataCheckMessages.
<i>DataCheckError</i>	DataCheckMessage subclass for errors returned by data checks.
<i>DataCheckWarning</i>	DataCheckMessage subclass for warnings returned by data checks.

evalml.data_checks.DataCheckMessage

evalml.data_checks.data_check_message.DataCheckMessage

class evalml.data_checks.DataCheckMessage(*message*, *data_check_name*)
Base class for all DataCheckMessages.

message_type = None

Methods:

<code>__init__</code>	Message returned by a DataCheck, tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to self.message attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckMessage.__init__

DataCheckMessage.**__init__**(*message*, *data_check_name*)
Message returned by a DataCheck, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckMessage.__str__

DataCheckMessage.**__str__**()
String representation of data check message, equivalent to self.message attribute.

evalml.data_checks.DataCheckMessage.__eq__`DataCheckMessage.__eq__` (*other*)

Checks for equality. Two `DataCheckMessage` objs are considered equivalent if their message type and message are equivalent.

evalml.data_checks.DataCheckError

class `evalml.data_checks.DataCheckError` (*message*, *data_check_name*)

`DataCheckMessage` subclass for errors returned by data checks.

message_type = 'error'

Methods:

<code>__init__</code>	Message returned by a <code>DataCheck</code> , tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to <code>self.message</code> attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckError.__init__

`DataCheckError.__init__` (*message*, *data_check_name*)

Message returned by a `DataCheck`, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckError.__str__

`DataCheckError.__str__` ()

String representation of data check message, equivalent to `self.message` attribute.

evalml.data_checks.DataCheckError.__eq__

`DataCheckError.__eq__` (*other*)

Checks for equality. Two `DataCheckMessage` objs are considered equivalent if their message type and message are equivalent.

evalml.data_checks.DataCheckWarning

class evalml.data_checks.DataCheckWarning(*message*, *data_check_name*)
DataCheckMessage subclass for warnings returned by data checks.
message_type = 'warning'

Methods:

<code>__init__</code>	Message returned by a DataCheck, tagged by name.”
<code>__str__</code>	String representation of data check message, equivalent to self.message attribute.
<code>__eq__</code>	Checks for equality.

evalml.data_checks.DataCheckWarning.__init__

DataCheckWarning.__init__(*message*, *data_check_name*)
Message returned by a DataCheck, tagged by name.”

Parameters

- **message** (*str*) – Message string
- **data_check_name** (*str*) – Name of data check

evalml.data_checks.DataCheckWarning.__str__

DataCheckWarning.__str__()
String representation of data check message, equivalent to self.message attribute.

evalml.data_checks.DataCheckWarning.__eq__

DataCheckWarning.__eq__(*other*)
Checks for equality. Two DataCheckMessage objs are considered equivalent if their message type and message are equivalent.

5.11.3 Data Check Message Types

<i>DataCheckMessageType</i>	Enum for type of data check message: WARNING or ERROR.
-----------------------------	--

evalml.data_checks.DataCheckMessageType

class evalml.data_checks.DataCheckMessageType
 Enum for type of data check message: WARNING or ERROR.

5.12 Utils

<code>import_or_raise</code>	Attempts to import the requested library by name.
<code>convert_to_seconds</code>	Converts a string describing a length of time to its length in seconds.
<code>get_random_state</code>	Generates a <code>numpy.random.RandomState</code> instance using seed.
<code>get_random_seed</code>	Given a <code>numpy.random.RandomState</code> object, generate an int representing a seed value for another random number generator.

5.12.1 evalml.utils.import_or_raise

`evalml.utils.import_or_raise(library, error_msg=None)`
 Attempts to import the requested library by name. If the import fails, raises an `ImportError`.

Parameters

- **library** (*str*) – the name of the library
- **error_msg** (*str*) – error message to return if the import fails

5.12.2 evalml.utils.convert_to_seconds

`evalml.utils.convert_to_seconds(input_str)`
 Converts a string describing a length of time to its length in seconds.

5.12.3 evalml.utils.get_random_state

`evalml.utils.get_random_state(seed)`
 Generates a `numpy.random.RandomState` instance using seed.

Parameters **seed** (*None, int, np.random.RandomState object*) – seed to use to generate `numpy.random.RandomState`. Must be between `SEED_BOUNDS.min_bound` and `SEED_BOUNDS.max_bound`, inclusive. Otherwise, an exception will be thrown.

5.12.4 evalml.utils.get_random_seed

`evalml.utils.get_random_seed(random_state, min_bound=0, max_bound=2147483647)`

Given a `numpy.random.RandomState` object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.

To protect against invalid input to a particular library's random number generator, if an int value is provided, and it is outside the bounds "[min_bound, max_bound)", the value will be projected into the range between the min_bound (inclusive) and max_bound (exclusive) using modular arithmetic.

Parameters

- **random_state** (*int*, *numpy.random.RandomState*) – random state
- **min_bound** (*None*, *int*) – if not default of *None*, will be min bound when generating seed (inclusive). Must be less than max_bound.
- **max_bound** (*None*, *int*) – if not default of *None*, will be max bound when generating seed (exclusive). Must be greater than min_bound.

Returns seed for random number generator

Return type `int`

RELEASE NOTES

Future Releases

- Enhancements
- Fixes
- Changes
- Documentation Changes
- Testing Changes

v0.12.2 Aug. 6, 2020

- **Enhancements**
 - Add save/load method to components [#1023](#)
 - Expose pickle *protocol* as optional arg to save/load [#1023](#)
- Fixes
- **Changes**
 - Removed DeprecationWarning for SimpleImputer [#1018](#)
- Documentation Changes
- **Testing Changes**
 - Test files are now included in the evalml package [#1029](#)

v0.12.0 Aug. 3, 2020

- **Enhancements**
 - Added string and categorical targets support for binary and multiclass pipelines and check for numeric targets for *DetectLabelLeakage* data check [#932](#)
 - Added clear exception for regression pipelines if target datatype is string or categorical [#960](#)
 - Added target column names and class labels in *predict* and *predict_proba* output for pipelines [#951](#)
 - Added *_compute_shap_values* and *normalize_values* to *pipelines/explanations* module [#958](#)
 - Added *explain_prediction* feature which explains single predictions with SHAP [#974](#)
 - Added Imputer to allow different imputation strategies for numerical and categorical dtypes [#991](#)
 - Added support for configuring logfile path using env var, and don't create logger if there are filesystem errors [#975](#)

- Updated catboost estimators’ default parameters and automl hyperparameter ranges to speed up fit time [#998](#)
- **Fixes**
 - Fixed ReadtheDocs warning failure regarding embedded gif [#943](#)
 - Removed incorrect parameter passed to pipeline classes in `_add_baseline_pipelines` [#941](#)
 - Added universal error for calling `predict`, `predict_proba`, `transform`, and `feature_importances` before fitting [#969](#), [#994](#)
 - Made `TextFeaturizer` component and pip dependencies `featuretools` and `nlp_primitives` optional [#976](#)
 - Updated imputation strategy in automl to no longer limit impute strategy to `most_frequent` for all features if there are any categorical columns [#991](#)
 - Fixed `UnboundLocalError` for ‘`cv_pipeline`’ when automl search errors [#996](#)
 - Fixed `Imputer` to reset dataframe index to preserve behavior expected from `SimpleImputer` [#1009](#)
- **Changes**
 - Moved `get_estimators` ‘ to ‘`evalml.pipelines.components.utils` [#934](#)
 - Modified Pipelines to raise `PipelineScoreError` when they encounter an error during scoring [#936](#)
 - Moved `evalml.model_families.list_model_families` to `evalml.pipelines.components.allowed_model_families` [#959](#)
 - Renamed `DateTimeFeaturization` to `DateTimeFeaturizer` [#977](#)
 - Added check to stop search and raise an error if all pipelines in a batch return NaN scores [#1015](#)
- **Documentation Changes**
 - Update README.md [#963](#)
 - Reworded message when errors are returned from data checks in search [#982](#)
 - Added section on understanding model predictions with `explain_prediction` to User Guide [#981](#)
 - Added a section to the user guide and api reference about how XGBoost and CatBoost are not fully supported. [#992](#)
 - Added custom components section in user guide [#993](#)
 - Update FAQ section formatting [#997](#)
 - Update release process documentation [#1003](#)
- **Testing Changes**
 - Moved `predict_proba` and `predict` tests regarding string / categorical targets to `test_pipelines.py` [#972](#)
 - Fix dependency update bot by updating python version to 3.7 to avoid frequent github version updates [#1002](#)

Warning:**Breaking Changes**

- `get_estimators` has been moved to `evalml.pipelines.components.utils` (previously was under `evalml.pipelines.utils`) [#934](#)

- Removed the `raise_errors` flag in AutoML search. All errors during pipeline evaluation will be caught and logged. #936
- `evalml.model_families.list_model_families` has been moved to `evalml.pipelines.components.allowed_model_families` #959
- `TextFeaturizer`: the `featuretools` and `nlp_primitives` packages must be installed after installing evalml in order to use this component #976
- Renamed `DateTimeFeaturization` to `DateTimeFeaturizer` #977

v0.11.2 July 16, 2020

- **Enhancements**
 - Added `NoVarianceDataCheck` to `DefaultDataChecks` #893
 - Added text processing and featurization component `TextFeaturizer` #913, #924
 - Added additional checks to `InvalidTargetDataCheck` to handle invalid target data types #929
 - `AutoMLSearch` will now handle `KeyboardInterrupt` and prompt user for confirmation #915
- **Fixes**
 - Makes `automl` results a read-only property #919
- **Changes**
 - Deleted static pipelines and refactored tests involving static pipelines, removed `all_pipelines()` and `get_pipelines()` #904
 - Moved `list_model_families` to `evalml.model_family.utils` #903
 - Updated `all_pipelines`, `all_estimators`, `all_components` to use the same mechanism for dynamically generating their elements #898
 - Rename `master` branch to `main` #918
 - Add pypi release github action #923
 - Updated `AutoMLSearch.search` stdout output and logging and removed tqdm progress bar #921
 - Moved `automl` config checks previously in `search()` to `init` #933
- **Documentation Changes**
 - Reorganized and rewrote documentation #937
 - Updated to use pydata sphinx theme #937
 - Updated docs to use `release_notes` instead of `changelog` #942
- **Testing Changes**
 - Cleaned up fixture names and usages in tests #895

Warning:

Breaking Changes

- `list_model_families` has been moved to `evalml.model_family.utils` (previously was under `evalml.pipelines.utils`) #903

- `get_estimators` has been moved to `evalml.pipelines.components.utils` (previously was under `evalml.pipelines.utils`) #934
- Static pipeline definitions have been removed, but similar pipelines can still be constructed via creating an instance of `PipelineBase` #904
- `all_pipelines()` and `get_pipelines()` utility methods have been removed #904

v0.11.0 June 30, 2020

- **Enhancements**

- Added multiclass support for ROC curve graphing #832
- Added preprocessing component to drop features whose percentage of NaN values exceeds a specified threshold #834
- Added data check to check for problematic target labels #814
- Added `PerColumnImputer` that allows imputation strategies per column #824
- Added transformer to drop specific columns #827
- Added support for *categories*, *handle_error*, and *drop* parameters in *OneHotEncoder* #830 #897
- Added preprocessing component to handle `DateTime` columns featurization #838
- Added ability to clone pipelines and components #842
- Define getter method for component *parameters* #847
- Added utility methods to calculate and graph permutation importances #860, #880
- Added new utility functions necessary for generating dynamic preprocessing pipelines #852
- Added kwargs to all components #863
- Updated *AutoSearchBase* to use dynamically generated preprocessing pipelines #870
- Added `SelectColumns` transformer #873
- Added ability to evaluate additional pipelines for automl search #874
- Added *default_parameters* class property to components and pipelines #879
- Added better support for disabling data checks in automl search #892
- Added ability to save and load AutoML objects to file #888
- Updated *AutoSearchBase.get_pipelines* to return an untrained pipeline instance #876
- Saved learned binary classification thresholds in automl results cv data dict #876

- **Fixes**

- Fixed bug where `SimpleImputer` cannot handle dropped columns #846
- Fixed bug where `PerColumnImputer` cannot handle dropped columns #855
- Enforce requirement that builtin components save all inputted values in their *parameters* dict #847
- Don't list base classes in *all_components* output #847
- Standardize all components to output pandas data structures, and accept either pandas or numpy #853
- Fixed rankings and *full_rankings* error when search has not been run #894

- **Changes**

- Update *all_pipelines* and *all_components* to try initializing pipelines/components, and on failure exclude them #849
- Refactor *handle_components* to *handle_components_class*, standardize to *ComponentBase* sub-class instead of instance #850
- Refactor “blacklist”/“whitelist” to “allow”/“exclude” lists #854
- Replaced *AutoClassificationSearch* and *AutoRegressionSearch* with *AutoMLSearch* #871
- Renamed *feature_importances* and *permutation_importances* methods to use singular names (*feature_importance* and *permutation_importance*) #883
- Updated *automl* default data splitter to train/validation split for large datasets #877
- Added open source license, update some repo metadata #887
- Removed dead code in *_get_preprocessing_components* #896

- **Documentation Changes**

- Fix some typos and update the EvalML logo #872

- **Testing Changes**

- Update the changelog check job to expect the new branching pattern for the deps update bot #836
- Check that all components output pandas datastructures, and can accept either pandas or numpy #853
- Replaced *AutoClassificationSearch* and *AutoRegressionSearch* with *AutoMLSearch* #871

Warning:

Breaking Changes

- Pipelines’ static *component_graph* field must contain either *ComponentBase* subclasses or *str*, instead of *ComponentBase* subclass instances #850
- Rename *handle_component* to *handle_component_class*. Now standardizes to *ComponentBase* subclasses instead of *ComponentBase* subclass instances #850
- Renamed *automl*’s *cv* argument to *data_split* #877
- Pipelines’ and classifiers’ *feature_importances* is renamed *feature_importance*, *graph_feature_importances* is renamed *graph_feature_importance* #883
- Passing *data_checks=None* to *automl* search will not perform any data checks as opposed to default checks. #892
- Pipelines to search for in AutoML are now determined automatically, rather than using the statically-defined pipeline classes. #870
- Updated *AutoSearchBase.get_pipelines* to return an untrained pipeline instance, instead of one which happened to be trained on the final cross-validation fold #876

v0.10.0 May 29, 2020

- **Enhancements**

- Added baseline models for classification and regression, add functionality to calculate baseline models before searching in AutoML #746

- Port over highly-null guardrail as a data check and define *DefaultDataChecks* and *DisableDataChecks* classes #745
- Update *Tuner* classes to work directly with pipeline parameters dicts instead of flat parameter lists #779
- Add Elastic Net as a pipeline option #812
- Added new Pipeline option *ExtraTrees* #790
- Added precision-recall curve metrics and plot for binary classification problems in *evalml.pipeline.graph_utils* #794
- Update the default automl algorithm to search in batches, starting with default parameters for each pipeline and iterating from there #793
- Added *AutoMLAlgorithm* class and *IterativeAlgorithm* impl, separated from *AutoSearchBase* #793
- **Fixes**
 - Update pipeline *score* to return *nan* score for any objective which throws an exception during scoring #787
 - Fixed bug introduced in #787 where binary classification metrics requiring predicted probabilities error in scoring #798
 - CatBoost and XGBoost classifiers and regressors can no longer have a learning rate of 0 #795
- **Changes**
 - Cleanup pipeline *score* code, and cleanup codecov #711
 - Remove *pass* for abstract methods for codecov #730
 - Added *__str__* for AutoSearch object #675
 - Add util methods to graph ROC and confusion matrix #720
 - Refactor *AutoBase* to *AutoSearchBase* #758
 - Updated AutoBase with *data_checks* parameter, removed previous *detect_label_leakage* parameter, and added functionality to run data checks before search in AutoML #765
 - Updated our logger to use Python’s logging utils #763
 - Refactor most of *AutoSearchBase._do_iteration* impl into *AutoSearchBase._evaluate* #762
 - Port over all guardrails to use the new DataCheck API #789
 - Expanded *import_or_raise* to catch all exceptions #759
 - Adds RMSE, MSLE, RMSLE as standard metrics #788
 - Don’t allow *Recall* to be used as an objective for AutoML #784
 - Removed feature selection from pipelines #819
 - Update default estimator parameters to make automl search faster and more accurate #793
- **Documentation Changes**
 - Add instructions to freeze *master* on *release.md* #726
 - Update release instructions with more details #727 #733
 - Add objective base classes to API reference #736
 - Fix components API to match other modules #747

- **Testing Changes**

- Delete codecov.yml, use codecov.io's default #732
- Added unit tests for fraud cost, lead scoring, and standard metric objectives #741
- Update codecov client #782
- Updated AutoBase `__str__` test to include no parameters case #783
- Added unit tests for *ExtraTrees* pipeline #790
- If codecov fails to upload, fail build #810
- Updated Python version of dependency action #816
- Update the dependency update bot to use a suffix when creating branches #817

Warning:

Breaking Changes

- The `detect_label_leakage` parameter for AutoML classes has been removed and replaced by a `data_checks` parameter #765
- Moved ROC and confusion matrix methods from `evalml.pipeline.plot_utils` to `evalml.pipeline.graph_utils` #720
- Tuner classes require a pipeline hyperparameter range dict as an init arg instead of a space definition #779
- `Tuner.propose` and `Tuner.add` work directly with pipeline parameters dicts instead of flat parameter lists #779
- `PipelineBase.hyperparameters` and `custom_hyperparameters` use pipeline parameters dict format instead of being represented as a flat list #779
- All guardrail functions previously under `evalml.guardrails.utils` will be removed and replaced by data checks #789
- *Recall* disallowed as an objective for AutoML #784
- AutoSearchBase parameter `tuner` has been renamed to `tuner_class` #793
- AutoSearchBase parameter `possible_pipelines` and `possible_model_families` have been renamed to `allowed_pipelines` and `allowed_model_families` #793

v0.9.0 Apr. 27, 2020

- **Enhancements**

- Added accuracy as a standard objective #624
- Added verbose parameter to `load_fraud` #560
- Added Balanced Accuracy metric for binary, multiclass #612 #661
- Added XGBoost regressor and XGBoost regression pipeline #666
- Added Accuracy metric for multiclass #672
- Added objective name in `AutoBase.describe_pipeline` #686
- Added *DataCheck* and *DataChecks*, *Message* classes and relevant subclasses #739

- **Fixes**

- Removed direct access to *cls.component_graph* #595
- Add testing files to .gitignore #625
- Remove circular dependencies from *Makefile* #637
- Add error case for *normalize_confusion_matrix()* #640
- Fixed XGBoostClassifier and XGBoostRegressor bug with feature names that contain [,], or < #659
- Update *make_pipeline_graph* to not accidentally create empty file when testing if path is valid #649
- Fix pip installation warning about docsutils version, from boto dependency #664
- Removed zero division warning for F1/precision/recall metrics #671
- Fixed *summary* for pipelines without estimators #707

- **Changes**

- Updated default objective for binary/multiseries classification to log loss #613
- Created classification and regression pipeline subclasses and removed objective as an attribute of pipeline classes #405
- Changed the output of *score* to return one dictionary #429
- Created binary and multiclass objective subclasses #504
- Updated objectives API #445
- Removed call to *get_plot_data* from AutoML #615
- Set *raise_error* to default to True for AutoML classes #638
- Remove unnecessary “u” prefixes on some unicode strings #641
- Changed one-hot encoder to return uint8 dtypes instead of ints #653
- Pipeline *_name* field changed to *custom_name* #650
- Removed *graphs.py* and moved methods into *PipelineBase* #657, #665
- Remove s3fs as a dev dependency #664
- Changed requirements-parser to be a core dependency #673
- Replace *supported_problem_types* field on pipelines with *problem_type* attribute on base classes #678
- Changed AutoML to only show best results for a given pipeline template in *rankings*, added *full_rankings* property to show all #682
- Update *ModelFamily* values: don’t list xgboost/catboost as classifiers now that we have regression pipelines for them #677
- Changed AutoML’s *describe_pipeline* to get problem type from pipeline instead #685
- Standardize *import_or_raise* error messages #683
- Updated argument order of objectives to align with sklearn’s #698
- Renamed *pipeline.feature_importance_graph* to *pipeline.graph_feature_importances* #700
- Moved ROC and confusion matrix methods to *evalml.pipelines.plot_utils* #704

- Renamed *MultiClassificationObjective* to *MulticlassClassificationObjective*, to align with pipeline naming scheme #715

- **Documentation Changes**

- Fixed some sphinx warnings #593
- Fixed docstring for AutoClassificationSearch with correct command #599
- Limit readthedocs formats to pdf, not htmlzip and epub #594 #600
- Clean up objectives API documentation #605
- Fixed function on Exploring search results page #604
- Update release process doc #567
- AutoClassificationSearch and AutoRegressionSearch show inherited methods in API reference #651
- Fixed improperly formatted code in breaking changes for changelog #655
- Added configuration to treat Sphinx warnings as errors #660
- Removed separate plotting section for pipelines in API reference #657, #665
- Have leads example notebook load S3 files using https, so we can delete s3fs dev dependency #664
- Categorized components in API reference and added descriptions for each category #663
- Fixed Sphinx warnings about BalancedAccuracy objective #669
- Updated API reference to include missing components and clean up pipeline docstrings #689
- Reorganize API ref, and clarify pipeline sub-titles #688
- Add and update preprocessing utils in API reference #687
- Added inheritance diagrams to API reference #695
- Documented which default objective AutoML optimizes for #699
- Create separate install page #701
- Include more utils in API ref, like *import_or_raise* #704
- Add more color to pipeline documentation #705

- **Testing Changes**

- Matched install commands of *check_latest_dependencies* test and it's GitHub action #578
- Added Github app to auto assign PR author as assignee #477
- Removed unneeded conda installation of xgboost in windows checkin tests #618
- Update graph tests to always use tmpfile dir #649
- Changelog checkin test workaround for release PRs: If 'future release' section is empty of PR refs, pass check #658
- Add changelog checkin test exception for *dep-update* branch #723

Warning: Breaking Changes

- Pipelines will now no longer take an objective parameter during instantiation, and will no longer have an objective attribute.

- `fit()` and `predict()` now use an optional `objective` parameter, which is only used in binary classification pipelines to fit for a specific objective.
- `score()` will now use a required `objectives` parameter that is used to determine all the objectives to score on. This differs from the previous behavior, where the pipeline's objective was scored on regardless.
- `score()` will now return one dictionary of all objective scores.
- ROC and ConfusionMatrix plot methods via `Auto(*).plot` have been removed by #615 and are replaced by `roc_curve` and `confusion_matrix` in `evalml.pipelines.plot_utils` in #704
- `normalize_confusion_matrix` has been moved to `evalml.pipelines.plot_utils` #704
- Pipelines `_name` field changed to `custom_name`
- Pipelines `supported_problem_types` field is removed because it is no longer necessary #678
- Updated argument order of objectives' `objective_function` to align with sklearn #698
- `pipeline.feature_importance_graph` has been renamed to `pipeline.graph_feature_importances` in #700
- Removed unsupported MSLE objective #704

v0.8.0 Apr. 1, 2020

- **Enhancements**

- Add normalization option and information to confusion matrix #484
- Add util function to drop rows with NaN values #487
- Renamed `PipelineBase.name` as `PipelineBase.summary` and redefined `PipelineBase.name` as class property #491
- Added access to parameters in Pipelines with `PipelineBase.parameters` (used to be return of `PipelineBase.describe`) #501
- Added `fill_value` parameter for SimpleImputer #509
- Added functionality to override component hyperparameters and made pipelines take hyperparameters from components #516
- Allow `numpy.random.RandomState` for `random_state` parameters #556

- **Fixes**

- Removed unused dependency `matplotlib`, and move `category_encoders` to test reqs #572

- **Changes**

- Undo version cap in XGBoost placed in #402 and allowed all released of XGBoost #407
- Support pandas 1.0.0 #486
- Made all references to the logger static #503
- Refactored `model_type` parameter for components and pipelines to `model_family` #507
- Refactored `problem_types` for pipelines and components into `supported_problem_types` #515
- Moved `pipelines/utils.save_pipeline` and `pipelines/utils.load_pipeline` to `PipelineBase.save` and `PipelineBase.load` #526
- Limit number of categories encoded by OneHotEncoder #517

- **Documentation Changes**

- Updated API reference to remove PipelinePlot and added moved PipelineBase plotting methods [#483](#)
- Add code style and github issue guides [#463](#) [#512](#)
- Updated API reference for to surface class variables for pipelines and components [#537](#)
- Fixed README documentation link [#535](#)
- Unhid PR references in changelog [#656](#)

- **Testing Changes**

- Added automated dependency check PR [#482](#), [#505](#)
- Updated automated dependency check comment [#497](#)
- Have build_docs job use python executor, so that env vars are set properly [#547](#)
- Added simple test to make sure OneHotEncoder's top_n works with large number of categories [#552](#)
- Run windows unit tests on PRs [#557](#)

Warning: Breaking Changes

- AutoClassificationSearch and AutoRegressionSearch's model_types parameter has been refactored into allowed_model_families
- ModelTypes enum has been changed to ModelFamily
- Components and Pipelines now have a model_family field instead of model_type
- get_pipelines utility function now accepts model_families as an argument instead of model_types
- PipelineBase.name no longer returns structure of pipeline and has been replaced by PipelineBase.summary
- PipelineBase.problem_types and Estimator.problem_types has been renamed to supported_problem_types
- pipelines/utils.save_pipeline and pipelines/utils.load_pipeline moved to PipelineBase.save and PipelineBase.load

v0.7.0 Mar. 9, 2020

- **Enhancements**

- Added emacs buffers to .gitignore [#350](#)
- Add CatBoost (gradient-boosted trees) classification and regression components and pipelines [#247](#)
- Added Tuner abstract base class [#351](#)
- Added n_jobs as parameter for AutoClassificationSearch and AutoRegressionSearch [#403](#)
- Changed colors of confusion matrix to shades of blue and updated axis order to match scikit-learn's [#426](#)
- Added PipelineBase graph and feature_importance_graph methods, moved from previous location [#423](#)
- Added support for python 3.8 [#462](#)

- **Fixes**
 - Fixed ROC and confusion matrix plots not being calculated if user passed own additional_objectives #276
 - Fixed ReadtheDocs FileNotFoundError exception for fraud dataset #439
- **Changes**
 - Added n_estimators as a tunable parameter for XGBoost #307
 - Remove unused parameter ObjectiveBase.fit_needs_proba #320
 - Remove extraneous parameter component_type from all components #361
 - Remove unused rankings.csv file #397
 - Downloaded demo and test datasets so unit tests can run offline #408
 - Remove _needs_fitting attribute from Components #398
 - Changed plot.feature_importance to show only non-zero feature importances by default, added optional parameter to show all #413
 - Refactored PipelineBase to take in parameter dictionary and moved pipeline metadata to class attribute #421
 - Dropped support for Python 3.5 #438
 - Removed unused apply.py file #449
 - Clean up requirements.txt to remove unused deps #451
 - Support installation without all required dependencies #459
- **Documentation Changes**
 - Update release.md with instructions to release to internal license key #354
- **Testing Changes**
 - Added tests for utils (and moved current utils to gen_utils) #297
 - Moved XGBoost install into it's own separate step on Windows using Conda #313
 - Rewind pandas version to before 1.0.0, to diagnose test failures for that version #325
 - Added dependency update checkin test #324
 - Rewind XGBoost version to before 1.0.0 to diagnose test failures for that version #402
 - Update dependency check to use a whitelist #417
 - Update unit test jobs to not install dev deps #455

Warning: Breaking Changes

- Python 3.5 will not be actively supported.

v0.6.0 Dec. 16, 2019

- **Enhancements**
 - Added ability to create a plot of feature importances #133
 - Add early stopping to AutoML using patience and tolerance parameters #241

- Added ROC and confusion matrix metrics and plot for classification problems and introduce PipelineSearchPlots class #242
- Enhanced AutoML results with search order #260
- Added utility function to show system and environment information #300
- **Fixes**
 - Lower botocore requirement #235
 - Fixed decision_function calculation for FraudCost objective #254
 - Fixed return value of Recall metrics #264
 - Components return *self* on fit #289
- **Changes**
 - Renamed automl classes to AutoRegressionSearch and AutoClassificationSearch #287
 - Updating demo datasets to retain column names #223
 - Moving pipeline visualization to PipelinePlots class #228
 - Standarizing inputs as pd.DataFrame / pd.Series #130
 - Enforcing that pipelines must have an estimator as last component #277
 - Added ipywidgets as a dependency in requirements.txt #278
 - Added Random and Grid Search Tuners #240
- **Documentation Changes**
 - Adding class properties to API reference #244
 - Fix and filter FutureWarnings from scikit-learn #249, #257
 - Adding Linear Regression to API reference and cleaning up some Sphinx warnings #227
- **Testing Changes**
 - Added support for testing on Windows with CircleCI #226
 - Added support for doctests #233

Warning: Breaking Changes

- The `fit()` method for `AutoClassifier` and `AutoRegressor` has been renamed to `search()`.
- `AutoClassifier` has been renamed to `AutoClassificationSearch`
- `AutoRegressor` has been renamed to `AutoRegressionSearch`
- `AutoClassificationSearch.results` and `AutoRegressionSearch.results` now is a dictionary with `pipeline_results` and `search_order` keys. `pipeline_results` can be used to access a dictionary that is identical to the old `.results` dictionary. Whereas, `search_order` returns a list of the search order in terms of `pipeline_id`.
- Pipelines now require an estimator as the last component in `component_list`. Slicing pipelines now throws an `NotImplementedError` to avoid returning pipelines without an estimator.

v0.5.2 Nov. 18, 2019

- **Enhancements**

- Adding basic pipeline structure visualization #211

- **Documentation Changes**

- Added notebooks to build process #212

v0.5.1 Nov. 15, 2019

- **Enhancements**

- Added basic outlier detection guardrail #151
- Added basic ID column guardrail #135
- Added support for unlimited pipelines with a max_time limit #70
- Updated .readthedocs.yaml to successfully build #188

- **Fixes**

- Removed MSLE from default additional objectives #203
- Fixed random_state passed in pipelines #204
- Fixed slow down in RFRegressor #206

- **Changes**

- Pulled information for describe_pipeline from pipeline's new describe method #190
- Refactored pipelines #108
- Removed guardrails from Auto(*) #202, #208

- **Documentation Changes**

- Updated documentation to show max_time enhancements #189
- Updated release instructions for RTD #193
- Added notebooks to build process #212
- Added contributing instructions #213
- Added new content #222

v0.5.0 Oct. 29, 2019

- **Enhancements**

- Added basic one hot encoding #73
- Use enums for model_type #110
- Support for splitting regression datasets #112
- Auto-infer multiclass classification #99
- Added support for other units in max_time #125
- Detect highly null columns #121
- Added additional regression objectives #100
- Show an interactive iteration vs. score plot when using fit() #134

- **Fixes**

- Reordered *describe_pipeline* #94
- Added type check for model_type #109

- Fixed `s` units when setting string `max_time` #132
- Fix objectives not appearing in API documentation #150
- **Changes**
 - Reorganized tests #93
 - Moved logging to its own module #119
 - Show progress bar history #111
 - Using cloudpickle instead of pickle to allow unloading of custom objectives #113
 - Removed `render.py` #154
- **Documentation Changes**
 - Update release instructions #140
 - Include `additional_objectives` parameter #124
 - Added Changelog #136
- **Testing Changes**
 - Code coverage #90
 - Added CircleCI tests for other Python versions #104
 - Added doc notebooks as tests #139
 - Test metadata for CircleCI and 2 core parallelism #137

v0.4.1 Sep. 16, 2019

- **Enhancements**
 - Added AutoML for classification and regressor using Autobase and Skopt #7 #9
 - Implemented standard classification and regression metrics #7
 - Added logistic regression, random forest, and XGBoost pipelines #7
 - Implemented support for custom objectives #15
 - Feature importance for pipelines #18
 - Serialization for pipelines #19
 - Allow fitting on objectives for optimal threshold #27
 - Added detect label leakage #31
 - Implemented callbacks #42
 - Allow for multiclass classification #21
 - Added support for additional objectives #79
- **Fixes**
 - Fixed feature selection in pipelines #13
 - Made `random_seed` usage consistent #45
- **Documentation Changes**
 - Documentation Changes
 - Added docstrings #6

- Created notebooks for docs #6
- Initialized readthedocs EvalML #6
- Added favicon #38

- **Testing Changes**

- Added testing for loading data #39

v0.2.0 Aug. 13, 2019

- **Enhancements**

- Created fraud detection objective #4

v0.1.0 July. 31, 2019

- *First Release*

- **Enhancements**

- Added lead scoring objective #1
 - Added basic classifier #1

- **Documentation Changes**

- Initialized Sphinx for docs #1
