**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit(*self*, *X*, *y*)**

Fits the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**fit\_transform(*self*, *X*, *y*)**

Fit and transform data using the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**get\_feature\_names(*self*)**

Return feature names for the input features after fitting.

**Returns** The feature names after encoding.

**Return type** `np.array`

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transform data using the fitted target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.TargetImputer*(*impute\_strategy*='most\_frequent', *fill\_value*=*None*, *random\_seed*=0, *\*\*kwargs*)

Imputes missing target data according to a specified imputation strategy.

**Parameters**

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types. Defaults to “most\_frequent”.
- **fill\_value** (*string*) – When *impute\_strategy* == “constant”, *fill\_value* is used to replace missing data. Defaults to None which uses 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                                                            |
|-------------------------------|------------------------------------------------------------|
| <b>hyper-parameter_ranges</b> | { "impute_strategy": ["mean", "median", "most_frequent"] } |
| <b>modifies_features</b>      | False                                                      |
| <b>modifies_target</b>        | True                                                       |
| <b>name</b>                   | Target Imputer                                             |
| <b>training_only</b>          | False                                                      |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.                |
| <i>fit_transform</i>      | Fits on and transforms the input target data.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |

| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y*)

Fits imputer to target data. ‘None’ values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]`. Ignored.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** *self*

**Raises** **TypeError** – If target is filled with all null values.

**fit\_transform**(*self*, *X*, *y*)

Fits on and transforms the input target data.

**Parameters**

- **X** (*pd.DataFrame*) – Features. Ignored.
- **y** (*pd.Series*) – Target data to impute.

**Returns** The original *X*, transformed *y*

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*)

Transforms input target data by imputing missing values. ‘None’ and `np.nan` values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Features. Ignored.

- **y** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (pd.DataFrame, pd.Series)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**TimeSeriesBaselineEstimator**(*gap=1*, *forecast\_horizon=1*, *random\_seed=0*, *\*\*kwargs*)

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

**Parameters**

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast\_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>hyper-parameter_ranges</b>  | {}                                                                                                            |

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits time series baseline estimator to data.                                                                                     |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted time series baseline estimator.                                                                    |
| <code>predict_proba</code>            | Make prediction probabilities using fitted time series baseline estimator.                                                       |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** *self*

**Raises** **ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted time series baseline estimator.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises** **ValueError** – If input `y` is `None`.

**predict\_proba**(*self*, *X*)

Make prediction probabilities using fitted time series baseline estimator.

**Parameters** *X* (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted probability values.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If input `y` is `None`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.TimeSeriesFeaturizer(time_index=None, max_delay=2, gap=0,
                                                    forecast_horizon=1, conf_level=0.05,
                                                    rolling_window_size=0.25,
                                                    delay_features=True, delay_target=True,
                                                    random_seed=0, **kwargs)
```

Transformer that delays input features and target variable for time series problems.

This component uses an algorithm based on the autocorrelation values of the target variable to determine which lags to select from the set of all possible lags.

The algorithm is based on the idea that the local maxima of the autocorrelation function indicate the lags that have the most impact on the present time.

The algorithm computes the autocorrelation values and finds the local maxima, called “peaks”, that are significant at the given `conf_level`. Since lags in the range `[0, 10]` tend to be predictive but not local maxima, the union of the peaks is taken with the significant lags in the range `[0, 10]`. At the end, only selected lags in the range `[0, max_delay]` are used.

Parametrizing the algorithm by `conf_level` lets the `AutoMLAlgorithm` tune the set of lags chosen so that the chances of finding a good set of lags is higher.

Using `conf_level` value of 1 selects all possible lags.

**Parameters**

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **max\_delay** (*int*) – Maximum number of time units to delay each feature. Defaults to 2.

- **forecast\_horizon** (*int*) – The number of time periods the pipeline is expected to forecast.
- **conf\_level** (*float*) – Float in range (0, 1] that determines the confidence interval size used to select which lags to compute from the set of [1, max\_delay]. A delay of 1 will always be computed. If 1, selects all possible lags in the set of [1, max\_delay], inclusive.
- **rolling\_window\_size** (*float*) – Float in range (0, 1] that determines the size of the window used for rolling features. Size is computed as rolling\_window\_size \* max\_delay.
- **delay\_features** (*bool*) – Whether to delay the input features. Defaults to True.
- **delay\_target** (*bool*) – Whether to delay the target. Defaults to True.
- **gap** (*int*) – The number of time units between when the features are collected and when the target is collected. For example, if you are predicting the next time step’s target, gap=1. This is only needed because when gap=0, we need to be sure to start the lagging of the target variable at 1. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

#### Attributes

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits the DelayFeatureTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises ValueError** – if self.time\_index is None

**fit\_transform(*self*, *X*, *y=None*)**

Fit the component and transform the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X.

**Return type** pd.DataFrame

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**save(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the delayed values and rolling means for *X* and *y*.

The chosen delays are determined by the autocorrelation function of the target variable. See the class docstring for more information on how they are chosen. If *y* is *None*, all possible lags are chosen.

If *y* is not *None*, it will also compute the delayed values for the target variable.

The rolling means for all numeric features in *X* and *y*, if *y* is numeric, are also returned.

#### Parameters

- **X** (*pd.DataFrame* or *None*) – Data to transform. *None* is expected when only the target variable is being used.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed *X*. No original features are returned.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

```
class evalml.pipelines.components.TimeSeriesImputer(categorical_impute_strategy='forwards_fill',  
                                                    numeric_impute_strategy='interpolate',  
                                                    target_impute_strategy='forwards_fill',  
                                                    random_seed=0, **kwargs)
```

Imputes missing data according to a specified timeseries-specific imputation strategy.

This Transformer should be used after the *TimeSeriesRegularizer* in order to impute the missing values that were added to *X* and *y* (if passed).

#### Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “backwards\_fill” and “forwards\_fill”. Defaults to “forwards\_fill”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “interpolate”.
- **target\_impute\_strategy** (*string*) – Impute strategy to use for the target column. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “forwards\_fill”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Raises** **ValueError** – If *categorical\_impute\_strategy*, *numeric\_impute\_strategy*, or *target\_impute\_strategy* is not one of the valid values.

| <b>training_only</b>          | True                                                                                                                                                                                                                                 |

## Methods

|                           |                                                                                                                                                                                   |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                             |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                          |
| <i>fit</i>                | Fits imputer to data.                                                                                                                                                             |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                       |
| <i>load</i>               | Loads component at file path.                                                                                                                                                     |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                                  |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                               |
| <i>save</i>               | Saves component at file path.                                                                                                                                                     |
| <i>transform</i>          | Transforms data X by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

#### Parameters

- **print\_name** (bool, optional) – whether to print name of component
- **return\_dict** (bool, optional) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits imputer to data.

'None' values are converted to `np.nan` before imputation and are treated as the same. If a value is missing at the beginning or end of a column, that value will be imputed using backwards fill or forwards fill as necessary, respectively.

**Parameters**

- **X** (*pd.DataFrame*, *np.ndarray*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Optionally, target data to transform.

**Returns** Transformed *X* and *y*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.TimeSeriesRegularizer(time_index=None,
                                                         frequency_payload=None,
                                                         window_length=4, threshold=0.4,
                                                         random_seed=0, **kwargs)
```

Transformer that regularizes an inconsistently spaced datetime column.

If *X* is passed in to fit/transform, the column *time\_index* will be checked for an inferrable offset frequency. If the *time\_index* column is perfectly inferrable then this Transformer will do nothing and return the original *X* and *y*.

If *X* does not have a perfectly inferrable frequency but one can be estimated, then *X* and *y* will be reformatted based on the estimated frequency for *time\_index*. In the original *X* and *y* passed: - Missing datetime values will be added and will have their corresponding columns in *X* and *y* set to None. - Duplicate datetime values will be dropped. - Extra datetime values will be dropped. - If it can be determined that a duplicate or extra value is misaligned, then it will be repositioned to take the place of a missing value.

This Transformer should be used before the *TimeSeriesImputer* in order to impute the missing values that were added to *X* and *y* (if passed).

**Parameters**

- **time\_index** (*string*) – Name of the column containing the datetime information used to order the data, required. Defaults to None.
- **frequency\_payload** (*tuple*) – Payload returned from Woodwork's *infer\_frequency* function where *debug* is True. Defaults to None.
- **window\_length** (*int*) – The size of the rolling window over which inference is conducted to determine the prevalence of unferrable frequencies.
- **5.** (*Lower values make this component more sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **threshold** (*float*) – The minimum percentage of windows that need to have been able to infer a frequency. Lower values make this component more
- **0.8.** (*sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

- **0.** (*Defaults to*) –

Raises **ValueError** – if the `frequency_payload` parameter has not been passed a tuple

| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits the TimeSeriesRegularizer.                                                                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Regularizes a dataframe and target data to an in-ferrable offset frequency.                                                                                                              |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits the TimeSeriesRegularizer.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – if self.time\_index is None, if X and y have different lengths, if *time\_index* in X does not have an offset frequency that can be estimated
- **TypeError** – if the *time\_index* column is not of type Datetime
- **KeyError** – if the *time\_index* column doesn't exist

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Regularizes a dataframe and target data to an inferrable offset frequency.

A ‘clean’ *X* and *y* (if *y* was passed in) are created based on an inferrable offset frequency and matching datetime values with the original *X* and *y* are imputed into the clean *X* and *y*. Datetime values identified as misaligned are shifted into their appropriate position.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Data with an inferrable *time\_index* offset frequency.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**Transformer**(*parameters=None*, *component\_obj=None*,  
*random\_seed=0*, *\*\*kwargs*)

A component that may or may not need fitting that transforms data. These components are used before an estimator.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an *\_\_init\_\_* method which sets up any necessary state and objects. Make sure your *\_\_init\_\_* only uses standard keyword arguments and calls *super().\_\_init\_\_()* with a parameters dict. You may also override the *fit*, *transform*, *fit\_transform* and other methods in this class if appropriate.

To see some examples, check out the definitions of any Transformer component.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|--------------------------------|-------|
| <b>modi-<br/>fies_features</b> | True  |
| <b>modi-<br/>fies_target</b>   | False |
| <b>train-<br/>ing_only</b>     | False |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>name</code>               | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.**Undersampler**(*sampling\_ratio=0.25*, *sampling\_ratio\_dict=None*, *min\_samples=100*, *min\_percentage=0.1*, *random\_seed=0*, *\*\*kwargs*)

Initializes an undersampling transformer to downsample the majority classes in the dataset.

This component is only run during training and not during predict.

#### Parameters

- **sampling\_ratio** (*float*) – The smallest minority:majority ratio that is accepted as ‘balanced’. For instance, a 1:4 ratio would be represented as 0.25, while a 1:1 ratio is 1.0. Must be between 0 and 1, inclusive. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: `sampling_ratio_dict={0: 0.5, 1: 1}`, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don’t sample class 1. Overrides `sampling_ratio` if provided. Defaults to None.
- **min\_samples** (*int*) – The minimum number of samples that we must have for any class, pre or post sampling. If a class must be downsampled, it will not be downsampled past this value. To determine severe imbalance, the minority class must occur less often than this and must have a class ratio below `min_percentage`. Must be greater than 0. Defaults to 100.
- **min\_percentage** (*float*) – The minimum percentage of the minimum class to total dataset that we tolerate, as long as it is above `min_samples`. If `min_percentage` and `min_samples` are not met, treat this as severely imbalanced, and we will not resample the data. Must be between 0 and 0.5, inclusive. Defaults to 0.1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

#### Raises

- **ValueError** – If `sampling_ratio` is not in the range (0, 1].
- **ValueError** – If `min_sample` is not greater than 0.
- **ValueError** – If `min_percentage` is not between 0 and 0.5, inclusive.

#### Attributes

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the sampler to the data.                                                                                                    |
| <code>fit_resample</code>       | Resampling technique for this sampler.                                                                                           |
| <code>fit_transform</code>      | Fit and transform data using the sampler component.                                                                              |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms the input data by sampling the data.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y)`

Fits the sampler to the data.

#### Parameters

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Target.

**Returns** self

**Raises** **ValueError** – If y is None.

**fit\_resample**(*self*, *X*, *y*)

Resampling technique for this sampler.

**Parameters**

- **X** (*pd.DataFrame*) – Training data to fit and resample.
- **y** (*pd.Series*) – Training data targets to fit and resample.

**Returns** Indices to keep for training data.

**Return type** list

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (pd.DataFrame, pd.Series)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by sampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** pd.DataFrame, pd.Series

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**URLFeaturizer**(*random\_seed=0*, *\*\*kwargs*)

Transformer that can automatically extract features from URL.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                |
|-------------------------------|----------------|
| <b>hyper-parameter_ranges</b> | {}             |
| <b>modifies_features</b>      | True           |
| <b>modifies_target</b>        | False          |
| <b>name</b>                   | URL Featurizer |
| <b>training_only</b>          | False          |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.VowpalWabbitBinaryClassifier(loss_function='logistic',  
                                                             learning_rate=0.5,  
                                                             decay_learning_rate=1.0,  
                                                             power_t=0.5, passes=1,  
                                                             random_seed=0, **kwargs)
```

Vowpal Wabbit Binary Classifier.

**Parameters**

- **loss\_function** (*str*) – Specifies the loss function to use. One of {"squared", "classic", "hinge", "logistic", "quantile"}. Defaults to "logistic".
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance for Vowpal Wabbit classifiers. This is not implemented.                                                       |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.VowpalWabbitMulticlassClassifier(loss_function='logistic',
                                                                    learning_rate=0.5,
                                                                    decay_learning_rate=1.0,
                                                                    power_t=0.5, passes=1,
                                                                    random_seed=0, **kwargs)
```

Vowpal Wabbit Multiclass Classifier.

**Parameters**

- **loss\_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.VowpalWabbitRegressor(learning_rate=0.5,  
                                                         decay_learning_rate=1.0, power_t=0.5,  
                                                         passes=1, random_seed=0, **kwargs)
```

Vowpal Wabbit Regressor.

**Parameters**

- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.

- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for Vowpal Wabbit regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.XGBoostClassifier(eta=0.1, max_depth=6, min_child_weight=1,
                                                    n_estimators=100, random_seed=0,
                                                    eval_metric='logloss', n_jobs=12, **kwargs)
```

XGBoost Classifier.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.

- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted XGBoost classifier.                                                                                 |
| <i>fit</i>                      | Fits XGBoost classifier component to data.                                                                                       |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted XGBoost classifier.                                                                            |
| <i>predict_proba</i>            | Make predictions using the fitted CatBoost classifier.                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**property feature\_importance(*self*)**

Feature importance of fitted XGBoost classifier.

**fit(*self*, *X*, *y=None*)**

Fits XGBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** `self`

**get\_prediction\_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted XGBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.DataFrame

**predict\_proba**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.DataFrame

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.components.XGBoostRegressor**(*eta: float = 0.1*, *max\_depth: int = 6*,  
*min\_child\_weight: int = 1*, *n\_estimators: int = 100*, *random\_seed: Union[int, float] = 0*, *n\_jobs: int = 12*, *\*\*kwargs*)

XGBoost Regressor.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.

- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance(*self*) → pandas.Series**

Feature importance of fitted XGBoost regressor.

**fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)**

Fits XGBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** *self*

**get\_prediction\_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted XGBoostRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**Submodules****binary\_classification\_pipeline**

Pipeline subclass for all binary classification pipelines.

|-------------------------------------|------------------------------------------------------------|
| <i>BinaryClassificationPipeline</i> | Pipeline subclass for all binary classification pipelines. |
|-------------------------------------|------------------------------------------------------------|

### Contents

```
class evalml.pipelines.binary_classification_pipeline.BinaryClassificationPipeline(component_graph,
                                                                                   parameters=None,
                                                                                   custom_name=None,
                                                                                   random_seed=0)
```

Pipeline subclass for all binary classification pipelines.

#### Parameters

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – ComponentGraph instance, list of components in order, or dictionary of components. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Example

```
>>> pipeline = BinaryClassificationPipeline(component_graph=["Simple Imputer",
↳ "Logistic Regression Classifier"],
...                                           parameters={"Logistic Regression_
↳ Classifier": {"penalty": "elasticnet",
...
↳ "solver": "liblinear"}},
...                                           custom_name="My Binary Pipeline")
>>> assert pipeline.custom_name == "My Binary Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {  
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},  
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',  
...                                       'C': 1.0,  
...                                       'n_jobs': -1,  
...                                       'multi_class': 'auto',  
...                                       'solver': 'liblinear'}}}
```

#### Methods

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <i>optimize_threshold</i>                | Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.                                             |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Make predictions using selected features.                                                                                                                                            |
| <i>predict_proba</i>                     | Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.                                                                        |
| <i>save</i>                              | Saves pipeline at file path.                                                                                                                                                         |
| <i>score</i>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <i>summary</i>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <i>threshold</i>                         | Threshold used to make a prediction. Defaults to None.                                                                                                                               |
| <i>transform</i>                         | Transform the input.                                                                                                                                                                 |
| <i>transform_all_but_final</i>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*) – The target data of length [*n\_samples*].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** *dag\_dict* (*dict*)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**optimize\_threshold**(*self*, *X*, *y*, *y\_pred\_proba*, *objective*)

Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Input target values.
- **y\_pred\_proba** (*pd.Series*) – The predicted probabilities of the target outputted by the pipeline.

- **objective** (*ObjectiveBase*) – The objective to threshold with. Must have a tunable threshold.

**Raises** **ValueError** – If objective is not optimizable.

**property** **parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Make predictions using selected features.

Note: we cast y as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** pd.Series

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series or None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** pd.Series

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]

- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**property threshold**(*self*)

Threshold used to make a prediction. Defaults to None.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** pd.DataFrame

## binary\_classification\_pipeline\_mixin

Binary classification pipeline mix-in class.

#### class

`evalml.pipelines.binary_classification_pipeline_mixin.BinaryClassificationPipelineMixin`

Binary classification pipeline mix-in class.

#### Methods

|                           |                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>optimize_threshold</i> | Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned. |
| <i>threshold</i>          | Threshold used to make a prediction. Defaults to None.                                                                                   |

**optimize\_threshold**(*self*, *X*, *y*, *y\_pred\_proba*, *objective*)

Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.

#### Parameters

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Input target values.
- **y\_pred\_proba** (*pd.Series*) – The predicted probabilities of the target outputted by the pipeline.
- **objective** (*ObjectiveBase*) – The objective to threshold with. Must have a tunable threshold.

**Raises ValueError** – If objective is not optimizable.

**property threshold**(*self*)

Threshold used to make a prediction. Defaults to None.

#### classification\_pipeline

Pipeline subclass for all classification pipelines.

|-----------------------------------------------|-----------------------------------------------------|
| <a href="#"><i>ClassificationPipeline</i></a> | Pipeline subclass for all classification pipelines. |
|-----------------------------------------------|-----------------------------------------------------|

---

### Contents

```
class evalml.pipelines.classification_pipeline.ClassificationPipeline(component_graph,
                                                                    parameters=None,
                                                                    custom_name=None,
                                                                    random_seed=0)
```

Pipeline subclass for all classification pipelines.

#### Parameters

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                     |      |
|---------------------|------|
| <b>problem_type</b> | None |
|---------------------|------|

#### Methods

|                                                |                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>classes_</code>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>predict_proba</code>                     | Make probability estimates for labels.                                                                                                                                               |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property** **classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static** **create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property** **custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property** **feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self, name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self, custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self, filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self, importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** *y* (`pd.Series`) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path*: `Union[str, io.BytesIO]`)

Loads pipeline at file path.

**Parameters** **file\_path** (`str/BytesIO`) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (`dict`) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self*, *X*, *objective*=`None`, *X\_train*=`None`, *y\_train*=`None`)

Make predictions using selected features.

Note: we cast *y* as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **objective** (`Object or string`) – The objective to use to make predictions.
- **X\_train** (`pd.DataFrame`) – Training data. Ignored. Only used for time series.

- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is not an estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]
- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**transform\_all\_but\_final** (*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

#### Parameters

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** `pd.DataFrame`

## component\_graph

Component graph for a pipeline as a directed acyclic graph (DAG).

## Module Contents

## Contents

**class** `evalml.pipelines.component_graph.ComponentGraph` (*component\_dict=None*, *cached\_data=None*, *random\_seed=0*)

Component graph for a pipeline as a directed acyclic graph (DAG).

#### Parameters

- **component\_dict** (*dict*) – A dictionary which specifies the components and edges between components that should be used to create the component graph. Defaults to *None*.
- **cached\_data** (*dict*) – A dictionary of nested cached data. If the hashes and components are in this cache, we skip fitting for these components. Expected to be of format `{hash1: {component_name: trained_component, ... }, hash2: {...}, ... }`. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Examples

```
>>> component_dict = {'Imputer': ['Imputer', 'X', 'y'],
...                   'Logistic Regression': ['Logistic Regression Classifier',
...                                           ↪ 'Imputer.x', 'y']}

```

## Methods

|                                                 |                                                                                                                                                                                                                       |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>compute_order</code>                      | The order that components will be computed or called in.                                                                                                                                                              |
| <code>default_parameters</code>                 | The default parameter dictionary for this pipeline.                                                                                                                                                                   |
| <code>describe</code>                           | Outputs component graph details including component parameters.                                                                                                                                                       |
| <code>fit</code>                                | Fit each component in the graph.                                                                                                                                                                                      |
| <code>fit_and_transform_all_but_final</code>    | Fit and transform all components save the final one, usually an estimator.                                                                                                                                            |
| <code>fit_transform</code>                      | Fit and transform all components in the component graph, if all components are Transformers.                                                                                                                          |
| <code>generate_order</code>                     | Regenerated the topologically sorted order of the graph.                                                                                                                                                              |
| <code>get_component</code>                      | Retrieves a single component object from the graph.                                                                                                                                                                   |
| <code>get_component_input_logical_types</code>  | Get the logical types that are passed to the given component.                                                                                                                                                         |
| <code>get_estimators</code>                     | Gets a list of all the estimator components within this graph.                                                                                                                                                        |
| <code>get_inputs</code>                         | Retrieves all inputs for a given component.                                                                                                                                                                           |
| <code>get_last_component</code>                 | Retrieves the component that is computed last in the graph, usually the final estimator.                                                                                                                              |
| <code>graph</code>                              | Generate an image representing the component graph.                                                                                                                                                                   |
| <code>has_dfs</code>                            | Whether this component graph contains a DFSTransformer or not.                                                                                                                                                        |
| <code>instantiate</code>                        | Instantiates all uninstantiated components within the graph using the given parameters. An error will be raised if a component is already instantiated but the parameters dict contains arguments for that component. |
| <code>inverse_transform</code>                  | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                                                     |
| <code>last_component_input_logical_types</code> | Get the logical types that are passed to the last component in the pipeline.                                                                                                                                          |
| <code>predict</code>                            | Make predictions using selected features.                                                                                                                                                                             |
| <code>transform</code>                          | Transform the input using the component graph.                                                                                                                                                                        |
| <code>transform_all_but_final</code>            | Transform all components save the final one, and gathers the data from any number of parents to get all the information that should be fed to the final component.                                                    |

**property** `compute_order(self)`

The order that components will be computed or called in.

**property** `default_parameters(self)`

The default parameter dictionary for this pipeline.

**Returns** Dictionary of all component default parameters.

**Return type** dict

**describe**(*self*, *return\_dict=False*)

Outputs component graph details including component parameters.

**Parameters** `return_dict` (*bool*) – If True, return dictionary of information about component

graph. Defaults to False.

**Returns** Dictionary of all component parameters if `return_dict` is True, else None

**Return type** dict

**Raises** **ValueError** – If the componentgraph is not instantiated

**fit**(*self*, *X*, *y*)

Fit each component in the graph.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**fit\_and\_transform\_all\_but\_final**(*self*, *X*, *y*)

Fit and transform all components save the final one, usually an estimator.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** Transformed features and target.

**Return type** Tuple (pd.DataFrame, pd.Series)

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**classmethod generate\_order**(*cls*, *component\_dict*)

Regenerated the topologically sorted order of the graph.

**get\_component**(*self*, *component\_name*)

Retrieves a single component object from the graph.

**Parameters** **component\_name** (*str*) – Name of the component to retrieve

**Returns** ComponentBase object

**Raises** **ValueError** – If the component is not in the graph.

**get\_component\_input\_logical\_types**(*self*, *component\_name*)

Get the logical types that are passed to the given component.

**Parameters** **component\_name** (*str*) – Name of component in the graph

**Returns** Dict - Mapping feature name to logical type instance.

**Raises**

- **ValueError** – If the component is not in the graph.
- **ValueError** – If the component graph has not been fitted

**get\_estimators**(*self*)

Gets a list of all the estimator components within this graph.

**Returns** All estimator objects within the graph.

**Return type** list

**Raises** **ValueError** – If the component graph is not yet instantiated.

**get\_inputs**(*self*, *component\_name*)

Retrieves all inputs for a given component.

**Parameters** **component\_name** (*str*) – Name of the component to look up.

**Returns** List of inputs for the component to use.

**Return type** list[*str*]

**Raises** **ValueError** – If the component is not in the graph.

**get\_last\_component**(*self*)

Retrieves the component that is computed last in the graph, usually the final estimator.

**Returns** ComponentBase object

**Raises** **ValueError** – If the component graph has no edges.

**graph**(*self*, *name=None*, *graph\_format=None*)

Generate an image representing the component graph.

**Parameters**

- **name** (*str*) – Name of the graph. Defaults to None.
- **graph\_format** (*str*) – file format to save the graph in. Defaults to None.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises** **RuntimeError** – If graphviz is not installed.

**property has\_dfs**(*self*)

Whether this component graph contains a DFSTransformer or not.

**instantiate**(*self*, *parameters=None*)

Instantiates all uninstantiated components within the graph using the given parameters. An error will be raised if a component is already instantiated but the parameters dict contains arguments for that component.

**Parameters** **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} or None implies using all default values for component parameters. If a component in the component graph is already instantiated, it will not use any of its parameters defined in this dictionary. Defaults to None.

**Returns** *self*

**Raises** **ValueError** – If component graph is already instantiated or if a component errored while instantiating.

**inverse\_transform**(*self*, *y*)

Apply component inverse\_transform methods to estimator predictions in reverse order.

Components that implement inverse\_transform are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** *y* – (pd.Series): Final component features.

**Returns** The target with inverse transformation applied.

**Return type** pd.Series

**property last\_component\_input\_logical\_types**(*self*)

Get the logical types that are passed to the last component in the pipeline.

**Returns** Dict - Mapping feature name to logical type instance.

**Raises**

- **ValueError** – If the component is not in the graph.
- **ValueError** – If the component graph as not been fitted

**predict**(*self*, *X*)

Make predictions using selected features.

**Parameters** *X* (pd.DataFrame) – Input features of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **ValueError** – If final component is not an Estimator.

**transform**(*self*, *X*, *y=None*)

Transform the input using the component graph.

**Parameters**

- *X* (pd.DataFrame) – Input features of shape [n\_samples, n\_features].
- *y* (pd.Series) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is not a Transformer.

**transform\_all\_but\_final**(*self*, *X*, *y=None*)

Transform all components save the final one, and gathers the data from any number of parents to get all the information that should be fed to the final component.

**Parameters**

- *X* (pd.DataFrame) – Data of shape [n\_samples, n\_features].
- *y* (pd.Series) – The target training data of length [n\_samples]. Defaults to None.

**Returns** Transformed values.

**Return type** pd.DataFrame

evalml.pipelines.component\_graph.logger

## multiclass\_classification\_pipeline

Pipeline subclass for all multiclass classification pipelines.

### Module Contents

#### Classes Summary

|                                                         |                                                                |
|---------------------------------------------------------|----------------------------------------------------------------|
| <i><a href="#">MulticlassClassificationPipeline</a></i> | Pipeline subclass for all multiclass classification pipelines. |
|---------------------------------------------------------|----------------------------------------------------------------|

### Contents

```

class evalml.pipelines.multiclass_classification_pipeline.MulticlassClassificationPipeline(component_graph,
                                             parameters=None,
                                             custom_name=None,
                                             random_seed=0)

```

Pipeline subclass for all multiclass classification pipelines.

#### Parameters

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or *None* implies using all default values for component parameters. Defaults to *None*.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = MulticlassClassificationPipeline(component_graph=["Simple Imputer",
↳ "Logistic Regression Classifier"],
...                                           parameters={"Logistic Regression_
↳ Classifier": {"penalty": "elasticnet",
...
↳ "solver": "liblinear"}}},
...                                           custom_name="My Multiclass Pipeline
↳ ")
...
>>> assert pipeline.custom_name == "My Multiclass Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                       'C': 1.0,
...                                       'n_jobs': -1,
...                                       'multi_class': 'auto',
...                                       'solver': 'liblinear'}}
```

| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>classes_</code>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>predict_proba</code>                     | Make probability estimates for labels.                                                                                                                                               |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property** **classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static** **create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property** **custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property** **feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self, name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self, custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self, filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self, importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** *y* (`pd.Series`) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path*: `Union[str, io.BytesIO]`)

Loads pipeline at file path.

**Parameters** **file\_path** (`str/BytesIO`) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (`dict`) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self*, *X*, *objective*=`None`, *X\_train*=`None`, *y\_train*=`None`)

Make predictions using selected features.

Note: we cast *y* as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **objective** (`Object or string`) – The objective to use to make predictions.
- **X\_train** (`pd.DataFrame`) – Training data. Ignored. Only used for time series.

- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is not an estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]
- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**transform\_all\_but\_final** (*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** `pd.DataFrame`

## pipeline\_base

Base machine learning pipeline class.

`evalml.pipelines.pipeline_base.logger`

**class** `evalml.pipelines.pipeline_base.PipelineBase` (*component\_graph*, *parameters=None*,  
*custom\_name=None*, *random\_seed=0*)

Machine learning pipeline.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component's index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier]

will have names ["Imputer", "One Hot Encoder", "Imputer\_2", "Logistic Regression Classifier"].

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a model.                                                                                                                                                                       |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**abstract fit**(*self*, *X*, *y*)

Build a model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** *custom\_hyperparameters* (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** *filepath* (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** *importance\_threshold* (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load**(*file\_path*: Union[str, io.BytesIO])

Loads pipeline at file path.

**Parameters** **file\_path** (str/BytesIO) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (dict) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (int) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective*=None, *X\_train*=None, *y\_train*=None)

Make predictions using selected features.

**Parameters**

- **X** (pd.DataFrame, or np.ndarray) – Data of shape [n\_samples, n\_features].
- **objective** (Object or string) – The objective to use to make predictions.
- **X\_train** (pd.DataFrame or np.ndarray or None) – Training data. Ignored. Only used for time series.
- **y\_train** (pd.Series or None) – Training labels. Ignored. Only used for time series.

**Returns** Predicted values.

**Return type** pd.Series

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves pipeline at file path.

**Parameters**

- **file\_path** (str) – Location to save file.
- **pickle\_protocol** (int) – The pickle data stream format.

**abstract score**(*self*, *X*, *y*, *objectives*, *X\_train*=None, *y\_train*=None)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

## pipeline\_meta

Metaclass that overrides creating a new pipeline by wrapping methods with validators and setters.

### Contents

#### `class evalml.pipelines.pipeline_meta.PipelineBaseMeta`

Metaclass that overrides creating a new pipeline by wrapping methods with validators and setters.

##### Attributes

|                            |                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------|
| <b>FIT_METHODS</b>         | ['fit', 'fit_transform']                                                              |
| <b>METHODS_TO_CHECK</b>    | ['predict', 'predict_proba', 'transform', 'inverse_transform', 'get_trend_dataframe'] |
| <b>PROPERTIES_TO_CHECK</b> | ['feature_importance']                                                                |

##### Methods

|                      |                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------|
| <i>check_for_fit</i> | <i>check_for_fit</i> wraps a method that validates if <i>self._is_fitted</i> is <i>True</i> . |
| <i>register</i>      | Register a virtual subclass of an ABC.                                                        |
| <i>set_fit</i>       | Wrapper for the fit method.                                                                   |

#### `classmethod check_for_fit(cls, method)`

*check\_for\_fit* wraps a method that validates if *self.\_is\_fitted* is *True*.

**Parameters** *method* (*callable*) – Method to wrap.

**Returns** The wrapped method.

**Raises** **PipelineNotYetFittedError** – If pipeline is not yet fitted.

#### `register(cls, subclass)`

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

#### `classmethod set_fit(cls, method)`

Wrapper for the fit method.

## regression\_pipeline

Pipeline subclass for all regression pipelines.

### Module Contents

|---------------------------|-------------------------------------------------|
| <i>RegressionPipeline</i> | Pipeline subclass for all regression pipelines. |
|---------------------------|-------------------------------------------------|

---

### Contents

```
class evalml.pipelines.regression_pipeline.RegistrationPipeline(component_graph,  
                                                                parameters=None,  
                                                                custom_name=None,  
                                                                random_seed=0)
```

Pipeline subclass for all regression pipelines.

#### Parameters

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or *None* implies using all default values for component parameters. Defaults to *None*.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Example

```
>>> pipeline = RegressionPipeline(component_graph=["Simple Imputer", "Linear_↵  
↵Regressor"],  
                                parameters={"Simple Imputer": {"impute_strategy":  
↵↵"mean"}},  
                                custom_name="My Regression Pipeline")  
>>> assert pipeline.custom_name == "My Regression Pipeline"  
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',  
↵↵'Linear Regressor'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {  
...     'Simple Imputer': {'impute_strategy': 'mean', 'fill_value': None},  
...     'Linear Regressor': {'fit_intercept': True, 'n_jobs': -1}}
```

|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a regression model.                                                                                                                                                            |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** *objective* (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a regression model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **ValueError** – If the target is not numeric.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** *custom\_hyperparameters* (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** *filepath* (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** *dag\_dict* (*dict*)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** *importance\_threshold* (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** *plotly.Figure*

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are *PolynomialDecomposer*, *LogTransformer*, *LabelEncoder* (*tbd*).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** *pd.Series*

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self, parameters, random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self, X, objective=None, X\_train=None, y\_train=None*)

Make predictions using selected features.

**Parameters**

- **X** (*pd.DataFrame, or np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series or None*) – Training labels. Ignored. Only used for time series.

**Returns** Predicted values.

**Return type** pd.Series

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self, X, y, objectives, X\_train=None, y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, or *np.ndarray*) – True values of length [n\_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

## time\_series\_classification\_pipelines

Pipeline base class for time-series classification problems.

## Module Contents

## Classes Summary

|                                                   |                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------|
| <i>TimeSeriesBinaryClassificationPipeline</i>     | Pipeline base class for time series binary classification problems.     |
| <i>TimeSeriesClassificationPipeline</i>           | Pipeline base class for time series classification problems.            |
| <i>TimeSeriesMulticlassClassificationPipeline</i> | Pipeline base class for time series multiclass classification problems. |

## Contents

```
class evalml.pipelines.time_series_classification_pipelines.TimeSeriesBinaryClassificationPipeline(comp
```

Pipeline base class for time series binary classification problems.

## Parameters

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as time\_index, gap, and max\_delay must be specified with the “pipeline” key. For example: Pipeline(parameters={"pipeline": {"time\_index": “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = TimeSeriesBinaryClassificationPipeline(component_graph=["Simple_
↳ Imputer", "Logistic Regression Classifier"],
...                                                    parameters={"Logistic_
↳ Regression Classifier": {"penalty": "elasticnet",
...                         "solver": "liblinear"},
...                         "pipeline": {"gap
↳ ": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
```

(continues on next page)

(continued from previous page)

```

...                                     custom_name="My_
↳TimeSeriesBinary Pipeline")
...
>>> assert pipeline.custom_name == "My TimeSeriesBinary Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳'Logistic Regression Classifier'}
...
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                         'C': 1.0,
...                                         'n_jobs': -1,
...                                         'multi_class': 'auto',
...                                         'solver': 'liblinear'},
...     'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_horizon': 1, 'time_index':
↳"date"}}

```

Table 7 – continued from previous page

|                                       |                                                                                                                                                                                      |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>graph_dict</code>               | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code> | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>        | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                     | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>             | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                     | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                      | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>optimize_threshold</code>       | Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.                                             |
| <code>parameters</code>               | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                  | Predict on future data where target is not known.                                                                                                                                    |
| <code>predict_in_sample</code>        | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <code>predict_proba</code>            | Predict on future data where the target is unknown.                                                                                                                                  |
| <code>predict_proba_in_sample</code>  | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <code>save</code>                     | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                    | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                  | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>threshold</code>                | Threshold used to make a prediction. Defaults to <code>None</code> .                                                                                                                 |
| <code>transform</code>                | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>  | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective(self, objective)`**

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** `objective` (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**`property classes_(self)`**

Gets the class names for the pipeline. Will return `None` before pipeline is fit.

**`clone(self)`**

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self, date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (*tuple(pd.Timestamp)*)

**dates\_needed\_for\_prediction\_range**(*self, start\_date, end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (*tuple(pd.Timestamp)*)

**Raises** **ValueError** – If `start_date` doesn't come before `end_date`

**describe**(*self, return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline.  
Defaults to False.

**Returns** Dictionary of all component parameters if `return_dict` is True, else None.

**Return type** `dict`

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** *pd.DataFrame*

**fit**(*self, X, y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length `[n_samples]`

**Returns** *self*

**Raises** **ValueError** – If the number of unique classes in `y` are not appropriate for the type of pipeline.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** *dag\_dict* (*dict*)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**optimize\_threshold**(*self*, *X*, *y*, *y\_pred\_proba*, *objective*)

Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Input target values.
- **y\_pred\_proba** (*pd.Series*) – The predicted probabilities of the target outputted by the pipeline.

- **objective** (*ObjectiveBase*) – The objective to threshold with. Must have a tunable threshold.

**Raises** **ValueError** – If objective is not optimizable.

**property** **parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises** **ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X** (*pd.DataFrame*) – Future data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*) – Objective used to threshold predicted probabilities, optional. Defaults to None.

**Returns** Estimated labels.

**Return type** pd.Series

**Raises** **ValueError** – If objective is not defined for time-series binary classification problems.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape `[n_samples, n_features]`.
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape `[n_samples]`.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train*=*None*, *y\_train*=*None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – True labels of length `[n_samples]`.
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Ordered dictionary of objective scores.

**Return type** `dict`

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**property threshold**(*self*)

Threshold used to make a prediction. Defaults to `None`.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*) – The target data of length [*n\_samples*]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the *X* and *y* arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

**class** evalml.pipelines.time\_series\_classification\_pipelines.**TimeSeriesClassificationPipeline**(*component\_graph=None*, *parameters=None*, *random\_seed=0*)

Pipeline base class for time series classification problems.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary { } implies using all default values for component parameters. Pipeline-level parameters such as *time\_index*, *gap*, and *max\_delay* must be specified with the “pipeline” key. For example: Pipeline(parameters={“pipeline”: {“time\_index”: “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series classification model.                                                                                                                                              |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Predict on future data where target is not known.                                                                                                                                    |
| <i>predict_in_sample</i>                 | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>predict_proba</i>                     | Predict on future data where the target is unknown.                                                                                                                                  |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** *objective* (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self*, *date*)

Return dates needed to forecast the given date in the future.

**Parameters** *date* (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**dates\_needed\_for\_prediction\_range**(*self*, *start\_date*, *end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**Raises** **ValueError** – If start\_date doesn't come before end\_date

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises** **ValueError** – If the number of unique classes in *y* are not appropriate for the type of pipeline.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property** `model_family(self)`

Returns model family of this pipeline.

**property** `name(self)`

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property** `parameters(self)`

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises** **ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*)

Predict on future data where the target is known, e.g. cross validation.

Note: we cast y as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.

**Returns** Estimated labels.

**Return type** `pd.Series`

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape `[n_samples, n_features]`.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape `[n_samples, n_features]`.
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape `[n_samples]`.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – True labels of length `[n_samples]`.
- **objectives** (*list*) – Non-empty list of objectives to score on.

- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we're calling `predict_in_sample` to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

**class** evalml.pipelines.time\_series\_classification\_pipelines.**TimeSeriesMulticlassClassificationPipeline**(

Pipeline base class for time series multiclass classification problems.

**Parameters**

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as time\_index, gap, and max\_delay must be specified with the “pipeline” key. For example: Pipeline(parameters={“pipeline”: {“time\_index”: “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = TimeSeriesMulticlassClassificationPipeline(component_graph=["Simple_
↳ Imputer", "Logistic Regression Classifier"],
...                                                         parameters={"Logistic_
↳ Regression Classifier": {"penalty": "elasticnet",
...                         "solver": "liblinear"},
...                                                         "pipeline": {
↳ "gap": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
...                                                         custom_name="My_
↳ TimeSeriesMulticlass Pipeline")
>>> assert pipeline.custom_name == "My TimeSeriesMulticlass Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                         'C': 1.0,
...                                         'n_jobs': -1,
...                                         'multi_class': 'auto',
...                                         'solver': 'liblinear'},
...     'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_horizon': 1, 'time_index':
↳ "date"}}
```

### Attributes

|                     |                                     |
|---------------------|-------------------------------------|
| <b>problem_type</b> | ProblemTypes.TIME_SERIES_MULTICLASS |
|---------------------|-------------------------------------|

### Methods

|                                          |                                                                                   |
|------------------------------------------|-----------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned. |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.   |

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series classification model.                                                                                                                                              |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Predict on future data where target is not known.                                                                                                                                    |
| <i>predict_in_sample</i>                 | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>predict_proba</i>                     | Predict on future data where the target is unknown.                                                                                                                                  |
| <i>predict_proba_in_sample</i>           | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>save</i>                              | Saves pipeline at file path.                                                                                                                                                         |
| <i>score</i>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <i>summary</i>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <i>transform</i>                         | Transform the input.                                                                                                                                                                 |
| <i>transform_all_but_final</i>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective(self, objective)`**

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property** **classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static** **create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property** **custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self, date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**dates\_needed\_for\_prediction\_range**(*self, start\_date, end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**Raises** **ValueError** – If start\_date doesn't come before end\_date

**describe**(*self, return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property** **feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** *pd.DataFrame*

**fit**(*self*, *X*, *y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** *self*

**Raises** **ValueError** – If the number of unique classes in *y* are not appropriate for the type of pipeline.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If *graphviz* is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*)

Predict on future data where the target is known, e.g. cross validation.

Note: we cast y as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.

**Returns** Estimated labels.

**Return type** pd.Series

**Raises ValueError** – If final component is not an Estimator.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].

- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the *X* and *y* arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

## time\_series\_pipeline\_base

Pipeline base class for time-series problems.

## Contents

```
class evalml.pipelines.time_series_pipeline_base.TimeSeriesPipelineBase(component_graph,  
                                                                           parameters=None,  
                                                                           custom_name=None,  
                                                                           random_seed=0)
```

Pipeline base class for time series problems.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as *time\_index*, *gap*, and *max\_delay* must be specified with the “pipeline” key. For example: Pipeline(parameters={“pipeline”: {“time\_index”: “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                     |      |
|---------------------|------|
| <b>problem_type</b> | None |
|---------------------|------|

#### Methods

|                                                |                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>dates_needed_for_prediction</code>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <code>dates_needed_for_prediction_range</code> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a model.                                                                                                                                                                       |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Predict on future data where target is not known.                                                                                                                                    |
| <code>predict_in_sample</code>                 | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self, date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**dates\_needed\_for\_prediction\_range**(*self, start\_date, end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**Raises** **ValueError** – If start\_date doesn't come before end\_date

**describe**(*self, return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** *pd.DataFrame*

**abstract fit**(*self, X, y*)

Build a model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *np.ndarray*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component inverse\_transform methods to estimator predictions in reverse order.

Components that implement inverse\_transform are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's \_\_new\_\_ method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises** **ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*, *calculating\_residuals=False*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples]
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features]
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train]
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.
- **calculating\_residuals** (*bool*) – Whether we're calling predict\_in\_sample to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** Estimated labels.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.

- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we're calling `predict_in_sample` to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

## time\_series\_regression\_pipeline

Pipeline base class for time series regression problems.

## Module Contents

### Classes Summary

---

*TimeSeriesRegressionPipeline*

---

Pipeline base class for time series regression problems.

---

### Contents

```
class evalml.pipelines.time_series_regression_pipeline.TimeSeriesRegressionPipeline(component_graph,
                                                                                   parameters=None,
                                                                                   custom_name=None,
                                                                                   random_seed=0)
```

Pipeline base class for time series regression problems.

#### Parameters

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as *time\_index*, *gap*, and *max\_delay* must be specified with the “pipeline” key. For example: Pipeline(parameters={“pipeline”: {“time\_index”: “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Example

```
>>> pipeline = TimeSeriesRegressionPipeline(component_graph=["Simple Imputer",
↪ "Linear Regressor"],
...                                         parameters={"Simple Imputer": {"impute_strategy": "mean"},
...                                         "pipeline": {"gap": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
↪ "TimeSeriesRegression Pipeline", custom_name="My TimeSeriesRegression Pipeline")
>>> assert pipeline.custom_name == "My TimeSeriesRegression Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↪ 'Linear Regressor'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'mean', 'fill_value': None},
...     'Linear Regressor': {'fit_intercept': True, 'n_jobs': -1},
...     'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_horizon': 1, 'time_index':
...     ↪ "date"}}}
```

### Attributes

| NO_PREDS_PIPELINE_TRANSFORMERS | PIPELINE_PROBLEM_TYPE |
|--------------------------------|-----------------------|
| prob-lem_type                  | None                  |

### Methods

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series pipeline.                                                                                                                                                          |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_forecast_period</i>               | Generates all possible forecasting time points based on latest data point in X.                                                                                                      |
| <i>get_forecast_predictions</i>          | Generates all possible forecasting predictions based on last period of X.                                                                                                            |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>get_prediction_intervals</i>          | Find the prediction intervals using the fitted regressor.                                                                                                                            |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |

continues on next page

Table 10 – continued from previous page

|                                |                                                                                                                                                                               |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>inverse_transform</i>       | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                             |
| <i>load</i>                    | Loads pipeline at file path.                                                                                                                                                  |
| <i>model_family</i>            | Returns model family of this pipeline.                                                                                                                                        |
| <i>name</i>                    | Name of the pipeline.                                                                                                                                                         |
| <i>new</i>                     | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method. |
| <i>parameters</i>              | Parameter dictionary for this pipeline.                                                                                                                                       |
| <i>predict</i>                 | Predict on future data where target is not known.                                                                                                                             |
| <i>predict_in_sample</i>       | Predict on future data where the target is known, e.g. cross validation.                                                                                                      |
| <i>save</i>                    | Saves pipeline at file path.                                                                                                                                                  |
| <i>score</i>                   | Evaluate model performance on current and additional objectives.                                                                                                              |
| <i>summary</i>                 | A short summary of the pipeline structure, describing the list of components used.                                                                                            |
| <i>transform</i>               | Transform the input.                                                                                                                                                          |
| <i>transform_all_but_final</i> | Transforms the data by applying all pre-processing components.                                                                                                                |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self*, *date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (*tuple(pd.Timestamp)*)

**dates\_needed\_for\_prediction\_range**(*self*, *start\_date*, *end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.

- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (`tuple(pd.Timestamp)`)

**Raises** **ValueError** – If `start_date` doesn't come before `end_date`

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline.  
Defaults to False.

**Returns** Dictionary of all component parameters if `return_dict` is True, else None.

**Return type** `dict`

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** `pd.DataFrame`

**fit**(*self*, *X*, *y*)

Fit a time series pipeline.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *np.ndarray*) – The target training targets of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If the target is not numeric.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target data of length `[n_samples]`.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** `Component`

**get\_forecast\_period**(*self*, *X*)

Generates all possible forecasting time points based on latest data point in *X*.

**Parameters** *X* (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.

**Raises** **ValueError** – If pipeline is not trained.

**Returns** Datetime periods from *gap* to *forecast\_horizon* + *gap*.

**Return type** *pd.Series*

**Example**

```
>>> X = pd.DataFrame({'date': pd.date_range(start='1-1-2022', periods=10, freq='D'), 'feature': range(10, 20)})
>>> y = pd.Series(range(0, 10), name='target')
>>> gap = 1
>>> forecast_horizon = 2
>>> pipeline = TimeSeriesRegressionPipeline(component_graph=["Linear Regressor"],
...                                           parameters={"Simple Imputer": {
... < "impute_strategy": "mean"},
...                                           "pipeline": {"gap": gap,
... < "max_delay": 1, "forecast_horizon": forecast_horizon, "time_index": "date"}},
...                                           )
>>> pipeline.fit(X, y)
pipeline = TimeSeriesRegressionPipeline(component_graph={'Linear Regressor': [
< 'Linear Regressor', 'X', 'y']}, parameters={'Linear Regressor': {'fit_intercept
< ': True, 'n_jobs': -1}, 'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_
< horizon': 2, 'time_index': 'date'}}, random_seed=0)
>>> dates = pipeline.get_forecast_period(X)
>>> expected = pd.Series(pd.date_range(start='2022-01-11', periods=forecast_
< horizon, freq='D').shift(gap), name='date', index=[10, 11])
>>> assert dates.equals(expected)
```

**get\_forecast\_predictions**(*self*, *X*, *y*)

Generates all possible forecasting predictions based on last period of *X*.

**Parameters**

- *X* (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- *y* (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Predictions from *gap* periods out to *forecast\_horizon* + *gap* periods.

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** *custom\_hyperparameters* (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**get\_prediction\_intervals**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *coverage=None*)

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Certain estimators (Extra Trees Estimator, XGBoost Estimator, Prophet Estimator, ARIMA, and Exponential Smoothing estimator) utilize a different methodology to calculate prediction intervals. See the docs for these estimators to learn more.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

#### Raises

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape `[n_samples, n_features]`.

- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data.
- **y\_train** (*pd.Series or None*) – Training labels.

**Raises ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self, X, y, X\_train, y\_train, objective=None, calculating\_residuals=False*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Future data of shape [n\_samples, n\_features]
- **y** (*pd.Series, np.ndarray*) – Future target of shape [n\_samples]
- **X\_train** (*pd.DataFrame, np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features]
- **y\_train** (*pd.Series, np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train]
- **objective** (*ObjectiveBase, str, None*) – Objective used to threshold predicted probabilities, optional.
- **calculating\_residuals** (*bool*) – Whether we're calling predict\_in\_sample to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** Estimated labels.

**Return type** pd.Series

**Raises ValueError** – If final component is not an Estimator.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self, X, y, objectives, X\_train=None, y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame, np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series, np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the *X* and *y* arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

## utils

Utility methods for EvalML pipelines.

## Module Contents

## Functions

|                                                   |                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>generate_pipeline_code</code>               | Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.                                                                                                                                                                |
| <code>generate_pipeline_example</code>            | Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.                                                                                                                                                                |
| <code>get_actions_from_option_defaults</code>     | Returns a list of actions based on the defaults parameters of each option in the input DataCheckActionOption list.                                                                                                                                                              |
| <code>make_pipeline</code>                        | Given input data, target data, an estimator class and the problem type, generates a pipeline class with a preprocessing chain which was recommended based on the inputs. The pipeline will be a subclass of the appropriate pipeline base class for the specified problem_type. |
| <code>make_pipeline_from_actions</code>           | Creates a pipeline of components to address the input DataCheckAction list.                                                                                                                                                                                                     |
| <code>make_pipeline_from_data_check_output</code> | Creates a pipeline of components to address warnings and errors output from running data checks. Uses all default suggestions.                                                                                                                                                  |
| <code>make_timeseries_baseline_pipeline</code>    | Make a baseline pipeline for time series regression problems.                                                                                                                                                                                                                   |
| <code>rows_of_interest</code>                     | Get the row indices of the data that are closest to the threshold. Works only for binary classification problems and pipelines.                                                                                                                                                 |

## Attributes Summary

---

`DECOMPOSER_PERIOD_CAP`

---

## Contents

`evalml.pipelines.utils.DECOMPOSER_PERIOD_CAP = 1000`

`evalml.pipelines.utils.generate_pipeline_code(element, features_path=None)`

Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.

### Parameters

- **element** (*pipeline instance*) – The instance of the pipeline to generate string Python code.
- **features\_path** (*str*) – path to features json created from `featuretools.save_features()`. Defaults to None.

**Returns** String representation of Python code that can be run separately in order to recreate the pipeline instance. Does not include code for custom component implementation.

**Return type** str

**Raises**

- **ValueError** – If element is not a pipeline, or if the pipeline is nonlinear.
- **ValueError** – If features in *features\_path* do not match the features on the pipeline.

`evalml.pipelines.utils.generate_pipeline_example(pipeline, path_to_train, path_to_holdout, target, path_to_features=None, path_to_mapping="", output_file_path=None)`

Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.

#### Parameters

- **pipeline** (*pipeline instance*) – The instance of the pipeline to generate string Python code.
- **path\_to\_train** (*str*) – path to training data.
- **path\_to\_holdout** (*str*) – path to holdout data.
- **target** (*str*) – target variable.
- **path\_to\_features** (*str*) – path to features json. Defaults to None.
- **path\_to\_mapping** (*str*) – path to mapping json. Defaults to None.
- **output\_file\_path** (*str*) – path to output python file. Defaults to None.

**Returns** String representation of Python code that can be run separately in order to recreate the pipeline instance. Does not include code for custom component implementation.

**Return type** `str`

`evalml.pipelines.utils.get_actions_from_option_defaults(action_options)`

Returns a list of actions based on the defaults parameters of each option in the input `DataCheckActionOption` list.

**Parameters** **action\_options** (*list[DataCheckActionOption]*) – List of `DataCheckActionOption` objects

**Returns** List of actions based on the defaults parameters of each option in the input list.

**Return type** `list[DataCheckAction]`

`evalml.pipelines.utils.make_pipeline(X, y, estimator, problem_type, parameters=None, sampler_name=None, extra_components_before=None, extra_components_after=None, use_estimator=True, known_in_advance=None, features=False, exclude_featurizers=None, include_decomposer=True)`

Given input data, target data, an estimator class and the problem type, generates a pipeline class with a preprocessing chain which was recommended based on the inputs. The pipeline will be a subclass of the appropriate pipeline base class for the specified `problem_type`.

#### Parameters

- **X** (*pd.DataFrame*) – The input data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target data of length `[n_samples]`.
- **estimator** (*Estimator*) – Estimator for pipeline.
- **problem\_type** (*ProblemTypes or str*) – Problem type for pipeline to generate.
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters.

- **sampler\_name** (*str*) – The name of the sampler component to add to the pipeline. Only used in classification problems. Defaults to None
- **extra\_components\_before** (*list[ComponentBase]*) – List of extra components to be added before preprocessing components. Defaults to None.
- **extra\_components\_after** (*list[ComponentBase]*) – List of extra components to be added after preprocessing components. Defaults to None.
- **use\_estimator** (*bool*) – Whether to add the provided estimator to the pipeline or not. Defaults to True.
- **known\_in\_advance** (*list[str]*, *None*) – List of features that are known in advance.
- **features** (*bool*) – Whether to add a DFSTransformer component to this pipeline.
- **exclude\_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipeline. Valid options are “DatetimeFeaturizer”, “EmailFeaturizer”, “URLFeaturizer”, “NaturalLanguageFeaturizer”, “TimeSeriesFeaturizer”
- **include\_decomposer** (*bool*) – For time series regression problems, whether or not to include a decomposer in the generated pipeline. Defaults to True.

**Returns** PipelineBase instance with dynamically generated preprocessing components and specified estimator.

**Return type** PipelineBase object

**Raises ValueError** – If estimator is not valid for the given problem type, or sampling is not supported for the given problem type.

```
evalml.pipelines.utils.make_pipeline_from_actions(problem_type, actions,
                                                  problem_configuration=None)
```

Creates a pipeline of components to address the input DataCheckAction list.

#### Parameters

- **problem\_type** (*str or ProblemType*) – The problem type that the pipeline should address.
- **actions** (*list[DataCheckAction]*) – List of DataCheckAction objects used to create list of components
- **problem\_configuration** (*dict*) – Required for time series problem types. Values should be passed in for time\_index, gap, forecast\_horizon, and max\_delay.

**Returns** Pipeline which can be used to address data check actions.

**Return type** PipelineBase

```
evalml.pipelines.utils.make_pipeline_from_data_check_output(problem_type, data_check_output,
                                                            problem_configuration=None)
```

Creates a pipeline of components to address warnings and errors output from running data checks. Uses all default suggestions.

#### Parameters

- **problem\_type** (*str or ProblemType*) – The problem type.
- **data\_check\_output** (*dict*) – Output from calling DataCheck.validate().
- **problem\_configuration** (*dict*) – Required for time series problem types. Values should be passed in for time\_index, gap, forecast\_horizon, and max\_delay.

**Returns** Pipeline which can be used to address data check outputs.

**Return type** PipelineBase

**Raises ValueError** – If problem\_type is of type time series but an incorrect problem\_configuration has been passed.

```
evalml.pipelines.utils.make_timeseries_baseline_pipeline(problem_type, gap, forecast_horizon,  
                                                         time_index, exclude_featurizer=False)
```

Make a baseline pipeline for time series regression problems.

**Parameters**

- **problem\_type** – One of TIME\_SERIES\_REGRESSION, TIME\_SERIES\_MULTICLASS, TIME\_SERIES\_BINARY
- **gap** (*int*) – Non-negative gap parameter.
- **forecast\_horizon** (*int*) – Positive forecast\_horizon parameter.
- **time\_index** (*str*) – Column name of time\_index parameter.
- **exclude\_featurizer** (*bool*) – Whether or not to exclude the TimeSeriesFeaturizer from the baseline graph. Defaults to False.

**Returns** TimeSeriesPipelineBase, a time series pipeline corresponding to the problem type.

```
evalml.pipelines.utils.rows_of_interest(pipeline, X, y=None, threshold=None, epsilon=0.1,  
                                         sort_values=True, types='all')
```

Get the row indices of the data that are closest to the threshold. Works only for binary classification problems and pipelines.

**Parameters**

- **pipeline** (*PipelineBase*) – The fitted binary pipeline.
- **X** (*ww.DataTable*, *pd.DataFrame*) – The input features to predict on.
- **y** (*ww.DataColumn*, *pd.Series*, *None*) – The input target data, if available. Defaults to None.
- **threshold** (*float*) – The threshold value of interest to separate positive and negative predictions. If None, uses the pipeline threshold if set, else 0.5. Defaults to None.
- **epsilon** (*epsilon*) – The difference between the probability and the threshold that would make the row interesting for us. For instance, epsilon=0.1 and threshold=0.5 would mean we consider all rows in [0.4, 0.6] to be of interest. Defaults to 0.1.
- **sort\_values** (*bool*) – Whether to return the indices sorted by the distance from the threshold, such that the first values are closer to the threshold and the later values are further. Defaults to True.
- **types** (*str*) – The type of rows to keep and return. Can be one of ['incorrect', 'correct', 'true\_positive', 'true\_negative', 'all']. Defaults to 'all'.

'incorrect' - return only the rows where the predictions are incorrect. This means that, given the threshold and target y, keep only the rows which are labeled wrong. 'correct' - return only the rows where the predictions are correct. This means that, given the threshold and target y, keep only the rows which are correctly labeled. 'true\_positive' - return only the rows which are positive, as given by the targets. 'true\_negative' - return only the rows which are negative, as given by the targets. 'all' - return all rows. This is the only option available when there is no target data provided.

**Returns** The indices corresponding to the rows of interest.

**Raises**

- **ValueError** – If pipeline is not a fitted Binary Classification pipeline.
- **ValueError** – If types is invalid or y is not provided when types is not ‘all’.
- **ValueError** – If the threshold is provided and is exclusive of [0, 1].

## Package Contents

### Classes Summary

|                                         |                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ARIMAREgressor</i>                   | Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <a href="https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html">https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html</a> . |
| <i>BinaryClassificationPipeline</i>     | Pipeline subclass for all binary classification pipelines.                                                                                                                                                                                                                                                                                                  |
| <i>CatBoostClassifier</i>               | CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                             |
| <i>CatBoostRegressor</i>                | CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                               |
| <i>ClassificationPipeline</i>           | Pipeline subclass for all classification pipelines.                                                                                                                                                                                                                                                                                                         |
| <i>ComponentGraph</i>                   | Component graph for a pipeline as a directed acyclic graph (DAG).                                                                                                                                                                                                                                                                                           |
| <i>DecisionTreeClassifier</i>           | Decision Tree Classifier.                                                                                                                                                                                                                                                                                                                                   |
| <i>DecisionTreeRegressor</i>            | Decision Tree Regressor.                                                                                                                                                                                                                                                                                                                                    |
| <i>DFSTransformer</i>                   | Featuretools DFS component that generates features for the input features.                                                                                                                                                                                                                                                                                  |
| <i>DropNaNRowsTransformer</i>           | Transformer to drop rows with NaN values.                                                                                                                                                                                                                                                                                                                   |
| <i>ElasticNetClassifier</i>             | Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.                                                                                                                                                                                                                                                             |
| <i>ElasticNetRegressor</i>              | Elastic Net Regressor.                                                                                                                                                                                                                                                                                                                                      |
| <i>Estimator</i>                        | A component that fits and predicts given data.                                                                                                                                                                                                                                                                                                              |
| <i>ExponentialSmoothingRegressor</i>    | Holt-Winters Exponential Smoothing Forecaster.                                                                                                                                                                                                                                                                                                              |
| <i>ExtraTreesClassifier</i>             | Extra Trees Classifier.                                                                                                                                                                                                                                                                                                                                     |
| <i>ExtraTreesRegressor</i>              | Extra Trees Regressor.                                                                                                                                                                                                                                                                                                                                      |
| <i>FeatureSelector</i>                  | Selects top features based on importance weights.                                                                                                                                                                                                                                                                                                           |
| <i>Imputer</i>                          | Imputes missing data according to a specified imputation strategy.                                                                                                                                                                                                                                                                                          |
| <i>KNeighborsClassifier</i>             | K-Nearest Neighbors Classifier.                                                                                                                                                                                                                                                                                                                             |
| <i>LightGBMClassifier</i>               | LightGBM Classifier.                                                                                                                                                                                                                                                                                                                                        |
| <i>LightGBMRegressor</i>                | LightGBM Regressor.                                                                                                                                                                                                                                                                                                                                         |
| <i>LinearRegressor</i>                  | Linear Regressor.                                                                                                                                                                                                                                                                                                                                           |
| <i>LogisticRegressionClassifier</i>     | Logistic Regression Classifier.                                                                                                                                                                                                                                                                                                                             |
| <i>MulticlassClassificationPipeline</i> | Pipeline subclass for all multiclass classification pipelines.                                                                                                                                                                                                                                                                                              |
| <i>OneHotEncoder</i>                    | A transformer that encodes categorical features in a one-hot numeric array.                                                                                                                                                                                                                                                                                 |

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OrdinalEncoder</i>                             | A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.                                                                                                                                                                                                                                                                    |
| <i>PerColumnImputer</i>                           | Imputes missing data according to a specified imputation strategy per column.                                                                                                                                                                                                                                                                                                                 |
| <i>PipelineBase</i>                               | Machine learning pipeline.                                                                                                                                                                                                                                                                                                                                                                    |
| <i>ProphetRegressor</i>                           | Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well. |
| <i>RandomForestClassifier</i>                     | Random Forest Classifier.                                                                                                                                                                                                                                                                                                                                                                     |
| <i>RandomForestRegressor</i>                      | Random Forest Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>RegressionPipeline</i>                         | Pipeline subclass for all regression pipelines.                                                                                                                                                                                                                                                                                                                                               |
| <i>RFClassifierSelectFromModel</i>                | Selects top features based on importance weights using a Random Forest classifier.                                                                                                                                                                                                                                                                                                            |
| <i>RFRegressorSelectFromModel</i>                 | Selects top features based on importance weights using a Random Forest regressor.                                                                                                                                                                                                                                                                                                             |
| <i>SimpleImputer</i>                              | Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.                                                                                                                                                                                                                                                                                      |
| <i>StackedEnsembleBase</i>                        | Stacked Ensemble Base Class.                                                                                                                                                                                                                                                                                                                                                                  |
| <i>StackedEnsembleClassifier</i>                  | Stacked Ensemble Classifier.                                                                                                                                                                                                                                                                                                                                                                  |
| <i>StackedEnsembleRegressor</i>                   | Stacked Ensemble Regressor.                                                                                                                                                                                                                                                                                                                                                                   |
| <i>StandardScaler</i>                             | A transformer that standardizes input features by removing the mean and scaling to unit variance.                                                                                                                                                                                                                                                                                             |
| <i>SVMClassifier</i>                              | Support Vector Machine Classifier.                                                                                                                                                                                                                                                                                                                                                            |
| <i>SVMRegressor</i>                               | Support Vector Machine Regressor.                                                                                                                                                                                                                                                                                                                                                             |
| <i>TargetEncoder</i>                              | A transformer that encodes categorical features into target encodings.                                                                                                                                                                                                                                                                                                                        |
| <i>TimeSeriesBinaryClassificationPipeline</i>     | Pipeline base class for time series binary classification problems.                                                                                                                                                                                                                                                                                                                           |
| <i>TimeSeriesClassificationPipeline</i>           | Pipeline base class for time series classification problems.                                                                                                                                                                                                                                                                                                                                  |
| <i>TimeSeriesFeaturizer</i>                       | Transformer that delays input features and target variable for time series problems.                                                                                                                                                                                                                                                                                                          |
| <i>TimeSeriesImputer</i>                          | Imputes missing data according to a specified timeseries-specific imputation strategy.                                                                                                                                                                                                                                                                                                        |
| <i>TimeSeriesMulticlassClassificationPipeline</i> | Pipeline base class for time series multiclass classification problems.                                                                                                                                                                                                                                                                                                                       |
| <i>TimeSeriesRegressionPipeline</i>               | Pipeline base class for time series regression problems.                                                                                                                                                                                                                                                                                                                                      |
| <i>TimeSeriesRegularizer</i>                      | Transformer that regularizes an inconsistently spaced datetime column.                                                                                                                                                                                                                                                                                                                        |
| <i>Transformer</i>                                | A component that may or may not need fitting that transforms data. These components are used before an estimator.                                                                                                                                                                                                                                                                             |
| <i>VowpalWabbitBinaryClassifier</i>               | Vowpal Wabbit Binary Classifier.                                                                                                                                                                                                                                                                                                                                                              |
| <i>VowpalWabbitMulticlassClassifier</i>           | Vowpal Wabbit Multiclass Classifier.                                                                                                                                                                                                                                                                                                                                                          |
| <i>VowpalWabbitRegressor</i>                      | Vowpal Wabbit Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>XGBoostClassifier</i>                          | XGBoost Classifier.                                                                                                                                                                                                                                                                                                                                                                           |

## Contents

```
class evalml.pipelines.ARIMAREgressor(time_index: Optional[Hashable] = None, trend: Optional[str] =
None, start_p: int = 2, d: int = 0, start_q: int = 2, max_p: int = 5,
max_d: int = 2, max_q: int = 5, seasonal: bool = True, sp: int = 1,
n_jobs: int = -1, random_seed: Union[int, float] = 0, maxiter: int
= 10, use_covariates: bool = True, **kwargs)
```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start\_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start\_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max\_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max\_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max\_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If "detect", this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                                |                                                                                                                                                                                  |

| <b>training_only</b>           | False                                                                                                                                                                            |

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.                                |
| <i>fit</i>                      | Fits ARIMA regressor to data.                                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted ARIMARegressor.                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted ARIMA regressor.                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature\_importance is not defined for ARIMA regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMARegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **ValueError** – If *X* was passed to *fit* but not passed in *predict*.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a *predict\_proba* method or a *component\_obj* that implements *predict\_proba*.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.BinaryClassificationPipeline*(*component\_graph*, *parameters=None*,  
*custom\_name=None*, *random\_seed=0*)

Pipeline subclass for all binary classification pipelines.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = BinaryClassificationPipeline(component_graph=["Simple Imputer",
↳ "Logistic Regression Classifier"],
...                                     parameters={"Logistic Regression_
↳ Classifier": {"penalty": "elasticnet",
...                                     "solver": "liblinear"}}},
...                                     custom_name="My Binary Pipeline")
...
>>> assert pipeline.custom_name == "My Binary Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                       'C': 1.0,
...                                       'n_jobs': -1,
...                                       'multi_class': 'auto',
...                                       'solver': 'liblinear'}}
```

|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>classes_</code>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <code>optimize_threshold</code>                | Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.                                             |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>predict_proba</code>                     | Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.                                                                        |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>threshold</code>                         | Threshold used to make a prediction. Defaults to None.                                                                                                                               |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*) – The target data of length [*n\_samples*].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath*=*None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** *dag\_dict* (*dict*)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**optimize\_threshold**(*self*, *X*, *y*, *y\_pred\_proba*, *objective*)

Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Input target values.
- **y\_pred\_proba** (*pd.Series*) – The predicted probabilities of the target outputted by the pipeline.

- **objective** (*ObjectiveBase*) – The objective to threshold with. Must have a tunable threshold.

**Raises** **ValueError** – If objective is not optimizable.

**property** **parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Make predictions using selected features.

Note: we cast y as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** pd.Series

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels. Assumes that the column at index 1 represents the positive label case.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series or None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** pd.Series

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]

- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**property threshold**(*self*)

Threshold used to make a prediction. Defaults to None.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** pd.DataFrame

```
class evalml.pipelines.CatBoostClassifier(n_estimators=10, eta=0.03, max_depth=6,
                                          bootstrap_type=None, silent=True,
                                          allow_writing_files=False, random_seed=0, n_jobs=-1,
                                          **kwargs)
```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

**Parameters**

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.

- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted CatBoost classifier.                                                                                |
| <i>fit</i>                      | Fits CatBoost classifier component to data.                                                                                      |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted CatBoost classifier.                                                                           |
| <i>predict_proba</i>            | Make prediction probabilities using the fitted CatBoost classifier.                                                              |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**property feature\_importance(*self*)**

Feature importance of fitted CatBoost classifier.

**fit(*self*, *X*, *y=None*)**

Fits CatBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** `self`

**get\_prediction\_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters`(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** `X` (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

**Parameters** `X` (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** *pd.DataFrame*

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- `file_path` (*str*) – Location to save file.
- `pickle_protocol` (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- `update_dict` (*dict*) – A dict of parameters to update.
- `reset_fit` (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.CatBoostRegressor`(*n\_estimators=10*, *eta=0.03*, *max\_depth=6*,  
*bootstrap\_type=None*, *silent=False*, *allow\_writing\_files=False*,  
*random\_seed=0*, *n\_jobs=-1*, *\*\*kwargs*)

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

**Parameters**

- `n_estimators` (*float*) – The maximum number of trees to build. Defaults to 10.

- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <a href="#"><i>load</i></a>                     | Loads component at file path.                                                                                                    |
| <a href="#"><i>needs_fitting</i></a>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <a href="#"><i>parameters</i></a>               | Returns the parameters which were used to initialize the component.                                                              |
| <a href="#"><i>predict</i></a>                  | Make predictions using the fitted CatBoost regressor.                                                                            |
| <a href="#"><i>predict_proba</i></a>            | Make probability estimates for labels.                                                                                           |
| <a href="#"><i>save</i></a>                     | Saves component at file path.                                                                                                    |
| <a href="#"><i>update_parameters</i></a>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted CatBoost regressor.

**fit**(*self*, *X*, *y=None*)

Fits CatBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**predict(*self*, *X*)**

Make predictions using the fitted CatBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series***

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=*True*)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.ClassificationPipeline(*component\_graph*, *parameters*=*None*, *custom\_name*=*None*, *random\_seed*=*0*)**

Pipeline subclass for all classification pipelines.

**Parameters**

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                     |      |
|---------------------|------|
| <b>problem_type</b> | None |
|---------------------|------|

#### Methods

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Make predictions using selected features.                                                                                                                                            |
| <i>predict_proba</i>                     | Make probability estimates for labels.                                                                                                                                               |
| <i>save</i>                              | Saves pipeline at file path.                                                                                                                                                         |
| <i>score</i>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <i>summary</i>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <i>transform</i>                         | Transform the input.                                                                                                                                                                 |
| <i>transform_all_but_final</i>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property** **classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static** **create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property** **custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property** **feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self, name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self, custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self, filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self, importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path*: *Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** *file\_path* (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self*, *X*, *objective*=*None*, *X\_train*=*None*, *y\_train*=*None*)

Make predictions using selected features.

Note: we cast *y* as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.

- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** *pd.DataFrame*

**Raises ValueError** – If final component is not an estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]
- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**transform\_all\_but\_final** (*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (`pd.DataFrame`) – Input data to the pipeline to transform.
- **y** (`pd.Series` or `None`) – Targets corresponding to X. Optional.
- **X\_train** (`pd.DataFrame` or `np.ndarray` or `None`) – Training data. Only used for time series.
- **y\_train** (`pd.Series` or `None`) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** `pd.DataFrame`

**class** `evalml.pipelines.ComponentGraph` (*component\_dict=None*, *cached\_data=None*, *random\_seed=0*)

Component graph for a pipeline as a directed acyclic graph (DAG).

**Parameters**

- **component\_dict** (*dict*) – A dictionary which specifies the components and edges between components that should be used to create the component graph. Defaults to `None`.
- **cached\_data** (*dict*) – A dictionary of nested cached data. If the hashes and components are in this cache, we skip fitting for these components. Expected to be of format `{hash1: {component_name: trained_component, ...}, hash2: {...}, ...}`. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Examples

```
>>> component_dict = {'Imputer': ['Imputer', 'X', 'y'],
...                   'Logistic Regression': ['Logistic Regression Classifier',
...                                           ↪ 'Imputer.x', 'y']}
>>> component_graph = ComponentGraph(component_dict)
>>> assert component_graph.compute_order == ['Imputer', 'Logistic Regression']
...
...
>>> component_dict = {'Imputer': ['Imputer', 'X', 'y'],
...                   'OHE': ['One Hot Encoder', 'Imputer.x', 'y'],
...                   'estimator_1': ['Random Forest Classifier', 'OHE.x', 'y'],
...                   'estimator_2': ['Decision Tree Classifier', 'OHE.x', 'y'],
...                   'final': ['Logistic Regression Classifier', 'estimator_1.x',
...                             ↪ 'estimator_2.x', 'y']}
>>> component_graph = ComponentGraph(component_dict)
```

The default parameters for every component in the component graph.

```
>>> assert component_graph.default_parameters == {
...     'Imputer': {'categorical_impute_strategy': 'most_frequent',
...                 'numeric_impute_strategy': 'mean',
...                 'boolean_impute_strategy': 'most_frequent',
```

```

## Methods

|                                                 |                                                                                                                                                                                                                       |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>compute_order</code>                      | The order that components will be computed or called in.                                                                                                                                                              |
| <code>default_parameters</code>                 | The default parameter dictionary for this pipeline.                                                                                                                                                                   |
| <code>describe</code>                           | Outputs component graph details including component parameters.                                                                                                                                                       |
| <code>fit</code>                                | Fit each component in the graph.                                                                                                                                                                                      |
| <code>fit_and_transform_all_but_final</code>    | Fit and transform all components save the final one, usually an estimator.                                                                                                                                            |
| <code>fit_transform</code>                      | Fit and transform all components in the component graph, if all components are Transformers.                                                                                                                          |
| <code>generate_order</code>                     | Regenerated the topologically sorted order of the graph.                                                                                                                                                              |
| <code>get_component</code>                      | Retrieves a single component object from the graph.                                                                                                                                                                   |
| <code>get_component_input_logical_types</code>  | Get the logical types that are passed to the given component.                                                                                                                                                         |
| <code>get_estimators</code>                     | Gets a list of all the estimator components within this graph.                                                                                                                                                        |
| <code>get_inputs</code>                         | Retrieves all inputs for a given component.                                                                                                                                                                           |
| <code>get_last_component</code>                 | Retrieves the component that is computed last in the graph, usually the final estimator.                                                                                                                              |
| <code>graph</code>                              | Generate an image representing the component graph.                                                                                                                                                                   |
| <code>has_dfs</code>                            | Whether this component graph contains a DFSTransformer or not.                                                                                                                                                        |
| <code>instantiate</code>                        | Instantiates all uninstantiated components within the graph using the given parameters. An error will be raised if a component is already instantiated but the parameters dict contains arguments for that component. |
| <code>inverse_transform</code>                  | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                                                     |
| <code>last_component_input_logical_types</code> | Get the logical types that are passed to the last component in the pipeline.                                                                                                                                          |
| <code>predict</code>                            | Make predictions using selected features.                                                                                                                                                                             |
| <code>transform</code>                          | Transform the input using the component graph.                                                                                                                                                                        |
| <code>transform_all_but_final</code>            | Transform all components save the final one, and gathers the data from any number of parents to get all the information that should be fed to the final component.                                                    |

**property** `compute_order(self)`

The order that components will be computed or called in.

**property** `default_parameters(self)`

The default parameter dictionary for this pipeline.

**Returns** Dictionary of all component default parameters.

**Return type** dict

**describe**(*self*, *return\_dict=False*)

Outputs component graph details including component parameters.

**Parameters** `return_dict` (*bool*) – If True, return dictionary of information about component

graph. Defaults to False.

**Returns** Dictionary of all component parameters if `return_dict` is True, else None

**Return type** dict

**Raises** **ValueError** – If the componentgraph is not instantiated

**fit**(*self*, *X*, *y*)

Fit each component in the graph.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**fit\_and\_transform\_all\_but\_final**(*self*, *X*, *y*)

Fit and transform all components save the final one, usually an estimator.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** Transformed features and target.

**Return type** Tuple (pd.DataFrame, pd.Series)

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**classmethod generate\_order**(*cls*, *component\_dict*)

Regenerated the topologically sorted order of the graph.

**get\_component**(*self*, *component\_name*)

Retrieves a single component object from the graph.

**Parameters** **component\_name** (*str*) – Name of the component to retrieve

**Returns** ComponentBase object

**Raises** **ValueError** – If the component is not in the graph.

**get\_component\_input\_logical\_types**(*self*, *component\_name*)

Get the logical types that are passed to the given component.

**Parameters** **component\_name** (*str*) – Name of component in the graph

**Returns** Dict - Mapping feature name to logical type instance.

**Raises**

- **ValueError** – If the component is not in the graph.
- **ValueError** – If the component graph has not been fitted

**get\_estimators**(*self*)

Gets a list of all the estimator components within this graph.

**Returns** All estimator objects within the graph.

**Return type** list

**Raises** **ValueError** – If the component graph is not yet instantiated.

**get\_inputs**(*self*, *component\_name*)

Retrieves all inputs for a given component.

**Parameters** **component\_name** (*str*) – Name of the component to look up.

**Returns** List of inputs for the component to use.

**Return type** list[*str*]

**Raises** **ValueError** – If the component is not in the graph.

**get\_last\_component**(*self*)

Retrieves the component that is computed last in the graph, usually the final estimator.

**Returns** ComponentBase object

**Raises** **ValueError** – If the component graph has no edges.

**graph**(*self*, *name=None*, *graph\_format=None*)

Generate an image representing the component graph.

**Parameters**

- **name** (*str*) – Name of the graph. Defaults to None.
- **graph\_format** (*str*) – file format to save the graph in. Defaults to None.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises** **RuntimeError** – If graphviz is not installed.

**property has\_dfs**(*self*)

Whether this component graph contains a DFSTransformer or not.

**instantiate**(*self*, *parameters=None*)

Instantiates all uninstantiated components within the graph using the given parameters. An error will be raised if a component is already instantiated but the parameters dict contains arguments for that component.

**Parameters** **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary {} or None implies using all default values for component parameters. If a component in the component graph is already instantiated, it will not use any of its parameters defined in this dictionary. Defaults to None.

**Returns** *self*

**Raises** **ValueError** – If component graph is already instantiated or if a component errored while instantiating.

**inverse\_transform**(*self*, *y*)

Apply component inverse\_transform methods to estimator predictions in reverse order.

Components that implement inverse\_transform are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** *y* – (pd.Series): Final component features.

**Returns** The target with inverse transformation applied.

**Return type** pd.Series

**property last\_component\_input\_logical\_types**(*self*)

Get the logical types that are passed to the last component in the pipeline.

**Returns** Dict - Mapping feature name to logical type instance.

**Raises**

- **ValueError** – If the component is not in the graph.
- **ValueError** – If the component graph as not been fitted

**predict**(*self*, *X*)

Make predictions using selected features.

**Parameters** *X* (pd.DataFrame) – Input features of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **ValueError** – If final component is not an Estimator.

**transform**(*self*, *X*, *y=None*)

Transform the input using the component graph.

**Parameters**

- *X* (pd.DataFrame) – Input features of shape [n\_samples, n\_features].
- *y* (pd.Series) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is not a Transformer.

**transform\_all\_but\_final**(*self*, *X*, *y=None*)

Transform all components save the final one, and gathers the data from any number of parents to get all the information that should be fed to the final component.

**Parameters**

- *X* (pd.DataFrame) – Data of shape [n\_samples, n\_features].
- *y* (pd.Series) – The target training data of length [n\_samples]. Defaults to None.

**Returns** Transformed values.

**Return type** pd.DataFrame

```
class evalml.pipelines.DecisionTreeClassifier(criterion='gini', max_features='auto', max_depth=6,  
                                             min_samples_split=2, min_weight_fraction_leaf=0.0,  
                                             random_seed=0, **kwargs)
```

Decision Tree Classifier.

#### Parameters

- **criterion** (*{`"gini"`, `"entropy"`}*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max\_features** (*int, float or {`"auto"`, `"sqrt"`, `"log2"`}*) – The number of features to consider when looking for the best split:
  - If int, then consider max\_features features at each split.
  - If float, then max\_features is a fraction and int(max\_features \* n\_features) features are considered at each split.
  - If “auto”, then max\_features=sqrt(n\_features).
  - If “sqrt”, then max\_features=sqrt(n\_features).
  - If “log2”, then max\_features=log2(n\_features).
  - If None, then max\_features = n\_features.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max\_features features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider min\_samples\_split as the minimum number.
  - If float, then min\_samples\_split is a fraction and ceil(min\_samples\_split \* n\_samples) are the minimum number of samples for each split.

Defaults to 2.

- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.DecisionTreeRegressor(criterion='squared_error', max_features='auto',
                                           max_depth=6, min_samples_split=2,
                                           min_weight_fraction_leaf=0.0, random_seed=0,
                                           **kwargs)
```

Decision Tree Regressor.

**Parameters**

- **criterion** (*{*"squared\_error", "friedman\_mse", "absolute\_error", "poisson"*}*) – The function to measure the quality of a split. Supported criteria are:

- “squared\_error” for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
- “friedman\_mse”, which uses mean squared error with Friedman’s improvement score for potential splits
- “absolute\_error” for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
- “poisson” which uses reduction in Poisson deviance to find splits.
- **max\_features** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If int, then consider max\_features features at each split.
  - If float, then max\_features is a fraction and  $\text{int}(\text{max\_features} * \text{n\_features})$  features are considered at each split.
  - If “auto”, then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If “sqrt”, then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If “log2”, then  $\text{max\_features} = \text{log2}(\text{n\_features})$ .
  - If None, then  $\text{max\_features} = \text{n\_features}$ .

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max\_features features.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider min\_samples\_split as the minimum number.
  - If float, then min\_samples\_split is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.

Defaults to 2.

- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (`pd.DataFrame`) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (`str`) – Location to save file.
- **`pickle_protocol`** (`int`) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (`dict`) – A dict of parameters to update.
- **`reset_fit`** (`bool`, *optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.DFSTransformer(index='index', features=None, random_seed=0, **kwargs)`**

Featuretools DFS component that generates features for the input features.

**Parameters**

- **`index`** (`string`) – The name of the column that contains the indices. If no column with this name exists, then `featuretools.EntitySet()` creates a column with this name to serve as the index column. Defaults to 'index'.
- **`random_seed`** (`int`) – Seed for the random number generator. Defaults to 0.
- **`features`** (`list`) – List of features to run DFS on. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input. If features is an empty list, no transformation will occur to inputted data.

**Attributes**

## Methods

|                                             |                                                                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                          | Constructs a new component with the same parameters and random state.                                                            |
| <code>contains_pre_existing_features</code> | Determines whether or not features from a DFS Transformer match pipeline input features.                                         |
| <code>default_parameters</code>             | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                       | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                            | Fits the DFSTransformer Transformer component.                                                                                   |
| <code>fit_transform</code>                  | Fits on X and transforms X.                                                                                                      |
| <code>load</code>                           | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>                  | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>                     | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>                           | Saves component at file path.                                                                                                    |
| <code>transform</code>                      | Computes the feature matrix for the input X using featuretools' dfs algorithm.                                                   |
| <code>update_parameters</code>              | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `static contains_pre_existing_features(dfs_features:`

*Optional[List[featuretools.feature\_base.FeatureBase]],*  
*input\_feature\_names: List[str], target: Optional[str] =*  
*None)*

Determines whether or not features from a DFS Transformer match pipeline input features.

#### Parameters

- **dfs\_features** (*Optional[List[FeatureBase]]*) – List of features output from a DFS Transformer.
- **input\_feature\_names** (*List[str]*) – List of input features into the DFS Transformer.
- **target** (*Optional[str]*) – The target whose values we are trying to predict. This is used to know which column to ignore if the target column is present in the list of features in the DFS Transformer's parameters.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits the DFSTransformer Transformer component.

**Parameters**

- **X** (*pd.DataFrame, np.array*) – The input data to transform, of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the feature matrix for the input *X* using featuretools' dfs algorithm.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data to transform. Has shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Feature matrix

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.**DropNaNRowsTransformer**(*parameters=None*, *component\_obj=None*,  
*random\_seed=0*, *\*\*kwargs*)

Transformer to drop rows with NaN values.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

**Attributes**

|                               |                           |
|-------------------------------|---------------------------|
| <b>hyper-parameter_ranges</b> | {}                        |
| <b>modifies_features</b>      | True                      |
| <b>modifies_target</b>        | True                      |
| <b>name</b>                   | Drop NaN Rows Transformer |
| <b>training_only</b>          | False                     |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data using fitted component.                                                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with NaN rows dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.**ElasticNetClassifier**(*penalty='elasticnet'*, *C=1.0*, *l1\_ratio=0.15*,  
*multi\_class='auto'*, *solver='saga'*, *n\_jobs=-1*,  
*random\_seed=0*, *\*\*kwargs*)

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

**Parameters**

- **penalty** (`{"l1", "l2", "elasticnet", "none"}`) – The norm used in penalization. Defaults to “elasticnet”.
- **C** (`float`) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **l1\_ratio** (`float`) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **multi\_class** (`{"auto", "ovr", "multinomial"}`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver='liblinear'`. “auto” selects “ovr” if the data is binary, or if `solver='liblinear'`, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (`{"newton-cg", "lbfgs", "liblinear", "sag", "saga"}`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
  - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
  - “liblinear” and “saga” also handle L1 penalty
  - “saga” also supports “elasticnet” penalty
  - “liblinear” does not support setting `penalty='none'`
 Defaults to “saga”.
- **n\_jobs** (`int`) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                                |                                                                                                                        |

#### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance for fitted ElasticNet classifier.                                                                             |
| <code>fit</code>                      | Fits ElasticNet classifier component to data.                                                                                    |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted ElasticNet classifier.

**fit**(*self*, *X*, *y*)

Fits ElasticNet classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.ElasticNetRegressor`(*alpha=0.0001*, *l1\_ratio=0.15*, *max\_iter=1000*, *random\_seed=0*, *\*\*kwargs*)

Elastic Net Regressor.

**Parameters**

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1\_ratio** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max\_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance for fitted ElasticNet regressor.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.Estimator(parameters: dict = None, component_obj:
    Type[evalml.pipelines.components.ComponentBase] = None,
    random_seed: Union[int, float] = 0, **kwargs)
```

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

**Parameters**

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>name</code>                     | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>supported_problem_types</code>  | Problem types this estimator supports.                                                                                           |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

#### **property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property model\_family**(*cls*)

Returns *ModelFamily* of this component.

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.ExponentialSmoothingRegressor**(*trend*: *Optional[str]* = *None*, *damped\_trend*: *bool* = *False*, *seasonal*: *Optional[str]* = *None*, *sp*: *int* = *2*, *n\_jobs*: *int* = *-1*, *random\_seed*: *Union[int, float]* = *0*, *\*\*kwargs*)

Holt-Winters Exponential Smoothing Forecaster.

Currently ExponentialSmoothingRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

**Parameters**

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped\_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –

- **None.** (but `AutoMLSearch` will not tune for this. Defaults to) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                                                       |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (bool, optional) – whether to print name of component
- **return\_dict** (bool, optional) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### **property feature\_importance**(self) → pandas.Series

Returns array of 0's with a length of 1 as feature\_importance is not defined for Exponential Smoothing regressor.

### **fit**(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits Exponential Smoothing Regressor to data.

#### **Parameters**

- **X** (pd.DataFrame) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (pd.Series) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

### **get\_prediction\_intervals**(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

#### **Parameters**

- **X** (pd.DataFrame) – Data of shape [n\_samples, n\_features].
- **y** (pd.Series) – Target data. Optional.
- **coverage** (List[float]) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (pd.Series) – Not used for Exponential Smoothing regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.ExtraTreesClassifier(n_estimators=100, max_features='auto', max_depth=6,  
                                           min_samples_split=2, min_weight_fraction_leaf=0.0,  
                                           n_jobs=-1, random_seed=0, **kwargs)
```

Extra Trees Classifier.

### Parameters

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_features** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If *int*, then consider *max\_features* features at each split.
  - If *float*, then *max\_features* is a fraction and  $\text{int}(\text{max\_features} * \text{n\_features})$  features are considered at each split.
  - If “auto”, then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If “sqrt”, then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If “log2”, then  $\text{max\_features} = \text{log2}(\text{n\_features})$ .
  - If *None*, then  $\text{max\_features} = \text{n\_features}$ .

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than *max\_features* features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If *int*, then consider *min\_samples\_split* as the minimum number.
  - If *float*, then *min\_samples\_split* is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.
- **2.** (*Defaults to*) –
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.ExtraTreesRegressor(n_estimators: int = 100, max_features: str = 'auto',
                                           max_depth: int = 6, min_samples_split: int = 2,
                                           min_weight_fraction_leaf: float = 0.0, n_jobs: int = - 1,
                                           random_seed: Union[int, float] = 0, **kwargs)
```

Extra Trees Regressor.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_features** (*int*, *float* or {"auto", "sqrt", "log2"}) – The number of features to consider when looking for the best split:

- If int, then consider max\_features features at each split.
- If float, then max\_features is a fraction and  $\text{int}(\text{max\_features} * \text{n\_features})$  features are considered at each split.
- If “auto”, then  $\text{max\_features} = \sqrt{\text{n\_features}}$ .
- If “sqrt”, then  $\text{max\_features} = \sqrt{\text{n\_features}}$ .
- If “log2”, then  $\text{max\_features} = \log_2(\text{n\_features})$ .
- If None, then  $\text{max\_features} = \text{n\_features}$ .

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max\_features features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider min\_samples\_split as the minimum number.
  - If float, then min\_samples\_split is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.
- **2.** (*Defaults to*) –
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ExtraTreesRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

#### Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.FeatureSelector(parameters=None, component_obj=None, random_seed=0, **kwargs)`**

Selects top features based on importance weights.

#### Parameters

- **`parameters`** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **`component_obj`** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

| <b><code>training_only</code></b>     | False |

#### Methods

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>name</code>               | Returns string name of this component.                                                                                                                                |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a `component_obj` that implements transform

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.Imputer`**(*categorical\_impute\_strategy='most\_frequent', categorical\_fill\_value=None, numeric\_impute\_strategy='mean', numeric\_fill\_value=None, boolean\_impute\_strategy='most\_frequent', boolean\_fill\_value=None, random\_seed=0, \*\*kwargs*)

Imputes missing data according to a specified imputation strategy.

#### Parameters

- **`categorical_impute_strategy`** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most\_frequent” and “constant”.
- **`numeric_impute_strategy`** (*string*) – Impute strategy to use for numeric columns. Valid values include “mean”, “median”, “most\_frequent”, and “constant”.
- **`boolean_impute_strategy`** (*string*) – Impute strategy to use for boolean columns. Valid values include “most\_frequent” and “constant”.
- **`categorical_fill_value`** (*string*) – When `categorical_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with the string “missing\_value”.
- **`numeric_fill_value`** (*int, float*) – When `numeric_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with 0.
- **`boolean_fill_value`** (*bool*) – When `boolean_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with True.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by imputing missing values.                                                                                    |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

**class** `evalml.pipelines.KNeighborsClassifier`(*n\_neighbors=5*, *weights='uniform'*, *algorithm='auto'*, *leaf\_size=30*, *p=2*, *random\_seed=0*, *\*\*kwargs*)

K-Nearest Neighbors Classifier.

## Parameters

- **n\_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** ({*'uniform'*, *'distance'*} or *callable*) – Weight function used in prediction. Can be:
  - *'uniform'* : uniform weights. All points in each neighborhood are weighted equally.
  - *'distance'* : weight points by the inverse of their distance. in this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
  - [*callable*] : a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** ({*'auto'*, *'ball\_tree'*, *'kd\_tree'*, *'brute'*}) – Algorithm used to compute the nearest neighbors:
  - *'ball\_tree'* will use BallTree
  - *'kd\_tree'* will use KDTree
  - *'brute'* will use a brute-force search.

*'auto'* will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf\_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.
- **p** (*int*) – Power parameter for the Minkowski metric. When  $p = 1$ , this is equivalent to using `manhattan_distance` (l1), and `euclidean_distance` (l2) for  $p = 2$ . For arbitrary  $p$ , `minkowski_distance (l_p)` is used. Defaults to 2.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                       |                                                                                                                                                                                          |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                                                                                       |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                                                                                 |
| <code>feature_importance</code>       | Returns array of 0's matching the input number of features as <code>feature_importance</code> is not defined for KNN classifiers.                                                        |
| <code>fit</code>                      | Fits estimator to data.                                                                                                                                                                  |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                                                                                |
| <code>load</code>                     | Loads component at file path.                                                                                                                                                            |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <code>predict</code>                  | Make predictions using selected features.                                                                                                                                                |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                                                                                   |
| <code>save</code>                     | Saves component at file path.                                                                                                                                                            |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                                                                                       |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns array of 0's matching the input number of features as `feature_importance` is not defined for KNN classifiers.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set `_is_fitted` to *False*.

**class** `evalml.pipelines.LightGBMClassifier`(*boosting\_type*='gbdt', *learning\_rate*=0.1, *n\_estimators*=100, *max\_depth*=0, *num\_leaves*=31, *min\_child\_samples*=20, *bagging\_fraction*=0.9, *bagging\_freq*=0, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

LightGBM Classifier.

**Parameters**

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. *k* means perform bagging at every *k* iteration. Every *k*-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next *k* iterations. Defaults to 0.

- **n\_jobs** (*int* or *None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits LightGBM classifier component to data.                                                                                      |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted LightGBM classifier.                                                                           |
| <i>predict_proba</i>            | Make prediction probabilities using the fitted LightGBM classifier.                                                              |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**predict(*self*, *X*)**

Make predictions using the fitted LightGBM classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba(*self*, *X*)**

Make prediction probabilities using the fitted LightGBM classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** *pd.DataFrame*

**save(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=*True*)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.LightGBMRegressor**(*boosting\_type*='gbdt', *learning\_rate*=0.1, *n\_estimators*=20, *max\_depth*=0, *num\_leaves*=31, *min\_child\_samples*=20, *bagging\_fraction*=0.9, *bagging\_freq*=0, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

LightGBM Regressor.

**Parameters**

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select bagging\_fraction \* 100 % of the data to use for the next k iterations. Defaults to 0.
- **n\_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted LightGBM regressor.                                                                                |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X, y=None)**

Fits LightGBM regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted LightGBM regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set `_is_fitted` to *False*.

**class** `evalml.pipelines.LinearRegressor`(*fit\_intercept*=*True*, *n\_jobs*=*-1*, *random\_seed*=*0*, *\*\*kwargs*)

Linear Regressor.

**Parameters**

- **fit\_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to *False*, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to *True*.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance for fitted linear regressor.                                                                                  |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted linear regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.LogisticRegressionClassifier(penalty='l2', C=1.0, multi_class='auto',
                                                    solver='lbfgs', n_jobs=-1, random_seed=0,
                                                    **kwargs)
```

Logistic Regression Classifier.

**Parameters**

- **penalty** (`{"l1", "l2", "elasticnet", "none"}`) – The norm used in penalization. Defaults to “l2”.
- **C** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi\_class** (`{"auto", "ovr", "multinomial"}`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver=“liblinear”`. “auto” selects “ovr” if the data is binary, or if `solver=“liblinear”`, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (`{"newton-cg", "lbfgs", "liblinear", "sag", "saga"}`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
  - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
  - “liblinear” and “saga” also handle L1 penalty
  - “saga” also supports “elasticnet” penalty
  - “liblinear” does not support setting `penalty=‘none’`Defaults to “lbfgs”.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance for fitted logistic regression classifier.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.MulticlassClassificationPipeline(*component\_graph*, *parameters*=*None*, *custom\_name*=*None*, *random\_seed*=*0*)

Pipeline subclass for all multiclass classification pipelines.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – ComponentGraph instance, list of components in order, or dictionary of components. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = MulticlassClassificationPipeline(component_graph=["Simple Imputer",
↳ "Logistic Regression Classifier"],
...                                           parameters={"Logistic Regression_
↳ Classifier": {"penalty": "elasticnet",
...
↳ "solver": "liblinear"}},
...                                           custom_name="My Multiclass Pipeline
↳ ")
...
>>> assert pipeline.custom_name == "My Multiclass Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                       'C': 1.0,
...                                       'n_jobs': -1,
...                                       'multi_class': 'auto',
...                                       'solver': 'liblinear'}}
```

### Methods

|                                                |                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>classes_</code>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n_classes-1.                      |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component inverse_transform methods to estimator predictions in reverse order.                                                                                                 |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's __new__ method.                     |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>predict_proba</code>                     | Make probability estimates for labels.                                                                                                                                               |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on objectives.                                                                                                                                            |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property** **classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static** **create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property** **custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if return\_dict is True, else None.

**Return type** dict

**property** **feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a classification model. For string and categorical targets, classes are sorted by sorted(set(y)) and then are mapped to values between 0 and n\_classes-1.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** self

**Raises**

- **ValueError** – If the number of unique classes in y are not appropriate for the type of pipeline.
- **TypeError** – If the dtype is boolean but pd.NA exists in the series.
- **Exception** – For all other exceptions.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self, name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self, custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self, filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self, importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** *y* (`pd.Series`) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path*: `Union[str, io.BytesIO]`)

Loads pipeline at file path.

**Parameters** **file\_path** (`str/BytesIO`) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (`dict`) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self*, *X*, *objective*=`None`, *X\_train*=`None`, *y\_train*=`None`)

Make predictions using selected features.

Note: we cast *y* as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **objective** (`Object or string`) – The objective to use to make predictions.
- **X\_train** (`pd.DataFrame`) – Training data. Ignored. Only used for time series.

- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Estimated labels.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Make probability estimates for labels.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Probability estimates

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If final component is not an estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on objectives.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – True labels of length [n\_samples]
- **objectives** (*list*) – List of objectives to score
- **X\_train** (*pd.DataFrame*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**transform\_all\_but\_final** (*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** `pd.DataFrame`

**class** `evalml.pipelines.OneHotEncoder` (*top\_n=10*, *features\_to\_encode=None*, *categories=None*,  
*drop='if\_binary'*, *handle\_unknown='ignore'*,  
*handle\_missing='error'*, *random\_seed=0*, *\*\*kwargs*)

A transformer that encodes categorical features in a one-hot numeric array.

**Parameters**

- **top\_n** (*int*) – Number of categories per column to encode. If *None*, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If *None*, all appropriate columns will be encoded. Defaults to *None*.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “auto” if *top\_n* is not *None*. Defaults to *None*.
- **drop** (*string*, *list*) – Method (“first” or “if\_binary”) to use to drop one category per feature. Can also be a list specifying which categories to drop for each feature. Defaults to “if\_binary”.
- **handle\_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top\_n* or *categories* is used to limit the number of categories per column, this must be “ignore”. Defaults to “ignore”.
- **handle\_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “as\_category” and NaN values are within the *n* most frequent, “nan” values will be encoded as their own column. If this is set to “error”, any missing values encountered will raise an error. Defaults to “error”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the one-hot encoder component.                                                                                              |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Return feature names for the categorical features after fitting.                                                                 |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | One-hot encode the input data.                                                                                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to one-hot encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to one-hot encoder as a training feature.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the one-hot encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If encoding a column failed.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the categorical features after fitting.

Feature names are formatted as {column name}\_{category name}. In the event of a duplicate name, an integer will be added at the end of the feature name to distinguish it.

For example, consider a dataframe with a column called "A" and category "x\_y" and another column called "A\_x" with "y". In this example, the feature names would be "A\_x\_y" and "A\_x\_y\_1".

**Returns** The feature names after encoding, provided in the same order as input\_features.

**Return type** np.ndarray

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

One-hot encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to one-hot encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each categorical feature has been encoded into numerical columns using one-hot encoding.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.OrdinalEncoder(features_to_encode=None, categories=None,
                                     handle_unknown='error', unknown_value=None,
                                     encoded_missing_value=None, random_seed=0, **kwargs)
```

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

**Parameters**

- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None. The order of columns does not matter.
- **categories** (*dict[str, list[str]]*) – A dictionary mapping column names to their categories in the dataframes passed in at fit and transform. The order of categories specified for a column does not matter. Any category found in the data that is not present in categories will be handled as an unknown value. To not have unknown values raise an error, set *handle\_unknown* to “use\_encoded\_value”. Defaults to None.
- **handle\_unknown** (“error” or “use\_encoded\_value”) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. When set to “error”, an

error will be raised when an unknown category is found. When set to “use\_encoded\_value”, unknown categories will be encoded as the value given for the parameter `unknown_value`. Defaults to “error.”

- **unknown\_value** (*int or np.nan*) – The value to use for unknown categories seen during fit or transform. Required when the parameter `handle_unknown` is set to “use\_encoded\_value.” The value has to be distinct from the values used to encode any of the categories in fit. Defaults to `None`.
- **encoded\_missing\_value** (*int or np.nan*) – The value to use for missing (null) values seen during fit or transform. Defaults to `np.nan`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                                                                              |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits the ordinal encoder component.                                                                                                                                                      |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i>get_feature_names</i>  | Return feature names for the ordinal features after fitting.                                                                                                                             |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Ordinally encode the input data.                                                                                                                                                         |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **categories**(*self, feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to ordinal encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to ordinal encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the ordinal encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – If encoding a column failed.
- **TypeError** – If non-Ordinal columns are specified in `features_to_encode`.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the ordinal features after fitting.

Feature names are formatted as {column name}\_ordinal\_encoding.

**Returns** The feature names after encoding, provided in the same order as `input_features`.

**Return type** `np.ndarray`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Ordinally encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each ordinal feature has been encoded into a numerical column where ordinal integers represent the relative order of categories.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

**class evalml.pipelines.PerColumnImputer**(*impute\_strategies=None*, *random\_seed=0*, *\*\*kwargs*)

Imputes missing data according to a specified imputation strategy per column.

**Parameters**

- **impute\_strategies** (*dict*) – Column and {"impute\_strategy": strategy, "fill\_value":value} pairings. Valid values for impute strategy include "mean", "median", "most\_frequent", "constant" for numerical data, and "most\_frequent", "constant" for object data types. Defaults to None, which uses "most\_frequent" for all columns. When impute\_strategy == "constant", fill\_value is used to replace missing data. When None, uses 0 when imputing numerical data and "missing\_value" for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputers on input data.                                                                                                     |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input data by imputing missing values.                                                                                |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that Component.default\_parameters == Component().parameters.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits imputers on input data.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features] to fit.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features] to transform.
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.PipelineBase*(*component\_graph*, *parameters=None*, *custom\_name=None*, *random\_seed=0*)

Machine learning pipeline.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”].
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                     |      |
|---------------------|------|
| <b>problem_type</b> | None |
|---------------------|------|

**Methods**

|                                                |                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a model.                                                                                                                                                                       |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**abstract fit**(*self*, *X*, *y*)

Build a model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** *custom\_hyperparameters* (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** *filepath* (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** *importance\_threshold* (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load**(*file\_path*: Union[str, io.BytesIO])

Loads pipeline at file path.

**Parameters** **file\_path** (str/BytesIO) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (dict) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (int) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective*=None, *X\_train*=None, *y\_train*=None)

Make predictions using selected features.

**Parameters**

- **X** (pd.DataFrame, or np.ndarray) – Data of shape [n\_samples, n\_features].
- **objective** (Object or string) – The objective to use to make predictions.
- **X\_train** (pd.DataFrame or np.ndarray or None) – Training data. Ignored. Only used for time series.
- **y\_train** (pd.Series or None) – Training labels. Ignored. Only used for time series.

**Returns** Predicted values.

**Return type** pd.Series

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves pipeline at file path.

**Parameters**

- **file\_path** (str) – Location to save file.
- **pickle\_protocol** (int) – The pickle data stream format.

**abstract score**(*self*, *X*, *y*, *objectives*, *X\_train*=None, *y\_train*=None)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** pd.DataFrame

```
class evalml.pipelines.ProphetRegressor(time_index: Optional[Hashable] = None,  
                                         changepoint_prior_scale: float = 0.05, seasonality_prior_scale:  
                                         int = 10, holidays_prior_scale: int = 10, seasonality_mode: str  
                                         = 'additive', stan_backend: str = 'CMDSTANPY',  
                                         interval_width: float = 0.95, random_seed: Union[int, float] =  
                                         0, **kwargs)
```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint\_prior\_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality\_prior\_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays\_prior\_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality\_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan\_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval\_width** (*float*) – Determines the confidence of the prediction interval range when calling `get_prediction_intervals`. Accepts values in the range (0,1). Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>build_prophet_df</code>         | Build the Prophet data to pass fit and predict on.                                                                               |
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.                                     |
| <code>fit</code>                      | Fits Prophet regressor component to data.                                                                                        |
| <code>get_params</code>               | Get parameters for the Prophet regressor.                                                                                        |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted ProphetRegressor.                                                                 |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted Prophet regressor.                                                                                 |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**static** `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time\_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*) → dict

Returns the default parameters for this component.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name*=False, *return\_dict*=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property** `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature\_importance is not defined for Prophet regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self**get\_params**(*self*) → dict

Get parameters for the Prophet regressor.

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.**Returns** ComponentBase object**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.

**Returns** Predicted values.**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.RandomForestClassifier`(*n\_estimators=100*, *max\_depth=6*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Random Forest Classifier.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.RandomForestRegressor(n_estimators: int = 100, max_depth: int = 6, n_jobs: int = -1, random_seed: Union[int, float] = 0, **kwargs)`**

Random Forest Regressor.

**Parameters**

- **`n_estimators`** (*float*) – The number of trees in the forest. Defaults to 100.
- **`max_depth`** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **`n_jobs`** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

## Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted RandomForestRegressor.                                                            |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `property feature_importance(self) → pandas.Series`

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted RandomForestRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

```
save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)
```

Saves component at file path.

## Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

## Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *is\_fitted* to False.

```
class evalml.pipelines.RegressionPipeline(component_graph, parameters=None, custom_name=None,
                                           random_seed=0)
```

Pipeline subclass for all regression pipelines.

## Parameters

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary or *None* implies using all default values for component parameters. Defaults to *None*.
- **custom\_name** (*str*) – Custom name for the pipeline. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

[illegible]

(continues on next page)

(continued from previous page)

```
>>> assert pipeline.custom_name == "My Regression Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Linear Regressor'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'mean', 'fill_value': None},
...     'Linear Regressor': {'fit_intercept': True, 'n_jobs': -1}}
```

#### Methods

|                                                |                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>can_tune_threshold_with_objective</code> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <code>clone</code>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <code>create_objectives</code>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <code>custom_name</code>                       | Custom name of the pipeline.                                                                                                                                                         |
| <code>describe</code>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <code>feature_importance</code>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <code>fit</code>                               | Build a regression model.                                                                                                                                                            |
| <code>fit_transform</code>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>                     | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                              | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>                      | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                              | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>parameters</code>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                           | Make predictions using selected features.                                                                                                                                            |
| <code>save</code>                              | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>transform</code>                         | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>           | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective`**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** *objective* (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** pd.DataFrame

**fit**(*self*, *X*, *y*)

Build a regression model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **ValueError** – If the target is not numeric.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples].

**Returns** Transformed output.

**Return type** pd.DataFrame

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** *custom\_hyperparameters* (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** *filepath* (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** *graphviz.Digraph*

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** *dag\_dict (dict)*

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** *importance\_threshold* (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** *plotly.Figure*

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component *inverse\_transform* methods to estimator predictions in reverse order.

Components that implement *inverse\_transform* are *PolynomialDecomposer*, *LogTransformer*, *LabelEncoder* (*tbd*).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** *pd.Series*

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self, parameters, random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self, X, objective=None, X\_train=None, y\_train=None*)

Make predictions using selected features.

**Parameters**

- **X** (*pd.DataFrame, or np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series or None*) – Training labels. Ignored. Only used for time series.

**Returns** Predicted values.

**Return type** pd.Series

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self, X, y, objectives, X\_train=None, y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, or *np.ndarray*) – True values of length [n\_samples]
- **objectives** (*list*) – Non-empty list of objectives to score on
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Ignored. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Ignored. Only used for time series.

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series* or *None*) – Targets corresponding to X. Optional.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data. Only used for time series.
- **y\_train** (*pd.Series* or *None*) – Training labels. Only used for time series.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

```
class evalml.pipelines.RFClassifierSelectFromModel(number_features=None, n_estimators=10,  
                                                max_depth=None, percent_features=0.5,  
                                                threshold='median', n_jobs=-1, random_seed=0,  
                                                **kwargs)
```

Selects top features based on importance weights using a Random Forest classifier.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to None.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.

- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both percent\_features and number\_features are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <b>training_only</b>          | False                                                                   |

#### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** `self`

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** `list[str]`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.RFRegressorSelectFromModel(number_features=None, n_estimators=10,
                                                max_depth=None, percent_features=0.5,
                                                threshold='median', n_jobs=- 1, random_seed=0,
                                                **kwargs)
```

Selects top features based on importance weights using a Random Forest regressor.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both percent\_features and number\_features are specified, take the greater number of features. Defaults to 0.5.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both percent\_features and number\_features are specified, take the greater number of features. Defaults to 0.5.

- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.SimpleImputer(impute_strategy='most_frequent', fill_value=None, random_seed=0, **kwargs)`

Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.

**Parameters**

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types.
- **fill\_value** (*string*) – When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. Defaults to 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|-------------------------------|------------------------------------------------------------|
| <b>hyper-parameter_ranges</b> | { "impute_strategy": ["mean", "median", "most_frequent"] } |
| <b>modifies_features</b>      | True                                                       |
| <b>modifies_target</b>        | False                                                      |
| <b>name</b>                   | Simple Imputer                                             |
| <b>training_only</b>          | False                                                      |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, optional) – the target training data of length [n\_samples]

**Returns** *self*

**Raises** **ValueError** – if the SimpleImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, optional) – Target data.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, optional) – Ignored.

**Returns** Transformed X

**Return type** pd.DataFrame

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.StackedEnsembleBase(*final\_estimator=None*, *n\_jobs=-1*, *random\_seed=0*,  
\*\**kwargs*)

Stacked Ensemble Base Class.

**Parameters**

- **final\_estimator** (*Estimator or subclass*) – The estimator used to combine the base estimators.
- **n\_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For *n\_jobs* greater than -1, (*n\_cpus* + 1 + *n\_jobs*) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n\_jobs*  $\neq 1$ . If this is the case, please use *n\_jobs* = 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                          |                      |
|--------------------------|----------------------|
| <b>model_family</b>      | ModelFamily.ENSEMBLE |
| <b>modifies_features</b> | True                 |
| <b>modifies_target</b>   | False                |
| <b>training_only</b>     | False                |

**Methods**

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for stacked ensemble classes.                                                                     |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.                                                      |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>name</code>                     | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>supported_problem_types</code>  | Problem types this estimator supports.                                                                                           |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.StackedEnsembleClassifier`(*final\_estimator*=*None*, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

Stacked Ensemble Classifier.

**Parameters**

- **final\_estimator** (*Estimator* or *subclass*) – The classifier used to combine the base estimators. If None, uses `ElasticNetClassifier`.
- **n\_jobs** (*int* or *None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` below -1, (`n_cpus` + 1 + `n_jobs`) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of `n_jobs` != 1. If this is the case, please use `n_jobs` = 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.classifiers.decision_tree_
↳ classifier import DecisionTreeClassifier
>>> from evalml.pipelines.components.estimators.classifiers.elasticnet_classifier_
↳ import ElasticNetClassifier
...
>>> component_graph = {
...     "Decision Tree": [DecisionTreeClassifier(random_seed=3), "X", "y"],
...     "Decision Tree B": [DecisionTreeClassifier(random_seed=4), "X", "y"],
```

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: pandas.DataFrame) → pandas.Series

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.StackedEnsembleRegressor`(*final\_estimator*=*None*, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

Stacked Ensemble Regressor.

**Parameters**

- **final\_estimator** (*Estimator* or *subclass*) – The regressor used to combine the base estimators. If None, uses `ElasticNetRegressor`.
- **n\_jobs** (*int* or *None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` greater than -1, (`n_cpus + 1 + n_jobs`) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of `n_jobs` != 1. If this is the case, please use `n_jobs = 1`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.regressors.rf_regressor import RandomForestRegressor

| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.                                                      |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static `load(file_path)`**

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** `ComponentBase` object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property `parameters(self)`**

Returns the parameters which were used to initialize the component.

**`predict(self, X: pandas.DataFrame) → pandas.Series`**

Make predictions using selected features.

**Parameters** `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** `X` (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- `file_path` (*str*) – Location to save file.
- `pickle_protocol` (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- `update_dict` (*dict*) – A dict of parameters to update.
- `reset_fit` (*bool, optional*) – If `True`, will set `_is_fitted` to `False`.

**class** evalml.pipelines.**StandardScaler**(*random\_seed=0, \*\*kwargs*)

A transformer that standardizes input features by removing the mean and scaling to unit variance.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the standard scalar on the given data.                                                                                      |
| <i>fit_transform</i>      | Fit and transform data using the standard scaler component.                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted standard scaler.                                                                                 |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self, print\_name=False, return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits the standard scalar on the given data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fit and transform data using the standard scaler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transform data using the fitted standard scaler.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.SVMClassifier`(*C=1.0*, *kernel='rbf'*, *gamma='auto'*, *probability=True*, *random\_seed=0*, *\*\*kwargs*)

Support Vector Machine Classifier.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses  $1 / (n\_features * X.var())$  as value of gamma - If “auto” (default), uses  $1 / n\_features$
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |                                                                                                                         |

| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**property feature\_importance(*self*)**

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

**Returns** Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

**fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.SVMRegressor`(*C*=*1.0*, *kernel*='rbf', *gamma*='auto', *random\_seed*=*0*, *\*\*kwargs*)

Support Vector Machine Regressor.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If `gamma='scale'` is passed then it uses `1 / (n_features * X.var())` as value of gamma - If “auto” (default), uses `1 / n_features`
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted SVM regresor.                                                                                       |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

**Returns** The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.**TargetEncoder**(*cols*=*None*, *smoothing*=*1*, *handle\_unknown*='value',  
                                          *handle\_missing*='value', *random\_seed*=*0*, *\*\*kwargs*)

A transformer that encodes categorical features into target encodings.

**Parameters**

- **cols** (*list*) – Columns to encode. If None, all string columns will be encoded, otherwise only the columns provided will be encoded. Defaults to None
- **smoothing** (*float*) – The smoothing factor to apply. The larger this value is, the more influence the expected target value has on the resulting target encodings. Must be strictly larger than 0. Defaults to 1.0

- **handle\_unknown** (*string*) – Determines how to handle unknown categories for a feature encountered. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **handle\_missing** (*string*) – Determines how to handle missing values encountered during *fit* or *transform*. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the target encoder.                                                                                                         |
| <i>fit_transform</i>      | Fit and transform data using the target encoder.                                                                                 |
| <i>get_feature_names</i>  | Return feature names for the input features after fitting.                                                                       |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted target encoder.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_feature\_names**(*self*)

Return feature names for the input features after fitting.

**Returns** The feature names after encoding.

**Return type** *np.array*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transform data using the fitted target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.TimeSeriesBinaryClassificationPipeline(component_graph,
                                                             parameters=None,
                                                             custom_name=None,
                                                             random_seed=0)
```

Pipeline base class for time series binary classification problems.

**Parameters**

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or ComponentBase subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as *time\_index*, *gap*, and *max\_delay* must be specified with the “pipeline” key. For example: Pipeline(parameters={“pipeline”: {“time\_index”: “Date”, “max\_delay”: 4, “gap”: 2}}).
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Example

```
>>> pipeline = TimeSeriesBinaryClassificationPipeline(component_graph=["Simple_
↳Imputer", "Logistic Regression Classifier"],
...                                                    parameters={"Logistic_
↳Regression Classifier": {"penalty": "elasticnet",
...
↳                                "solver": "liblinear"},
...                                                    "pipeline": {"gap
↳": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
...                                                    custom_name="My_
↳TimeSeriesBinary Pipeline")
...
>>> assert pipeline.custom_name == "My TimeSeriesBinary Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳'Logistic Regression Classifier'}
...
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...     'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                         'C': 1.0,
...                                         'n_jobs': -1,

|                                        |                                                                                                                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>fit</code>                       | Fit a time series classification model.                                                                                                                                              |
| <code>fit_transform</code>             | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <code>get_component</code>             | Returns component by name.                                                                                                                                                           |
| <code>get_hyperparameter_ranges</code> | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <code>graph</code>                     | Generate an image representing the pipeline graph.                                                                                                                                   |
| <code>graph_dict</code>                | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <code>graph_feature_importance</code>  | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <code>inverse_transform</code>         | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <code>load</code>                      | Loads pipeline at file path.                                                                                                                                                         |
| <code>model_family</code>              | Returns model family of this pipeline.                                                                                                                                               |
| <code>name</code>                      | Name of the pipeline.                                                                                                                                                                |
| <code>new</code>                       | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <code>optimize_threshold</code>        | Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.                                             |
| <code>parameters</code>                | Parameter dictionary for this pipeline.                                                                                                                                              |
| <code>predict</code>                   | Predict on future data where target is not known.                                                                                                                                    |
| <code>predict_in_sample</code>         | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <code>predict_proba</code>             | Predict on future data where the target is unknown.                                                                                                                                  |
| <code>predict_proba_in_sample</code>   | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <code>save</code>                      | Saves pipeline at file path.                                                                                                                                                         |
| <code>score</code>                     | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <code>summary</code>                   | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |
| <code>threshold</code>                 | Threshold used to make a prediction. Defaults to None.                                                                                                                               |
| <code>transform</code>                 | Transform the input.                                                                                                                                                                 |
| <code>transform_all_but_final</code>   | Transforms the data by applying all pre-processing components.                                                                                                                       |

**`can_tune_threshold_with_objective(self, objective)`**

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** `objective` (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**`property classes_(self)`**

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self, date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** *dates\_needed* (*tuple(pd.Timestamp)*)

**dates\_needed\_for\_prediction\_range**(*self, start\_date, end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** *dates\_needed* (*tuple(pd.Timestamp)*)

**Raises** **ValueError** – If *start\_date* doesn't come before *end\_date*

**describe**(*self, return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** *dict*

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** *pd.DataFrame*

**fit**(*self, X, y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [n\_samples]

**Returns** *self*

**Raises `ValueError`** – If the number of unique classes in `y` are not appropriate for the type of pipeline.

**`fit_transform(self, X, y)`**

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **`X`** (*`pd.DataFrame`*) – Input features of shape `[n_samples, n_features]`.
- **`y`** (*`pd.Series`*) – The target data of length `[n_samples]`.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**Raises `ValueError`** – If final component is an Estimator.

**`get_component(self, name)`**

Returns component by name.

**Parameters** **`name`** (*`str`*) – Name of component.

**Returns** Component to return

**Return type** Component

**`get_hyperparameter_ranges(self, custom_hyperparameters)`**

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **`custom_hyperparameters`** (*`dict`*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** `dict`

**`graph(self, filepath=None)`**

Generate an image representing the pipeline graph.

**Parameters** **`filepath`** (*`str`*, *optional*) – Path to where the graph should be saved. If set to `None` (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** `graphviz.Digraph`

**Raises**

- **`RuntimeError`** – If `graphviz` is not installed.
- **`ValueError`** – If path is not writeable.

**`graph_dict(self)`**

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

`x_edges` specifies from which component feature data is being passed. `y_edges` specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: `{“Nodes”: {“component_name”: {“Name”: class_name, “Parameters”: parameters_attributes}, ...}}, “x_edges”: [[from_component_name, to_component_name], [from_component_name, to_component_name], ...], “y_edges”: [[from_component_name, to_component_name], [from_component_name, to_component_name], ...]}`

**Returns** A dictionary representing the DAG structure.

**Return type** `dag_dict` (`dict`)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than *importance\_threshold*. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** `plotly.Figure`

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a `BytesIO` object.

**Returns** `PipelineBase` object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or `None` implies using all default values for component parameters. Defaults to `None`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**optimize\_threshold**(*self*, *X*, *y*, *y\_pred\_proba*, *objective*)

Optimize the pipeline threshold given the objective to use. Only used for binary problems with objectives whose thresholds can be tuned.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Input target values.
- **y\_pred\_proba** (*pd.Series*) – The predicted probabilities of the target outputted by the pipeline.

- **objective** (*ObjectiveBase*) – The objective to threshold with. Must have a tunable threshold.

**Raises** **ValueError** – If objective is not optimizable.

**property** **parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises** **ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X** (*pd.DataFrame*) – Future data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*) – Objective used to threshold predicted probabilities, optional. Defaults to None.

**Returns** Estimated labels.

**Return type** *pd.Series*

**Raises** **ValueError** – If objective is not defined for time-series binary classification problems.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape `[n_samples, n_features]`.
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape `[n_samples]`.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Estimated probabilities.

**Return type** `pd.Series`

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – True labels of length `[n_samples]`.
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Ordered dictionary of objective scores.

**Return type** `dict`

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**property threshold**(*self*)

Threshold used to make a prediction. Defaults to None.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the *X* and *y* arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

**class** `evalml.pipelines.TimeSeriesClassificationPipeline`(*component\_graph*, *parameters=None*, *custom\_name=None*, *random\_seed=0*)

Pipeline base class for time series classification problems.

**Parameters**

- **component\_graph** (*ComponentGraph*, *list*, *dict*) – *ComponentGraph* instance, list of components in order, or dictionary of components. Accepts strings or *ComponentBase* subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as `time_index`, `gap`, and `max_delay` must be specified with the “pipeline” key. For example: `Pipeline(parameters={"pipeline": {"time_index": “Date”, “max_delay”: 4, “gap”: 2}})`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                     |      |
|---------------------|------|
| <b>problem_type</b> | None |
|---------------------|------|

**Methods**

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series classification model.                                                                                                                                              |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component <i>inverse_transform</i> methods to estimator predictions in reverse order.                                                                                          |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Predict on future data where target is not known.                                                                                                                                    |
| <i>predict_in_sample</i>                 | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>predict_proba</i>                     | Predict on future data where the target is unknown.                                                                                                                                  |
| <i>predict_proba_in_sample</i>           | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>save</i>                              | Saves pipeline at file path.                                                                                                                                                         |
| <i>score</i>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |
| <i>summary</i>                           | A short summary of the pipeline structure, describing the list of components used.                                                                                                   |

|                                      |                                                                |
|--------------------------------------|----------------------------------------------------------------|
| <code>transform</code>               | Transform the input.                                           |
| <code>transform_all_but_final</code> | Transforms the data by applying all pre-processing components. |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self*, *date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**dates\_needed\_for\_prediction\_range**(*self*, *start\_date*, *end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**Raises** **ValueError** – If *start\_date* doesn't come before *end\_date*

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property** `feature_importance(self)`

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** `pd.DataFrame`

**fit**(*self*, *X*, *y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length `[n_samples]`

**Returns** *self*

**Raises** **ValueError** – If the number of unique classes in *y* are not appropriate for the type of pipeline.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target data of length `[n_samples]`.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** *dict*

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to *None* (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** `graphviz.Digraph`

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict(self)**

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

`x_edges` specifies from which component feature data is being passed. `y_edges` specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance(self, importance\_threshold=0)**

Generate a bar graph of the pipeline's feature importance.

**Parameters** `importance_threshold` (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than `importance_threshold`. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform(self, y)**

Apply component `inverse_transform` methods to estimator predictions in reverse order.

Components that implement `inverse_transform` are `PolynomialDecomposer`, `LogTransformer`, `LabelEncoder` (tbd).

**Parameters** `y` (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** pd.Series

**static load(file\_path: Union[str, io.BytesIO])**

Loads pipeline at file path.

**Parameters** `file_path` (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family(self)**

Returns model family of this pipeline.

**property name(self)**

Name of the pipeline.

**new(self, parameters, random\_seed=0)**

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** dict

**predict**(*self*, *X*, *objective=None*, *X\_train=None*, *y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*)

Predict on future data where the target is known, e.g. cross validation.

Note: we cast y as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.

**Returns** Estimated labels.

**Return type** pd.Series

**Raises ValueError** – If final component is not an Estimator.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].

- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

```
class evalml.pipelines.TimeSeriesFeaturizer(time_index=None, max_delay=2, gap=0,  
                                           forecast_horizon=1, conf_level=0.05,  
                                           rolling_window_size=0.25, delay_features=True,  
                                           delay_target=True, random_seed=0, **kwargs)
```

Transformer that delays input features and target variable for time series problems.

This component uses an algorithm based on the autocorrelation values of the target variable to determine which lags to select from the set of all possible lags.

The algorithm is based on the idea that the local maxima of the autocorrelation function indicate the lags that have the most impact on the present time.

The algorithm computes the autocorrelation values and finds the local maxima, called “peaks”, that are significant at the given `conf_level`. Since lags in the range [0, 10] tend to be predictive but not local maxima, the union of the peaks is taken with the significant lags in the range [0, 10]. At the end, only selected lags in the range [0, `max_delay`] are used.

Parametrizing the algorithm by `conf_level` lets the AutoMLAlgorithm tune the set of lags chosen so that the chances of finding a good set of lags is higher.

Using `conf_level` value of 1 selects all possible lags.

**Parameters**

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **max\_delay** (*int*) – Maximum number of time units to delay each feature. Defaults to 2.
- **forecast\_horizon** (*int*) – The number of time periods the pipeline is expected to forecast.
- **conf\_level** (*float*) – Float in range (0, 1] that determines the confidence interval size used to select which lags to compute from the set of [1, max\_delay]. A delay of 1 will always be computed. If 1, selects all possible lags in the set of [1, max\_delay], inclusive.
- **rolling\_window\_size** (*float*) – Float in range (0, 1] that determines the size of the window used for rolling features. Size is computed as rolling\_window\_size \* max\_delay.
- **delay\_features** (*bool*) – Whether to delay the input features. Defaults to True.
- **delay\_target** (*bool*) – Whether to delay the target. Defaults to True.
- **gap** (*int*) – The number of time units between when the features are collected and when the target is collected. For example, if you are predicting the next time step’s target, gap=1. This is only needed because when gap=0, we need to be sure to start the lagging of the target variable at 1. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

#### Attributes

|---------------------------|-----------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state. |
| <i>default_parameters</i> | Returns the default parameters for this component.                    |
| <i>describe</i>           | Describe a component and its parameters.                              |
| <i>fit</i>                | Fits the DelayFeatureTransformer.                                     |
| <i>fit_transform</i>      | Fit the component and transform the input data.                       |
| <i>load</i>               | Loads component at file path.                                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.   |
| <i>save</i>               | Saves component at file path.                                         |
| <i>transform</i>          | Computes the delayed values and rolling means for X and y.            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                    |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the DelayFeatureTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **ValueError** – if `self.time_index` is `None`

**fit\_transform**(*self*, *X*, *y=None*)

Fit the component and transform the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X.

**Return type** pd.DataFrame

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the delayed values and rolling means for X and y.

The chosen delays are determined by the autocorrelation function of the target variable. See the class docstring for more information on how they are chosen. If y is None, all possible lags are chosen.

If y is not None, it will also compute the delayed values for the target variable.

The rolling means for all numeric features in X and y, if y is numeric, are also returned.

#### Parameters

- **X** (*pd.DataFrame* or *None*) – Data to transform. None is expected when only the target variable is being used.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X. No original features are returned.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.TimeSeriesImputer(categorical_impute_strategy='forwards_fill',
                                         numeric_impute_strategy='interpolate',
                                         target_impute_strategy='forwards_fill', random_seed=0,
                                         **kwargs)
```

Imputes missing data according to a specified timeseries-specific imputation strategy.

This Transformer should be used after the *TimeSeriesRegularizer* in order to impute the missing values that were added to X and y (if passed).

#### Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “backwards\_fill” and “forwards\_fill”. Defaults to “forwards\_fill”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “interpolate”.
- **target\_impute\_strategy** (*string*) – Impute strategy to use for the target column. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “forwards\_fill”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Raises `ValueError`** – If `categorical_impute_strategy`, `numeric_impute_strategy`, or `target_impute_strategy` is not one of the valid values.

#### **`clone(self)`**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **`default_parameters(cls)`**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **`describe(self, print_name=False, return_dict=False)`**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits imputer to data.

'None' values are converted to np.nan before imputation and are treated as the same. If a value is missing at the beginning or end of a column, that value will be imputed using backwards fill or forwards fill as necessary, respectively.

**Parameters**

- **X** (*pd.DataFrame*, *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values using specified timeseries-specific strategies. ‘None’ values are converted to `np.nan` before imputation and are treated as the same.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Optionally, target data to transform.

**Returns** Transformed *X* and *y*

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.TimeSeriesMulticlassClassificationPipeline(component_graph,
                                                                parameters=None,
                                                                custom_name=None,
                                                                random_seed=0)
```

Pipeline base class for time series multiclass classification problems.

#### Parameters

- **component\_graph** (*list or dict*) – List of components in order. Accepts strings or `ComponentBase` subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary `{}` implies using all default values for component parameters. Pipeline-level parameters such as `time_index`, `gap`, and `max_delay` must be specified with the “pipeline” key. For example: `Pipeline(parameters={"pipeline": {"time_index": "Date", "max_delay": 4, "gap": 2}})`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Example

```
>>> pipeline = TimeSeriesMulticlassClassificationPipeline(component_graph=["Simple_
↪ Imputer", "Logistic Regression Classifier"],
...
↪ Regression Classifier": {"penalty": "elasticnet",
...
↪                               "solver": "liblinear"},
...
↪                               "pipeline": {
↪ "gap": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
...
↪                               custom_name="My_
↪ TimeSeriesMulticlass Pipeline")
```

(continues on next page)

(continued from previous page)

```
>>> assert pipeline.custom_name == "My TimeSeriesMulticlass Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Logistic Regression Classifier'}
>>> assert pipeline.parameters == {
...   'Simple Imputer': {'impute_strategy': 'most_frequent', 'fill_value': None},
...   'Logistic Regression Classifier': {'penalty': 'elasticnet',
...                                     'C': 1.0,
...                                     'n_jobs': -1,
...                                     'multi_class': 'auto',
...                                     'solver': 'liblinear'},
...   'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_horizon': 1, 'time_index':
↳ "date"}}}
```

**Attributes**

|                           |                                     |
|---------------------------|-------------------------------------|
| <b>prob-<br/>lem_type</b> | ProblemTypes.TIME_SERIES_MULTICLASS |
|---------------------------|-------------------------------------|

**Methods**

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>classes_</i>                          | Gets the class names for the pipeline. Will return None before pipeline is fit.                                                                                                      |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series classification model.                                                                                                                                              |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |

Table 14 – continued from previous page

|                                |                                                                                                                                                                               |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>inverse_transform</i>       | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                             |
| <i>load</i>                    | Loads pipeline at file path.                                                                                                                                                  |
| <i>model_family</i>            | Returns model family of this pipeline.                                                                                                                                        |
| <i>name</i>                    | Name of the pipeline.                                                                                                                                                         |
| <i>new</i>                     | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method. |
| <i>parameters</i>              | Parameter dictionary for this pipeline.                                                                                                                                       |
| <i>predict</i>                 | Predict on future data where target is not known.                                                                                                                             |
| <i>predict_in_sample</i>       | Predict on future data where the target is known, e.g. cross validation.                                                                                                      |
| <i>predict_proba</i>           | Predict on future data where the target is unknown.                                                                                                                           |
| <i>predict_proba_in_sample</i> | Predict on future data where the target is known, e.g. cross validation.                                                                                                      |
| <i>save</i>                    | Saves pipeline at file path.                                                                                                                                                  |
| <i>score</i>                   | Evaluate model performance on current and additional objectives.                                                                                                              |
| <i>summary</i>                 | A short summary of the pipeline structure, describing the list of components used.                                                                                            |
| <i>transform</i>               | Transform the input.                                                                                                                                                          |
| <i>transform_all_but_final</i> | Transforms the data by applying all pre-processing components.                                                                                                                |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** *objective* (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**property classes\_**(*self*)

Gets the class names for the pipeline. Will return None before pipeline is fit.

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self*, *date*)

Return dates needed to forecast the given date in the future.

**Parameters** *date* (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (*tuple(pd.Timestamp)*)

**dates\_needed\_for\_prediction\_range**(*self*, *start\_date*, *end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** `dates_needed` (`tuple(pd.Timestamp)`)

**Raises** **ValueError** – If *start\_date* doesn't come before *end\_date*

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** `dict`

**property feature\_importance**(*self*)

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** `pd.DataFrame`

**fit**(*self*, *X*, *y*)

Fit a time series classification model.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [*n\_samples*, *n\_features*]
- **y** (*pd.Series*, *np.ndarray*) – The target training labels of length [*n\_samples*]

**Returns** *self*

**Raises** **ValueError** – If the number of unique classes in *y* are not appropriate for the type of pipeline.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (*pd.DataFrame*) – Input features of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*) – The target data of length [*n\_samples*].

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If final component is an Estimator.

**get\_component**(*self*, *name*)

Returns component by name.

**Parameters** **name** (*str*) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_hyperparameter\_ranges**(*self*, *custom\_hyperparameters*)

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** **custom\_hyperparameters** (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** dict

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component inverse\_transform methods to estimator predictions in reverse order.

Components that implement inverse\_transform are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** **y** (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** `pd.Series`

**static load**(*file\_path: Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** **file\_path** (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self, parameters, random\_seed=0*)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's `__new__` method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** `dict`

**predict**(*self, X, objective=None, X\_train=None, y\_train=None*)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame, or np.ndarray*) – Data of shape `[n_samples, n_features]`.
- **objective** (*Object or string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame or np.ndarray or None*) – Training data.
- **y\_train** (*pd.Series or None*) – Training labels.

**Raises** **ValueError** – If `X_train` and/or `y_train` are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self, X, y, X\_train, y\_train, objective=None*)

Predict on future data where the target is known, e.g. cross validation.

Note: we cast `y` as ints first to address boolean values that may be returned from calculating predictions which we would not be able to otherwise transform if we originally had integer targets.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Future data of shape `[n_samples, n_features]`.

- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.

**Returns** Estimated labels.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba**(*self*, *X*, *X\_train=None*, *y\_train=None*)

Predict on future data where the target is unknown.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**predict\_proba\_in\_sample**(*self*, *X\_holdout*, *y\_holdout*, *X\_train*, *y\_train*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X\_holdout** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features].
- **y\_holdout** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples].
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Estimated probabilities.

**Return type** *pd.Series*

**Raises** **ValueError** – If the final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** dict

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** pd.DataFrame

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we're calling predict\_in\_sample to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** pd.DataFrame

```
class evalml.pipelines.TimeSeriesRegressionPipeline(component_graph, parameters=None,
                                                    custom_name=None, random_seed=0)
```

Pipeline base class for time series regression problems.

#### Parameters

- **component\_graph** (`ComponentGraph`, `list`, `dict`) – `ComponentGraph` instance, list of components in order, or dictionary of components. Accepts strings or `ComponentBase` subclasses in the list. Note that when duplicate components are specified in a list, the duplicate component names will be modified with the component’s index in the list. For example, the component graph [Imputer, One Hot Encoder, Imputer, Logistic Regression Classifier] will have names [“Imputer”, “One Hot Encoder”, “Imputer\_2”, “Logistic Regression Classifier”]
- **parameters** (`dict`) – Dictionary with component names as keys and dictionary of that component’s parameters as values. An empty dictionary {} implies using all default values for component parameters. Pipeline-level parameters such as `time_index`, `gap`, and `max_delay` must be specified with the “pipeline” key. For example: `Pipeline(parameters={"pipeline": {"time_index": "Date", "max_delay": 4, "gap": 2}})`.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

#### Example

```
>>> pipeline = TimeSeriesRegressionPipeline(component_graph=["Simple Imputer",
↳ "Linear Regressor"],
                                           parameters={"Simple Imputer": {"impute_strategy": "mean"},
↳ "pipeline": {"gap": 1, "max_delay": 1, "forecast_horizon": 1, "time_index": "date"}},
                                           custom_name="My TimeSeriesRegression Pipeline")
>>> assert pipeline.custom_name == "My TimeSeriesRegression Pipeline"
>>> assert pipeline.component_graph.component_dict.keys() == {'Simple Imputer',
↳ 'Linear Regressor'}
```

The pipeline parameters will be chosen from the default parameters for every component, unless specific parameters were passed in as they were above.

```
>>> assert pipeline.parameters == {
...     'Simple Imputer': {'impute_strategy': 'mean', 'fill_value': None},
...     'Linear Regressor': {'fit_intercept': True, 'n_jobs': -1},
...     'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_horizon': 1, 'time_index':
↳ "date"}}
```

#### Attributes

| NO_PREDS_PIPELINE_ESTIMATOR.TIME_SERIES_REGRESSION |      |
|----------------------------------------------------|------|
| problem_type                                       | None |

#### Methods

|                                          |                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>can_tune_threshold_with_objective</i> | Determine whether the threshold of a binary classification pipeline can be tuned.                                                                                                    |
| <i>clone</i>                             | Constructs a new pipeline with the same components, parameters, and random seed.                                                                                                     |
| <i>create_objectives</i>                 | Create objective instances from a list of strings or objective classes.                                                                                                              |
| <i>custom_name</i>                       | Custom name of the pipeline.                                                                                                                                                         |
| <i>dates_needed_for_prediction</i>       | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>dates_needed_for_prediction_range</i> | Return dates needed to forecast the given date in the future.                                                                                                                        |
| <i>describe</i>                          | Outputs pipeline details including component parameters.                                                                                                                             |
| <i>feature_importance</i>                | Importance associated with each feature. Features dropped by the feature selection are excluded.                                                                                     |
| <i>fit</i>                               | Fit a time series pipeline.                                                                                                                                                          |
| <i>fit_transform</i>                     | Fit and transform all components in the component graph, if all components are Transformers.                                                                                         |
| <i>get_component</i>                     | Returns component by name.                                                                                                                                                           |
| <i>get_forecast_period</i>               | Generates all possible forecasting time points based on latest data point in X.                                                                                                      |
| <i>get_forecast_predictions</i>          | Generates all possible forecasting predictions based on last period of X.                                                                                                            |
| <i>get_hyperparameter_ranges</i>         | Returns hyperparameter ranges from all components as a dictionary.                                                                                                                   |
| <i>get_prediction_intervals</i>          | Find the prediction intervals using the fitted regressor.                                                                                                                            |
| <i>graph</i>                             | Generate an image representing the pipeline graph.                                                                                                                                   |
| <i>graph_dict</i>                        | Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases. |
| <i>graph_feature_importance</i>          | Generate a bar graph of the pipeline's feature importance.                                                                                                                           |
| <i>inverse_transform</i>                 | Apply component <code>inverse_transform</code> methods to estimator predictions in reverse order.                                                                                    |
| <i>load</i>                              | Loads pipeline at file path.                                                                                                                                                         |
| <i>model_family</i>                      | Returns model family of this pipeline.                                                                                                                                               |
| <i>name</i>                              | Name of the pipeline.                                                                                                                                                                |
| <i>new</i>                               | Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's <code>__new__</code> method.        |
| <i>parameters</i>                        | Parameter dictionary for this pipeline.                                                                                                                                              |
| <i>predict</i>                           | Predict on future data where target is not known.                                                                                                                                    |
| <i>predict_in_sample</i>                 | Predict on future data where the target is known, e.g. cross validation.                                                                                                             |
| <i>save</i>                              | Saves pipeline at file path.                                                                                                                                                         |
| <i>score</i>                             | Evaluate model performance on current and additional objectives.                                                                                                                     |

|--------------------------------|------------------------------------------------------------------------------------|
| <i>summary</i>                 | A short summary of the pipeline structure, describing the list of components used. |
| <i>transform</i>               | Transform the input.                                                               |
| <i>transform_all_but_final</i> | Transforms the data by applying all pre-processing components.                     |

**can\_tune\_threshold\_with\_objective**(*self*, *objective*)

Determine whether the threshold of a binary classification pipeline can be tuned.

**Parameters** **objective** (*ObjectiveBase*) – Primary AutoMLSearch objective.

**Returns** True if the pipeline threshold can be tuned.

**Return type** bool

**clone**(*self*)

Constructs a new pipeline with the same components, parameters, and random seed.

**Returns** A new instance of this pipeline with identical components, parameters, and random seed.

**static create\_objectives**(*objectives*)

Create objective instances from a list of strings or objective classes.

**property custom\_name**(*self*)

Custom name of the pipeline.

**dates\_needed\_for\_prediction**(*self*, *date*)

Return dates needed to forecast the given date in the future.

**Parameters** **date** (*pd.Timestamp*) – Date to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**dates\_needed\_for\_prediction\_range**(*self*, *start\_date*, *end\_date*)

Return dates needed to forecast the given date in the future.

**Parameters**

- **start\_date** (*pd.Timestamp*) – Start date of range to forecast in the future.
- **end\_date** (*pd.Timestamp*) – End date of range to forecast in the future.

**Returns** Range of dates needed to forecast the given date.

**Return type** dates\_needed (tuple(*pd.Timestamp*))

**Raises** **ValueError** – If *start\_date* doesn't come before *end\_date*

**describe**(*self*, *return\_dict=False*)

Outputs pipeline details including component parameters.

**Parameters** **return\_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Dictionary of all component parameters if *return\_dict* is True, else None.

**Return type** dict

**property feature\_importance(*self*)**

Importance associated with each feature. Features dropped by the feature selection are excluded.

**Returns** Feature names and their corresponding importance

**Return type** `pd.DataFrame`

**fit(*self*, *X*, *y*)**

Fit a time series pipeline.

**Parameters**

- **X** (`pd.DataFrame` or `np.ndarray`) – The input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`, `np.ndarray`) – The target training targets of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If the target is not numeric.

**fit\_transform(*self*, *X*, *y*)**

Fit and transform all components in the component graph, if all components are Transformers.

**Parameters**

- **X** (`pd.DataFrame`) – Input features of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – The target data of length `[n_samples]`.

**Returns** Transformed output.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If final component is an Estimator.

**get\_component(*self*, *name*)**

Returns component by name.

**Parameters** **name** (`str`) – Name of component.

**Returns** Component to return

**Return type** Component

**get\_forecast\_period(*self*, *X*)**

Generates all possible forecasting time points based on latest data point in *X*.

**Parameters** **X** (`pd.DataFrame`, `np.ndarray`) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.

**Raises** **ValueError** – If pipeline is not trained.

**Returns** Datetime periods from *gap* to *forecast\_horizon* + *gap*.

**Return type** `pd.Series`

### Example

```
>>> X = pd.DataFrame({'date': pd.date_range(start='1-1-2022', periods=10, freq=
↳ 'D'), 'feature': range(10, 20)})
>>> y = pd.Series(range(0, 10), name='target')
>>> gap = 1
>>> forecast_horizon = 2
>>> pipeline = TimeSeriesRegressionPipeline(component_graph=["Linear Regressor
↳ "],
...                                     parameters={"Simple Imputer": {
↳ "impute_strategy": "mean"},
...                                     "pipeline": {"gap": gap,
↳ "max_delay": 1, "forecast_horizon": forecast_horizon, "time_index": "date"}},
...                                     )
>>> pipeline.fit(X, y)
pipeline = TimeSeriesRegressionPipeline(component_graph={'Linear Regressor': [
↳ 'Linear Regressor', 'X', 'y']}, parameters={'Linear Regressor': {'fit_intercept
↳ ': True, 'n_jobs': -1}, 'pipeline': {'gap': 1, 'max_delay': 1, 'forecast_
↳ horizon': 2, 'time_index': 'date'}}, random_seed=0)
>>> dates = pipeline.get_forecast_period(X)
>>> expected = pd.Series(pd.date_range(start='2022-01-11', periods=forecast_
↳ horizon, freq='D').shift(gap), name='date', index=[10, 11])
>>> assert dates.equals(expected)
```

#### `get_forecast_predictions(self, X, y)`

Generates all possible forecasting predictions based on last period of X.

##### Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape `[n_samples_train, n_features]`.
- **y** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape `[n_samples_train]`.

**Returns** Predictions from `gap` periods out to `forecast_horizon + gap` periods.

#### `get_hyperparameter_ranges(self, custom_hyperparameters)`

Returns hyperparameter ranges from all components as a dictionary.

**Parameters** `custom_hyperparameters` (*dict*) – Custom hyperparameters for the pipeline.

**Returns** Dictionary of hyperparameter ranges for each component in the pipeline.

**Return type** `dict`

#### `get_prediction_intervals(self, X, y=None, X_train=None, y_train=None, coverage=None)`

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Certain estimators (Extra Trees Estimator, XGBoost Estimator, Prophet Estimator, ARIMA, and Exponential Smoothing estimator) utilize a different methodology to calculate prediction intervals. See the docs for these estimators to learn more.

##### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**graph**(*self*, *filepath=None*)

Generate an image representing the pipeline graph.

**Parameters** **filepath** (*str*, *optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

**Returns** Graph object that can be directly displayed in Jupyter notebooks.

**Return type** graphviz.Digraph

**Raises**

- **RuntimeError** – If graphviz is not installed.
- **ValueError** – If path is not writeable.

**graph\_dict**(*self*)

Generates a dictionary with nodes consisting of the component names and parameters, and edges detailing component relationships. This dictionary is JSON serializable in most cases.

*x\_edges* specifies from which component feature data is being passed. *y\_edges* specifies from which component target data is being passed. This can be used to build graphs across a variety of visualization tools. Template: {"Nodes": {"component\_name": {"Name": class\_name, "Parameters": parameters\_attributes}, ...}, "x\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...], "y\_edges": [[from\_component\_name, to\_component\_name], [from\_component\_name, to\_component\_name], ...]}

**Returns** A dictionary representing the DAG structure.

**Return type** dag\_dict (dict)

**graph\_feature\_importance**(*self*, *importance\_threshold=0*)

Generate a bar graph of the pipeline's feature importance.

**Parameters** **importance\_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance\_threshold. Defaults to zero.

**Returns** A bar graph showing features and their corresponding importance.

**Return type** plotly.Figure

**Raises** **ValueError** – If importance threshold is not valid.

**inverse\_transform**(*self*, *y*)

Apply component inverse\_transform methods to estimator predictions in reverse order.

Components that implement inverse\_transform are PolynomialDecomposer, LogTransformer, LabelEncoder (tbd).

**Parameters** *y* (*pd.Series*) – Final component features.

**Returns** The inverse transform of the target.

**Return type** *pd.Series*

**static load**(*file\_path*: *Union[str, io.BytesIO]*)

Loads pipeline at file path.

**Parameters** *file\_path* (*str/BytesIO*) – load filepath or a BytesIO object.

**Returns** PipelineBase object

**property model\_family**(*self*)

Returns model family of this pipeline.

**property name**(*self*)

Name of the pipeline.

**new**(*self*, *parameters*, *random\_seed*=0)

Constructs a new instance of the pipeline with the same component graph but with a different set of parameters. Not to be confused with python's \_\_new\_\_ method.

**Parameters**

- **parameters** (*dict*) – Dictionary with component names as keys and dictionary of that component's parameters as values. An empty dictionary or None implies using all default values for component parameters. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** A new instance of this pipeline with identical components.

**property parameters**(*self*)

Parameter dictionary for this pipeline.

**Returns** Dictionary of all component parameters.

**Return type** *dict*

**predict**(*self*, *X*, *objective*=None, *X\_train*=None, *y\_train*=None)

Predict on future data where target is not known.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **objective** (*Object* or *string*) – The objective to use to make predictions.
- **X\_train** (*pd.DataFrame* or *np.ndarray* or *None*) – Training data.
- **y\_train** (*pd.Series* or *None*) – Training labels.

**Raises ValueError** – If X\_train and/or y\_train are None or if final component is not an Estimator.

**Returns** Predictions.

**predict\_in\_sample**(*self*, *X*, *y*, *X\_train*, *y\_train*, *objective=None*, *calculating\_residuals=False*)

Predict on future data where the target is known, e.g. cross validation.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Future data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *np.ndarray*) – Future target of shape [n\_samples]
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features]
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train]
- **objective** (*ObjectiveBase*, *str*, *None*) – Objective used to threshold predicted probabilities, optional.
- **calculating\_residuals** (*bool*) – Whether we’re calling predict\_in\_sample to calculate the residuals. This means the X and y arguments are not future data, but actually the train data.

**Returns** Estimated labels.

**Return type** *pd.Series*

**Raises** **ValueError** – If final component is not an Estimator.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves pipeline at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**score**(*self*, *X*, *y*, *objectives*, *X\_train=None*, *y\_train=None*)

Evaluate model performance on current and additional objectives.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – True labels of length [n\_samples].
- **objectives** (*list*) – Non-empty list of objectives to score on.
- **X\_train** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on of shape [n\_samples\_train, n\_features].
- **y\_train** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline of shape [n\_samples\_train].

**Returns** Ordered dictionary of objective scores.

**Return type** *dict*

**property summary**(*self*)

A short summary of the pipeline structure, describing the list of components used.

Example: Logistic Regression Classifier w/ Simple Imputer + One Hot Encoder

**Returns** A string describing the pipeline structure.

**transform**(*self*, *X*, *y=None*)

Transform the input.

**Parameters**

- **X** (*pd.DataFrame*, or *np.ndarray*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target data of length [n\_samples]. Defaults to None.

**Returns** Transformed output.

**Return type** *pd.DataFrame*

**transform\_all\_but\_final**(*self*, *X*, *y=None*, *X\_train=None*, *y\_train=None*, *calculating\_residuals=False*)

Transforms the data by applying all pre-processing components.

**Parameters**

- **X** (*pd.DataFrame*) – Input data to the pipeline to transform.
- **y** (*pd.Series*) – Targets corresponding to the pipeline targets.
- **X\_train** (*pd.DataFrame*) – Training data used to generate features from past observations.
- **y\_train** (*pd.Series*) – Training targets used to generate features from past observations.
- **calculating\_residuals** (*bool*) – Whether we’re calling `predict_in_sample` to calculate the residuals. This means the *X* and *y* arguments are not future data, but actually the train data.

**Returns** New transformed features.

**Return type** *pd.DataFrame*

**class** `evalml.pipelines.TimeSeriesRegularizer`(*time\_index=None*, *frequency\_payload=None*, *window\_length=4*, *threshold=0.4*, *random\_seed=0*, *\*\*kwargs*)

Transformer that regularizes an inconsistently spaced datetime column.

If *X* is passed in to `fit/transform`, the column *time\_index* will be checked for an inferrable offset frequency. If the *time\_index* column is perfectly inferrable then this Transformer will do nothing and return the original *X* and *y*.

If *X* does not have a perfectly inferrable frequency but one can be estimated, then *X* and *y* will be reformatted based on the estimated frequency for *time\_index*. In the original *X* and *y* passed: - Missing datetime values will be added and will have their corresponding columns in *X* and *y* set to *None*. - Duplicate datetime values will be dropped. - Extra datetime values will be dropped. - If it can be determined that a duplicate or extra value is misaligned, then it will be repositioned to take the place of a missing value.

This Transformer should be used before the *TimeSeriesImputer* in order to impute the missing values that were added to *X* and *y* (if passed).

**Parameters**

- **time\_index** (*string*) – Name of the column containing the datetime information used to order the data, required. Defaults to *None*.
- **frequency\_payload** (*tuple*) – Payload returned from Woodwork’s `infer_frequency` function where `debug` is *True*. Defaults to *None*.
- **window\_length** (*int*) – The size of the rolling window over which inference is conducted to determine the prevalence of uninferable frequencies.
- **5.** (Lower values make this component more sensitive to recognizing numerous faulty datetime values. Defaults to) –

- **threshold** (*float*) – The minimum percentage of windows that need to have been able to infer a frequency. Lower values make this component more
- **0.8.** (*sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.
- **0.** (*Defaults to*) –

**Raises** **ValueError** – if the frequency\_payload parameter has not been passed a tuple

#### Attributes

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the TimeSeriesRegularizer.                                                                                                  |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Regularizes a dataframe and target data to an inferable offset frequency.                                                        |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the TimeSeriesRegularizer.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – if self.time\_index is None, if X and y have different lengths, if *time\_index* in X does not have an offset frequency that can be estimated
- **TypeError** – if the *time\_index* column is not of type Datetime
- **KeyError** – if the *time\_index* column doesn't exist

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Regularizes a dataframe and target data to an inferrable offset frequency.

A ‘clean’ *X* and *y* (if *y* was passed in) are created based on an inferrable offset frequency and matching datetime values with the original *X* and *y* are imputed into the clean *X* and *y*. Datetime values identified as misaligned are shifted into their appropriate position.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Data with an inferrable *time\_index* offset frequency.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.Transformer(parameters=None, component_obj=None, random_seed=0, **kwargs)`

A component that may or may not need fitting that transforms data. These components are used before an estimator.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Transformer component.

**Parameters**

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |       |
|--------------------------------|-------|
| <b>modi-<br/>fies_features</b> | True  |
| <b>modi-<br/>fies_target</b>   | False |
| <b>train-<br/>ing_only</b>     | False |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>name</i>               | Returns string name of this component.                                                                                           |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

### **fit**(*self*, *X*, *y=None*)

Fits component to data.

#### **Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises `MethodPropertyNotFoundError`** – If transformer does not have a transform method or a `component_obj` that implements transform.

**`update_parameters`**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.VowpalWabbitBinaryClassifier`**(*loss\_function='logistic'*, *learning\_rate=0.5*,  
*decay\_learning\_rate=1.0*, *power\_t=0.5*,  
*passes=1*, *random\_seed=0*, *\*\*kwargs*)

Vowpal Wabbit Binary Classifier.

**Parameters**

- **`loss_function`** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **`learning_rate`** (*float*) – Boosting learning rate. Defaults to 0.5.
- **`decay_learning_rate`** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **`power_t`** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **`passes`** (*int*) – Number of training passes. Defaults to 1.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |                                                          |

**Methods**

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance for Vowpal Wabbit classifiers. This is not implemented.                                                       |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.VowpalWabbitMulticlassClassifier`(*loss\_function='logistic'*, *learning\_rate=0.5*, *decay\_learning\_rate=1.0*, *power\_t=0.5*, *passes=1*, *random\_seed=0*, *\*\*kwargs*)

Vowpal Wabbit Multiclass Classifier.

**Parameters**

- **loss\_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `property feature_importance(self)`

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

### `fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.VowpalWabbitRegressor`(*learning\_rate=0.5*, *decay\_learning\_rate=1.0*, *power\_t=0.5*, *passes=1*, *random\_seed=0*, *\*\*kwargs*)

Vowpal Wabbit Regressor.

**Parameters**

- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for `learning_rate`. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `property feature_importance(self)`

Feature importance for Vowpal Wabbit regressor.

### `fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.XGBoostClassifier`(*eta*=0.1, *max\_depth*=6, *min\_child\_weight*=1, *n\_estimators*=100, *random\_seed*=0, *eval\_metric*='logloss', *n\_jobs*=12, *\*\*kwargs*)

XGBoost Classifier.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

**Attributes**

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted XGBoost classifier.

**fit**(*self, X, y=None*)

Fits XGBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted XGBoost classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.XGBoostRegressor(*eta: float = 0.1*, *max\_depth: int = 6*, *min\_child\_weight: int = 1*, *n\_estimators: int = 100*, *random\_seed: Union[int, float] = 0*, *n\_jobs: int = 12*, *\*\*kwargs*)

XGBoost Regressor.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

## Attributes

|                                |                                                                                                                               |

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted XGBoost regressor.                                                                                  |
| <i>fit</i>                      | Fits XGBoost regressor component to data.                                                                                        |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted XGBoostRegressor.                                                                 |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted XGBoost regressor.                                                                                 |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## Preprocessing

Preprocessing utilities.

## Subpackages

### data\_splitters

Data splitter classes.

## Submodules

### no\_split

Empty Data Splitter class.

## Module Contents

### Classes Summary

|                |                                                                     |
|----------------|---------------------------------------------------------------------|
| <i>NoSplit</i> | Does not split the training data into training and validation sets. |
|----------------|---------------------------------------------------------------------|

---

## Contents

**class** evalml.preprocessing.data\_splitters.no\_split.**NoSplit**(*random\_seed=0*)

Does not split the training data into training and validation sets.

All data is passed as the training set, test data is simply an array of *None*. To be used for future unsupervised learning, should not be used in any of the currently supported pipelines.

**Parameters** **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0. Not used.

### Methods

|                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <i>get_n_splits</i> | Return the number of splits of this object.                                     |
| <i>is_cv</i>        | Returns whether or not the data splitter is a cross-validation data splitter.   |
| <i>split</i>        | Divide the data into training and testing sets, where the testing set is empty. |

---

**static** **get\_n\_splits**()

Return the number of splits of this object.

**Returns** Always returns 0.

**Return type** int

**property** **is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*)

Divide the data into training and testing sets, where the testing set is empty.

**Parameters**

- **X** (*pd.DataFrame*) – Dataframe of points to split
- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

## sk\_splitters

SKLearn data splitter wrapper classes.

## Module Contents

### Classes Summary

|                        |                                                        |
|------------------------|--------------------------------------------------------|
| <i>KFold</i>           | Wrapper class for sklearn's KFold splitter.            |
| <i>StratifiedKFold</i> | Wrapper class for sklearn's Stratified KFold splitter. |

## Contents

**class** evalml.preprocessing.data\_splitters.sk\_splitters.**KFold**(*n\_splits=5, \*, shuffle=False, random\_state=None*)

Wrapper class for sklearn's KFold splitter.

### Methods

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <i>get_n_splits</i> | Returns the number of splitting iterations in the cross-validator             |
| <i>is_cv</i>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <i>split</i>        | Generate indices to split data into training and test set.                    |

**get\_n\_splits**(*self, X=None, y=None, groups=None*)

Returns the number of splitting iterations in the cross-validator

### Parameters

- **X** (*object*) – Always ignored, exists for compatibility.
- **y** (*object*) – Always ignored, exists for compatibility.
- **groups** (*object*) – Always ignored, exists for compatibility.

**Returns** **n\_splits** – Returns the number of splitting iterations in the cross-validator.

**Return type** int

**property** **is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self, X, y=None, groups=None*)

Generate indices to split data into training and test set.

### Parameters

- **X** (*array-like of shape (n\_samples, n\_features)*) – Training data, where *n\_samples* is the number of samples and *n\_features* is the number of features.
- **y** (*array-like of shape (n\_samples,)*, *default=None*) – The target variable for supervised learning problems.
- **groups** (*array-like of shape (n\_samples,)*, *default=None*) – Group labels for the samples used while splitting the dataset into train/test set.

**Yields**

- **train** (*ndarray*) – The training set indices for that split.
- **test** (*ndarray*) – The testing set indices for that split.

```
class evalml.preprocessing.data_splitters.sk_splitters.StratifiedKfold(n_splits=5, *,  
                                                                    shuffle=False,  
                                                                    random_state=None)
```

Wrapper class for sklearn's Stratified KFold splitter.

**Methods**

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Returns the number of splitting iterations in the cross-validator             |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Generate indices to split data into training and test set.                    |

**get\_n\_splits**(*self, X=None, y=None, groups=None*)

Returns the number of splitting iterations in the cross-validator

**Parameters**

- **X** (*object*) – Always ignored, exists for compatibility.
- **y** (*object*) – Always ignored, exists for compatibility.
- **groups** (*object*) – Always ignored, exists for compatibility.

**Returns** **n\_splits** – Returns the number of splitting iterations in the cross-validator.

**Return type** `int`

**property is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** `bool`

**split**(*self, X, y, groups=None*)

Generate indices to split data into training and test set.

**Parameters**

- **X** (*array-like of shape (n\_samples, n\_features)*) – Training data, where *n\_samples* is the number of samples and *n\_features* is the number of features.

Note that providing **y** is sufficient to generate the splits and hence `np.zeros(n_samples)` may be used as a placeholder for **X** instead of actual training data.

- **y** (*array-like of shape (n\_samples,)*) – The target variable for supervised learning problems. Stratification is done based on the y labels.
- **groups** (*object*) – Always ignored, exists for compatibility.

#### Yields

- **train** (*ndarray*) – The training set indices for that split.
- **test** (*ndarray*) – The testing set indices for that split.

#### Notes

Randomized CV splitters may return different results for each call of split. You can make the results identical by setting *random\_state* to an integer.

### time\_series\_split

Rolling Origin Cross Validation for time series problems.

#### Module Contents

#### Classes Summary

|                        |                                                           |
|------------------------|-----------------------------------------------------------|
| <i>TimeSeriesSplit</i> | Rolling Origin Cross Validation for time series problems. |
|------------------------|-----------------------------------------------------------|

#### Contents

```
class evalml.preprocessing.data_splitters.time_series_split.TimeSeriesSplit(max_delay=0,  
                                                                           gap=0, fore-  
                                                                           cast_horizon=None,  
                                                                           time_index=None,  
                                                                           n_splits=3)
```

Rolling Origin Cross Validation for time series problems.

The *max\_delay*, *gap*, and *forecast\_horizon* parameters are only used to validate that the requested split size is not too small given these parameters.

#### Parameters

- **max\_delay** (*int*) – Max delay value for feature engineering. Time series pipelines create delayed features from existing features. This process will introduce NaNs into the first *max\_delay* number of rows. The splitter uses the last *max\_delay* number of rows from the previous split as the first *max\_delay* number of rows of the current split to avoid “throwing out” more data than is necessary. Defaults to 0.
- **gap** (*int*) – Number of time units separating the data used to generate features and the data to forecast on. Defaults to 0.
- **forecast\_horizon** (*int, None*) – Number of time units to forecast. Used for parameter validation. If an integer, will set the size of the cv splits. Defaults to None.

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Defaults to None.
- **n\_splits** (*int*) – number of data splits to make. Defaults to 3.

### Example

```
>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> ts_split = TimeSeriesSplit(n_splits=4)
>>> generator_ = ts_split.split(X, y)
...
>>> first_split = next(generator_)
>>> assert (first_split[0] == np.array([0, 1])).all()
>>> assert (first_split[1] == np.array([2, 3])).all()
...
>>> second_split = next(generator_)
>>> assert (second_split[0] == np.array([0, 1, 2, 3])).all()
>>> assert (second_split[1] == np.array([4, 5])).all()
...
>>> third_split = next(generator_)
>>> assert (third_split[0] == np.array([0, 1, 2, 3, 4, 5])).all()
>>> assert (third_split[1] == np.array([6, 7])).all()
...
>>> fourth_split = next(generator_)
>>> assert (fourth_split[0] == np.array([0, 1, 2, 3, 4, 5, 6, 7])).all()
>>> assert (fourth_split[1] == np.array([8, 9])).all()
```

### Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Get the number of data splits.                                                |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Get the time series splits.                                                   |

**get\_n\_splits**(*self*, *X=None*, *y=None*, *groups=None*)

Get the number of data splits.

#### Parameters

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to None.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to None.

**Returns** Number of splits.

**property** `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*, *groups=None*)

Get the time series splits.

*X* and *y* are assumed to be sorted in ascending time order. This method can handle passing in empty or None *X* and *y* data but note that *X* and *y* cannot be None or empty at the same time.

**Parameters**

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to None.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to None.

**Yields** Iterator of (train, test) indices tuples.

**Raises** **ValueError** – If one of the proposed splits would be empty.

**training\_validation\_split**

Training Validation Split class.

**Module Contents****Classes Summary**

|                                |                                                            |
|--------------------------------|------------------------------------------------------------|
| <i>TrainingValidationSplit</i> | Split the training data into training and validation sets. |
|--------------------------------|------------------------------------------------------------|

---

**Contents**

**class** evalml.preprocessing.data\_splitters.training\_validation\_split.**TrainingValidationSplit**(*test\_size=None*, *train\_size=None*, *shuffle=True*, *shuffle\_seed=None*, *stratify=None*, *random\_state=None*)

Split the training data into training and validation sets.

**Parameters**

- **test\_size** (*float*) – What percentage of data points should be included in the validation set. Defaults to the complement of *train\_size* if *train\_size* is set, and 0.25 otherwise.
- **train\_size** (*float*) – What percentage of data points should be included in the training set. Defaults to the complement of *test\_size*
- **shuffle** (*boolean*) – Whether to shuffle the data before splitting. Defaults to False.

- **stratify** (*list*) – Splits the data in a stratified fashion, using this argument as class labels. Defaults to None.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

## Examples

```
>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> tv_split = TrainingValidationSplit()
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4, 5, 6])).all()
>>> assert (split_[1] == np.array([7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(test_size=0.5)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4])).all()
>>> assert (split_[1] == np.array([5, 6, 7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(shuffle=True)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([9, 1, 6, 7, 3, 0, 5])).all()
>>> assert (split_[1] == np.array([2, 8, 4])).all()
...
>>> y = pd.Series([i % 3 for i in range(10)])
>>> tv_split = TrainingValidationSplit(shuffle=True, stratify=y)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([1, 9, 3, 2, 8, 6, 7])).all()
>>> assert (split_[1] == np.array([0, 4, 5])).all()
```

## Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Return the number of splits of this object.                                   |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Divide the data into training and testing sets.                               |

### static `get_n_splits()`

Return the number of splits of this object.

**Returns** Always returns 1.

**Return type** int

### property `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*)

Divide the data into training and testing sets.

**Parameters**

- **X** (*pd.DataFrame*) – Dataframe of points to split
- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

| <i>TimeSeriesSplit</i>         | Rolling Origin Cross Validation for time series problems.           |
| <i>TrainingValidationSplit</i> | Split the training data into training and validation sets.          |

### Contents

**class** evalml.preprocessing.data\_splitters.**KFold**(*n\_splits=5*, \*, *shuffle=False*, *random\_state=None*)

Wrapper class for sklearn's KFold splitter.

**Methods**

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <i>get_n_splits</i> | Returns the number of splitting iterations in the cross-validator             |
| <i>is_cv</i>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <i>split</i>        | Generate indices to split data into training and test set.                    |

**get\_n\_splits**(*self*, *X=None*, *y=None*, *groups=None*)

Returns the number of splitting iterations in the cross-validator

**Parameters**

- **X** (*object*) – Always ignored, exists for compatibility.
- **y** (*object*) – Always ignored, exists for compatibility.
- **groups** (*object*) – Always ignored, exists for compatibility.

**Returns** **n\_splits** – Returns the number of splitting iterations in the cross-validator.

**Return type** int

**property** `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*, *groups=None*)

Generate indices to split data into training and test set.

**Parameters**

- **X** (*array-like of shape (n\_samples, n\_features)*) – Training data, where *n\_samples* is the number of samples and *n\_features* is the number of features.
- **y** (*array-like of shape (n\_samples,)*, *default=None*) – The target variable for supervised learning problems.
- **groups** (*array-like of shape (n\_samples,)*, *default=None*) – Group labels for the samples used while splitting the dataset into train/test set.

**Yields**

- **train** (*ndarray*) – The training set indices for that split.
- **test** (*ndarray*) – The testing set indices for that split.

**class** `evalml.preprocessing.data_splitters.NoSplit(random_seed=0)`

Does not split the training data into training and validation sets.

All data is passed as the training set, test data is simply an array of *None*. To be used for future unsupervised learning, should not be used in any of the currently supported pipelines.

**Parameters** **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0. Not used.

**Methods**

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Return the number of splits of this object.                                     |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter.   |
| <code>split</code>        | Divide the data into training and testing sets, where the testing set is empty. |

**static** `get_n_splits()`

Return the number of splits of this object.

**Returns** Always returns 0.

**Return type** int

**property** `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*)

Divide the data into training and testing sets, where the testing set is empty.

**Parameters**

- **X** (*pd.DataFrame*) – Dataframe of points to split

- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

**class** evalml.preprocessing.data\_splitters.**StratifiedKfold**(*n\_splits=5, \*, shuffle=False, random\_state=None*)

Wrapper class for sklearn's Stratified KFold splitter.

#### Methods

|                     |                                                                               |
|---------------------|-------------------------------------------------------------------------------|
| <i>get_n_splits</i> | Returns the number of splitting iterations in the cross-validator             |
| <i>is_cv</i>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <i>split</i>        | Generate indices to split data into training and test set.                    |

**get\_n\_splits**(*self, X=None, y=None, groups=None*)

Returns the number of splitting iterations in the cross-validator

#### Parameters

- **X** (*object*) – Always ignored, exists for compatibility.
- **y** (*object*) – Always ignored, exists for compatibility.
- **groups** (*object*) – Always ignored, exists for compatibility.

**Returns** **n\_splits** – Returns the number of splitting iterations in the cross-validator.

**Return type** int

**property** **is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self, X, y, groups=None*)

Generate indices to split data into training and test set.

#### Parameters

- **X** (*array-like of shape (n\_samples, n\_features)*) – Training data, where *n\_samples* is the number of samples and *n\_features* is the number of features.  
Note that providing **y** is sufficient to generate the splits and hence `np.zeros(n_samples)` may be used as a placeholder for **X** instead of actual training data.
- **y** (*array-like of shape (n\_samples,)*) – The target variable for supervised learning problems. Stratification is done based on the **y** labels.
- **groups** (*object*) – Always ignored, exists for compatibility.

#### Yields

- **train** (*ndarray*) – The training set indices for that split.
- **test** (*ndarray*) – The testing set indices for that split.

## Notes

Randomized CV splitters may return different results for each call of split. You can make the results identical by setting *random\_state* to an integer.

```
class evalml.preprocessing.data_splitters.TimeSeriesSplit(max_delay=0, gap=0,
                                                         forecast_horizon=None,
                                                         time_index=None, n_splits=3)
```

Rolling Origin Cross Validation for time series problems.

The *max\_delay*, *gap*, and *forecast\_horizon* parameters are only used to validate that the requested split size is not too small given these parameters.

## Parameters

- **max\_delay** (*int*) – Max delay value for feature engineering. Time series pipelines create delayed features from existing features. This process will introduce NaNs into the first *max\_delay* number of rows. The splitter uses the last *max\_delay* number of rows from the previous split as the first *max\_delay* number of rows of the current split to avoid “throwing out” more data than is necessary. Defaults to 0.
- **gap** (*int*) – Number of time units separating the data used to generate features and the data to forecast on. Defaults to 0.
- **forecast\_horizon** (*int*, *None*) – Number of time units to forecast. Used for parameter validation. If an integer, will set the size of the cv splits. Defaults to *None*.
- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Defaults to *None*.
- **n\_splits** (*int*) – number of data splits to make. Defaults to 3.

## Example

```
>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> ts_split = TimeSeriesSplit(n_splits=4)
>>> generator_ = ts_split.split(X, y)
...
>>> first_split = next(generator_)
>>> assert (first_split[0] == np.array([0, 1])).all()
>>> assert (first_split[1] == np.array([2, 3])).all()
...
>>> second_split = next(generator_)
>>> assert (second_split[0] == np.array([0, 1, 2, 3])).all()
>>> assert (second_split[1] == np.array([4, 5])).all()
...
>>> third_split = next(generator_)
>>> assert (third_split[0] == np.array([0, 1, 2, 3, 4, 5])).all()
>>> assert (third_split[1] == np.array([6, 7])).all()
```

(continues on next page)

(continued from previous page)

```

...
...
>>> fourth_split = next(generator_)
>>> assert (fourth_split[0] == np.array([0, 1, 2, 3, 4, 5, 6, 7])).all()
>>> assert (fourth_split[1] == np.array([8, 9])).all()

```

## Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Get the number of data splits.                                                |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Get the time series splits.                                                   |

**get\_n\_splits**(*self*, *X=None*, *y=None*, *groups=None*)

Get the number of data splits.

### Parameters

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to *None*.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to *None*.

**Returns** Number of splits.

**property is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*, *groups=None*)

Get the time series splits.

*X* and *y* are assumed to be sorted in ascending time order. This method can handle passing in empty or *None* *X* and *y* data but note that *X* and *y* cannot be *None* or empty at the same time.

### Parameters

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to *None*.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to *None*.

**Yields** Iterator of (train, test) indices tuples.

**Raises ValueError** – If one of the proposed splits would be empty.

```

class evalml.preprocessing.data_splitters.TrainingValidationSplit(test_size=None,
                                                                train_size=None,
                                                                shuffle=False, stratify=None,
                                                                random_seed=0)

```

Split the training data into training and validation sets.

### Parameters

- **test\_size** (*float*) – What percentage of data points should be included in the validation set. Defaults to the complement of *train\_size* if *train\_size* is set, and 0.25 otherwise.

- **train\_size** (*float*) – What percentage of data points should be included in the training set. Defaults to the complement of *test\_size*
- **shuffle** (*boolean*) – Whether to shuffle the data before splitting. Defaults to False.
- **stratify** (*list*) – Splits the data in a stratified fashion, using this argument as class labels. Defaults to None.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

## Examples

```
>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> tv_split = TrainingValidationSplit()
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4, 5, 6])).all()
>>> assert (split_[1] == np.array([7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(test_size=0.5)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4])).all()
>>> assert (split_[1] == np.array([5, 6, 7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(shuffle=True)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([9, 1, 6, 7, 3, 0, 5])).all()
>>> assert (split_[1] == np.array([2, 8, 4])).all()
...
>>> y = pd.Series([i % 3 for i in range(10)])
>>> tv_split = TrainingValidationSplit(shuffle=True, stratify=y)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([1, 9, 3, 2, 8, 6, 7])).all()
>>> assert (split_[1] == np.array([0, 4, 5])).all()
```

## Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Return the number of splits of this object.                                   |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Divide the data into training and testing sets.                               |

### static `get_n_splits()`

Return the number of splits of this object.

**Returns** Always returns 1.

**Return type** int

**property** `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*)

Divide the data into training and testing sets.

**Parameters**

- **X** (*pd.DataFrame*) – Dataframe of points to split
- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

**Submodules****utils**

Helpful preprocessing utilities.

**Module Contents****Functions**

|                                  |                                                                   |
|----------------------------------|-------------------------------------------------------------------|
| <code>load_data</code>           | Load features and target from file.                               |
| <code>number_of_features</code>  | Get the number of features of each specific dtype in a DataFrame. |
| <code>split_data</code>          | Split data into train and test sets.                              |
| <code>target_distribution</code> | Get the target distributions.                                     |

**Contents**

`evalml.preprocessing.utils.load_data(path, index, target, n_rows=None, drop=None, verbose=True, **kwargs)`

Load features and target from file.

**Parameters**

- **path** (*str*) – Path to file or a http/ftp/s3 URL.
- **index** (*str*) – Column for index.
- **target** (*str*) – Column for target.
- **n\_rows** (*int*) – Number of rows to return. Defaults to None.
- **drop** (*list*) – List of columns to drop. Defaults to None.
- **verbose** (*bool*) – If True, prints information about features and target. Defaults to True.

- **\*\*kwargs** – Other keyword arguments that should be passed to panda’s `read_csv` method.

**Returns** Features matrix and target.

**Return type** `pd.DataFrame`, `pd.Series`

`evalml.preprocessing.utils.number_of_features(dtypes)`

Get the number of features of each specific dtype in a DataFrame.

**Parameters** **dtypes** (`pd.Series`) – `DataFrame.dtypes` to get the number of features for.

**Returns** dtypes and the number of features for each input type.

**Return type** `pd.Series`

### Example

```
>>> X = pd.DataFrame()
>>> X["integers"] = [i for i in range(10)]
>>> X["floats"] = [float(i) for i in range(10)]
>>> X["strings"] = [str(i) for i in range(10)]
>>> X["booleans"] = [bool(i%2) for i in range(10)]
```

Lists the number of columns corresponding to each dtype.

```
>>> number_of_features(X.dtypes)
      Number of Features
Boolean                1
Categorical            1
Numeric               2
```

`evalml.preprocessing.utils.split_data(X, y, problem_type, problem_configuration=None, test_size=None, random_seed=0)`

Split data into train and test sets.

#### Parameters

- **X** (`pd.DataFrame` or `np.ndarray`) – data of shape `[n_samples, n_features]`
- **y** (`pd.Series`, or `np.ndarray`) – target data of length `[n_samples]`
- **problem\_type** (`str` or `ProblemTypes`) – type of supervised learning problem. see `evalml.problem_types.problemtypes.all_problem_types` for a full list.
- **problem\_configuration** (`dict`) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, and `max_delay` variables.
- **test\_size** (`float`) – What percentage of data points should be included in the test set. Defaults to 0.2 (20%) for non-timeseries problems and 0.1 (10%) for timeseries problems.
- **random\_seed** (`int`) – Seed for the random number generator. Defaults to 0.

**Returns** Feature and target data each split into train and test sets.

**Return type** `pd.DataFrame`, `pd.DataFrame`, `pd.Series`, `pd.Series`

## Examples

```
>>> X = pd.DataFrame([1, 2, 3, 4, 5, 6], columns=["First"])
>>> y = pd.Series([8, 9, 10, 11, 12, 13])
...
>>> X_train, X_validation, y_train, y_validation = split_data(X, y, "regression",
↳ random_seed=42)
>>> X_train
   First
5      6
2      3
4      5
3      4
>>> X_validation
   First
0      1
1      2
>>> y_train
5    13
2    10
4    12
3    11
dtype: int64
>>> y_validation
0     8
1     9
dtype: int64
```

`evalml.preprocessing.utils.target_distribution(targets)`

Get the target distributions.

**Parameters** `targets` (`pd.Series`) – Target data.

**Returns** Target data and their frequency distribution as percentages.

**Return type** `pd.Series`

## Examples

```
>>> y = pd.Series([1, 2, 4, 1, 3, 3, 1, 2])
>>> target_distribution(y)
Targets
1    37.50%
2    25.00%
3    25.00%
4    12.50%
dtype: object
>>> y = pd.Series([True, False, False, False, True])
>>> target_distribution(y)
Targets
False    60.00%
True     40.00%
dtype: object
```

## Package Contents

### Classes Summary

|                                |                                                                     |
|--------------------------------|---------------------------------------------------------------------|
| <i>NoSplit</i>                 | Does not split the training data into training and validation sets. |
| <i>TimeSeriesSplit</i>         | Rolling Origin Cross Validation for time series problems.           |
| <i>TrainingValidationSplit</i> | Split the training data into training and validation sets.          |

### Functions

|                            |                                                                   |
|----------------------------|-------------------------------------------------------------------|
| <i>load_data</i>           | Load features and target from file.                               |
| <i>number_of_features</i>  | Get the number of features of each specific dtype in a DataFrame. |
| <i>split_data</i>          | Split data into train and test sets.                              |
| <i>target_distribution</i> | Get the target distributions.                                     |

### Contents

`evalml.preprocessing.load_data(path, index, target, n_rows=None, drop=None, verbose=True, **kwargs)`

Load features and target from file.

#### Parameters

- **path** (*str*) – Path to file or a http/ftp/s3 URL.
- **index** (*str*) – Column for index.
- **target** (*str*) – Column for target.
- **n\_rows** (*int*) – Number of rows to return. Defaults to None.
- **drop** (*list*) – List of columns to drop. Defaults to None.
- **verbose** (*bool*) – If True, prints information about features and target. Defaults to True.
- **\*\*kwargs** – Other keyword arguments that should be passed to panda’s `read_csv` method.

**Returns** Features matrix and target.

**Return type** `pd.DataFrame`, `pd.Series`

**class** `evalml.preprocessing.NoSplit(random_seed=0)`

Does not split the training data into training and validation sets.

All data is passed as the training set, test data is simply an array of *None*. To be used for future unsupervised learning, should not be used in any of the currently supported pipelines.

**Parameters** **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0. Not used.

#### Methods

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Return the number of splits of this object.                                     |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter.   |
| <code>split</code>        | Divide the data into training and testing sets, where the testing set is empty. |

**static** `get_n_splits()`

Return the number of splits of this object.

**Returns** Always returns 0.

**Return type** int

**property** `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*)

Divide the data into training and testing sets, where the testing set is empty.

**Parameters**

- **X** (*pd.DataFrame*) – Dataframe of points to split
- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

`evalml.preprocessing.number_of_features(dtypes)`

Get the number of features of each specific dtype in a DataFrame.

**Parameters** **dtypes** (*pd.Series*) – DataFrame.dtypes to get the number of features for.

**Returns** dtypes and the number of features for each input type.

**Return type** *pd.Series*

**Example**

```
>>> X = pd.DataFrame()
>>> X["integers"] = [i for i in range(10)]
>>> X["floats"] = [float(i) for i in range(10)]
>>> X["strings"] = [str(i) for i in range(10)]
>>> X["booleans"] = [bool(i%2) for i in range(10)]
```

Lists the number of columns corresponding to each dtype.

```
>>> number_of_features(X.dtypes)
      Number of Features
Boolean                1
Categorical            1
Numeric               2
```

```
evalml.preprocessing.split_data(X, y, problem_type, problem_configuration=None, test_size=None,
                                random_seed=0)
```

Split data into train and test sets.

#### Parameters

- **X** (*pd.DataFrame* or *np.ndarray*) – data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, or *np.ndarray*) – target data of length [n\_samples]
- **problem\_type** (*str* or *ProblemTypes*) – type of supervised learning problem. see `evalml.problem_types.problemtype.all_problem_types` for a full list.
- **problem\_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, and `max_delay` variables.
- **test\_size** (*float*) – What percentage of data points should be included in the test set. Defaults to 0.2 (20%) for non-timeseries problems and 0.1 (10%) for timeseries problems.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Returns** Feature and target data each split into train and test sets.

**Return type** `pd.DataFrame`, `pd.DataFrame`, `pd.Series`, `pd.Series`

#### Examples

```
>>> X = pd.DataFrame([1, 2, 3, 4, 5, 6], columns=["First"])
>>> y = pd.Series([8, 9, 10, 11, 12, 13])
...
>>> X_train, X_validation, y_train, y_validation = split_data(X, y, "regression",
↳random_seed=42)
>>> X_train
   First
5      6
2      3
4      5
3      4
>>> X_validation
   First
0      1
1      2
>>> y_train
5    13
2    10
4    12
3    11
dtype: int64
>>> y_validation
0     8
1     9
dtype: int64
```

```
evalml.preprocessing.target_distribution(targets)
```

Get the target distributions.

**Parameters** `targets` (`pd.Series`) – Target data.

**Returns** Target data and their frequency distribution as percentages.

**Return type** `pd.Series`

### Examples

```
>>> y = pd.Series([1, 2, 4, 1, 3, 3, 1, 2])
>>> target_distribution(y)
Targets
1      37.50%
2      25.00%
3      25.00%
4      12.50%
dtype: object
>>> y = pd.Series([True, False, False, False, True])
>>> target_distribution(y)
Targets
False    60.00%
True     40.00%
dtype: object
```

**class** `evalml.preprocessing.TimeSeriesSplit`(`max_delay=0`, `gap=0`, `forecast_horizon=None`, `time_index=None`, `n_splits=3`)

Rolling Origin Cross Validation for time series problems.

The `max_delay`, `gap`, and `forecast_horizon` parameters are only used to validate that the requested split size is not too small given these parameters.

#### Parameters

- **`max_delay`** (`int`) – Max delay value for feature engineering. Time series pipelines create delayed features from existing features. This process will introduce NaNs into the first `max_delay` number of rows. The splitter uses the last `max_delay` number of rows from the previous split as the first `max_delay` number of rows of the current split to avoid “throwing out” more data than is necessary. Defaults to 0.
- **`gap`** (`int`) – Number of time units separating the data used to generate features and the data to forecast on. Defaults to 0.
- **`forecast_horizon`** (`int`, `None`) – Number of time units to forecast. Used for parameter validation. If an integer, will set the size of the cv splits. Defaults to `None`.
- **`time_index`** (`str`) – Name of the column containing the datetime information used to order the data. Defaults to `None`.
- **`n_splits`** (`int`) – number of data splits to make. Defaults to 3.

### Example

```

>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> ts_split = TimeSeriesSplit(n_splits=4)
>>> generator_ = ts_split.split(X, y)
...
>>> first_split = next(generator_)
>>> assert (first_split[0] == np.array([0, 1])).all()
>>> assert (first_split[1] == np.array([2, 3])).all()
...
>>> second_split = next(generator_)
>>> assert (second_split[0] == np.array([0, 1, 2, 3])).all()
>>> assert (second_split[1] == np.array([4, 5])).all()
...
>>> third_split = next(generator_)
>>> assert (third_split[0] == np.array([0, 1, 2, 3, 4, 5])).all()
>>> assert (third_split[1] == np.array([6, 7])).all()
...
>>> fourth_split = next(generator_)
>>> assert (fourth_split[0] == np.array([0, 1, 2, 3, 4, 5, 6, 7])).all()
>>> assert (fourth_split[1] == np.array([8, 9])).all()

```

### Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Get the number of data splits.                                                |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Get the time series splits.                                                   |

**get\_n\_splits**(*self*, *X=None*, *y=None*, *groups=None*)

Get the number of data splits.

#### Parameters

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to *None*.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to *None*.

**Returns** Number of splits.

**property is\_cv**(*self*)

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

**split**(*self*, *X*, *y=None*, *groups=None*)

Get the time series splits.

*X* and *y* are assumed to be sorted in ascending time order. This method can handle passing in empty or None *X* and *y* data but note that *X* and *y* cannot be None or empty at the same time.

#### Parameters

- **X** (*pd.DataFrame*, *None*) – Features to split.
- **y** (*pd.DataFrame*, *None*) – Target variable to split. Defaults to *None*.
- **groups** – Ignored but kept for compatibility with sklearn API. Defaults to *None*.

**Yields** Iterator of (train, test) indices tuples.

**Raises** **ValueError** – If one of the proposed splits would be empty.

**class** evalml.preprocessing.**TrainingValidationSplit**(*test\_size=None*, *train\_size=None*, *shuffle=False*, *stratify=None*, *random\_seed=0*)

Split the training data into training and validation sets.

#### Parameters

- **test\_size** (*float*) – What percentage of data points should be included in the validation set. Defaults to the complement of *train\_size* if *train\_size* is set, and 0.25 otherwise.
- **train\_size** (*float*) – What percentage of data points should be included in the training set. Defaults to the complement of *test\_size*.
- **shuffle** (*boolean*) – Whether to shuffle the data before splitting. Defaults to *False*.
- **stratify** (*list*) – Splits the data in a stratified fashion, using this argument as class labels. Defaults to *None*.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

### Examples

```
>>> import numpy as np
>>> import pandas as pd
...
>>> X = pd.DataFrame([i for i in range(10)], columns=["First"])
>>> y = pd.Series([i for i in range(10)])
...
>>> tv_split = TrainingValidationSplit()
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4, 5, 6])).all()
>>> assert (split_[1] == np.array([7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(test_size=0.5)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([0, 1, 2, 3, 4])).all()
>>> assert (split_[1] == np.array([5, 6, 7, 8, 9])).all()
...
>>> tv_split = TrainingValidationSplit(shuffle=True)
>>> split_ = next(tv_split.split(X, y))
```

(continues on next page)

(continued from previous page)

```

>>> assert (split_[0] == np.array([9, 1, 6, 7, 3, 0, 5])).all()
>>> assert (split_[1] == np.array([2, 8, 4])).all()
...
...
>>> y = pd.Series([i % 3 for i in range(10)])
>>> tv_split = TrainingValidationSplit(shuffle=True, stratify=y)
>>> split_ = next(tv_split.split(X, y))
>>> assert (split_[0] == np.array([1, 9, 3, 2, 8, 6, 7])).all()
>>> assert (split_[1] == np.array([0, 4, 5])).all()

```

## Methods

|                           |                                                                               |
|---------------------------|-------------------------------------------------------------------------------|
| <code>get_n_splits</code> | Return the number of splits of this object.                                   |
| <code>is_cv</code>        | Returns whether or not the data splitter is a cross-validation data splitter. |
| <code>split</code>        | Divide the data into training and testing sets.                               |

### static `get_n_splits()`

Return the number of splits of this object.

**Returns** Always returns 1.

**Return type** int

### property `is_cv(self)`

Returns whether or not the data splitter is a cross-validation data splitter.

**Returns** If the splitter is a cross-validation data splitter

**Return type** bool

### `split(self, X, y=None)`

Divide the data into training and testing sets.

#### Parameters

- **X** (*pd.DataFrame*) – Dataframe of points to split
- **y** (*pd.Series*) – Series of points to split

**Returns** Indices to split data into training and test set

**Return type** list

## Problem Types

The supported types of machine learning problems.

**all\_problem\_types**(cls)

Get a list of all defined problem types.

**Returns** List of all defined problem types.

**Return type** list(*ProblemTypes*)

**name**(self)

The name of the Enum member.

**value**(self)

The value of the Enum member.

## utils

Utility methods for the ProblemTypes enum in EvalML.

### Functions

|                                   |                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>detect_problem_type</code>  | Determine the type of problem is being solved based on the targets (binary vs multiclass classification, regression). Ignores missing and null data. |
| <code>handle_problem_types</code> | Handles problem_type by either returning the ProblemTypes or converting from a str.                                                                  |
| <code>is_binary</code>            | Determines if the provided problem_type is a binary classification problem type.                                                                     |
| <code>is_classification</code>    | Determines if the provided problem_type is a classification problem type.                                                                            |
| <code>is_multiclass</code>        | Determines if the provided problem_type is a multiclass classification problem type.                                                                 |
| <code>is_regression</code>        | Determines if the provided problem_type is a regression problem type.                                                                                |
| <code>is_time_series</code>       | Determines if the provided problem_type is a time series problem type.                                                                               |

### Contents

`evalml.problem_types.utils.detect_problem_type(y)`

Determine the type of problem is being solved based on the targets (binary vs multiclass classification, regression). Ignores missing and null data.

**Parameters** `y` (`pd.Series`) – The target labels to predict.

**Returns** ProblemType Enum

**Return type** ProblemType

### Examples

```
>>> y = pd.Series([0, 1, 0, 0, 0, 1, 1, 0, 0, 1, 1])
>>> assert detect_problem_type(y) == ProblemTypes.BINARY
...
>>> y = pd.Series([1, 2, 3, 2, 1, 1, 1, 2, 2, 3, 3])
>>> assert detect_problem_type(y) == ProblemTypes.MULTICLASS
...
>>> y = pd.Series([1.6, 4.2, 3.3, 2.9, 4, 1, 5.5, 2, -2, -3.2, 3])
>>> assert detect_problem_type(y) == ProblemTypes.REGRESSION
```

**Raises** `ValueError` – If the input has less than two classes.

`evalml.problem_types.utils.handle_problem_types(problem_type)`

Handles `problem_type` by either returning the `ProblemTypes` or converting from a str.

**Parameters** `problem_type` (*str or ProblemTypes*) – Problem type that needs to be handled.

**Returns** `ProblemTypes` enum

**Raises**

- **KeyError** – If input is not a valid `ProblemTypes` enum value.
- **ValueError** – If input is not a string or `ProblemTypes` object.

### Examples

```
>>> assert handle_problem_types("regression") == ProblemTypes.REGRESSION
>>> assert handle_problem_types("TIME SERIES BINARY") == ProblemTypes.TIME_SERIES_
↳BINARY
>>> assert handle_problem_types("Multiclass") == ProblemTypes.MULTICLASS
```

`evalml.problem_types.utils.is_binary(problem_type)`

Determines if the provided `problem_type` is a binary classification problem type.

**Parameters** `problem_type` (*str or ProblemTypes*) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a binary classification problem type.

**Return type** bool

### Examples

```
>>> assert is_binary("Binary")
>>> assert is_binary(ProblemTypes.BINARY)
>>> assert is_binary(ProblemTypes.TIME_SERIES_BINARY)
```

`evalml.problem_types.utils.is_classification(problem_type)`

Determines if the provided `problem_type` is a classification problem type.

**Parameters** `problem_type` (*str or ProblemTypes*) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a classification problem type.

**Return type** bool

### Examples

```
>>> assert is_classification("Multiclass")
>>> assert is_classification(ProblemTypes.TIME_SERIES_BINARY)
>>> assert not is_classification(ProblemTypes.REGRESSION)
```

`evalml.problem_types.utils.is_multiclass(problem_type)`

Determines if the provided `problem_type` is a multiclass classification problem type.

**Parameters** `problem_type` (*str* or *ProblemTypes*) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a multiclass classification problem type.

**Return type** bool

### Examples

```
>>> assert is_multiclass("Multiclass")
>>> assert is_multiclass(ProblemTypes.MULTICLASS)
>>> assert is_multiclass(ProblemTypes.TIME_SERIES_MULTICLASS)
```

`evalml.problem_types.utils.is_regression(problem_type)`

Determines if the provided `problem_type` is a regression problem type.

**Parameters** `problem_type` (*str* or *ProblemTypes*) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a regression problem type.

**Return type** bool

### Examples

```
>>> assert is_regression("Regression")
>>> assert is_regression(ProblemTypes.REGRESSION)
>>> assert is_regression(ProblemTypes.TIME_SERIES_REGRESSION)
```

`evalml.problem_types.utils.is_time_series(problem_type)`

Determines if the provided `problem_type` is a time series problem type.

**Parameters** `problem_type` (*str* or *ProblemTypes*) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a time series problem type.

**Return type** bool

### Examples

```
>>> assert is_time_series("time series regression")
>>> assert is_time_series(ProblemTypes.TIME_SERIES_BINARY)
>>> assert not is_time_series(ProblemTypes.REGRESSION)
```

## Package Contents

### Classes Summary

|                     |                                                                 |
|---------------------|-----------------------------------------------------------------|
| <i>ProblemTypes</i> | Enum defining the supported types of machine learning problems. |
|---------------------|-----------------------------------------------------------------|

### Functions

|                             |                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>detect_problem_type</i>  | Determine the type of problem is being solved based on the targets (binary vs multiclass classification, regression). Ignores missing and null data. |
| <i>handle_problem_types</i> | Handles problem_type by either returning the ProblemTypes or converting from a str.                                                                  |
| <i>is_binary</i>            | Determines if the provided problem_type is a binary classification problem type.                                                                     |
| <i>is_classification</i>    | Determines if the provided problem_type is a classification problem type.                                                                            |
| <i>is_multiclass</i>        | Determines if the provided problem_type is a multiclass classification problem type.                                                                 |
| <i>is_regression</i>        | Determines if the provided problem_type is a regression problem type.                                                                                |
| <i>is_time_series</i>       | Determines if the provided problem_type is a time series problem type.                                                                               |

### Contents

`evalml.problem_types.detect_problem_type(y)`

Determine the type of problem is being solved based on the targets (binary vs multiclass classification, regression). Ignores missing and null data.

**Parameters** *y* (*pd.Series*) – The target labels to predict.

**Returns** ProblemType Enum

**Return type** ProblemType

### Examples

```
>>> y = pd.Series([0, 1, 0, 0, 0, 1, 1, 0, 0, 1, 1])
>>> assert detect_problem_type(y) == ProblemTypes.BINARY
...
>>> y = pd.Series([1, 2, 3, 2, 1, 1, 1, 2, 2, 3, 3])
>>> assert detect_problem_type(y) == ProblemTypes.MULTICLASS
...
>>> y = pd.Series([1.6, 4.2, 3.3, 2.9, 4, 1, 5.5, 2, -2, -3.2, 3])
>>> assert detect_problem_type(y) == ProblemTypes.REGRESSION
```

**Raises** **ValueError** – If the input has less than two classes.

`evalml.problem_types.handle_problem_types(problem_type)`

Handles `problem_type` by either returning the `ProblemTypes` or converting from a str.

**Parameters** `problem_type` (*str* or `ProblemTypes`) – Problem type that needs to be handled.

**Returns** `ProblemTypes` enum

**Raises**

- **KeyError** – If input is not a valid `ProblemTypes` enum value.
- **ValueError** – If input is not a string or `ProblemTypes` object.

### Examples

```
>>> assert handle_problem_types("regression") == ProblemTypes.REGRESSION
>>> assert handle_problem_types("TIME SERIES BINARY") == ProblemTypes.TIME_SERIES_
↳ BINARY
>>> assert handle_problem_types("Multiclass") == ProblemTypes.MULTICLASS
```

`evalml.problem_types.is_binary(problem_type)`

Determines if the provided `problem_type` is a binary classification problem type.

**Parameters** `problem_type` (*str* or `ProblemTypes`) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a binary classification problem type.

**Return type** bool

### Examples

```
>>> assert is_binary("Binary")
>>> assert is_binary(ProblemTypes.BINARY)
>>> assert is_binary(ProblemTypes.TIME_SERIES_BINARY)
```

`evalml.problem_types.is_classification(problem_type)`

Determines if the provided `problem_type` is a classification problem type.

**Parameters** `problem_type` (*str* or `ProblemTypes`) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a classification problem type.

**Return type** bool

### Examples

```
>>> assert is_classification("Multiclass")
>>> assert is_classification(ProblemTypes.TIME_SERIES_BINARY)
>>> assert not is_classification(ProblemTypes.REGRESSION)
```

`evalml.problem_types.is_multiclass(problem_type)`

Determines if the provided `problem_type` is a multiclass classification problem type.

**Parameters** `problem_type` (`str` or `ProblemTypes`) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a multiclass classification problem type.

**Return type** `bool`

### Examples

```
>>> assert is_multiclass("Multiclass")
>>> assert is_multiclass(ProblemTypes.MULTICLASS)
>>> assert is_multiclass(ProblemTypes.TIME_SERIES_MULTICLASS)
```

`evalml.problem_types.is_regression(problem_type)`

Determines if the provided `problem_type` is a regression problem type.

**Parameters** `problem_type` (`str` or `ProblemTypes`) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a regression problem type.

**Return type** `bool`

### Examples

```
>>> assert is_regression("Regression")
>>> assert is_regression(ProblemTypes.REGRESSION)
>>> assert is_regression(ProblemTypes.TIME_SERIES_REGRESSION)
```

`evalml.problem_types.is_time_series(problem_type)`

Determines if the provided `problem_type` is a time series problem type.

**Parameters** `problem_type` (`str` or `ProblemTypes`) – type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.

**Returns** Whether or not the provided `problem_type` is a time series problem type.

**Return type** `bool`

### Examples

```
>>> assert is_time_series("time series regression")
>>> assert is_time_series(ProblemTypes.TIME_SERIES_BINARY)
>>> assert not is_time_series(ProblemTypes.REGRESSION)
```

`class evalml.problem_types.ProblemTypes`

Enum defining the supported types of machine learning problems.

**Attributes**

|                               |                                                |
|-------------------------------|------------------------------------------------|
| <b>BINARY</b>                 | Binary classification problem.                 |
| <b>MULTI-CLASS</b>            | Multiclass classification problem.             |
| <b>REGRESSION</b>             | Regression problem.                            |
| <b>TIME_SERIES_BINARY</b>     | Time series binary classification problem.     |
| <b>TIME_SERIES_MULTICLASS</b> | Time series multiclass classification problem. |
| <b>TIME_SERIES_REGRESSION</b> | Time series regression problem.                |

## Methods

|                                          |                                          |
|------------------------------------------|------------------------------------------|
| <a href="#"><i>all_problem_types</i></a> | Get a list of all defined problem types. |
| <a href="#"><i>name</i></a>              | The name of the Enum member.             |
| <a href="#"><i>value</i></a>             | The value of the Enum member.            |

### **all\_problem\_types**(cls)

Get a list of all defined problem types.

**Returns** List of all defined problem types.

**Return type** list(*ProblemTypes*)

### **name**(self)

The name of the Enum member.

### **value**(self)

The value of the Enum member.

## Tuners

EvalML tuner classes.

## Submodules

### **grid\_search\_tuner**

Grid Search Optimizer, which generates all of the possible points to search for using a grid.

## Module Contents

### Classes Summary

| <a href="#"><i>GridSearchTuner</i></a> | Grid Search Optimizer, which generates all of the possible points to search for using a grid. |
|----------------------------------------|-----------------------------------------------------------------------------------------------|

## Contents

**class** evalml.tuners.grid\_search\_tuner.**GridSearchTuner**(*pipeline\_hyperparameter\_ranges*,  
*n\_points=10*, *random\_seed=0*)

Grid Search Optimizer, which generates all of the possible points to search for using a grid.

### Parameters

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **n\_points** (*int*) – The number of points to sample from along each dimension defined in the space argument. Defaults to 10.
- **random\_seed** (*int*) – Seed for random number generator. Unused in this class, defaults to 0.

### Examples

```
>>> tuner = GridSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': ['a', 'b', 'c']}}, n_points=5)
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 0.0, 'param b': 'a'}
```

Determines points using a grid search approach.

```
>>> for each in range(5):
...     print(tuner.propose())
{'My Component': {'param a': 0.0, 'param b': 'b'}}
{'My Component': {'param a': 0.0, 'param b': 'c'}}
{'My Component': {'param a': 10.0, 'param b': 'a'}}
{'My Component': {'param a': 10.0, 'param b': 'b'}}
{'My Component': {'param a': 10.0, 'param b': 'c'}}
```

### Methods

|                                  |                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.                                                         |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                                                   |
| <i>is_search_space_exhausted</i> | Checks if it is possible to generate a set of valid parameters. Stores generated parameters in <code>self.curr_params</code> to be returned by <code>propose()</code> . |
| <i>propose</i>                   | Returns parameters from <code>_grid_points</code> iterations.                                                                                                           |

**add**(*self*, *pipeline\_parameters*, *score*)

Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.

### Parameters

- **pipeline\_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline

- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

**get\_starting\_parameters** (*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

**Parameters**

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted** (*self*)

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in *self.curr\_params* to be returned by *propose()*.

**Returns** If no more valid parameters exists in the search space, return False.

**Return type** bool

**Raises** **NoParamsException** – If a search space is exhausted, then this exception is thrown.

**propose** (*self*)

Returns parameters from *\_grid\_points* iterations.

If all possible combinations of parameters have been scored, then *NoParamsException* is raised.

**Returns** proposed pipeline parameters

**Return type** dict

## random\_search\_tuner

Random Search Optimizer.

|--------------------------|

## Contents

```
class evalml.tuners.random_search_tuner.RandomSearchTuner(pipeline_hyperparameter_ranges,
                                                           with_replacement=False,
                                                           replacement_max_attempts=10,
                                                           random_seed=0)
```

Random Search Optimizer.

**Parameters**

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters

- **with\_replacement** (*bool*) – If false, only unique hyperparameters will be shown
- **replacement\_max\_attempts** (*int*) – The maximum number of tries to get a unique set of random parameters. Only used if tuner is initialized with `with_replacement=True`
- **random\_seed** (*int*) – Seed for random number generator. Defaults to 0.

### Example

```
>>> tuner = RandomSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': [
↪ 'a', 'b', 'c']}}, random_seed=42)
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 3.7454011884736254, 'param b': 'c
↪'}
```

Determines points using a random search approach.

```
>>> for each in range(7):
...     print(tuner.propose())
{'My Component': {'param a': 7.3199394181140525, 'param b': 'b'}}
{'My Component': {'param a': 1.5601864044243654, 'param b': 'a'}}
{'My Component': {'param a': 0.5808361216819947, 'param b': 'c'}}
{'My Component': {'param a': 6.011150117432089, 'param b': 'c'}}
{'My Component': {'param a': 0.2058449429580245, 'param b': 'c'}}
{'My Component': {'param a': 8.32442640800422, 'param b': 'a'}}
{'My Component': {'param a': 1.8182496720710064, 'param b': 'a'}}
```

### Methods

|                                  |                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.                                                       |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                                                   |
| <i>is_search_space_exhausted</i> | Checks if it is possible to generate a set of valid parameters. Stores generated parameters in <code>self.curr_params</code> to be returned by <code>propose()</code> . |
| <i>propose</i>                   | Generate a unique set of parameters.                                                                                                                                    |

**add**(*self*, *pipeline\_parameters*, *score*)

Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.

#### Parameters

- **pipeline\_parameters** (*dict*) – A dict of the parameters used to evaluate a pipeline
- **score** (*float*) – The score obtained by evaluating the pipeline with the provided parameters

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

#### Parameters

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

**Returns** If no more valid parameters exists in the search space, return False.

**Return type** bool

**Raises** **NoParamsException** – If a search space is exhausted, then this exception is thrown.

**propose**(*self*)

Generate a unique set of parameters.

If tuner was initialized with `with_replacement=True` and the tuner is unable to generate a unique set of parameters after `replacement_max_attempts` tries, then `NoParamsException` is raised.

**Returns** Proposed pipeline parameters

**Return type** dict

## skopt\_tuner

Bayesian Optimizer.

## Module Contents

### Classes Summary

---

*SKOptTuner*

Bayesian Optimizer.

---

### Attributes Summary

*logger*

---

## Contents

`evalml.tuners.skopt_tuner.logger`

**class** `evalml.tuners.skopt_tuner.SKOptTuner`(*pipeline\_hyperparameter\_ranges*, *random\_seed=0*)  
Bayesian Optimizer.

### Parameters

- **pipeline\_hyperparameter\_ranges** (*dict*) – A set of hyperparameter ranges corresponding to a pipeline’s parameters.
- **random\_seed** (*int*) – The seed for the random number generator. Defaults to 0.

### Examples

```
>>> tuner = SKOptTuner({'My Component': {'param a': [0.0, 10.0], 'param b': ['a', 'b', 'c']}})
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 5.928446182250184, 'param b': 'c'}
```

Determines points using a Bayesian Optimizer approach.

```
>>> for each in range(7):
...     print(tuner.propose())
{'My Component': {'param a': 8.57945617622757, 'param b': 'c'}}
{'My Component': {'param a': 6.235636967859724, 'param b': 'b'}}
{'My Component': {'param a': 2.9753460654447235, 'param b': 'a'}}
{'My Component': {'param a': 2.7265629458011325, 'param b': 'b'}}
{'My Component': {'param a': 8.121687287754932, 'param b': 'b'}}
{'My Component': {'param a': 3.927847961008298, 'param b': 'c'}}
{'My Component': {'param a': 3.3739616041726843, 'param b': 'b'}}
```

### Methods

|                                        |                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <code>add</code>                       | Add score to sample.                                                                                                                   |
| <code>get_starting_parameters</code>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                  |
| <code>is_search_space_exhausted</code> | Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored. |
| <code>propose</code>                   | Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.     |

**add**(*self*, *pipeline\_parameters*, *score*)  
Add score to sample.

### Parameters

- **pipeline\_parameters** (*dict*) – A dict of the parameters used to evaluate a pipeline

- **score** (*float*) – The score obtained by evaluating the pipeline with the provided parameters

**Returns** None

**Raises**

- **Exception** – If skopt tuner errors.
- **ParameterError** – If skopt receives invalid parameters.

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

**Parameters**

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

**Returns** Returns true if all possible parameters in a search space has been scored.

**Return type** bool

**propose**(*self*)

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

**Returns** Proposed pipeline parameters.

**Return type** dict

## tuner

Base Tuner class.

## Module Contents

### Classes Summary

---

*Tuner*

---

Base Tuner class.

---

## Contents

**class** evalml.tuners.tuner.Tuner(*pipeline\_hyperparameter\_ranges*, *random\_seed=0*)

Base Tuner class.

Tuners implement different strategies for sampling from a search space. They're used in EvalML to search the space of pipeline hyperparameters.

### Parameters

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline's parameters.
- **random\_seed** (*int*) – The random state. Defaults to 0.

### Methods

|                                  |                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.                         |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                  |
| <i>is_search_space_exhausted</i> | Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored. |
| <i>propose</i>                   | Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.     |

**abstract add**(*self*, *pipeline\_parameters*, *score*)

Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.

### Parameters

- **pipeline\_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

**Returns** None

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

### Parameters

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

**Returns** Returns true if all possible parameters in a search space has been scored.

**Return type** bool

**abstract propose**(*self*)

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

**Returns** Proposed pipeline parameters

**Return type** dict

## tuner\_exceptions

Exception thrown by tuner classes.

## Module Contents

### Contents

**exception** evalml.tuners.tuner\_exceptions.NoParamsException

Raised when a tuner exhausts its search space and runs out of parameters to propose.

**exception** evalml.tuners.tuner\_exceptions.ParameterError

Raised when a tuner encounters an error with the parameters being used with it.

| <i>RandomSearchTuner</i> | Random Search Optimizer.                                                                      |
| <i>SKOptTuner</i>        | Bayesian Optimizer.                                                                           |
| <i>Tuner</i>             | Base Tuner class.                                                                             |

## Exceptions Summary

### Contents

**class** evalml.tuners.GridSearchTuner(*pipeline\_hyperparameter\_ranges*, *n\_points*=10, *random\_seed*=0)

Grid Search Optimizer, which generates all of the possible points to search for using a grid.

#### Parameters

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **n\_points** (*int*) – The number of points to sample from along each dimension defined in the space argument. Defaults to 10.

- **random\_seed** (*int*) – Seed for random number generator. Unused in this class, defaults to 0.

## Examples

```
>>> tuner = GridSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': ['a', 'b', 'c']}}, n_points=5)
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 0.0, 'param b': 'a'}
```

Determines points using a grid search approach.

```
>>> for each in range(5):
...     print(tuner.propose())
{'My Component': {'param a': 0.0, 'param b': 'b'}}
{'My Component': {'param a': 0.0, 'param b': 'c'}}
{'My Component': {'param a': 10.0, 'param b': 'a'}}
{'My Component': {'param a': 10.0, 'param b': 'b'}}
{'My Component': {'param a': 10.0, 'param b': 'c'}}
```

## Methods

|                                  |                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.                                                         |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                                                   |
| <i>is_search_space_exhausted</i> | Checks if it is possible to generate a set of valid parameters. Stores generated parameters in <code>self.curr_params</code> to be returned by <code>propose()</code> . |
| <i>propose</i>                   | Returns parameters from <code>_grid_points</code> iterations.                                                                                                           |

**add**(*self*, *pipeline\_parameters*, *score*)

Not applicable to grid search tuner as generated parameters are not dependent on scores of previous parameters.

### Parameters

- **pipeline\_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

### Parameters

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted(self)**

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

**Returns** If no more valid parameters exists in the search space, return False.

**Return type** bool

**Raises** `NoParamsException` – If a search space is exhausted, then this exception is thrown.

**propose(self)**

Returns parameters from `_grid_points` iterations.

If all possible combinations of parameters have been scored, then `NoParamsException` is raised.

**Returns** proposed pipeline parameters

**Return type** dict

**exception evalml.tuners.NoParamsException**

Raised when a tuner exhausts its search space and runs out of parameters to propose.

**exception evalml.tuners.ParameterError**

Raised when a tuner encounters an error with the parameters being used with it.

**class** evalml.tuners.RandomSearchTuner(*pipeline\_hyperparameter\_ranges*, *with\_replacement=False*, *replacement\_max\_attempts=10*, *random\_seed=0*)

Random Search Optimizer.

**Parameters**

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline’s parameters
- **with\_replacement** (*bool*) – If false, only unique hyperparameters will be shown
- **replacement\_max\_attempts** (*int*) – The maximum number of tries to get a unique set of random parameters. Only used if tuner is initialized with `with_replacement=True`
- **random\_seed** (*int*) – Seed for random number generator. Defaults to 0.

**Example**

```
>>> tuner = RandomSearchTuner({'My Component': {'param a': [0.0, 10.0], 'param b': [
↪ 'a', 'b', 'c']}}, random_seed=42)
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 3.7454011884736254, 'param b': 'c
↪'}
```

Determines points using a random search approach.

```
>>> for each in range(7):
...     print(tuner.propose())
{'My Component': {'param a': 7.3199394181140525, 'param b': 'b'}}
{'My Component': {'param a': 1.5601864044243654, 'param b': 'a'}}
{'My Component': {'param a': 0.5808361216819947, 'param b': 'c'}}
{'My Component': {'param a': 6.011150117432089, 'param b': 'c'}}
```

(continues on next page)

(continued from previous page)

```
{'My Component': {'param a': 0.2058449429580245, 'param b': 'c'}}
{'My Component': {'param a': 8.32442640800422, 'param b': 'a'}}
{'My Component': {'param a': 1.8182496720710064, 'param b': 'a'}}
```

## Methods

|                                        |                                                                                                                                                                         |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>add</code>                       | Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.                                                       |
| <code>get_starting_parameters</code>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                                                   |
| <code>is_search_space_exhausted</code> | Checks if it is possible to generate a set of valid parameters. Stores generated parameters in <code>self.curr_params</code> to be returned by <code>propose()</code> . |
| <code>propose</code>                   | Generate a unique set of parameters.                                                                                                                                    |

**add**(*self*, *pipeline\_parameters*, *score*)

Not applicable to random search tuner as generated parameters are not dependent on scores of previous parameters.

### Parameters

- **pipeline\_parameters** (*dict*) – A dict of the parameters used to evaluate a pipeline
- **score** (*float*) – The score obtained by evaluating the pipeline with the provided parameters

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

### Parameters

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Checks if it is possible to generate a set of valid parameters. Stores generated parameters in `self.curr_params` to be returned by `propose()`.

**Returns** If no more valid parameters exists in the search space, return False.

**Return type** bool

**Raises** `NoParamsException` – If a search space is exhausted, then this exception is thrown.

**propose**(*self*)

Generate a unique set of parameters.

If tuner was initialized with `with_replacement=True` and the tuner is unable to generate a unique set of parameters after `replacement_max_attempts` tries, then `NoParamsException` is raised.

**Returns** Proposed pipeline parameters

**Return type** dict

**class** evalml.tuners.SKOptTuner(*pipeline\_hyperparameter\_ranges*, *random\_seed=0*)

Bayesian Optimizer.

#### Parameters

- **pipeline\_hyperparameter\_ranges** (*dict*) – A set of hyperparameter ranges corresponding to a pipeline’s parameters.
- **random\_seed** (*int*) – The seed for the random number generator. Defaults to 0.

#### Examples

```
>>> tuner = SKOptTuner({'My Component': {'param a': [0.0, 10.0], 'param b': ['a', 'b', 'c']}})
>>> proposal = tuner.propose()
...
>>> assert proposal.keys() == {'My Component'}
>>> assert proposal['My Component'] == {'param a': 5.928446182250184, 'param b': 'c'}
```

Determines points using a Bayesian Optimizer approach.

```
>>> for each in range(7):
...     print(tuner.propose())
{'My Component': {'param a': 8.57945617622757, 'param b': 'c'}}
{'My Component': {'param a': 6.235636967859724, 'param b': 'b'}}
{'My Component': {'param a': 2.9753460654447235, 'param b': 'a'}}
{'My Component': {'param a': 2.7265629458011325, 'param b': 'b'}}
{'My Component': {'param a': 8.121687287754932, 'param b': 'b'}}
{'My Component': {'param a': 3.927847961008298, 'param b': 'c'}}
{'My Component': {'param a': 3.3739616041726843, 'param b': 'b'}}
```

#### Methods

|                                  |                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Add score to sample.                                                                                                                   |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                  |
| <i>is_search_space_exhausted</i> | Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored. |
| <i>propose</i>                   | Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.     |

**add**(*self*, *pipeline\_parameters*, *score*)

Add score to sample.

#### Parameters

- **pipeline\_parameters** (*dict*) – A dict of the parameters used to evaluate a pipeline
- **score** (*float*) – The score obtained by evaluating the pipeline with the provided parameters

**Returns** None

**Raises**

- **Exception** – If skopt tuner errors.
- **ParameterError** – If skopt receives invalid parameters.

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

**Parameters**

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

**Returns** Returns true if all possible parameters in a search space has been scored.

**Return type** bool

**propose**(*self*)

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

**Returns** Proposed pipeline parameters.

**Return type** dict

**class** evalml.tuners.Tuner(*pipeline\_hyperparameter\_ranges*, *random\_seed=0*)

Base Tuner class.

Tuners implement different strategies for sampling from a search space. They're used in EvalML to search the space of pipeline hyperparameters.

**Parameters**

- **pipeline\_hyperparameter\_ranges** (*dict*) – a set of hyperparameter ranges corresponding to a pipeline's parameters.
- **random\_seed** (*int*) – The random state. Defaults to 0.

**Methods**

|                                  |                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>add</i>                       | Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.                         |
| <i>get_starting_parameters</i>   | Gets the starting parameters given the pipeline hyperparameter range.                                                                  |
| <i>is_search_space_exhausted</i> | Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored. |
| <i>propose</i>                   | Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.     |

**abstract add**(*self*, *pipeline\_parameters*, *score*)

Register a set of hyperparameters with the score obtained from training a pipeline with those hyperparameters.

**Parameters**

- **pipeline\_parameters** (*dict*) – a dict of the parameters used to evaluate a pipeline
- **score** (*float*) – the score obtained by evaluating the pipeline with the provided parameters

**Returns** None

**get\_starting\_parameters**(*self*, *hyperparameter\_ranges*, *random\_seed=0*)

Gets the starting parameters given the pipeline hyperparameter range.

**Parameters**

- **hyperparameter\_ranges** (*dict*) – The custom hyperparameter ranges passed in during search. Used to determine the starting parameters.
- **random\_seed** (*int*) – The random seed to use. Defaults to 0.

**Returns** The starting parameters, randomly chosen, to initialize a pipeline with.

**Return type** dict

**is\_search\_space\_exhausted**(*self*)

Optional. If possible search space for tuner is finite, this method indicates whether or not all possible parameters have been scored.

**Returns** Returns true if all possible parameters in a search space has been scored.

**Return type** bool

**abstract propose**(*self*)

Returns a suggested set of parameters to train and score a pipeline with, based off the search space dimensions and prior samples.

**Returns** Proposed pipeline parameters

**Return type** dict

---

## Contents

`evalml.utils.cli_utils.CONDA_TO_PIP_NAME`

`evalml.utils.cli_utils.get_evalml_black_config(evalml_path)`

Gets configuration for black.

**Parameters** `evalml_path` – Path to evalml root.

**Returns** Dictionary of black configuration.

`evalml.utils.cli_utils.get_evalml_pip_requirements(evalml_path, ignore_packages=None, convert_to_conda=True)`

Gets pip requirements for evalml (with pip packages converted to conda names)

**Parameters**

- `evalml_path` – Path to evalml root.
- `ignore_packages` – List of packages to ignore. Defaults to None.

**Returns** List of pip requirements for evalml.

`evalml.utils.cli_utils.get_evalml_requirements_file(evalml_path, requirements_file_path)`

Gets pip requirements for evalml as a requirements file

**Parameters**

- `evalml_path` – Path to evalml root.
- `requirements_file_path` – Path to requirements file.

**Returns** Pip requirements for evalml in a singular string.

`evalml.utils.cli_utils.get_evalml_root()`

Gets location where evalml is installed.

**Returns** Location where evalml is installed.

`evalml.utils.cli_utils.get_installed_packages()`

Get dictionary mapping installed package names to their versions.

**Returns** Dictionary mapping installed package names to their versions.

`evalml.utils.cli_utils.get_sys_info()`

Returns system information.

**Returns** List of tuples about system stats.

`evalml.utils.cli_utils.print_deps()`

Prints the version number of each dependency.

`evalml.utils.cli_utils.print_info()`

Prints information about the system, evalml, and dependencies of evalml.

`evalml.utils.cli_utils.print_sys_info()`

Prints system information.

`evalml.utils.cli_utils.standardize_format(packages, ignore_packages=None, convert_to_conda=True)`

Standardizes the format of the given packages.

**Parameters**

- **packages** – Requirements package generator object.
- **ignore\_packages** – List of packages to ignore. Defaults to None.

**Returns** List of packages with standardized format.

## gen\_utils

## Contents

`evalml.utils.gen_utils.are_datasets_separated_by_gap_time_index(train, test, pipeline_params, freq=None)`

Determine if the train and test datasets are separated by gap number of units using the time\_index.

This will be true when users are predicting on unseen data but not during cross validation since the target is known.

### Parameters

- **train** (*pd.DataFrame*) – Training data.
- **test** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **pipeline\_params** (*dict*) – Dictionary of time series parameters.
- **freq** (*str*) – Frequency of time index.

**Returns** True if the difference in time units is equal to gap + 1.

**Return type** bool

`evalml.utils.gen_utils.are_ts_parameters_valid_for_split(gap, max_delay, forecast_horizon, n_obs, n_splits)`

Validates the time series parameters in problem\_configuration are compatible with split sizes.

### Parameters

- **gap** (*int*) – gap value.
- **max\_delay** (*int*) – max\_delay value.
- **forecast\_horizon** (*int*) – forecast\_horizon value.
- **n\_obs** (*int*) – Number of observations in the dataset.
- **n\_splits** (*int*) – Number of cross validation splits.

### Returns

**TsParameterValidationResult - named tuple with four fields** `is_valid` (bool): True if parameters are valid. `msg` (str): Contains error message to display. Empty if `is_valid`. `smallest_split_size` (int): Smallest split size given `n_obs` and `n_splits`. `max_window_size` (int): Max window size given `gap`, `max_delay`, `forecast_horizon`.

**class** `evalml.utils.gen_utils.classproperty(func)`

Allows function to be accessed as a class level property.

Example: .. code-block:

```
class LogisticRegressionBinaryPipeline(PipelineBase):
    component_graph = ['Simple Imputer', 'Logistic Regression Classifier']

    @classproperty
    def summary(cls):
        summary = ""
        for component in cls.component_graph:
            component = handle_component_class(component)
            summary += component.name + " + "
        return summary
```

(continues on next page)

(continued from previous page)

```

assert LogisticRegressionBinaryPipeline.summary == "Simple Imputer + Logistic_
↪Regression Classifier + "
assert LogisticRegressionBinaryPipeline().summary == "Simple Imputer + Logistic_
↪Regression Classifier + "

```

`evalml.utils.gen_utils.contains_all_ts_parameters(problem_configuration)`

Validates that the problem configuration contains all required keys.

**Parameters** `problem_configuration` (*dict*) – Problem configuration.

**Returns**

**True if the configuration contains all parameters. If False, msg is a non-empty string with error message.**

**Return type** `bool, str`

`evalml.utils.gen_utils.convert_to_seconds(input_str)`

Converts a string describing a length of time to its length in seconds.

**Parameters** `input_str` (*str*) – The string to be parsed and converted to seconds.

**Returns** Returns the library if importing succeeded.

**Raises** `AssertionError` – If an invalid unit is used.

## Examples

```

>>> assert convert_to_seconds("10 hr") == 36000.0
>>> assert convert_to_seconds("30 minutes") == 1800.0
>>> assert convert_to_seconds("2.5 min") == 150.0

```

`evalml.utils.gen_utils.deprecate_arg(old_arg, new_arg, old_value, new_value)`

Helper to raise warnings when a deprecated arg is used.

**Parameters**

- `old_arg` (*str*) – Name of old/deprecated argument.
- `new_arg` (*str*) – Name of new argument.
- `old_value` (*Any*) – Value the user passed in for the old argument.
- `new_value` (*Any*) – Value the user passed in for the new argument.

**Returns** `old_value` if not `None`, else `new_value`

`evalml.utils.gen_utils.drop_rows_with_nans(*pd_data)`

Drop rows that have any NaNs in all dataframes or series.

**Parameters** `*pd_data` – sequence of `pd.Series` or `pd.DataFrame` or `None`

**Returns** list of `pd.DataFrame` or `pd.Series` or `None`

`evalml.utils.gen_utils.get_importable_subclasses(base_class, used_in_automl=True)`

Get importable subclasses of a base class. Used to list all of our estimators, transformers, components and pipelines dynamically.

**Parameters**

- `base_class` (*abc.ABCMeta*) – Base class to find all of the subclasses for.

- **used\_in\_automl** – Not all components/pipelines/estimators are used in automl search. If True, only include those subclasses that are used in the search. This would mean excluding classes related to ExtraTrees, ElasticNet, and Baseline estimators.

**Returns** List of subclasses.

`evalml.utils.gen_utils.get_random_seed(random_state, min_bound=SEED_BOUNDS.min_bound, max_bound=SEED_BOUNDS.max_bound)`

Given a `numpy.random.RandomState` object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.

To protect against invalid input to a particular library's random number generator, if an int value is provided, and it is outside the bounds "[min\_bound, max\_bound)", the value will be projected into the range between the min\_bound (inclusive) and max\_bound (exclusive) using modular arithmetic.

#### Parameters

- **random\_state** (*int*, *numpy.random.RandomState*) – random state
- **min\_bound** (*None*, *int*) – if not default of None, will be min bound when generating seed (inclusive). Must be less than max\_bound.
- **max\_bound** (*None*, *int*) – if not default of None, will be max bound when generating seed (exclusive). Must be greater than min\_bound.

**Returns** Seed for random number generator

**Return type** int

**Raises** **ValueError** – If boundaries are not valid.

`evalml.utils.gen_utils.get_random_state(seed)`

Generates a `numpy.random.RandomState` instance using seed.

**Parameters** **seed** (*None*, *int*, *np.random.RandomState object*) – seed to use to generate `numpy.random.RandomState`. Must be between `SEED_BOUNDS.min_bound` and `SEED_BOUNDS.max_bound`, inclusive.

**Raises** **ValueError** – If the input seed is not within the acceptable range.

**Returns** A `numpy.random.RandomState` instance.

`evalml.utils.gen_utils.get_time_index(X: pandas.DataFrame, y: pandas.Series, time_index_name: str)`

Determines the column in the given data that should be used as the time index.

`evalml.utils.gen_utils.import_or_raise(library, error_msg=None, warning=False)`

Attempts to import the requested library by name. If the import fails, raises an `ImportError` or warning.

#### Parameters

- **library** (*str*) – The name of the library.
- **error\_msg** (*str*) – Error message to return if the import fails.
- **warning** (*bool*) – If True, `import_or_raise` gives a warning instead of `ImportError`. Defaults to False.

**Returns** Returns the library if importing succeeded.

**Raises**

- **ImportError** – If attempting to import the library fails because the library is not installed.
- **Exception** – If importing the library fails.

`evalml.utils.gen_utils.is_all_numeric(df)`

Checks if the given DataFrame contains only numeric values.

**Parameters** `df` (*pd.DataFrame*) – The DataFrame to check data types of.

**Returns** True if all the columns are numeric and are not missing any values, False otherwise.

`evalml.utils.gen_utils.jupyter_check()`

Get whether or not the code is being run in a Ipython environment (such as Jupyter Notebook or Jupyter Lab).

**Returns** True if Ipython, False otherwise.

**Return type** boolean

`evalml.utils.gen_utils.logger`

`evalml.utils.gen_utils.pad_with_nans(pd_data, num_to_pad)`

Pad the beginning num\_to\_pad rows with nans.

**Parameters**

- **pd\_data** (*pd.DataFrame* or *pd.Series*) – Data to pad.
- **num\_to\_pad** (*int*) – Number of nans to pad.

**Returns** *pd.DataFrame* or *pd.Series*

`evalml.utils.gen_utils.safe_repr(value)`

Convert the given value into a string that can safely be used for repr.

**Parameters** **value** – The item to convert

**Returns** String representation of the value

`evalml.utils.gen_utils.save_plot(fig, filepath=None, format='png', interactive=False, return_filepath=False)`

Saves fig to filepath if specified, or to a default location if not.

**Parameters**

- **fig** (*Figure*) – Figure to be saved.
- **filepath** (*str* or *Path*, *optional*) – Location to save file. Default is with filename “test\_plot”.
- **format** (*str*) – Extension for figure to be saved as. Ignored if interactive is True and fig is of type *plotly.Figure*. Defaults to ‘png’.
- **interactive** (*bool*, *optional*) – If True and fig is of type *plotly.Figure*, saves the fig as interactive instead of static, and format will be set to ‘html’. Defaults to False.
- **return\_filepath** (*bool*, *optional*) – Whether to return the final filepath the image is saved to. Defaults to False.

**Returns** String representing the final filepath the image was saved to if return\_filepath is set to True. Defaults to None.

`evalml.utils.gen_utils.SEED_BOUNDS`

`evalml.utils.gen_utils.validate_holdout_datasets(X, X_train, pipeline_params)`

Validate the holdout datasets match our expectations.

This function is run before calling predict in a time series pipeline. It verifies that X (the holdout set) is gap units away from the training set and is less than or equal to the forecast\_horizon.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **X\_train** (*pd.DataFrame*) – Training data.
- **pipeline\_params** (*dict*) – Dictionary of time series parameters with `gap`, `forecast_horizon`, and `time_index` being required.

**Returns**

**TSHoldoutValidationResult - named tuple with three fields** `is_valid` (bool): True if holdout data is valid. `error_messages` (list): List of error messages to display. Empty if `is_valid`. `error_codes` (list): List of error codes to display. Empty if `is_valid`.

**logger**

Logging functions.

**Contents**

`evalml.utils.logger.get_logger(name)`

Get the logger with the associated name.

**Parameters** `name` (*str*) – Name of the logger to get.

**Returns** The logger object with the associated name.

`evalml.utils.logger.log_batch_times(logger, batch_times)`

Used to print out the batch times.

**Parameters**

- **logger** – the logger.
- **batch\_times** – dict with (batch number, {pipeline name, pipeline time}).

`evalml.utils.logger.log_subtitle(logger, title, underline='=')`

Log with a subtitle.

`evalml.utils.logger.log_title(logger, title)`

Log with a title.

`evalml.utils.logger.time_elapsed(start_time)`

How much time has elapsed since the search started.

**Parameters** `start_time` (*int*) – Time when search started.

**Returns** elapsed time formatted as a string [H:]MM:SS

**Return type** str

## Contents

`evalml.utils.woodwork_utils.downcast_nullable_types(data, ignore_null_cols=True)`

Downcasts IntegerNullable, BooleanNullable types to Double, Boolean in order to support certain estimators like ARIMA, CatBoost, and LightGBM.

### Parameters

- **data** (*pd.DataFrame, pd.Series*) – Feature data.
- **ignore\_null\_cols** (*bool*) – Whether to ignore downcasting columns with null values or not. Defaults to True.

**Returns** DataFrame or Series initialized with logical type information where BooleanNullable are cast as Double.

**Return type** data

`evalml.utils.woodwork_utils.infer_feature_types(data, feature_types=None)`

Create a Woodwork structure from the given list, pandas, or numpy input, with specified types for columns. If a column's type is not specified, it will be inferred by Woodwork.

### Parameters

- **data** (*pd.DataFrame, pd.Series*) – Input data to convert to a Woodwork data structure.
- **feature\_types** (*string, ww.logical\_type obj, dict, optional*) – If data is a 2D structure, feature\_types must be a dictionary mapping column names to the type of data represented in the column. If data is a 1D structure, then feature\_types must be a Woodwork logical type or a string representing a Woodwork logical type (“Double”, “Integer”, “Boolean”, “Categorical”, “Datetime”, “NaturalLanguage”)

**Returns** A Woodwork data structure where the data type of each column was either specified or inferred.

**Raises** **ValueError** – If there is a mismatch between the dataframe and the woodwork schema.

`evalml.utils.woodwork_utils.numeric_and_boolean_ww`

## Functions

|                                        |                                                                                                                                                                                  |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>convert_to_seconds</code>        | Converts a string describing a length of time to its length in seconds.                                                                                                          |
| <code>deprecate_arg</code>             | Helper to raise warnings when a deprecated arg is used.                                                                                                                          |
| <code>downcast_nullable_types</code>   | Downcasts IntegerNullable, BooleanNullable types to Double, Boolean in order to support certain estimators like ARIMA, CatBoost, and LightGBM.                                   |
| <code>drop_rows_with_nans</code>       | Drop rows that have any NaNs in all dataframes or series.                                                                                                                        |
| <code>get_importable_subclasses</code> | Get importable subclasses of a base class. Used to list all of our estimators, transformers, components and pipelines dynamically.                                               |
| <code>get_logger</code>                | Get the logger with the associated name.                                                                                                                                         |
| <code>get_random_seed</code>           | Given a <code>numpy.random.RandomState</code> object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.       |
| <code>get_random_state</code>          | Generates a <code>numpy.random.RandomState</code> instance using seed.                                                                                                           |
| <code>get_time_index</code>            | Determines the column in the given data that should be used as the time index.                                                                                                   |
| <code>import_or_raise</code>           | Attempts to import the requested library by name. If the import fails, raises an <code>ImportError</code> or warning.                                                            |
| <code>infer_feature_types</code>       | Create a Woodwork structure from the given list, pandas, or numpy input, with specified types for columns. If a column's type is not specified, it will be inferred by Woodwork. |
| <code>is_all_numeric</code>            | Checks if the given DataFrame contains only numeric values.                                                                                                                      |
| <code>jupyter_check</code>             | Get whether or not the code is being run in a Jupyter environment (such as Jupyter Notebook or Jupyter Lab).                                                                     |
| <code>log_subtitle</code>              | Log with a subtitle.                                                                                                                                                             |
| <code>log_title</code>                 | Log with a title.                                                                                                                                                                |
| <code>pad_with_nans</code>             | Pad the beginning num_to_pad rows with nans.                                                                                                                                     |
| <code>safe_repr</code>                 | Convert the given value into a string that can safely be used for repr.                                                                                                          |
| <code>save_plot</code>                 | Saves fig to filepath if specified, or to a default location if not.                                                                                                             |

## Contents

`class evalml.utils.classproperty(func)`

Allows function to be accessed as a class level property.

Example: .. code-block:

```
class LogisticRegressionBinaryPipeline(PipelineBase):
    component_graph = ['Simple Imputer', 'Logistic Regression Classifier']

    @classproperty
    def summary(cls):
        summary = ""
        for component in cls.component_graph:
            component = handle_component_class(component)
            summary += component.name + " + "
        return summary

assert LogisticRegressionBinaryPipeline.summary == "Simple Imputer + Logistic_
↪Regression Classifier + "
assert LogisticRegressionBinaryPipeline().summary == "Simple Imputer + Logistic_
↪Regression Classifier + "
```

`evalml.utils.convert_to_seconds(input_str)`

Converts a string describing a length of time to its length in seconds.

**Parameters** `input_str (str)` – The string to be parsed and converted to seconds.

**Returns** Returns the library if importing succeeded.

**Raises** `AssertionError` – If an invalid unit is used.

## Examples

```
>>> assert convert_to_seconds("10 hr") == 36000.0
>>> assert convert_to_seconds("30 minutes") == 1800.0
>>> assert convert_to_seconds("2.5 min") == 150.0
```

`evalml.utils.deprecate_arg(old_arg, new_arg, old_value, new_value)`

Helper to raise warnings when a deprecated arg is used.

**Parameters**

- **old\_arg (str)** – Name of old/deprecated argument.
- **new\_arg (str)** – Name of new argument.
- **old\_value (Any)** – Value the user passed in for the old argument.
- **new\_value (Any)** – Value the user passed in for the new argument.

**Returns** `old_value` if not `None`, else `new_value`

`evalml.utils.downcast_nullable_types(data, ignore_null_cols=True)`

Downcasts IntegerNullable, BooleanNullable types to Double, Boolean in order to support certain estimators like ARIMA, CatBoost, and LightGBM.

**Parameters**

- **data** (*pd.DataFrame*, *pd.Series*) – Feature data.
- **ignore\_null\_cols** (*bool*) – Whether to ignore downcasting columns with null values or not. Defaults to True.

**Returns** DataFrame or Series initialized with logical type information where BooleanNullable are cast as Double.

**Return type** data

`evalml.utils.drop_rows_with_nans(*pd_data)`

Drop rows that have any NaNs in all dataframes or series.

**Parameters** **\*pd\_data** – sequence of *pd.Series* or *pd.DataFrame* or *None*

**Returns** list of *pd.DataFrame* or *pd.Series* or *None*

`evalml.utils.get_importable_subclasses(base_class, used_in_automl=True)`

Get importable subclasses of a base class. Used to list all of our estimators, transformers, components and pipelines dynamically.

**Parameters**

- **base\_class** (*abc.ABCMeta*) – Base class to find all of the subclasses for.
- **used\_in\_automl** – Not all components/pipelines/estimators are used in automl search. If True, only include those subclasses that are used in the search. This would mean excluding classes related to ExtraTrees, ElasticNet, and Baseline estimators.

**Returns** List of subclasses.

`evalml.utils.get_logger(name)`

Get the logger with the associated name.

**Parameters** **name** (*str*) – Name of the logger to get.

**Returns** The logger object with the associated name.

`evalml.utils.get_random_seed(random_state, min_bound=SEED_BOUNDS.min_bound,  
max_bound=SEED_BOUNDS.max_bound)`

Given a *numpy.random.RandomState* object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.

To protect against invalid input to a particular library’s random number generator, if an int value is provided, and it is outside the bounds “[min\_bound, max\_bound)”, the value will be projected into the range between the min\_bound (inclusive) and max\_bound (exclusive) using modular arithmetic.

**Parameters**

- **random\_state** (*int*, *numpy.random.RandomState*) – random state
- **min\_bound** (*None*, *int*) – if not default of *None*, will be min bound when generating seed (inclusive). Must be less than max\_bound.
- **max\_bound** (*None*, *int*) – if not default of *None*, will be max bound when generating seed (exclusive). Must be greater than min\_bound.

**Returns** Seed for random number generator

**Return type** int

**Raises** **ValueError** – If boundaries are not valid.

`evalml.utils.get_random_state(seed)`

Generates a `numpy.random.RandomState` instance using `seed`.

**Parameters** `seed` (*None, int, np.random.RandomState object*) – `seed` to use to generate `numpy.random.RandomState`. Must be between `SEED_BOUNDS.min_bound` and `SEED_BOUNDS.max_bound`, inclusive.

**Raises** **ValueError** – If the input `seed` is not within the acceptable range.

**Returns** A `numpy.random.RandomState` instance.

`evalml.utils.get_time_index(X: pandas.DataFrame, y: pandas.Series, time_index_name: str)`

Determines the column in the given data that should be used as the time index.

`evalml.utils.import_or_raise(library, error_msg=None, warning=False)`

Attempts to import the requested library by name. If the import fails, raises an `ImportError` or warning.

**Parameters**

- **library** (*str*) – The name of the library.
- **error\_msg** (*str*) – Error message to return if the import fails.
- **warning** (*bool*) – If `True`, `import_or_raise` gives a warning instead of `ImportError`. Defaults to `False`.

**Returns** Returns the library if importing succeeded.

**Raises**

- **ImportError** – If attempting to import the library fails because the library is not installed.
- **Exception** – If importing the library fails.

`evalml.utils.infer_feature_types(data, feature_types=None)`

Create a Woodwork structure from the given list, pandas, or numpy input, with specified types for columns. If a column's type is not specified, it will be inferred by Woodwork.

**Parameters**

- **data** (*pd.DataFrame, pd.Series*) – Input data to convert to a Woodwork data structure.
- **feature\_types** (*string, ww.logical\_type obj, dict, optional*) – If data is a 2D structure, `feature_types` must be a dictionary mapping column names to the type of data represented in the column. If data is a 1D structure, then `feature_types` must be a Woodwork logical type or a string representing a Woodwork logical type ("Double", "Integer", "Boolean", "Categorical", "Datetime", "NaturalLanguage")

**Returns** A Woodwork data structure where the data type of each column was either specified or inferred.

**Raises** **ValueError** – If there is a mismatch between the dataframe and the woodwork schema.

`evalml.utils.is_all_numeric(df)`

Checks if the given DataFrame contains only numeric values.

**Parameters** `df` (*pd.DataFrame*) – The DataFrame to check data types of.

**Returns** `True` if all the columns are numeric and are not missing any values, `False` otherwise.

`evalml.utils.jupyter_check()`

Get whether or not the code is being run in a Jupyter environment (such as Jupyter Notebook or Jupyter Lab).

**Returns** `True` if Jupyter, `False` otherwise.

**Return type** boolean

`evalml.utils.log_subtitle(logger, title, underline='')`

Log with a subtitle.

`evalml.utils.log_title(logger, title)`

Log with a title.

`evalml.utils.pad_with_nans(pd_data, num_to_pad)`

Pad the beginning num\_to\_pad rows with nans.

**Parameters**

- **pd\_data** (*pd.DataFrame* or *pd.Series*) – Data to pad.
- **num\_to\_pad** (*int*) – Number of nans to pad.

**Returns** *pd.DataFrame* or *pd.Series*

`evalml.utils.safe_repr(value)`

Convert the given value into a string that can safely be used for repr.

**Parameters** **value** – The item to convert

**Returns** String representation of the value

`evalml.utils.save_plot(fig, filepath=None, format='png', interactive=False, return_filepath=False)`

Saves fig to filepath if specified, or to a default location if not.

**Parameters**

- **fig** (*Figure*) – Figure to be saved.
- **filepath** (*str* or *Path*, *optional*) – Location to save file. Default is with filename “test\_plot”.
- **format** (*str*) – Extension for figure to be saved as. Ignored if interactive is True and fig is of type *plotly.Figure*. Defaults to ‘png’.
- **interactive** (*bool*, *optional*) – If True and fig is of type *plotly.Figure*, saves the fig as interactive instead of static, and format will be set to ‘html’. Defaults to False.
- **return\_filepath** (*bool*, *optional*) – Whether to return the final filepath the image is saved to. Defaults to False.

**Returns** String representing the final filepath the image was saved to if return\_filepath is set to True. Defaults to None.

`evalml.utils.SEED_BOUNDS`

```

Automated Pipeline search.

### Parameters

- **X\_train** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Required.
- **y\_train** (*pd.Series*) – The target training data of length [n\_samples]. Required for supervised learning tasks.
- **X\_holdout** (*pd.DataFrame*) – The input holdout data of shape [n\_samples, n\_features].
- **y\_holdout** (*pd.Series*) – The target holdout data of length [n\_samples].
- **problem\_type** (*str* or *ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **max\_iterations** (*int*) – Maximum number of iterations to search. If `max_iterations` and `max_time` is not set, then `max_iterations` will default to `max_iterations` of 5.
- **max\_time** (*int*, *str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If `None`, early stopping is disabled. Defaults to `None`.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if `patience` is not `None`. Defaults to `None`.

- **allowed\_component\_graphs** (*dict*) – A dictionary of lists or ComponentGraphs indicating the component graphs allowed in the search. The format should follow { “Name\_0”: [list\_of\_components], “Name\_1”: ComponentGraph(...) }

The default of None indicates all pipeline component graphs for this problem type are allowed. Setting this field will cause allowed\_model\_families to be ignored.

e.g. allowed\_component\_graphs = { “My\_Graph”: [“Imputer”, “One Hot Encoder”, “Random Forest Classifier”] }

- **allowed\_model\_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run evalml.pipelines.components.utils.allowed\_model\_families(“binary”) to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if allowed\_pipelines is provided, this parameter will be ignored.
- **features** (*list*) – List of features to run DFS on AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the search input and if the feature itself is not in search input. If features is an empty list, the DFS Transformer will not be included in pipelines.
- **data\_splitter** (*sklearn.model\_selection.BaseCrossValidator*) – Data splitting method to use. Defaults to StratifiedKFold.
- **tuner\_class** – The tuner class to use. Defaults to SKOptTuner.
- **optimize\_thresholds** (*bool*) – Whether or not to optimize the binary pipeline threshold. Defaults to True.
- **start\_iteration\_callback** (*callable*) – Function called before each pipeline training iteration. Callback function takes three positional parameters: The pipeline instance and the AutoMLSearch object.
- **add\_result\_callback** (*callable*) – Function called after each pipeline training iteration. Callback function takes three positional parameters: A dictionary containing the training results for the new pipeline, an untrained\_pipeline containing the parameters used during training, and the AutoMLSearch object.
- **error\_callback** (*callable*) – Function called when *search()* errors and raises an Exception. Callback function takes three positional parameters: the Exception raised, the traceback, and the AutoMLSearch object. Must also accepts kwargs, so AutoMLSearch is able to pass along other appropriate parameters by default. Defaults to None, which will call *log\_error\_callback*.
- **additional\_objectives** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **alternate\_thresholding\_objective** (*str*) – The objective to use for thresholding binary classification pipelines if the main objective provided isn’t tuneable. Defaults to F1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n\_jobs below -1, (n\_cpus + 1 + n\_jobs) are used.
- **ensembling** (*boolean*) – If True, runs ensembling in a separate batch after every allowed pipeline class has been iterated over. If the number of unique pipelines to search over per batch is one, ensembling will not run. Defaults to False.
- **max\_batches** (*int*) – The maximum number of batches of pipelines to search. Parameters max\_time, and max\_iterations have precedence over stopping the search.

- **problem\_configuration** (*dict*, *None*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **train\_best\_pipeline** (*boolean*) – Whether or not to train the best pipeline before returning it. Defaults to `True`.
- **search\_parameters** (*dict*) – A dict of the hyperparameter ranges or pipeline parameters used to iterate over during search. Keys should consist of the component names and values should specify a singular value/list for pipeline parameters, or `skopt.Space` for hyperparameter ranges. In the example below, the Imputer parameters would be passed to the hyperparameter ranges, and the Label Encoder parameters would be used as the component parameter.  
  
e.g. `search_parameters = { 'Imputer' : [{ 'numeric_impute_strategy': Categorical(['most_frequent', 'median']) },], 'Label Encoder': { 'positive_label': True } }`
- **sampler\_method** (*str*) – The data sampling component to use in the pipelines if the problem type is classification and the target balance is smaller than the `sampler_balanced_ratio`. Either `'auto'`, which will use our preferred sampler for the data, `'Undersampler'`, `'Oversampler'`, or `None`. Defaults to `'auto'`.
- **sampler\_balanced\_ratio** (*float*) – The minority:majority class ratio that we consider balanced, so a 1:4 ratio would be equal to 0.25. If the class balance is larger than this provided value, then we will not add a sampler since the data is then considered balanced. Overrides the `sampler_ratio` of the samplers. Defaults to 0.25.
- **allow\_long\_running\_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If `False` and no pipelines, component graphs, or model families are provided, AutoMLSearch will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to `False`.
- **\_ensembling\_split\_size** (*float*) – The amount of the training data we'll set aside for training ensemble metalearners. Only used when `ensembling` is `True`. Must be between 0 and 1, exclusive. Defaults to 0.2
- **\_pipelines\_per\_batch** (*int*) – The number of pipelines to train for every batch after the first one. The first batch will train a baseline pipeline + one of each pipeline family allowed in the search.
- **automl\_algorithm** (*str*) – The automl algorithm to use. Currently the two choices are `'iterative'` and `'default'`. Defaults to `default`.
- **engine** (*EngineBase* or *str*) – The engine instance used to evaluate pipelines. Dask or `concurrent.futures` engines can also be chosen by providing a string from the list [`"sequential"`, `"cf_threaded"`, `"cf_process"`, `"dask_threaded"`, `"dask_process"`]. If a parallel engine is selected this way, the maximum amount of parallelism, as determined by the engine, will be used. Defaults to `"sequential"`.
- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to stdout while search is running. Defaults to `False`.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to `False`.
- **exclude\_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by search. Valid options are `"DatetimeFeaturizer"`, `"EmailFeaturizer"`, `"URLFeaturizer"`, `"NaturalLanguageFeaturizer"`, `"TimeSeriesFeaturizer"`

- **excluded\_model\_families** (*list[ModelFamily]*) – A list of model families to exclude from the estimators used when building pipelines. For default algorithm, this only excludes estimators in the non-naive batches.
- **holdout\_set\_size** (*float*) – The size of the holdout set that AutoML search will take for datasets larger than 500 rows. If set to 0, holdout set will not be taken regardless of number of rows. Must be between 0 and 1, exclusive. Defaults to 0.1.
- **use\_recommendation** (*bool*) – Whether or not to use a recommendation score to rank pipelines instead of optimization objective. Defaults to False.
- **include\_recommendation** (*list[str]*) – A list of objectives to include beyond the defaults in the recommendation score. Defaults to None.
- **exclude\_recommendation** (*list[str]*) – A list of objectives to exclude from the defaults in the recommendation score. Defaults to None.

## Methods

|                                           |                                                                                                                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>add_to_rankings</i>                    | Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run.                                                |
| <i>best_pipeline</i>                      | Returns a trained instance of the best pipeline and parameters found during automl search. If <i>train_best_pipeline</i> is set to False, returns an untrained pipeline instance.     |
| <i>close_engine</i>                       | Function to explicitly close the engine, client, parallel resources.                                                                                                                  |
| <i>describe_pipeline</i>                  | Describe a pipeline.                                                                                                                                                                  |
| <i>full_rankings</i>                      | Returns a pandas.DataFrame with scoring results from all pipelines searched.                                                                                                          |
| <i>get_ensemble_input_pipelines</i>       | Returns a list of input pipeline IDs given an ensemble pipeline ID.                                                                                                                   |
| <i>get_pipeline</i>                       | Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search. |
| <i>get_recommendation_score_breakdown</i> | Reports the scores for the objectives used in the given pipeline's recommendation score calculation.                                                                                  |
| <i>get_recommendation_scores</i>          | Calculates recommendation scores for all pipelines in the search results.                                                                                                             |
| <i>load</i>                               | Loads AutoML object at file path.                                                                                                                                                     |
| <i>plot</i>                               | Return an instance of the plot with the latest scores.                                                                                                                                |
| <i>rankings</i>                           | Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.                                                                   |
| <i>results</i>                            | Class that allows access to a copy of the results from <i>automl_search</i> .                                                                                                         |
| <i>save</i>                               | Saves AutoML object at file path.                                                                                                                                                     |
| <i>score_pipelines</i>                    | Score a list of pipelines on the given holdout data.                                                                                                                                  |
| <i>search</i>                             | Find the best pipeline for the data set.                                                                                                                                              |
| <i>train_pipelines</i>                    | Train a list of pipelines on the training data.                                                                                                                                       |

### **add\_to\_rankings**(*self, pipeline*)

Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that

automl search has been run.

**Parameters** `pipeline` (*PipelineBase*) – pipeline to train and evaluate.

**property** `best_pipeline`(*self*)

Returns a trained instance of the best pipeline and parameters found during automl search. If `train_best_pipeline` is set to False, returns an untrained pipeline instance.

**Returns** A trained instance of the best pipeline and parameters found during automl search. If `train_best_pipeline` is set to False, returns an untrained pipeline instance.

**Return type** PipelineBase

**Raises** `PipelineNotFoundError` – If this is called before `.search()` is called.

**close\_engine**(*self*)

Function to explicitly close the engine, client, parallel resources.

**describe\_pipeline**(*self*, *pipeline\_id*, *return\_dict=False*)

Describe a pipeline.

**Parameters**

- `pipeline_id` (*int*) – pipeline to describe
- `return_dict` (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

**Returns** Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

**Raises** `PipelineNotFoundError` – If `pipeline_id` is not a valid ID.

**property** `full_rankings`(*self*)

Returns a pandas.DataFrame with scoring results from all pipelines searched.

**get\_ensembler\_input\_pipelines**(*self*, *ensemble\_pipeline\_id*)

Returns a list of input pipeline IDs given an ensembler pipeline ID.

**Parameters** `ensemble_pipeline_id` (*id*) – Ensemble pipeline ID to get input pipeline IDs from.

**Returns** A list of ensemble input pipeline IDs.

**Return type** list[int]

**Raises** `ValueError` – If `ensemble_pipeline_id` does not correspond to a valid ensemble pipeline ID.

**get\_pipeline**(*self*, *pipeline\_id*)

Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.

**Parameters** `pipeline_id` (*int*) – Pipeline to retrieve.

**Returns** Untrained pipeline instance associated with the provided ID.

**Return type** PipelineBase

**Raises** `PipelineNotFoundError` – if `pipeline_id` is not a valid ID.

**get\_recommendation\_score\_breakdown**(*self*, *pipeline\_id*)

Reports the scores for the objectives used in the given pipeline's recommendation score calculation.

Note that these scores are reported in their raw form, not scaled to be between 0 and 1.

**Parameters** `pipeline_id (int)` – The id of the pipeline to get the recommendation score breakdown for.

**Returns** A dictionary of the scores for each objective used in the recommendation score calculation.

**Return type** dict

**get\_recommendation\_scores**(*self*, *priority=None*, *custom\_weights=None*, *use\_pipeline\_names=False*)

Calculates recommendation scores for all pipelines in the search results.

**Parameters**

- **priority** (*str*) – An optional name of a priority objective that should be given heavier weight (of 0.5) than the other objectives contributing to the score. Defaults to None, where all objectives are weighted equally.
- **custom\_weights** (*dict[str, float]*) – A dictionary mapping objective names to corresponding weights between 0 and 1. Should not be used at the same time as prioritized\_objective. Defaults to None.
- **use\_pipeline\_names** (*bool*) – Whether or not to return the pipeline names instead of ids as the keys to the recommendation score dictionary. Defaults to False.

**Returns** A dictionary mapping pipeline IDs to recommendation scores

**static load**(*file\_path*, *pickle\_type='cloudpickle'*)

Loads AutoML object at file path.

**Parameters**

- **file\_path** (*str*) – Location to find file to load
- **pickle\_type** (*{ "pickle", "cloudpickle" }*) – The pickling library to use. Currently not used since the standard pickle library can handle cloudpickles.

**Returns** AutoSearchBase object

**property plot**(*self*)

Return an instance of the plot with the latest scores.

**property rankings**(*self*)

Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

**property results**(*self*)

Class that allows access to a copy of the results from *automl\_search*.

**Returns**

Dictionary containing *pipeline\_results*, a dict with results from each pipeline, and *search\_order*, a list describing the order the pipelines were searched.

**Return type** dict

**save**(*self*, *file\_path*, *pickle\_type='cloudpickle'*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves AutoML object at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_type** (*{ "pickle", "cloudpickle" }*) – The pickling library to use.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**Raises `ValueError`** – If `pickle_type` is not “pickle” or “cloudpickle”.

**`score_pipelines`**(*self*, *pipelines*, *X\_holdout*, *y\_holdout*, *objectives*)

Score a list of pipelines on the given holdout data.

**Parameters**

- **`pipelines`** (*list* [*PipelineBase*]) – List of pipelines to train.
- **`X_holdout`** (*pd.DataFrame*) – Holdout features.
- **`y_holdout`** (*pd.Series*) – Holdout targets for scoring.
- **`objectives`** (*list* [*str*], *list* [*ObjectiveBase*]) – Objectives used for scoring.

**Returns** Dictionary keyed by pipeline name that maps to a dictionary of scores. Note that the any pipelines that error out during scoring will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

**Return type** dict[str, Dict[str, float]]

**`search`**(*self*, *interactive\_plot=True*)

Find the best pipeline for the data set.

**Parameters `interactive_plot`** (*boolean*, *True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.

**Raises `AutoMLSearchException`** – If all pipelines in the current AutoML batch produced a score of np.nan on the primary objective.

**Returns** Dictionary keyed by batch number that maps to the timings for pipelines run in that batch, as well as the total time for each batch. Pipelines within a batch are labeled by pipeline name.

**Return type** Dict[int, Dict[str, Timestamp]]

**`train_pipelines`**(*self*, *pipelines*)

Train a list of pipelines on the training data.

This can be helpful for training pipelines once the search is complete.

**Parameters `pipelines`** (*list* [*PipelineBase*]) – List of pipelines to train.

**Returns** Dictionary keyed by pipeline name that maps to the fitted pipeline. Note that the any pipelines that error out during training will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

**Return type** Dict[str, PipelineBase]

**`evalml.search`**(*X\_train=None*, *y\_train=None*, *problem\_type=None*, *objective='auto'*, *mode='fast'*, *max\_time=None*, *patience=None*, *tolerance=None*, *problem\_configuration=None*, *n\_splits=3*, *verbose=False*, *timing=False*)

Given data and configuration, run an automl search.

This method will run EvalML’s default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you’d like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and AutoMLSearch, instead of using this method.

**Parameters**

- **`X_train`** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Required.

- **y\_train** (*pd.Series*) – The target training data of length [n\_samples]. Required for supervised learning tasks.
- **problem\_type** (*str or ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str, ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **mode** (*str*) – mode for `DefaultAlgorithm`. There are two modes: fast and long, where fast is a subset of long. Please look at `DefaultAlgorithm` for more details.
- **max\_time** (*int, str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If `None`, early stopping is disabled. Defaults to `None`.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not `None`. Defaults to `None`.
- **problem\_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n\_splits** (*int*) – Number of splits to use with the default data splitter.
- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to stdout while search is running. Defaults to `False`.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to `False`.

**Returns** The automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

**Return type** (*AutoMLSearch*, dict)

**Raises** **ValueError** – If search configuration is not valid.

```
evalml.search_iterative(X_train=None, y_train=None, problem_type=None, objective='auto',  
                        problem_configuration=None, n_splits=3, timing=False, **kwargs)
```

Given data and configuration, run an automl search.

This method will run EvalML's default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you'd like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and `AutoMLSearch`, instead of using this method.

#### Parameters

- **X\_train** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Required.
- **y\_train** (*pd.Series*) – The target training data of length [n\_samples]. Required for supervised learning tasks.

- **problem\_type** (*str or ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str, ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **problem\_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n\_splits** (*int*) – Number of splits to use with the default data splitter.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to `False`.
- **\*\*kwargs** – Other keyword arguments which are provided will be passed to `AutoMLSearch`.

**Returns** the automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

**Return type** (*AutoMLSearch, dict*)

**Raises** **ValueError** – If the search configuration is invalid.

## RELEASE NOTES

### Future Releases

- Enhancements
- Fixes
- Changes
- Documentation Changes
- Testing Changes

|                                  |
|----------------------------------|
| <b>Warning: Breaking Changes</b> |
|----------------------------------|

### v0.77.0 June. 07, 2023

- **Enhancements**
  - Added `check_distribution` function for determining if the predicted distribution matches the true one [#4184](#)
  - Added `get_recommendation_score_breakdown` function for insight on the recommendation score [#4188](#)
  - Added `excluded_model_families` parameter to `AutoMLSearch()` [#4196](#)
  - Added option to exclude time index in `IDColumnsDataCheck` [#4194](#)
- **Fixes**
  - Fixed small errors in `ARIMAREgressor` implementation [#4186](#)
  - Fixed `get_forecast_period` to properly handle `gap` parameter [#4200](#)
- Changes
- Documentation Changes
- **Testing Changes**
  - Run looking glass performance tests on merge via Airflow [#4198](#)

### v0.76.0 May. 09, 2023

- **Enhancements**
  - Added optional `recommendation_score` to rank pipelines during `AutoMLSearch` [#4156](#)
  - Added BytesIO support to `PipelinBase.load()` [#4179](#)
- **Fixes**

- Capped numpy at <=1.23.5 as a temporary measure for SHAP [#4172](#)
- Updated our readthedocs recipe to reenable builds [#4177](#)

**v0.75.0 May. 01, 2023**

- **Fixes**
  - Fixed bug where resetting the holdout data indices would cause time series `predict_in_sample` to be wrong [#4161](#)
- **Changes**
  - Changed per-pipeline timings to store as a float [#4160](#)
  - Update Dask install commands in `pyproject.toml` [#4164](#)
  - Capped *IPython* version to < 8.12.1 for readthedocs and plotly compatibility [#3987](#)

**v0.74.0 Apr. 18, 2023**

- **Enhancements**
  - Saved computed `additional_objectives` computed during search to AutoML object [#4141](#)
  - Remove extra naive pipelines [#4142](#)
- **Fixes**
  - Fixed usage of codecov after uploader deprecation [#4144](#)
  - Fixed issue where prediction intervals were becoming NaNs due to index errors [#4154](#)
- **Changes**
  - Capped size of seasonal period used for determining whether to include `STLDecomposer` in pipelines [#4147](#)

**v0.73.0 Apr. 10, 2023**

- **Enhancements**
  - Allowed `InvalidTargetDataCheck` to return a `DROP_ROWS DataCheckActionOption` [#4116](#)
  - Implemented prediction intervals for non-time series native pipelines using the naïve method [#4127](#)
- **Changes**
  - Removed unnecessary logic from imputer components prior to nullable type handling [#4038](#), [#4043](#)
  - Added calls to `_handle_nullable_types` in component `fit`, `transform`, and `predict` methods when needed [#4046](#), [#4043](#)
  - Removed existing nullable type handling across `AutoMLSearch` to just use new handling [#4085](#), [#4043](#)
  - Handled nullable type incompatibility in `Decomposer` [#4105](#), `:pr:4043`
  - Removed nullable type incompatibility handling for `ARIMA` and `ExponentialSmoothingRegressor` [#4129](#)
  - Changed the default value for `null_strategy` in `InvalidTargetDataCheck` to `drop` [#4131](#)
  - Pinned `sktime` version to 0.17.0 for nullable types support [#4137](#)
- **Testing Changes**

- Fixed installation of prophet for linux nightly tests [#4114](#)

**v0.72.0 Mar. 27, 2023**

- **Enhancements**

- Updated `pipeline.get_prediction_intervals()` to add trend prediction interval information from STL decomposer [#4093](#)
- Added `method=all` support for `TargetLeakageDataCheck` [#4106](#)

- **Fixes**

- Fixed ensemble pipelines not working with `generate_pipeline_example` [#4102](#)

- **Changes**

- Pinned ipywidgets version under 8.0.5 [#4097](#)
- Calculated partial dependence grid values for integer data by rounding instead of truncating fractional values [#4096](#)

- **Testing Changes**

- Updated graphviz installation in GitHub workflows to fix windows nightlies [#4088](#)

**v0.71.0 Mar. 17, 2023\***

- **Fixes**

- Fixed error in `PipelineBase._supports_fast_permutation_importance` with stacked ensemble pipelines [#4083](#)

**v0.70.0 Mar. 16, 2023**

- **Changes**

- Added Oversampler nullable type incompatibility in X [#4068](#)
- Removed nullable handling from objective functions, `roc_curve`, and `correlation_matrix` [#4072](#)
- Transitioned from `prophet-prebuilt` to `prophet` directly [#4045](#)

**v0.69.0 Mar. 15, 2023**

- **Enhancements**

- Move black to regular dependency and use it for `generate_pipeline_code` [#4005](#)
- Implement `generate_pipeline_example` [#4023](#)
- Add new downcast utils for component-specific nullable type handling and begin implementation on objective and component base classes [#4024](#)
- Add nullable type incompatibility properties to the components that need them [#4031](#)
- Add `get_evalml_requirements_file` [#4034](#)
- Pipelines with DFS Transformers will run fast permutation importance if DFS features pre-exist [#4037](#)
- Add `get_prediction_intervals()` at the pipeline level [#4052](#)

- **Fixes**

- Fixed `generate_pipeline_example` erroring out for pipelines with a `DFSTransformer` [#4059](#)
- Remove nullable types handling for `OverSampler` [#4064](#)

- **Changes**

- Uncapped `pmdarima` and updated minimum version [#4027](#)
- Increase min `catboost` to 1.1.1 and `xgboost` to 1.7.0 to add nullable type support for those estimators [#3996](#)
- Unpinned `networkx` and updated minimum version [#4035](#)
- Increased `scikit-learn` version to 1.2.2 [#4064](#)
- Capped max `holidays` version to 0.21 [#4064](#)
- Stop allowing `knn` as a boolean impute strategy [#4058](#)
- Capped `nbsphinx` at < 0.9.0 [#4071](#)

- **Testing Changes**

- Use `release.yaml` for performance tests on merge to main [#4007](#)
- Pin `github-action-check-linked-issues` at v1.4.5 [#4042](#)
- Updated tests to support Woodwork’s object dtype inference for numeric columns [#4066](#)
- Updated `TargetLeakageDataCheck` tests to handle boolean targets properly [#4066](#)

**v0.68.0 Feb. 15, 2023**

- **Enhancements**

- Integrated `determine_periodicity` into `AutoMLSearch` [#3952](#)
- Removed frequency limitations for decomposition using the `STLDecomposer` [#3952](#)

- **Changes**

- Remove `requirements-parser` requirement [#3978](#)
- Updated the `SKOptTuner` to use a gradient boosting regressor for tuning instead of extra trees [#3983](#)
- Unpinned `sktime` from below 1.2, increased minimum to 1.2.1 [#3983](#)

- **Testing Changes**

- Add pull request check for linked issues to CI workflow [#3970](#), [#3980](#)
- Upgraded minimum `IPython` version to 8.10.0 [#3987](#)

**v0.67.0 Jan. 31, 2023**

- **Fixes**

- Re-added `TimeSeriesPipeline.should_skip_featurization` to fix bug where data would get featurized unnecessarily [#3964](#)
- Allow float categories to be passed into `CatBoost` estimators [#3966](#)

- **Changes**

- Update `pyproject.toml` to correctly specify the data filepaths [#3967](#)

- **Documentation Changes**

- Added demo for prediction intervals [#3954](#)

**v0.66.1 Jan. 26, 2023**

- **Fixes**

- Updated `LabelEncoder` to store the original typing information [#3960](#)
- Fixed bug where all-null `BooleanNullable` columns would break the imputer during transform [#3959](#)

**v0.66.0 Jan. 24, 2023****• Enhancements**

- Improved decomposer `determine_periodicity` functionality for better period guesses [#3912](#)
- Added `dates_needed_for_prediction` for time series pipelines [#3906](#)
- Added `RFClassifierRFSelector` and `RFRegressorRFSelector` components for feature selection using recursive feature elimination [#3934](#)
- Added `dates_needed_for_prediction_range` for time series pipelines [#3941](#)

**• Fixes**

- Fixed `set_period()` not updating decomposer parameters [#3932](#)
- Removed second identical batch for time series problems in `DefaultAlgorithm` [#3936](#)
- Fix install command for `alteryx-open-src-update-checker` [#3940](#)
- Fixed non-prophet case of `test_components_can_be_used_for_partial_dependence_fast_mode` [#3949](#)

**• Changes**

- Updated `PolynomialDecomposer` to work with `sktime` v0.15.1 [#3930](#)
- Add `ruff` and use `pyproject.toml` (move away from `setup.cfg`) [#3928](#)
- Pinned `category-encoders` to 2.5.1.post0 [#3933](#)
- Remove `requirements-parser` and `tomli` from core requirements [#3948](#)

**v0.65.0 Jan. 3, 2023****• Enhancements**

- Added the ability to retrieve prediction intervals for estimators that support time series regression [#3876](#)
- Added utils to handle the logic for threshold tuning objective and resplitting data [#3888](#)
- Integrated `OrdinalEncoder` into `AutoMLSearch` [#3765](#)

**• Fixes**

- Fixed `ARIMA` not accounting for gap in prediction from end of training data [#3884](#)
- Fixed `DefaultAlgorithm` adding an extra `OneHotEncoder` when a categorical column is not selected [#3914](#)

**• Changes**

- Added a threshold to `DateTimeFormatDataCheck` to account for too many duplicate or nan values [#3883](#)
- Changed treatment of `Boolean` columns for `SimpleImputer` and `ClassImbalanceDataCheck` to be compatible with new `Woodwork` inference [#3892](#)
- Split decomposer `seasonal_period` parameter into `seasonal_smoother` and `period` parameters [#3896](#)
- Excluded `catboost` from the broken link checking workflow due to 403 errors [#3899](#)

- Pinned scikit-learn version below 1.2.0 [#3901](#)
- Cast newly created one hot encoded columns as bool dtype [#3913](#)

- **Documentation Changes**

- Hid non-essential warning messages in time series docs [#3890](#)

- Testing Changes

**v0.64.0 Dec. 8, 2022**

- Enhancements

- **Fixes**

- Allowed the DFS Transformer to calculate feature values for Features with a `dataframe_name` that is not "X" [#3873](#)
- Stopped passing full list of DFS Transformer features into cloned pipeline in partial dependence fast mode [#3875](#)

- **Changes**

- Update leaderboard names to show *ranking\_score* instead of *validation\_score* [#3878](#)
- Remove Int64Index after Pandas 1.5 Upgrade [#3825](#)
- Reduced the threshold for setting `use_covariates` to False for ARIMA models in AutoMLSearch [#3868](#)
- Pinned woodwork version at  $\leq 0.19.0$  [#3871](#)
- Updated minimum Pandas version to 1.5.0 [#3808](#)
- Remove dsherry from automated dependency update reviews and added tamargrey [#3870](#)

- Documentation Changes

- Testing Changes

**v0.63.0 Nov. 23, 2022**

- **Enhancements**

- Added fast mode to partial dependence [#3753](#)
- Added the ability to serialize featuretools features into time series pipelines [#3836](#)

- **Fixes**

- Fixed TimeSeriesFeaturizer potentially selecting lags outside of feature engineering window [#3773](#)
- Fixed bug where TimeSeriesFeaturizer could not encode Ordinal columns with non numeric categories [#3812](#)
- Updated demo dataset links to point to new endpoint [#3826](#)
- Updated STLDecomposer to infer the time index frequency if it's not present [#3829](#)
- Updated `_drop_time_index` to move the time index from X to both `X.index` and `y.index` [#3829](#)
- Fixed bug where engineered features lost their origin attribute in partial dependence, causing it to fail [#3830](#)
- Fixed bug where partial dependence's fast mode handling for the DFS Transformer wouldn't work with multi output features [#3830](#)

- Allowed target to be present and ignored in partial dependence’s DFS Transformer fast mode handling [#3830](#)

- **Changes**

- Consolidated decomposition frequency validation logic to `Decomposer` class [#3811](#)
- Removed Featuretools version upper bound and prevent Woodwork 0.20.0 from being installed [#3813](#)
- Updated min Featuretools version to 0.16.0, min nlp-primitives version to 2.9.0 and min Dask version to 2022.2.0 [#3823](#)
- Rename issue templates `config.yaml` to `config.yml` [#3844](#)
- Reverted change adding a `should_skip_featurization` flag to time series pipelines [#3862](#)

- **Documentation Changes**

- Added information about STL Decomposition to the time series docs [#3835](#)
- Removed RTD failure on warnings [#3864](#)

#### **v0.62.0 Nov. 01, 2022**

- **Fixes**

- Fixed bug with datetime conversion in `get_time_index` [#3792](#)
- Fixed bug where invalid anchored or offset frequencies were including the `STLDecomposer` in pipelines [#3794](#)
- Fixed bug where irregular datetime frequencies were causing errors in `make_pipeline` [#3800](#)

- **Changes**

- Capped dask at < 2022.10.1 [#3797](#)
- Uncapped dask and excluded 2022.10.1 from viable versions [#3803](#)
- Removed all references to XGBoost’s deprecated `_use_label_encoder` argument [#3805](#)
- Capped featuretools at < 1.17.0 [#3805](#)
- Capped woodwork at < 0.21.0 [#3805](#)

#### **v0.61.1 Oct. 27, 2022**

- **Fixes**

- Fixed bug where `TimeSeriesBaselinePipeline` wouldn’t preserve index name of input features [#3788](#)
- Fixed bug in `TimeSeriesBaselinePipeline` referencing a static string instead of time index var [#3788](#)

- **Documentation Changes**

- Updated Release Notes [#3788](#)

#### **v0.61.0 Oct. 25, 2022**

- **Enhancements**

- Added the STL Decomposer [#3741](#)
- Integrated `STLDecomposer` into `AutoMLSearch` for time series regression problems [#3781](#)
- Brought the `PolynomialDecomposer` up to parity with `STLDecomposer` [#3768](#)

- **Changes**

- Cap Featuretools at < 1.15.0 [#3775](#)
- Remove Featuretools upper bound restriction and fix nlp-primitives import statements [#3778](#)

**v0.60.0 Oct. 19, 2022**

- **Enhancements**

- Add forecast functions to time series regression pipeline [#3742](#)

- **Fixes**

- Fix to allow IDColumnsDataCheck to work with IntegerNullable inputs [#3740](#)
- Fixed datasets name for main performance tests [#3743](#)

- **Changes**

- Use Woodwork’s `dependence_dict` method to calculate for TargetLeakageDataCheck [#3728](#)

- Documentation Changes

- Testing Changes

**Warning:**

**Breaking Changes**

- TargetLeakageDataCheck now uses argument `mutual_info` rather than `mutual` [#3728](#)

**v0.59.0 Sept. 27, 2022**

- **Enhancements**

- Enhanced Decomposer with `determine_periodicity` function to automatically determine periodicity of seasonal target. [#3729](#)
- Enhanced Decomposer with `set_seasonal_period` function to set a Decomposer object’s seasonal period automatically. [#3729](#)
- Added OrdinalEncoder component [#3736](#)

- **Fixes**

- Fixed holdout warning message showing when using default parameters [#3727](#)
- Fixed bug in Oversampler where categorical dtypes would fail [#3732](#)

- **Changes**

- Automatic sorting of the `time_index` prior to running DataChecks has been disabled [#3723](#)

- Documentation Changes

- **Testing Changes**

- Update job to use new looking glass report command [#3733](#)

**v0.58.0 Sept. 20, 2022**

- **Enhancements**

- Defined `get_trend_df()` for PolynomialDecomposer to allow decomposition of target data into trend, seasonality and residual. [#3720](#)
- Updated to run with Woodwork `>= 0.18.0` [#3700](#)

- Pass time index column to time series native estimators but drop otherwise [#3691](#)
- Added `errors` attribute to `AutoMLSearch` for useful debugging [#3702](#)
- **Fixes**
  - Removed multiple samplers occurring in pipelines generated by `DefaultAlgorithm` [#3696](#)
  - Fix search order changing when using `DefaultAlgorithm` [#3704](#)
- **Changes**
  - Bumped up minimum version of `sktime` to 0.12.0. [#3720](#)
  - Added abstract `Decomposer` class as a parent to `PolynomialDecomposer` to support additional decomposers. [#3720](#)
  - Pinned `pmdarima` < 2.0.0 [#3679](#)
  - Added support for using `downcast_nullable_types` with `Series` as well as `DataFrames` [#3697](#)
  - Added distinction between ranking and optimization objectives [#3721](#)
- **Documentation Changes**
- **Testing Changes**
  - Updated `pytest` fixtures and brittle test files to explicitly set `woodwork` typing information [#3697](#)
  - Added github workflow to run looking glass performance tests on merge to main [#3690](#)
  - Fixed looking glass performance test script [#3715](#)
  - Remove commit message from looking glass slack message [#3719](#)

#### v0.57.0 Sept. 6, 2022

- **Enhancements**
  - Added `KNNImputer` class and created new `knn` parameter for `Imputer` [#3662](#)
- **Fixes**
  - `IDColumnsDataCheck` now only returns an action code to set the first column as the primary key if it contains unique values [#3639](#)
  - `IDColumnsDataCheck` now can handle primary key columns containing “integer” values that are of the double type [#3683](#)
  - Added support for `BooleanNullable` columns in EvalML pipelines and imputer [#3678](#)
  - Updated `StandardScaler` to only apply to numeric columns [#3686](#)
- **Changes**
  - Unpinned `sktime` to allow for version 0.13.2 [#3685](#)
  - Pinned `pmdarima` < 2.0.0 [#3679](#)

#### v0.56.1 Aug. 19, 2022

- **Fixes**
  - `IDColumnsDataCheck` now only returns an action code to set the first column as the primary key if it contains unique values [#3639](#)
  - Reverted the `make_pipeline` changes that conditionally included the imputers [#3672](#)

#### v0.56.0 Aug. 15, 2022

- **Enhancements**

- Add CI testing environment in Mac for install workflow [#3646](#)
- Updated `make_pipeline` to only include the Imputer in pipelines if NaNs exist in the data [#3657](#)
- Updated to run with Woodwork  $\geq 0.17.2$  [#3626](#)
- Add `exclude_featurizers` parameter to `AutoMLSearch` to specify featurizers that should be excluded from all pipelines [#3631](#)
- Add `fit_transform` method to pipelines and component graphs [#3640](#)
- Changed default value of data splitting for time series problem holdout set evaluation [#3650](#)

- **Fixes**

- Reverted the Woodwork 0.17.x compatibility work due to performance regression [#3664](#)

- **Changes**

- Disable holdout set in AutoML search by default [#3659](#)
- Pinned `sktime` at  $\geq 0.7.0, < 0.13.1$  due to slowdowns with time series modeling [#3658](#)
- Added additional testing support for Python 3.10 [#3609](#)

- **Documentation Changes**

- Updated broken link checker to exclude stackoverflow domain [#3633](#)
- Add instructions to add new users to `evalml-core-feedstock` [#3636](#)

## v0.55.0 July. 24, 2022

- **Enhancements**

- Increased the amount of logical type information passed to Woodwork when calling `ww.init()` in transformers [#3604](#)
- Added ability to log how long each batch and pipeline take in `automl.search()` [#3577](#)
- Added the option to set the `sp` parameter for ARIMA models [#3597](#)
- Updated the CV split size of time series problems to match forecast horizon for improved performance [#3616](#)
- Added holdout set evaluation as part of AutoML search and pipeline ranking [#3499](#)
- Added `Dockerfile.arm` and `.dockerignore` for python version and M1 testing [#3609](#)
- Added `test_gen_utils::in_container_arm64()` fixture [#3609](#)

- **Fixes**

- Fixed iterative graphs not appearing in documentation [#3592](#)
- Updated the `load_diabetes()` method to account for scikit-learn 1.1.1 changes to the dataset [#3591](#)
- Capped woodwork version at  $< 0.17.0$  [#3612](#)
- Bump minimum scikit-optimize version to 0.9.0 *:pr: 3614*
- Invalid target data checks involving regression and unsupported data types now produce a different `DataCheckMessageCode` [#3630](#)
- Updated `test_data_checks.py::test_data_checks_raises_value_errors_on_init` - more lenient text check [#3609](#)

- **Changes**

- Add pre-commit hooks for linting [#3608](#)
- Implemented a lower threshold and window size for the `TimeSeriesRegularizer` and `DatetimeFormatDataCheck` [#3627](#)
- Updated `IDColumnsDataCheck` to return an action to set the first column as the primary key if it is identified as an ID column [#3634](#)

- **Documentation Changes**

- **Testing Changes**

- Pinned `GraphViz` version for Windows CI Test [#3596](#)
- Removed skipping of `PolynomialDecomposer` tests for Python 3.9 envs. [#3720](#)
- Removed `pytest.mark.skip_if_39` pytest marker [#3602](#) [#3607](#)
- Updated `pytest==7.1.2` [#3609](#)
- Added `Dockerfile.arm` and `.dockerignore` for python version and M1 testing [#3609](#)
- Added `test_gen_utils::in_container_arm64()` fixture [#3609](#)

**Warning:**

**Breaking Changes**

- Refactored test cases that iterate over all components to use `pytest.mark.parametrize` and changed the corresponding `if...continue` blocks to `pytest.mark.xfail` [#3622](#)

**v0.54.0 June. 23, 2022**

- **Fixes**

- Updated the `Imputer` and `SimpleImputer` to work with `scikit-learn 1.1.1`. [#3525](#)
- Bumped the minimum versions of `scikit-learn` to 1.1.1 and `imbalanced-learn` to 0.9.1. [#3525](#)
- Added a clearer error message when `describe` is called on an un-instantiated `ComponentGraph` [#3569](#)
- Added a clearer error message when time series' `predict` is called with its `X_train` or `y_train` parameter set as `None` [#3579](#)

- **Changes**

- Don't pass `time_index` as kwargs to `sktime ARIMA` implementation for compatibility with latest version [#3564](#)
- Remove incompatible `nlp-primitives` version 2.6.0 from accepted dependency versions [#3572](#), [#3574](#)
- Updated `evalml` authors [#3581](#)

- **Documentation Changes**

- Fix typo in `long_description` field in `setup.cfg` [#3553](#)
- Update install page to remove Python 3.7 mention [#3567](#)

**v0.53.1 June. 9, 2022**

- **Changes**

- Set the development status to 4 - Beta in `setup.cfg` #3550

#### v0.53.0 June. 9, 2022

- **Enhancements**

- Pass `n_jobs` to default algorithm #3548

- **Fixes**

- Fixed github workflows for featuretools and woodwork to test their main branch against evalml. #3517
- Suppress warnings in `TargetEncoder` raised by a coming change to default parameters #3540
- Fixed bug where schema was not being preserved in column renaming for XGBoost and LightGBM models #3496

- **Changes**

- Transitioned to use `pyproject.toml` and `setup.cfg` away from `setup.py` #3494, #3536

- **Documentation Changes**

- Updated the Time Series User Guide page to include known-in-advance features and fix typos #3521
- Add slack and stackoverflow icon to footer #3528
- Add install instructions for M1 Mac #3543

- **Testing Changes**

- Rename `yml` to `yaml` for GitHub Actions #3522
- Remove `noncore_dependency` pytest marker #3541
- Changed `test_smotenc_category_features` to use valid postal code values in response to new woodwork type validation #3544

#### v0.52.0 May. 12, 2022

- **Changes**

- Added github workflows for featuretools and woodwork to test their main branch against evalml. #3504
- Added `pmdarima` to conda recipe. #3505
- Added a threshold for `NullDataCheck` before a warning is issued for null values #3507
- Changed `NoVarianceDataCheck` to only output warnings #3506
- Reverted XGBoost Classifier/Regressor patch for all boolean columns needing to be converted to int. #3503
- Updated `roc_curve()` and `conf_matrix()` to work with `IntegerNullable` and `BooleanNullable` types. #3465
- Changed `ComponentGraph._transform_features` to raise a `PipelineError` instead of a `ValueError`. This is not a breaking change because `PipelineError` is a subclass of `ValueError`. #3497
- Capped `sklearn` at version 1.1.0 #3518

- **Documentation Changes**

- Updated to install prophet extras in Read the Docs. #3509

- **Testing Changes**

- Moved vowpal wabbit in test recipe to evalml package from evalml-core #3502

**v0.51.0 Apr. 28, 2022**

- **Enhancements**

- Updated `make_pipeline_from_data_check_output` to work with time series problems. #3454

- **Fixes**

- Changed `PipelineBase.graph_json()` to return a python dictionary and renamed as `graph_dict()` #3463

- **Changes**

- Added `vowpalwabbit` to local recipe and remove `is_using_conda` pytest skip markers from relevant tests #3481

- **Documentation Changes**

- Fixed broken link in contributing guide #3464
- Improved development instructions #3468
- Added the `TimeSeriesRegularizer` and `TimeSeriesImputer` to the timeseries section of the User Guide #3473
- Updated OSS slack link #3487
- Fix rendering of model understanding plotly charts in docs #3460

- **Testing Changes**

- Updated unit tests to support woodwork 0.16.2 #3482
- Fix some unit tests after vowpal wabbit got added to conda recipe #3486

**Warning:**

**Breaking Changes**

- Renamed `PipelineBase.graph_json()` to `PipelineBase.graph_dict()` #3463
- Minimum supported woodwork version is now 0.16.2 #3482

**v0.50.0 Apr. 12, 2022**

- **Enhancements**

- Added `TimeSeriesImputer` component #3374
- Replaced `pipeline_parameters` and `custom_hyperparameters` with `search_parameters` in `AutoMLSearch` #3373, #3427
- Added `TimeSeriesRegularizer` to smooth unferrable date ranges for time series problems #3376
- Enabled ensembling as a parameter for `DefaultAlgorithm` #3435, #3444

- **Fixes**

- Fix `DefaultAlgorithm` not handling Email and URL features #3419
- Added test to ensure `LabelEncoder` parameters preserved during `AutoMLSearch` #3326

- **Changes**

- Updated `DateTimeFormatDataCheck` to use woodwork's `infer_frequency` function [#3425](#)
- Renamed `graphs.py` to `visualizations.py` [#3439](#)

- **Documentation Changes**

- Updated the model understanding section of the user guide to include missing functions [#3446](#)
- Rearranged the user guide model understanding page for easier navigation [#3457](#)
- Update README text to Alteryx [#3462](#)

**Warning:**

**Breaking Changes**

- Renamed `graphs.py` to `visualizations.py` [#3439](#)
- Replaced `pipeline_parameters` and `custom_hyperparameters` with `search_parameters` in `AutoMLSearch` [#3373](#)

**v0.49.0 Mar. 31, 2022**

- **Enhancements**

- Added `use_covariates` parameter to `ARIMAREgressor` [#3407](#)
- `AutoMLSearch` will set `use_covariates` to `False` for `ARIMA` when dataset is large [#3407](#)
- Add ability to retrieve logical types to a component in the graph via `get_component_input_logical_types` [#3428](#)
- Add ability to get logical types passed to the last component via `last_component_input_logical_types` [#3428](#)

- **Fixes**

- Fix conda build after PR [3407](#) [#3429](#)

- **Changes**

- Moved model understanding metrics from `graph.py` into a separate file [#3417](#)
- Unpin click dependency [#3420](#)
- For `IterativeAlgorithm`, put time series algorithms first [#3407](#)
- Use `prophet-prebuilt` to install prophet in extras [#3407](#)

**Warning:**

**Breaking Changes**

- Moved model understanding metrics from `graph.py` to `metrics.py` [#3417](#)

**v0.48.0 Mar. 25, 2022**

- **Enhancements**

- Add support for oversampling in time series classification problems [#3387](#)

- **Fixes**

- Fixed `TimeSeriesFeaturizer` to make it deterministic when creating and choosing columns [#3384](#)
- Fixed bug where Email/URL features with missing values would cause the imputer to error out [#3388](#)
- **Changes**
  - Update maintainers to add Frank [#3382](#)
  - Allow `woodwork` version 0.14.0 to be installed [#3381](#)
  - Moved partial dependence functions from `graph.py` to a separate file [#3404](#)
  - Pin `click` at 8.0.4 due to incompatibility with `black` [#3413](#)
- **Documentation Changes**
  - Added automl user guide section covering search algorithms [#3394](#)
  - Updated broken links and automated broken link detection [#3398](#)
  - Upgraded `nbconvert` [#3402](#), [#3411](#)
- **Testing Changes**
  - Updated scheduled workflows to only run on Alteryx owned repos ([#3395](#))
  - Exclude documentation versions other than latest from broken link check [#3401](#)

**Warning:****Breaking Changes**

- Moved partial dependence functions from `graph.py` to `partial_dependence.py` [#3404](#)

**v0.47.0 Mar. 16, 2022**

- **Enhancements**
  - Added `TimeSeriesFeaturizer` into ARIMA-based pipelines [#3313](#)
  - Added caching capability for ensemble training during `AutoMLSearch` [#3257](#)
  - Added new error code for zero unique values in `NoVarianceDataCheck` [#3372](#)
- **Fixes**
  - Fixed `get_pipelines` to reset pipeline threshold for binary cases [#3360](#)
- **Changes**
  - Update maintainers [#3365](#)
  - Revert `pandas` 1.3.0 compatibility patch [#3378](#)
- **Documentation Changes**
  - Fixed documentation links to point to correct pages [#3358](#)
- **Testing Changes**
  - Checkout main branch in `build_conda_pkg` job [#3375](#)

**v0.46.0 Mar. 03, 2022**

- **Enhancements**

- Added `test_size` parameter to `ClassImbalanceDataCheck` #3341
- Make target optional for `NoVarianceDataCheck` #3339

- **Changes**

- Removed `python_version<3.9` environment marker from sktime dependency #3332
- Updated `DatetimeFormatDataCheck` to return all messages and not return early if NaNs are detected #3354

- **Documentation Changes**

- Added in-line tabs and copy-paste functionality to documentation, overhauled Install page #3353

**v0.45.0 Feb. 17, 2022**

- **Enhancements**

- Added support for pandas  $\geq 1.4.0$  #3324
- Standardized feature importance for estimators #3305
- Replaced usage of private method with Woodwork’s public `get_subset_schema` method #3325

- **Changes**

- Added an `is_cv` property to the datasplitters used #3297
- Changed `SimpleImputer` to ignore Natural Language columns #3324
- Added drop NaN component to some time series pipelines #3310

- **Documentation Changes**

- Update README.md with Alteryx link (#3319)
- Added formatting to the AutoML user guide to shorten result outputs #3328

- **Testing Changes**

- Add auto approve dependency workflow schedule for every 30 mins #3312

**v0.44.0 Feb. 04, 2022**

- **Enhancements**

- Updated `DefaultAlgorithm` to also limit estimator usage for long-running multiclass problems #3099
- Added `make_pipeline_from_data_check_output()` utility method #3277
- Updated `AutoMLSearch` to use `DefaultAlgorithm` as the default automl algorithm #3261, #3304
- Added more specific data check errors to `DatetimeFormatDataCheck` #3288
- Added `features` as a parameter for `AutoMLSearch` and add `DFSTransformer` to pipelines when features are present #3309

- **Fixes**

- Updated the binary classification pipeline’s `optimize_thresholds` method to use Nelder-Mead #3280
- Fixed bug where feature importance on time series pipelines only showed 0 for time index #3285

- **Changes**

- Removed `DateTimeNaNDataCheck` and `NaturalLanguageNaNDataCheck` in favor of `NullDataCheck` #3260
- Drop support for Python 3.7 #3291
- Updated minimum version of `woodwork` to `v0.12.0` #3290

- **Documentation Changes**

- Update documentation and docstring for `validate_holdout_datasets` for time series problems #3278
- Fixed mistake in documentation where wrong objective was used for calculating percent-better-than-baseline #3285

**Warning:****Breaking Changes**

- Removed `DateTimeNaNDataCheck` and `NaturalLanguageNaNDataCheck` in favor of `NullDataCheck` #3260
- Dropped support for Python 3.7 #3291

**v0.43.0 Jan. 25, 2022**

- **Enhancements**

- Updated new `NullDataCheck` to return a warning and suggest an action to impute columns with null values #3197
- Updated `make_pipeline_from_actions` to handle null column imputation #3237
- Updated data check actions API to return options instead of actions and add functionality to suggest and take action on columns with null values #3182

- **Fixes**

- Fixed categorical data leaking into non-categorical sub-pipelines in `DefaultAlgorithm` #3209
- Fixed Python 3.9 installation for prophet by updating `pmdarima` version in requirements #3268
- Allowed `DateTime` columns to pass through `PerColumnImputer` without breaking #3267

- **Changes**

- Updated `DataCheck.validate()` output to return a dictionary instead of list for actions #3142
- Updated `DataCheck.validate()` API to use the new `DataCheckActionOption` class instead of `DataCheckAction` #3152
- Uncapped `numba` version and removed it from requirements #3263
- Renamed `HighlyNullDataCheck` to `NullDataCheck` #3197
- Updated data check `validate()` output to return a list of warnings and errors instead of a dictionary #3244
- Capped `pandas` at `< 1.4.0` #3274

- **Testing Changes**

- Bumped minimum `IPython` version to 7.16.3 in `test-requirements.txt` based on dependabot feedback #3269

**Warning:****Breaking Changes**

- Renamed `HighlyNullDataCheck` to `NullDataCheck` [#3197](#)
- Updated data check `validate()` output to return a list of warnings and errors instead of a dictionary. See the Data Check or Data Check Actions pages (under User Guide) for examples. [#3244](#)
- Removed `impute_all` and `default_impute_strategy` parameters from the `PerColumnImputer` [#3267](#)
- Updated `PerColumnImputer` such that columns not specified in `impute_strategies` dict will not be imputed anymore [#3267](#)

**v0.42.0 Jan. 18, 2022****• Enhancements**

- Required the separation of training and test data by `gap + 1` units to be verified by `time_index` for time series problems [#3208](#)
- Added support for boolean features for `ARIMARegressor` [#3187](#)
- Updated dependency bot workflow to remove outdated description and add new configuration to delete branches automatically [#3212](#)
- Added `n_obs` and `n_splits` to `TimeSeriesParametersDataCheck` error details [#3246](#)

**• Fixes**

- Fixed classification pipelines to only accept target data with the appropriate number of classes [#3185](#)
- Added support for time series in `DefaultAlgorithm` [#3177](#)
- Standardized names of featurization components [#3192](#)
- Removed empty cell in `text_input.ipynb` [#3234](#)
- Removed potential prediction explanations failure when pipelines predicted a class with probability 1 [#3221](#)
- Dropped NaNs before partial dependence grid generation [#3235](#)
- Allowed prediction explanations to be json-serializable [#3262](#)
- Fixed bug where `InvalidTargetDataCheck` would not check time series regression targets [#3251](#)
- Fixed bug in `are_datasets_separated_by_gap_time_index` [#3256](#)

**• Changes**

- Raised lowest compatible numpy version to 1.21.0 to address security concerns [#3207](#)
- Changed the default objective to `MedianAE` from `R2` for time series regression [#3205](#)
- Removed all-nan Unknown to Double logical conversion in `infer_feature_types` [#3196](#)
- Checking the validity of holdout data for time series problems can be performed by calling `pipelines.utils.validate_holdout_datasets` prior to calling `predict` [#3208](#)

**• Testing Changes**

- Update auto approve workflow trigger and delete branch after merge [#3265](#)

**Warning:****Breaking Changes**

- Renamed `DateTimeFeaturizerComponent` to `DateTimeFeaturizer` and `NaturalLanguageFeaturizationComponent` to `NaturalLanguageFeaturizer` [#3192](#)

**v0.41.0 Jan. 06, 2022**• **Enhancements**

- Added string support for `DataCheckActionCode` [#3167](#)
- Added `DataCheckActionOption` class [#3134](#)
- Add issue templates for bugs, feature requests and documentation improvements for GitHub [#3199](#)

• **Fixes**

- Fix bug where prediction explanations `class_name` was shown as float for boolean targets [#3179](#)
- Fixed bug in nightly linux tests [#3189](#)

• **Changes**

- Removed usage of scikit-learn's `LabelEncoder` in favor of ours [#3161](#)
- Removed nullable types checking from `infer_feature_types` [#3156](#)
- Fixed `mean_cv_data` and `validation_score` values in `AutoMLSearch.rankings` to reflect cv score or NaN when appropriate [#3162](#)

• **Testing Changes**

- Updated tests to use new pipeline API instead of defining custom pipeline classes [#3172](#)
- Add workflow to auto-merge dependency PRs if status checks pass [#3184](#)

**v0.40.0 Dec. 22, 2021**• **Enhancements**

- Added `TimeSeriesSplittingDataCheck` to `DefaultDataChecks` to verify adequate class representation in time series classification problems [#3141](#)
- Added the ability to accept serialized features and skip computation in `DFSTransformer` [#3106](#)
- Added support for known-in-advance features [#3149](#)
- Added Holt-Winters `ExponentialSmoothingRegressor` for time series regression problems [#3157](#)
- Required the separation of training and test data by `gap + 1` units to be verified by `time_index` for time series problems [#3160](#)

• **Fixes**

- Fixed error caused when tuning threshold for time series binary classification [#3140](#)

• **Changes**

- `TimeSeriesParametersDataCheck` was added to `DefaultDataChecks` for time series problems [#3139](#)
- Renamed `date_index` to `time_index` in `problem_configuration` for time series problems [#3137](#)

- Updated `nlp-primitives` minimum version to 2.1.0 #3166
- Updated minimum version of `woodwork` to v0.11.0 #3171
- Revert 3160 until uninferable frequency can be addressed earlier in the process #3198
- **Documentation Changes**
  - Added comments to provide clarity on doctests #3155
- **Testing Changes**
  - Parameterized tests in `test_datasets.py` #3145

**Warning:****Breaking Changes**

- Renamed `date_index` to `time_index` in `problem_configuration` for time series problems #3137

**v0.39.0 Dec. 9, 2021**

- **Enhancements**
  - Renamed `DelayedFeatureTransformer` to `TimeSeriesFeaturizer` and enhanced it to compute rolling features #3028
  - Added ability to impute only specific columns in `PerColumnImputer` #3123
  - Added `TimeSeriesParametersDataCheck` to verify the time series parameters are valid given the number of splits in cross validation #3111
- **Fixes**
  - Default parameters for `RFRegressorSelectFromModel` and `RFClassifierSelectFromModel` has been fixed to avoid selecting all features #3110
- **Changes**
  - Removed reliance on a datetime index for `ARIMAREgressor` and `ProphetRegressor` #3104
  - Included target leakage check when fitting `ARIMAREgressor` to account for the lack of `TimeSeriesFeaturizer` in `ARIMAREgressor` based pipelines #3104
  - Cleaned up and refactored `InvalidTargetDataCheck` implementation and docstring #3122
  - Removed indices information from the output of `HighlyNullDataCheck`'s `validate()` method #3092
  - Added `ReplaceNullableTypes` component to prepare for handling pandas nullable types. #3090
  - Updated `make_pipeline` for handling pandas nullable types in preprocessing pipeline. #3129
  - Removed unused `EnsembleMissingPipelinesError` exception definition #3131
- **Testing Changes**
  - Refactored tests to avoid using `importorskip` #3126
  - Added `skip_during_conda` test marker to skip tests that are not supposed to run during conda build #3127
  - Added `skip_if_39` test marker to skip tests that are not supposed to run during python 3.9 #3133

**Warning:****Breaking Changes**

- Renamed DelayedFeatureTransformer to TimeSeriesFeaturizer #3028
- ProphetRegressor now requires a datetime column in X represented by the date\_index parameter #3104
- Renamed module evalml.data\_checks.invalid\_target\_data\_check to evalml.data\_checks.invalid\_targets\_data\_check #3122
- Removed unused EnsembleMissingPipelinesError exception definition #3131

v0.38.0 Nov. 27, 2021

• **Enhancements**

- Added data\_check\_name attribute to the data check action class #3034
- Added NumWords and NumCharacters primitives to TextFeaturizer and renamed TextFeaturizer to NaturalLanguageFeaturizer #3030
- Added support for scikit-learn > 1.0.0 #3051
- Required the date\_index parameter to be specified for time series problems in AutoMLSearch #3041
- Allowed time series pipelines to predict on test datasets whose length is less than or equal to the forecast\_horizon. Also allowed the test set index to start at 0. #3071
- Enabled time series pipeline to predict on data with features that are not known-in-advanced #3094

• **Fixes**

- Added in error message when fit and predict/predict\_proba data types are different #3036
- Fixed bug where ensembling components could not get converted to JSON format #3049
- Fixed bug where components with tuned integer hyperparameters could not get converted to JSON format #3049
- Fixed bug where force plots were not displaying correct feature values #3044
- Included confusion matrix at the pipeline threshold for find\_confusion\_matrix\_per\_threshold #3080
- Fixed bug where One Hot Encoder would error out if a non-categorical feature had a missing value #3083
- Fixed bug where features created from categorical columns by Delayed Feature Transformer would be inferred as categorical #3083

• **Changes**

- Delete predict\_uses\_y estimator attribute #3069
- Change DateTimeFeaturizer to use corresponding Featuretools primitives #3081
- Updated TargetDistributionDataCheck to return metadata details as floats rather strings #3085
- Removed dependency on psutil package #3093

• **Documentation Changes**

- Updated docs to use data check action methods rather than manually cleaning data [#3050](#)
- **Testing Changes**
  - Updated integration tests to use `make_pipeline_from_actions` instead of private method [#3047](#)

**Warning:**

**Breaking Changes**

- Added `data_check_name` attribute to the data check action class [#3034](#)
- Renamed `TextFeaturizer`` to ```NaturalLanguageFeaturizer` [#3030](#)
- Updated the `Pipeline.graph_json` function to return a dictionary of “from” and “to” edges instead of tuples [#3049](#)
- Delete `predict_uses_y` estimator attribute [#3069](#)
- Changed time series problems in `AutoMLSearch` to need a not-None `date_index` [#3041](#)
- Changed the `DelayedFeatureTransformer` to throw a `ValueError` during fit if the `date_index` is None [#3041](#)
- Passing `X=None` to `DelayedFeatureTransformer` is deprecated [#3041](#)

**v0.37.0 Nov. 9, 2021**

- **Enhancements**
  - Added `find_confusion_matrix_per_threshold` to Model Understanding [#2972](#)
  - Limit computationally-intensive models during `AutoMLSearch` for certain multiclass problems, allow for opt-in with parameter `allow_long_running_models` [#2982](#)
  - Added support for stacked ensemble pipelines to prediction explanations module [#2971](#)
  - Added integration tests for data checks and data checks actions workflow [#2883](#)
  - Added a change in pipeline structure to handle categorical columns separately for pipelines in `DefaultAlgorithm` [#2986](#)
  - Added an algorithm to `DelayedFeatureTransformer` to select better lags [#3005](#)
  - Added test to ensure pickling pipelines preserves thresholds [#3027](#)
  - Added `AutoML` function to access ensemble pipeline’s input pipelines IDs [#3011](#)
  - Added ability to define which class is “positive” for label encoder in binary classification case [#3033](#)
- **Fixes**
  - Fixed bug where `Oversampler` didn’t consider boolean columns to be categorical [#2980](#)
  - Fixed permutation importance failing when target is categorical [#3017](#)
  - Updated estimator and pipelines’ `predict`, `predict_proba`, `transform`, `inverse_transform` methods to preserve input indices [#2979](#)
  - Updated demo dataset link for daily min temperatures [#3023](#)
- **Changes**

- Updated `OutliersDataCheck` and `UniquenessDataCheck` and allow for the suspension of the Nullable types error [#3018](#)

- **Documentation Changes**

- Fixed cost benefit matrix demo formatting [#2990](#)
- Update `ReadMe.md` with new badge links and updated installation instructions for conda [#2998](#)
- Added more comprehensive doctests [#3002](#)

## v0.36.0 Oct. 27, 2021

- **Enhancements**

- Added LIME as an algorithm option for `explain_predictions` and `explain_predictions_best_worst` [#2905](#)
- Standardized data check messages and added default “rows” and “columns” to data check message details dictionary [#2869](#)
- Added `rows_of_interest` to pipeline utils [#2908](#)
- Added support for woodwork version 0.8.2 [#2909](#)
- Enhanced the `DateTimeFeaturizer` to handle NaNs in date features [#2909](#)
- Added support for woodwork logical types `PostalCode`, `SubRegionCode`, and `CountryCode` in model understanding tools [#2946](#)
- Added Vowpal Wabbit regressor and classifiers [#2846](#)
- Added `NoSplit` data splitter for future unsupervised learning searches [#2958](#)
- Added method to convert actions into a preprocessing pipeline [#2968](#)

- **Fixes**

- Fixed bug where partial dependence was not respecting the ww schema [#2929](#)
- Fixed `calculate_permutation_importance` for datetimes on `StandardScaler` [#2938](#)
- Fixed `SelectColumns` to only select available features for feature selection in `DefaultAlgorithm` [#2944](#)
- Fixed `DropColumns` component not receiving parameters in `DefaultAlgorithm` [#2945](#)
- Fixed bug where trained binary thresholds were not being returned by `get_pipeline` or `clone` [#2948](#)
- Fixed bug where `Oversampler` selected ww logical categorical instead of ww semantic category [#2946](#)

- **Changes**

- Changed `make_pipeline` function to place the `DateTimeFeaturizer` prior to the `Imputer` so that NaN dates can be imputed [#2909](#)
- Refactored `OutliersDataCheck` and `HighlyNullDataCheck` to add more descriptive metadata [#2907](#)
- Bumped minimum version of dask from 2021.2.0 to 2021.10.0 [#2978](#)

- **Documentation Changes**

- Added back Future Release section to release notes [#2927](#)
- Updated CI to run doctest (docstring tests) and apply necessary fixes to docstrings [#2933](#)

- Added documentation for BinaryClassificationPipeline thresholding [#2937](#)
- **Testing Changes**
  - Fixed dependency checker to catch full names of packages [#2930](#)
  - Refactored build\_conda\_pkg to work from a local recipe [#2925](#)
  - Refactored component test for different environments [#2957](#)

**Warning:**

**Breaking Changes**

- Standardized data check messages and added default “rows” and “columns” to data check message details dictionary. This may change the number of messages returned from a data check. [#2869](#)

**v0.35.0 Oct. 14, 2021**

- **Enhancements**
  - Added human-readable pipeline explanations to model understanding [#2861](#)
  - Updated to support Featuretools 1.0.0 and nlp-primitives 2.0.0 [#2848](#)
- **Fixes**
  - Fixed bug where long mode for the top level search method was not respected [#2875](#)
  - Pinned cmdstan to 0.28.0 in cmdstan-builder to prevent future breaking of support for Prophet [#2880](#)
  - Added Jarque-Bera to the TargetDistributionDataCheck [#2891](#)
- **Changes**
  - Updated pipelines to use a label encoder component instead of doing encoding on the pipeline level [#2821](#)
  - Deleted scikit-learn ensembler [#2819](#)
  - Refactored pipeline building logic out of AutoMLSearch and into IterativeAlgorithm [#2854](#)
  - Refactored names for methods in ComponentGraph and PipelineBase [#2902](#)
- **Documentation Changes**
  - Updated install.ipynb to reflect flexibility for cmdstan version installation [#2880](#)
  - Updated the conda section of our contributing guide [#2899](#)
- **Testing Changes**
  - Updated test\_all\_estimators to account for Prophet being allowed for Python 3.9 [#2892](#)
  - Updated linux tests to use cmdstan-builder==0.0.8 [#2880](#)

**Warning:**

**Breaking Changes**

- Updated pipelines to use a label encoder component instead of doing encoding on the pipeline level. This means that pipelines will no longer automatically encode non-numerical targets. Please use a label encoder if working with classification problems and non-numeric targets. [#2821](#)

- Deleted scikit-learn ensembler [#2819](#)
- `IterativeAlgorithm` now requires `X`, `y`, `problem_type` as required arguments as well as `sampler_name`, `allowed_model_families`, `allowed_component_graphs`, `max_batches`, and `verbose` as optional arguments [#2854](#)
- Changed method names of `fit_features` and `compute_final_component_features` to `fit_and_transform_all_but_final` and `transform_all_but_final` in `ComponentGraph`, and `compute_estimator_features` to `transform_all_but_final` in pipeline classes [#2902](#)

**v0.34.0 Sep. 30, 2021**• **Enhancements**

- Updated to work with Woodwork 0.8.1 [#2783](#)
- Added validation that `training_data` and `training_target` are not `None` in prediction explanations [#2787](#)
- Added support for training-only components in pipelines and component graphs [#2776](#)
- Added default argument for the `parameters` value for `ComponentGraph.instantiate` [#2796](#)
- Added `TIME_SERIES_REGRESSION` to `LightGBMRegressor`'s supported problem types [#2793](#)
- Provided a JSON representation of a pipeline's DAG structure [#2812](#)
- Added validation to holdout data passed to `predict` and `predict_proba` for time series [#2804](#)
- Added information about which row indices are outliers in `OutliersDataCheck` [#2818](#)
- Added `verbose` flag to top level `search()` method [#2813](#)
- Added support for linting jupyter notebooks and clearing the executed cells and empty cells [#2829](#) [#2837](#)
- Added “DROP\_ROWS” action to output of `OutliersDataCheck.validate()` [#2820](#)
- Added the ability of `AutoMLSearch` to accept a `SequentialEngine` instance as engine input [#2838](#)
- Added new label encoder component to EvalML [#2853](#)
- Added our own partial dependence implementation [#2834](#)

• **Fixes**

- Fixed bug where `calculate_permutation_importance` was not calculating the right value for pipelines with target transformers [#2782](#)
- Fixed bug where transformed target values were not used in `fit` for time series pipelines [#2780](#)
- Fixed bug where `score_pipelines` method of `AutoMLSearch` would not work for time series problems [#2786](#)
- Removed `TargetTransformer` class [#2833](#)
- Added tests to verify `ComponentGraph` support by pipelines [#2830](#)
- Fixed incorrect parameter for baseline regression pipeline in `AutoMLSearch` [#2847](#)
- Fixed bug where the desired estimator family order was not respected in `IterativeAlgorithm` [#2850](#)

• **Changes**

- Changed `woodwork` initialization to use partial schemas #2774
- Made `Transformer.transform()` an abstract method #2744
- Deleted `EmptyDataChecks` class #2794
- Removed data check for checking log distributions in `make_pipeline` #2806
- Changed the minimum `woodwork` version to 0.8.0 #2783
- Pinned `woodwork` version to 0.8.0 #2832
- Removed `model_family` attribute from `ComponentBase` and transformers #2828
- Limited `scikit-learn` until new features and errors can be addressed #2842
- Show `DeprecationWarning` when `Sklearn Ensemblers` are called #2859
- **Testing Changes**
  - Updated matched assertion message regarding monotonic indices in polynomial detrender tests #2811
  - Added a test to make sure pip versions match conda versions #2851

**Warning:**

**Breaking Changes**

- Made `Transformer.transform()` an abstract method #2744
- Deleted `EmptyDataChecks` class #2794
- Removed data check for checking log distributions in `make_pipeline` #2806

**v0.33.0 Sep. 15, 2021**

- **Fixes**
  - Fixed bug where warnings during `make_pipeline` were not being raised to the user #2765
- **Changes**
  - Refactored and removed `SamplerBase` class #2775
- **Documentation Changes**
  - Added docstring linting packages `pydocstyle` and `darglint` to *make-lint* command #2670

**v0.32.1 Sep. 10, 2021**

- **Enhancements**
  - Added `verbose` flag to `AutoMLSearch` to run search in silent mode by default #2645
  - Added label encoder to `XGBoostClassifier` to remove the warning #2701
  - Set `eval_metric` to `logloss` for `XGBoostClassifier` #2741
  - Added support for `woodwork` versions 0.7.0 and 0.7.1 #2743
  - Changed `explain_predictions` functions to display original feature values #2759
  - Added `X_train` and `y_train` to `graph_prediction_vs_actual_over_time` and `get_prediction_vs_actual_over_time_data` #2762
  - Added `forecast_horizon` as a required parameter to time series pipelines and `AutoMLSearch` #2697

- Added `predict_in_sample` and `predict_proba_in_sample` methods to time series pipelines to predict on data where the target is known, e.g. cross-validation [#2697](#)
- **Fixes**
  - Fixed bug where `_catch_warnings` assumed all warnings were `PipelineNotUsed` [#2753](#)
  - Fixed bug where `Imputer.transform` would erase ww typing information prior to handing data to the `SimpleImputer` [#2752](#)
  - Fixed bug where `Oversampler` could not be copied [#2755](#)
- **Changes**
  - Deleted `drop_nan_target_rows` utility method [#2737](#)
  - Removed default logging setup and debugging log file [#2645](#)
  - Changed the default `n_jobs` value for `XGBoostClassifier` and `XGBoostRegressor` to 12 [#2757](#)
  - Changed `TimeSeriesBaselineEstimator` to only work on a time series pipeline with a `DelayedFeaturesTransformer` [#2697](#)
  - Added `X_train` and `y_train` as optional parameters to pipeline `predict`, `predict_proba`. Only used for time series pipelines [#2697](#)
  - Added `training_data` and `training_target` as optional parameters to `explain_predictions` and `explain_predictions_best_worst` to support time series pipelines [#2697](#)
  - Changed time series pipeline predictions to no longer output series/dataframes padded with NaNs. A prediction will be returned for every row in the `X` input [#2697](#)
- **Documentation Changes**
  - Specified installation steps for Prophet [#2713](#)
  - Added documentation for data exploration on data check actions [#2696](#)
  - Added a user guide entry for time series modelling [#2697](#)
- **Testing Changes**
  - Fixed flaky `TargetDistributionDataCheck` test for very\_lognormal distribution [#2748](#)

**Warning:****Breaking Changes**

- Removed default logging setup and debugging log file [#2645](#)
- Added `X_train` and `y_train` to `graph_prediction_vs_actual_over_time` and `get_prediction_vs_actual_over_time_data` [#2762](#)
- Added `forecast_horizon` as a required parameter to time series pipelines and `AutoMLSearch` [#2697](#)
- Changed `TimeSeriesBaselineEstimator` to only work on a time series pipeline with a `DelayedFeaturesTransformer` [#2697](#)
- Added `X_train` and `y_train` as required parameters for `predict` and `predict_proba` in time series pipelines [#2697](#)
- Added `training_data` and `training_target` as required parameters to `explain_predictions` and `explain_predictions_best_worst` for time series pipelines [#2697](#)

v0.32.0 Aug. 31, 2021

- **Enhancements**

- Allow string for engine parameter for AutoMLSearch #2667
- Add ProphetRegressor to AutoML #2619
- Integrated DefaultAlgorithm into AutoMLSearch #2634
- Removed SVM “linear” and “precomputed” kernel hyperparameter options, and improved default parameters #2651
- Updated ComponentGraph initialization to raise ValueError when user attempts to use .y for a component that does not produce a tuple output #2662
- Updated to support Woodwork 0.6.0 #2690
- Updated pipeline graph() to distinguish X and y edges #2654
- Added DropRowsTransformer component #2692
- Added DROP\_ROWS to \_make\_component\_list\_from\_actions and clean up metadata #2694
- Add new ensembler component #2653

- **Fixes**

- Updated Oversampler logic to select best SMOTE based on component input instead of pipeline input #2695
- Added ability to explicitly close DaskEngine resources to improve runtime and reduce Dask warnings #2667
- Fixed partial dependence bug for ensemble pipelines #2714
- Updated TargetLeakageDataCheck to maintain user-selected logical types #2711

- **Changes**

- Replaced SMOTEOversampler, SMOTENOverSampler and SMOTENCOverSampler with consolidated Oversampler component #2695
- Removed LinearRegressor from the list of default AutoMLSearch estimators due to poor performance #2660

- **Documentation Changes**

- Added user guide documentation for using ComponentGraph and added ComponentGraph to API reference #2673
- Updated documentation to make parallelization of AutoML clearer #2667

- **Testing Changes**

- Removes the process-level parallelism from the test\_cancel\_job test #2666
- Installed numba 0.53 in windows CI to prevent problems installing version 0.54 #2710

**Warning:**

**Breaking Changes**

- Renamed the current top level search method to search\_iterative and defined a new search method for the DefaultAlgorithm #2634

- Replaced SMOTEOverSampler, SMOTENOverSampler and SMOTENCOversampler with consolidated OverSampler component [#2695](#)
- Removed LinearRegressor from the list of default AutoMLSearch estimators due to poor performance [#2660](#)

**v0.31.0 Aug. 19, 2021**

- **Enhancements**
  - Updated the high variance check in AutoMLSearch to be robust to a variety of objectives and cv scores [#2622](#)
  - Use Woodwork’s outlier detection for the OutliersDataCheck [#2637](#)
  - Added ability to utilize instantiated components when creating a pipeline [#2643](#)
  - Sped up the all Nan and unknown check in infer\_feature\_types [#2661](#)
- Fixes
- **Changes**
  - Deleted \_put\_into\_original\_order helper function [#2639](#)
  - Refactored time series pipeline code using a time series pipeline base class [#2649](#)
  - Renamed dask\_tests to parallel\_tests [#2657](#)
  - Removed commented out code in pipeline\_meta.py [#2659](#)
- **Documentation Changes**
  - Add complete install command to README and Install section [#2627](#)
  - Cleaned up documentation for MulticollinearityDataCheck [#2664](#)
- **Testing Changes**
  - Speed up CI by splitting Prophet tests into a separate workflow in GitHub [#2644](#)

**Warning:****Breaking Changes**

- TimeSeriesRegressionPipeline no longer inherits from TimeSeriesRegressionPipeline [#2649](#)

**v0.30.2 Aug. 16, 2021**

- **Fixes**
  - Updated changelog and version numbers to match the release. Release 0.30.1 was release erroneously without a change to the version numbers. 0.30.2 replaces it.

**v0.30.1 Aug. 12, 2021**

- **Enhancements**
  - Added DatetimeFormatDataCheck for time series problems [#2603](#)
  - Added ProphetRegressor to estimators [#2242](#)

- Updated `ComponentGraph` to handle not calling samplers' transform during predict, and updated samplers' transform methods s.t. `fit_transform` is equivalent to `fit(X, y).transform(X, y)` #2583
- Updated `ComponentGraph._validate_component_dict` logic to be stricter about input values #2599
- Patched bug in `xgboost` estimators where predicting on a feature matrix of only booleans would throw an exception. #2602
- Updated `ARIMAREgressor` to use relative forecasting to predict values #2613
- Added support for creating pipelines without an estimator as the final component and added `transform(X, y)` method to pipelines and component graphs #2625
- Updated to support Woodwork 0.5.1 #2610
- **Fixes**
  - Updated `AutoMLSearch` to drop `ARIMAREgressor` from `allowed_estimators` if an incompatible frequency is detected #2632
  - Updated `get_best_sampler_for_data` to consider all non-numeric datatypes as categorical for SMOTE #2590
  - Fixed inconsistent test results from `TargetDistributionDataCheck` #2608
  - Adopted vectorized `pd.NA` checking for Woodwork 0.5.1 support #2626
  - Pinned upper version of `astroid` to 2.6.6 to keep `ReadTheDocs` working. #2638
- **Changes**
  - Renamed SMOTE samplers to SMOTE oversampler #2595
  - Changed `partial_dependence` and `graph_partial_dependence` to raise a `PartialDependenceError` instead of `ValueError`. This is not a breaking change because `PartialDependenceError` is a subclass of `ValueError` #2604
  - Cleaned up code duplication in `ComponentGraph` #2612
  - Stored `predict_proba` results in `.x` for intermediate estimators in `ComponentGraph` #2629
- **Documentation Changes**
  - To avoid local docs build error, only add warning disable and download headers on `ReadTheDocs` builds, not locally #2617
- **Testing Changes**
  - Updated `partial_dependence` tests to change the element-wise comparison per the Plotly 5.2.1 upgrade #2638
  - Changed the lint CI job to only check against python 3.9 via the `-t` flag #2586
  - Installed Prophet in linux nightlies test and fixed `test_all_components` #2598
  - Refactored and fixed all `make_pipeline` tests to assert correct order and address new Woodwork Unknown type inference #2572
  - Removed `component_graphs` as a global variable in `test_component_graphs.py` #2609

**Warning:****Breaking Changes**

- Renamed SMOTE samplers to SMOTE oversampler. Please use SMOTEoversampler, SMOTENCoversampler, SMOTENoversampler instead of SMOTESampler, SMOTENCSampler, and SMOTENSampler #2595

**v0.30.0 Aug. 3, 2021**• **Enhancements**

- Added LogTransformer and TargetDistributionDataCheck #2487
- Issue a warning to users when a pipeline parameter passed in isn't used in the pipeline #2564
- Added Gini coefficient as an objective #2544
- Added repr to ComponentGraph #2565
- Added components to extract features from URL and EmailAddress Logical Types #2550
- Added support for *NaN* values in TextFeaturizer #2532
- Added SelectByType transformer #2531
- Added separate thresholds for percent null rows and columns in HighlyNullDataCheck #2562
- Added support for *NaN* natural language values #2577

• **Fixes**

- Raised error message for types URL, NaturalLanguage, and EmailAddress in partial\_dependence #2573

• **Changes**

- Updated PipelineBase implementation for creating pipelines from a list of components #2549
- Moved get\_hyperparameter\_ranges to PipelineBase class from automl/utils module #2546
- Renamed ComponentGraph's get\_parents to get\_inputs #2540
- Removed ComponentGraph.linearized\_component\_graph and ComponentGraph.from\_list #2556
- Updated ComponentGraph to enforce requiring .x and .y inputs for each component in the graph #2563
- Renamed existing ensembler implementation from StackedEnsemblers to SklearnStackedEnsemblers #2578

• **Documentation Changes**

- Added documentation for DaskEngine and CFEngine parallel engines #2560
- Improved detail of TextFeaturizer docstring and tutorial #2568

• **Testing Changes**

- Added test that makes sure split\_data does not shuffle for time series problems #2552

**Warning:****Breaking Changes**

- Moved get\_hyperparameter\_ranges to PipelineBase class from automl/utils module #2546
- Renamed ComponentGraph's get\_parents to get\_inputs #2540

- Removed `ComponentGraph.linearized_component_graph` and `ComponentGraph.from_list` #2556
- Updated `ComponentGraph` to enforce requiring `.x` and `.y` inputs for each component in the graph #2563

v0.29.0 Jul. 21, 2021

- **Enhancements**

- Updated 1-way partial dependence support for datetime features #2454
- Added details on how to fix error caused by broken ww schema #2466
- Added ability to use built-in pickle for saving `AutoMLSearch` #2463
- Updated our components and component graphs to use latest features of ww 0.4.1, e.g. `concat_columns` and `drop in-place`. #2465
- Added new, `concurrent.futures` based engine for parallel AutoML #2506
- Added support for new Woodwork `Unknown` type in `AutoMLSearch` #2477
- Updated our components with an attribute that describes if they modify features or targets and can be used in list API for pipeline initialization #2504
- Updated `ComponentGraph` to accept `X` and `y` as inputs #2507
- Removed unused `TARGET_BINARY_INVALID_VALUES` from `DataCheckMessageCode` enum and fixed formatting of objective documentation #2520
- Added `EvalMLAlgorithm` #2525
- Added support for `NaN` values in `TextFeaturizer` #2532

- **Fixes**

- Fixed `FraudCost` objective and reverted threshold optimization method for binary classification to `Golden` #2450
- Added custom exception message for partial dependence on features with scales that are too small #2455
- Ensures the typing for `Ordinal` and `Datetime` ltypes are passed through `_retain_custom_types_and_initialize_woodwork` #2461
- Updated to work with Pandas 1.3.0 #2442
- Updated to work with sktime 0.7.0 #2499

- **Changes**

- Updated XGBoost dependency to `>=1.4.2` #2484, #2498
- Added a `DeprecationWarning` about deprecating the list API for `ComponentGraph` #2488
- Updated `make_pipeline` for AutoML to create dictionaries, not lists, to initialize pipelines #2504
- No longer installing `graphviz` on windows in our CI pipelines because release 0.17 breaks windows 3.7 #2516

- **Documentation Changes**

- Moved docstrings from `__init__` to class pages, added missing docstrings for missing classes, and updated missing default values #2452
- Build documentation with `sphinx-autoapi` #2458

- Change `autoapi_ignore` to only ignore files in `evalml/tests/*` #2530

- **Testing Changes**

- Fixed flaky dask tests #2471
- Removed shellcheck action from `build_conda_pkg` action #2514
- Added a `tmp_dir` fixture that deletes its contents after tests run #2505
- Added a test that makes sure all pipelines in `AutoMLSearch` get the same data splits #2513
- Condensed warning output in test logs #2521

**Warning:**

**Breaking Changes**

- `NaN` values in the *Natural Language* type are no longer supported by the Imputer with the pandas upgrade. #2477

**v0.28.0 Jul. 2, 2021**

- **Enhancements**

- Added support for showing a Individual Conditional Expectations plot when graphing Partial Dependence #2386
- Exposed `thread_count` for Catboost estimators as `n_jobs` parameter #2410
- Updated Objectives API to allow for sample weighting #2433

- **Fixes**

- Deleted unreachable line from `IterativeAlgorithm` #2464

- **Changes**

- Pinned Woodwork version between 0.4.1 and 0.4.2 #2460
- Updated psutils minimum version in requirements #2438
- Updated `log_error_callback` to not include filepath in logged message #2429

- **Documentation Changes**

- Sped up docs #2430
- Removed mentions of `DataTable` and `DataColumn` from the docs #2445

- **Testing Changes**

- Added slack integration for nightlies tests #2436
- Changed `build_conda_pkg` CI job to run only when dependencies are updates #2446
- Updated workflows to store pytest runtimes as test artifacts #2448
- Added `AutoMLTestEnv` test fixture for making it easy to mock automl tests #2406

**v0.27.0 Jun. 22, 2021**

- **Enhancements**

- Adds force plots for prediction explanations #2157
- Removed self-reference from `AutoMLSearch` #2304

- Added support for nonlinear pipelines for `generate_pipeline_code` #2332
- Added `inverse_transform` method to pipelines #2256
- Add optional automatic update checker #2350
- Added `search_order` to `AutoMLSearch`’s rankings and `full_rankings` tables #2345
- Updated threshold optimization method for binary classification #2315
- Updated demos to pull data from S3 instead of including demo data in package #2387
- Upgrade `woodwork` version to v0.4.1 #2379
- **Fixes**
  - Preserve user-specified `woodwork` types throughout pipeline fit/predict #2297
  - Fixed `ComponentGraph` appending target to `final_component_features` if there is a component that returns both X and y #2358
  - Fixed partial dependence graph method failing on multiclass problems when the class labels are numeric #2372
  - Added `thresholding_objective` argument to `AutoMLSearch` for binary classification problems #2320
  - Added change for `k_neighbors` parameter in SMOTE Oversamplers to automatically handle small samples #2375
  - Changed naming for `Logistic Regression Classifier` file #2399
  - Pinned `pytest-timeout` to fix minimum dependence checker #2425
  - Replaced `Elastic Net Classifier` base class with `Logistic Regression` to avoid NaN outputs #2420
- **Changes**
  - Cleaned up `PipelineBase`’s `component_graph` and `_component_graph` attributes. Updated `PipelineBase` `__repr__` and added `__eq__` for `ComponentGraph` #2332
  - Added and applied `black` linting package to the EvalML repo in place of `autopep8` #2306
  - Separated `custom_hyperparameters` from pipelines and added them as an argument to `AutoMLSearch` #2317
  - Replaced `allowed_pipelines` with `allowed_component_graphs` #2364
  - Removed private method `_compute_features_during_fit` from `PipelineBase` #2359
  - Updated `compute_order` in `ComponentGraph` to be a read-only property #2408
  - Unpinned `PyZMQ` version in `requirements.txt` #2389
  - Uncapping `LightGBM` version in `requirements.txt` #2405
  - Updated minimum version of `plotly` #2415
  - Removed `SensitivityLowAlert` objective from core objectives #2418
- **Documentation Changes**
  - Fixed lead scoring weights in the demos documentation #2315
  - Fixed start page code and description dataset naming discrepancy #2370
- **Testing Changes**

- Update minimum unit tests to run on all pull requests [#2314](#)
- Pass token to authorize uploading of codecov reports [#2344](#)
- Add `pytest-timeout`. All tests that run longer than 6 minutes will fail. [#2374](#)
- Separated the dask tests out into separate github action jobs to isolate dask failures. [#2376](#)
- Refactored dask tests [#2377](#)
- Added the combined dask/non-dask unit tests back and renamed the dask only unit tests. [#2382](#)
- Sped up unit tests and split into separate jobs [#2365](#)
- Change CI job names, run lint for python 3.9, run nightlies on python 3.8 at 3am EST [#2395](#) [#2398](#)
- Set fail-fast to false for CI jobs that run for PRs [#2402](#)

**Warning:****Breaking Changes**

- *AutoMLSearch* will accept *allowed\_component\_graphs* instead of *allowed\_pipelines* [#2364](#)
- Removed *PipelineBase*'s *\_component\_graph* attribute. Updated *PipelineBase* *\_\_repr\_\_* and added *\_\_eq\_\_* for *ComponentGraph* [#2332](#)
- *pipeline\_parameters* will no longer accept *skopt.space* variables since hyperparameter ranges will now be specified through *custom\_hyperparameters* [#2317](#)

**v0.25.0 Jun. 01, 2021**• **Enhancements**

- Upgraded minimum woodwork to version 0.3.1. Previous versions will not be supported [#2181](#)
- Added a new callback parameter for *explain\_predictions\_best\_worst* [#2308](#)

• **Fixes**• **Changes**

- Deleted the *return\_pandas* flag from our demo data loaders [#2181](#)
- Moved *default\_parameters* to *ComponentGraph* from *PipelineBase* [#2307](#)

• **Documentation Changes**

- Updated the release procedure documentation [#2230](#)

• **Testing Changes**

- Ignoring *test\_saving\_png\_file* while building conda package [#2323](#)

**Warning:****Breaking Changes**

- Deleted the *return\_pandas* flag from our demo data loaders [#2181](#)
- Upgraded minimum woodwork to version 0.3.1. Previous versions will not be supported [#2181](#)
- Due to the weak-ref in woodwork, set the result of *infer\_feature\_types* to a variable before accessing woodwork [#2181](#)

**v0.24.2 May. 24, 2021**

- **Enhancements**

- Added oversamplers to AutoMLSearch #2213 #2286
- Added dictionary input functionality for Undersampler component #2271
- Changed the default parameter values for Elastic Net Classifier and Elastic Net Regressor #2269
- Added dictionary input functionality for the Oversampler components #2288

- **Fixes**

- Set default `n_jobs` to 1 for `StackedEnsembleClassifier` and `StackedEnsembleRegressor` until fix for text-based parallelism in sklearn stacking can be found #2295

- **Changes**

- Updated `start_iteration_callback` to accept a pipeline instance instead of a pipeline class and no longer accept pipeline parameters as a parameter #2290
- Refactored `calculate_permutation_importance` method and add per-column permutation importance method #2302
- Updated logging information in `AutoMLSearch.__init__` to clarify pipeline generation #2263

- **Documentation Changes**

- Minor changes to the release procedure #2230

- **Testing Changes**

- Use codecov action to update coverage reports #2238
- Removed MarkupSafe dependency version pin from requirements.txt and moved instead into RTD docs build CI #2261

**Warning:**

**Breaking Changes**

- Updated `start_iteration_callback` to accept a pipeline instance instead of a pipeline class and no longer accept pipeline parameters as a parameter #2290
- Moved `default_parameters` to `ComponentGraph` from `PipelineBase`. A pipeline's `default_parameters` is now accessible via `pipeline.component_graph.default_parameters` #2307

**v0.24.1 May. 16, 2021**

- **Enhancements**

- Integrated `ARIMAREgressor` into AutoML #2009
- Updated `HighlyNullDataCheck` to also perform a null row check #2222
- Set `max_depth` to 1 in calls to `featuretools dfs` #2231

- **Fixes**

- Removed data splitter sampler calls during training #2253
- Set minimum required version for `pyzmq`, `colorama`, and `docutils` #2254
- Changed `BaseSampler` to return `None` instead of `y` #2272

- **Changes**

- Removed ensemble split and indices in `AutoMLSearch` #2260
- Updated pipeline `repr()` and `generate_pipeline_code` to return pipeline instances without generating custom pipeline class #2227

- **Documentation Changes**

- Capped Sphinx version under 4.0.0 #2244

- **Testing Changes**

- Change number of cores for pytest from 4 to 2 #2266
- Add minimum dependency checker to generate minimum requirement files #2267
- Add unit tests with minimum dependencies #2277

**v0.24.0 May. 04, 2021**

- **Enhancements**

- Added `date_index` as a required parameter for TimeSeries problems #2217
- Have the `OneHotEncoder` return the transformed columns as booleans rather than floats #2170
- Added Oversampler transformer component to EvalML #2079
- Added Undersampler to `AutoMLSearch`, as well as arguments `_sampler_method` and `sampler_balanced_ratio` #2128
- Updated prediction explanations functions to allow pipelines with XGBoost estimators #2162
- Added partial dependence for datetime columns #2180
- Update precision-recall curve with positive label index argument, and fix for 2d predicted probabilities #2090
- Add `pct_null_rows` to `HighlyNullDataCheck` #2211
- Added a standalone `AutoML search` method for convenience, which runs data checks and then runs `automl` #2152
- Make the first batch of AutoML have a predefined order, with linear models first and complex models last #2223 #2225
- Added sampling dictionary support to `BalancedClassificationSampler` #2235

- **Fixes**

- Fixed partial dependence not respecting grid resolution parameter for numerical features #2180
- Enable prediction explanations for catboost for multiclass problems #2224

- **Changes**

- Deleted baseline pipeline classes #2202
- Reverting user specified date feature PR #2155 until `pmdarima` installation fix is found #2214
- Updated pipeline API to accept component graph and other class attributes as instance parameters. Old pipeline API still works but will not be supported long-term. #2091
- Removed all old datasplitters from EvalML #2193
- Deleted `make_pipeline_from_components` #2218

- **Documentation Changes**

- Renamed dataset to clarify that its gzipped but not a tarball #2183
- Updated documentation to use pipeline instances instead of pipeline subclasses #2195
- Updated contributing guide with a note about GitHub Actions permissions #2090
- Updated automl and model understanding user guides #2090
- **Testing Changes**
  - Use machineFL user token for dependency update bot, and add more reviewers #2189

**Warning:****Breaking Changes**

- All baseline pipeline classes (BaselineBinaryPipeline, BaselineMulticlassPipeline, BaselineRegressionPipeline, etc.) have been deleted #2202
- Updated pipeline API to accept component graph and other class attributes as instance parameters. Old pipeline API still works but will not be supported long-term. Pipelines can now be initialized by specifying the component graph as the first parameter, and then passing in optional arguments such as custom\_name, parameters, etc. For example, BinaryClassificationPipeline(["Random Forest Classifier"], parameters={}). #2091
- Removed all old datasplitters from EvalML #2193
- Deleted utility method make\_pipeline\_from\_components #2218

**v0.23.0 Apr. 20, 2021**

- **Enhancements**
  - Refactored EngineBase and SequentialEngine api. Adding DaskEngine #1975.
  - Added optional engine argument to AutoMLSearch #1975
  - Added a warning about how time series support is still in beta when a user passes in a time series problem to AutoMLSearch #2118
  - Added NaturalLanguageNaNDataCheck data check #2122
  - Added ValueError to partial\_dependence to prevent users from computing partial dependence on columns with all NaNs #2120
  - Added standard deviation of cv scores to rankings table #2154
- **Fixes**
  - Fixed BalancedClassificationDataCVSplit, BalancedClassificationDataTVSplit, and BalancedClassificationSampler to use minority:majority ratio instead of majority:minority #2077
  - Fixed bug where two-way partial dependence plots with categorical variables were not working correctly #2117
  - Fixed bug where hyperparameters were not displaying properly for pipelines with a list component\_graph and duplicate components #2133
  - Fixed bug where pipeline\_parameters argument in AutoMLSearch was not applied to pipelines passed in as allowed\_pipelines #2133
  - Fixed bug where AutoMLSearch was not applying custom hyperparameters to pipelines with a list component\_graph and duplicate components #2133

- **Changes**

- Removed `hyperparameter_ranges` from `Undersampler` and renamed `balanced_ratio` to `sampling_ratio` for samplers #2113
- Renamed `TARGET_BINARY_NOT_TWO_EXAMPLES_PER_CLASS` data check message code to `TARGET_MULTICLASS_NOT_TWO_EXAMPLES_PER_CLASS` #2126
- Modified one-way partial dependence plots of categorical features to display data with a bar plot #2117
- Renamed score column for `automl.rankings` as `mean_cv_score` #2135
- Remove ‘warning’ from docs tool output #2031

- **Documentation Changes**

- Fixed `conf.py` file #2112
- Added a sentence to the automl user guide stating that our support for time series problems is still in beta. #2118
- Fixed documentation demos #2139
- Update test badge in README to use GitHub Actions #2150

- **Testing Changes**

- Fixed `test_describe_pipeline` for pandas v1.2.4 #2129
- Added a GitHub Action for building the conda package #1870 #2148

**Warning:**

**Breaking Changes**

- Renamed `balanced_ratio` to `sampling_ratio` for the `BalancedClassificationDataCVSplit`, `BalancedClassificationDataTVSplit`, `BalancedClassificationSampler`, and `Undersampler` #2113
- Deleted the “errors” key from automl results #1975
- Deleted the `raise_and_save_error_callback` and the `log_and_save_error_callback` #1975
- Fixed `BalancedClassificationDataCVSplit`, `BalancedClassificationDataTVSplit`, and `BalancedClassificationSampler` to use minority:majority ratio instead of majority:minority #2077

**v0.22.0 Apr. 06, 2021**

- **Enhancements**

- Added a GitHub Action for `linux_unit_tests` #2013
- Added recommended actions for `InvalidTargetDataCheck`, updated `_make_component_list_from_actions` to address new action, and added `TargetImputer` component #1989
- Updated `AutoMLSearch._check_for_high_variance` to not emit `RuntimeWarning` #2024
- Added exception when pipeline passed to `explain_predictions` is a `Stacked Ensemble` pipeline #2033
- Added sensitivity at low alert rates as an objective #2001
- Added `Undersampler` transformer component #2030

- **Fixes**
  - Updated Engine’s `train_batch` to apply undersampling [#2038](#)
  - Fixed bug in where Time Series Classification pipelines were not encoding targets in `predict` and `predict_proba` [#2040](#)
  - Fixed data splitting errors if target is float for classification problems [#2050](#)
  - Pinned docutils to <0.17 to fix ReadtheDocs warning issues [#2088](#)
- **Changes**
  - Removed lists as acceptable hyperparameter ranges in `AutoMLSearch` [#2028](#)
  - Renamed “details” to “metadata” for data check actions [#2008](#)
- **Documentation Changes**
  - Catch and suppress warnings in documentation [#1991](#) [#2097](#)
  - Change spacing in `start.ipynb` to provide clarity for `AutoMLSearch` [#2078](#)
  - Fixed start code on README [#2108](#)
- **Testing Changes**

**v0.21.0 Mar. 24, 2021**

- **Enhancements**
  - Changed `AutoMLSearch` to default `optimize_thresholds` to `True` [#1943](#)
  - Added multiple oversampling and undersampling sampling methods as data splitters for imbalanced classification [#1775](#)
  - Added params to balanced classification data splitters for visibility [#1966](#)
  - Updated `make_pipeline` to not add `Imputer` if input data does not have numeric or categorical columns [#1967](#)
  - Updated `ClassImbalanceDataCheck` to better handle multiclass imbalances [#1986](#)
  - Added recommended actions for the output of data check’s `validate` method [#1968](#)
  - Added error message for `partial_dependence` when features are mostly the same value [#1994](#)
  - Updated `OneHotEncoder` to drop one redundant feature by default for features with two categories [#1997](#)
  - Added a `PolynomialDecomposer` component [#1992](#)
  - Added `DateTimeNaNDataCheck` data check [#2039](#)
- **Fixes**
  - Changed best pipeline to train on the entire dataset rather than just ensemble indices for ensemble problems [#2037](#)
  - Updated binary classification pipelines to use objective decision function during scoring of custom objectives [#1934](#)
- **Changes**
  - Removed `data_checks` parameter, `data_check_results` and data checks logic from `AutoMLSearch` [#1935](#)
  - Deleted `random_state` argument [#1985](#)

- Updated Woodwork version requirement to v0.0.11 #1996
- Documentation Changes
- Testing Changes
  - Removed build\_docs CI job in favor of RTD GH builder #1974
  - Added tests to confirm support for Python 3.9 #1724
  - Added tests to support Dask AutoML/Engine #1990
  - Changed build\_conda\_pkg job to use latest\_release\_changes branch in the feedstock. #1979

**Warning:****Breaking Changes**

- Changed AutoMLSearch to default optimize\_thresholds to True #1943
- Removed data\_checks parameter, data\_check\_results and data checks logic from AutoMLSearch. To run the data checks which were previously run by default in AutoMLSearch, please call DefaultDataChecks().validate(X\_train, y\_train) or take a look at our documentation for more examples. #1935
- Deleted random\_state argument #1985

**v0.20.0 Mar. 10, 2021**

- Enhancements
  - Added a GitHub Action for Detecting dependency changes #1933
  - Create a separate CV split to train stacked ensembler on for AutoMLSearch #1814
  - Added a GitHub Action for Linux unit tests #1846
  - Added ARIMAREgressor estimator #1894
  - Added DataCheckAction class and DataCheckActionCode enum #1896
  - Updated Woodwork requirement to v0.0.10 #1900
  - Added BalancedClassificationDataCVSplit and BalancedClassificationDataTVSplit to AutoMLSearch #1875
  - Update default classification data splitter to use downsampling for highly imbalanced data #1875
  - Updated describe\_pipeline to return more information, including id of pipelines used for ensemble models #1909
  - Added utility method to create list of components from a list of DataCheckAction #1907
  - Updated validate method to include a action key in returned dictionary for all DataCheck and DataChecks #1916
  - Aggregating the shap values for predictions that we know the provenance of, e.g. OHE, text, and date-time. #1901
  - Improved error message when custom objective is passed as a string in pipeline.score #1941
  - Added score\_pipelines and train\_pipelines methods to AutoMLSearch #1913
  - Added support for pandas version 1.2.0 #1708

- Added `score_batch` and `train_batch` abstract methods to `EngineBase` and implementations in `SequentialEngine` [#1913](#)
- Added ability to handle index columns in `AutoMLSearch` and `DataChecks` [#2138](#)
- **Fixes**
  - Removed CI check for `check_dependencies_updated_linux` [#1950](#)
  - Added metaclass for time series pipelines and fix binary classification pipeline `predict` not using objective if it is passed as a named argument [#1874](#)
  - Fixed stack trace in prediction explanation functions caused by mixed string/numeric pandas column names [#1871](#)
  - Fixed stack trace caused by passing pipelines with duplicate names to `AutoMLSearch` [#1932](#)
  - Fixed `AutoMLSearch.get_pipelines` returning pipelines with the same attributes [#1958](#)
- **Changes**
  - Reversed GitHub Action for Linux unit tests until a fix for report generation is found [#1920](#)
  - Updated `add_results` in `AutoMLAlgorithm` to take in entire pipeline results dictionary from `AutoMLSearch` [#1891](#)
  - Updated `ClassImbalanceDataCheck` to look for severe class imbalance scenarios [#1905](#)
  - Deleted the `explain_prediction` function [#1915](#)
  - Removed `HighVarianceCVDDataCheck` and converted it to an `AutoMLSearch` method instead [#1928](#)
  - Removed warning in `InvalidTargetDataCheck` returned when numeric binary classification targets are not (0, 1) [#1959](#)
- **Documentation Changes**
  - Updated `model_understanding.ipynb` to demo the two-way partial dependence capability [#1919](#)
- **Testing Changes**

**Warning:****Breaking Changes**

- Deleted the `explain_prediction` function [#1915](#)
- Removed `HighVarianceCVDDataCheck` and converted it to an `AutoMLSearch` method instead [#1928](#)
- Added `score_batch` and `train_batch` abstract methods to `EngineBase`. These need to be implemented in `Engine` subclasses [#1913](#)

**v0.19.0 Feb. 23, 2021**

- **Enhancements**
  - Added a GitHub Action for Python windows unit tests [#1844](#)
  - Added a GitHub Action for checking updated release notes [#1849](#)
  - Added a GitHub Action for Python lint checks [#1837](#)
  - Adjusted `explain_prediction`, `explain_predictions` and `explain_predictions_best_worst` to handle timeseries problems. [#1818](#)

- Updated `InvalidTargetDataCheck` to check for mismatched indices in target and features [#1816](#)
- Updated `Woodwork` structures returned from components to support `Woodwork` logical type overrides set by the user [#1784](#)
- Updated estimators to keep track of input feature names during `fit()` [#1794](#)
- Updated `visualize_decision_tree` to include feature names in output [#1813](#)
- Added `is_bounded_like_percentage` property for objectives. If true, the `calculate_percent_difference` method will return the absolute difference rather than relative difference [#1809](#)
- Added full error traceback to `AutoMLSearch` logger file [#1840](#)
- Changed `TargetEncoder` to preserve custom indices in the data [#1836](#)
- Refactored `explain_predictions` and `explain_predictions_best_worst` to only compute features once for all rows that need to be explained [#1843](#)
- Added custom random undersampler data splitter for classification [#1857](#)
- Updated `OutliersDataCheck` implementation to calculate the probability of having no outliers [#1855](#)
- Added Engines pipeline processing API [#1838](#)
- **Fixes**
  - Changed `EngineBase` `random_state` arg to `random_seed` and same for user guide docs [#1889](#)
- **Changes**
  - Modified `calculate_percent_difference` so that division by 0 is now `inf` rather than `nan` [#1809](#)
  - Removed `text_columns` parameter from `LSA` and `TextFeaturizer` components [#1652](#)
  - Added `random_seed` as an argument to our `automl/pipeline/component` API. Using `random_state` will raise a warning [#1798](#)
  - Added `DataCheckError` message in `InvalidTargetDataCheck` if input target is `None` and removed exception raised [#1866](#)
- Documentation Changes
- **Testing Changes**
  - Added back coverage for `_get_feature_provenance` in `TextFeaturizer` after `text_columns` was removed [#1842](#)
  - Pin `graphviz` version for windows builds [#1847](#)
  - Unpin `graphviz` version for windows builds [#1851](#)

**Warning:****Breaking Changes**

- Added a deprecation warning to `explain_prediction`. It will be deleted in the next release. [#1860](#)

v0.18.2 Feb. 10, 2021

- **Enhancements**
  - Added uniqueness score data check [#1785](#)

- Added “dataframe” output format for prediction explanations [#1781](#)
- Updated LightGBM estimators to handle `pandas.MultiIndex` [#1770](#)
- Sped up permutation importance for some pipelines [#1762](#)
- Added sparsity data check [#1797](#)
- Confirmed support for threshold tuning for binary time series classification problems [#1803](#)
- Fixes
- Changes
- **Documentation Changes**
  - Added section on conda to the contributing guide [#1771](#)
  - Updated release process to reflect freezing *main* before perf tests [#1787](#)
  - Moving some prs to the right section of the release notes [#1789](#)
  - Tweak README.md. [#1800](#)
  - Fixed back arrow on install page docs [#1795](#)
  - Fixed docstring for `ClassImbalanceDataCheck.validate()` [#1817](#)
- Testing Changes

**v0.18.1 Feb. 1, 2021**

- **Enhancements**
  - Added `graph_t_sne` as a visualization tool for high dimensional data [#1731](#)
  - Added the ability to see the linear coefficients of features in linear models terms [#1738](#)
  - Added support for `scikit-learn v0.24.0` [#1733](#)
  - Added support for `scipy v1.6.0` [#1752](#)
  - Added SVM Classifier and Regressor to estimators [#1714](#) [#1761](#)
- **Fixes**
  - Addressed bug with `partial_dependence` and categorical data with more categories than grid resolution [#1748](#)
  - Removed `random_state` arg from `get_pipelines` in `AutoMLSearch` [#1719](#)
  - Pinned `pymzmq` at less than 22.0.0 till we add support [#1756](#)
- **Changes**
  - Updated components and pipelines to return `Woodwork` data structures [#1668](#)
  - Updated `clone()` for pipelines and components to copy over random state automatically [#1753](#)
  - Dropped support for Python version 3.6 [#1751](#)
  - Removed deprecated `verbose` flag from `AutoMLSearch` parameters [#1772](#)
- **Documentation Changes**
  - Add Twitter and Github link to documentation toolbar [#1754](#)
  - Added Open Graph info to documentation [#1758](#)
- Testing Changes

**Warning:****Breaking Changes**

- Components and pipelines return Woodwork data structures instead of pandas data structures [#1668](#)
- Python 3.6 will not be actively supported due to discontinued support from EvalML dependencies.
- Deprecated verbose flag is removed for AutoMLSearch [#1772](#)

**v0.18.0 Jan. 26, 2021**• **Enhancements**

- Added RMSLE, MSLE, and MAPE to core objectives while checking for negative target values in `invalid_targets_data_check` [#1574](#)
- Added validation checks for binary problems with regression-like datasets and multiclass problems without true multiclass targets in `invalid_targets_data_check` [#1665](#)
- Added time series support for `make_pipeline` [#1566](#)
- Added target name for output of pipeline `predict` method [#1578](#)
- Added multiclass check to `InvalidTargetDataCheck` for two examples per class [#1596](#)
- Added support for `graphviz v0.16` [#1657](#)
- Enhanced time series pipelines to accept empty features [#1651](#)
- Added KNN Classifier to estimators. [#1650](#)
- Added support for list inputs for objectives [#1663](#)
- Added support for AutoMLSearch to handle time series classification pipelines [#1666](#)
- Enhanced `DelayedFeaturesTransformer` to encode categorical features and targets before delaying them [#1691](#)
- Added 2-way dependence plots. [#1690](#)
- Added ability to directly iterate through components within Pipelines [#1583](#)

• **Fixes**

- Fixed inconsistent attributes and added Exceptions to docs [#1673](#)
- Fixed `TargetLeakageDataCheck` to use Woodwork `mutual_information` rather than using Pandas' Pearson Correlation [#1616](#)
- Fixed thresholding for pipelines in AutoMLSearch to only threshold binary classification pipelines [#1622](#) [#1626](#)
- Updated `load_data` to return Woodwork structures and update default parameter value for `index` to `None` [#1610](#)
- Pinned `scipy` at `< 1.6.0` while we work on adding support [#1629](#)
- Fixed data check message formatting in AutoMLSearch [#1633](#)
- Addressed stacked ensemble component for `scikit-learn v0.24` support by setting `shuffle=True` for default CV [#1613](#)
- Fixed bug where `Imputer` reset the index on `X` [#1590](#)
- Fixed AutoMLSearch stacktrace when a custom objective was passed in as a primary objective or additional objective [#1575](#)

- Fixed custom index bug for MAPE objective [#1641](#)
  - Fixed index bug for TextFeaturizer and LSA components [#1644](#)
  - Limited load\_fraud dataset loaded into automl.ipynb [#1646](#)
  - add\_to\_rankings updates AutoMLSearch.best\_pipeline when necessary [#1647](#)
  - Fixed bug where time series baseline estimators were not receiving gap and max\_delay in AutoMLSearch [#1645](#)
  - Fixed jupyter notebooks to help the RTD buildtime [#1654](#)
  - Added positive\_only objectives to non\_core\_objectives [#1661](#)
  - Fixed stacking argument n\_jobs for IterativeAlgorithm [#1706](#)
  - Updated CatBoost estimators to return self in .fit() rather than the underlying model for consistency [#1701](#)
  - Added ability to initialize pipeline parameters in AutoMLSearch constructor [#1676](#)
- **Changes**
    - Added labeling to graph\_confusion\_matrix [#1632](#)
    - Rerunning search for AutoMLSearch results in a message thrown rather than failing the search, and removed has\_searched property [#1647](#)
    - Changed tuner class to allow and ignore single parameter values as input [#1686](#)
    - Capped LightGBM version limit to remove bug in docs [#1711](#)
    - Removed support for np.random.RandomState in EvalML [#1727](#)
  - **Documentation Changes**
    - Update Model Understanding in the user guide to include visualize\_decision\_tree [#1678](#)
    - Updated docs to include information about AutoMLSearch callback parameters and methods [#1577](#)
    - Updated docs to prompt users to install graphviz on Mac [#1656](#)
    - Added infer\_feature\_types to the start.ipynb guide [#1700](#)
    - Added multicollinearity data check to API reference and docs [#1707](#)
  - **Testing Changes**

**Warning:****Breaking Changes**

- Removed has\_searched property from AutoMLSearch [#1647](#)
- Components and pipelines return Woodwork data structures instead of pandas data structures [#1668](#)
- Removed support for np.random.RandomState in EvalML. Rather than passing np.random.RandomState as component and pipeline random\_state values, we use int random\_seed [#1727](#)

**v0.17.0 Dec. 29, 2020**

- **Enhancements**
  - Added save\_plot that allows for saving figures from different backends [#1588](#)

- Added `LightGBM` Regressor to regression components #1459
  - Added `visualize_decision_tree` for tree visualization with `decision_tree_data_from_estimator` and `decision_tree_data_from_pipeline` to reformat tree structure output #1511
  - Added *DFS Transformer* component into transformer components #1454
  - Added MAPE to the standard metrics for time series problems and update objectives #1510
  - Added `graph_prediction_vs_actual_over_time` and `get_prediction_vs_actual_over_time_data` to the model understanding module for time series problems #1483
  - Added a `ComponentGraph` class that will support future pipelines as directed acyclic graphs #1415
  - Updated data checks to accept Woodwork data structures #1481
  - Added parameter to `InvalidTargetDataCheck` to show only top unique values rather than all unique values #1485
  - Added multicollinearity data check #1515
  - Added baseline pipeline and components for time series regression problems #1496
  - Added more information to users about ensembling behavior in `AutoMLSearch` #1527
  - Add woodwork support for more utility and graph methods #1544
  - Changed `DateTimeFeaturizer` to encode features as int #1479
  - Return trained pipelines from `AutoMLSearch.best_pipeline` #1547
  - Added utility method so that users can set feature types without having to learn about Woodwork directly #1555
  - Added Linear Discriminant Analysis transformer for dimensionality reduction #1331
  - Added multiclass support for `partial_dependence` and `graph_partial_dependence` #1554
  - Added `TimeSeriesBinaryClassificationPipeline` and `TimeSeriesMulticlassClassificationPipeline` classes #1528
  - Added `make_data_splitter` method for easier automl data split customization #1568
  - Integrated `ComponentGraph` class into Pipelines for full non-linear pipeline support #1543
  - Update `AutoMLSearch` constructor to take training data instead of search and `add_to_leaderboard` #1597
  - Update `split_data` helper args #1597
  - Add problem type utils `is_regression`, `is_classification`, `is_timeseries` #1597
  - Rename `AutoMLSearch` `data_split` arg to `data_splitter` #1569
- **Fixes**
    - Fix AutoML not passing CV folds to `DefaultDataChecks` for usage by `ClassImbalanceDataCheck` #1619
    - Fix Windows CI jobs: install numba via conda, required for shap #1490
    - Added custom-index support for `reset-index-get_prediction_vs_actual_over_time_data` #1494
    - Fix `generate_pipeline_code` to account for boolean and None differences between Python and JSON #1524 #1531

- Set max value for plotly and xgboost versions while we debug CI failures with newer versions [#1532](#)
- Undo version pinning for plotly [#1533](#)
- Fix ReadTheDocs build by updating the version of `setuptools` [#1561](#)
- Set `random_state` of data splitter in `AutoMLSearch` to take int to keep consistency in the resulting splits [#1579](#)
- Pin `sklearn` version while we work on adding support [#1594](#)
- Pin `pandas` at `<1.2.0` while we work on adding support [#1609](#)
- Pin `graphviz` at `< 0.16` while we work on adding support [#1609](#)
- **Changes**
  - Reverting `save_graph` [#1550](#) to resolve kaleido build issues [#1585](#)
  - Update circleci badge to apply to main [#1489](#)
  - Added script to generate github markdown for releases [#1487](#)
  - Updated selection using `pandas dtypes` to selecting using Woodwork logical types [#1551](#)
  - Updated dependencies to fix `ImportError: cannot import name 'MaskedArray' from 'sklearn.utils.fixes'` error and to address Woodwork and Featuretools dependencies [#1540](#)
  - Made `get_prediction_vs_actual_data()` a public method [#1553](#)
  - Updated Woodwork version requirement to `v0.0.7` [#1560](#)
  - Move data splitters from `evalml.automl.data_splitters` to `evalml.preprocessing.data_splitters` [#1597](#)
  - Rename “# Testing” in automl log output to “# Validation” [#1597](#)
- **Documentation Changes**
  - Added partial dependence methods to API reference [#1537](#)
  - Updated documentation for confusion matrix methods [#1611](#)
- **Testing Changes**
  - Set `n_jobs=1` in most unit tests to reduce memory [#1505](#)

**Warning:****Breaking Changes**

- Updated minimal dependencies: `numpy>=1.19.1`, `pandas>=1.1.0`, `scikit-learn>=0.23.1`, `scikit-optimize>=0.8.1`
- Updated `AutoMLSearch.best_pipeline` to return a trained pipeline. Pass in `train_best_pipeline=False` to `AutoMLSearch` in order to return an untrained pipeline.
- Pipeline component instances can no longer be iterated through using `Pipeline.component_graph` [#1543](#)
- Update `AutoMLSearch` constructor to take training data instead of `search` and `add_to_leaderboard` [#1597](#)
- Update `split_data` helper args [#1597](#)

- Move data splitters from `evalml automl.data_splitters` to `evalml.preprocessing.data_splitters` #1597
- Rename AutoMLSearch `data_split` arg to `data_splitter` #1569

**v0.16.1 Dec. 1, 2020**

- **Enhancements**
  - Pin woodwork version to v0.0.6 to avoid breaking changes #1484
  - Updated Woodwork to  $\geq 0.5$  in `core-requirements.txt` #1473
  - Removed `copy_dataframe` parameter for Woodwork, updated Woodwork to  $\geq 0.6$  in `core-requirements.txt` #1478
  - Updated `detect_problem_type` to use `pandas.api.is_numeric_dtype` #1476
- **Changes**
  - Changed `make_clean` to delete coverage reports as a convenience for developers #1464
  - Set `n_jobs=-1` by default for stacked ensemble components #1472
- **Documentation Changes**
  - Updated pipeline and component documentation and demos to use Woodwork #1466
- **Testing Changes**
  - Update dependency update checker to use everything from core and optional dependencies #1480

**v0.16.0 Nov. 24, 2020**

- **Enhancements**
  - Updated pipelines and `make_pipeline` to accept Woodwork inputs #1393
  - Updated components to accept Woodwork inputs #1423
  - Added ability to freeze hyperparameters for AutoMLSearch #1284
  - Added `Target Encoder` into transformer components #1401
  - Added callback for error handling in AutoMLSearch #1403
  - Added the index id to the `explain_predictions_best_worst` output to help users identify which rows in their data are included #1365
  - The `top_k` features displayed in `explain_predictions_*` functions are now determined by the magnitude of shap values as opposed to the `top_k` largest and smallest shap values. #1374
  - Added a problem type for time series regression #1386
  - Added a `is_defined_for_problem_type` method to `ObjectiveBase` #1386
  - Added a `random_state` parameter to `make_pipeline_from_components` function #1411
  - Added `DelayedFeaturesTransformer` #1396
  - Added a `TimeSeriesRegressionPipeline` class #1418
  - Removed `core-requirements.txt` from the package distribution #1429
  - Updated data check messages to include a “*code*” and “*details*” fields #1451, #1462
  - Added a `TimeSeriesSplit` data splitter for time series problems #1441

- Added a `problem_configuration` parameter to `AutoMLSearch` #1457
- **Fixes**
  - Fixed `IndexError` raised in `AutoMLSearch` when `ensembling = True` but only one pipeline to iterate over #1397
  - Fixed stacked ensemble input bug and `LightGBM` warning and bug in `AutoMLSearch` #1388
  - Updated enum classes to show possible enum values as attributes #1391
  - Updated calls to `Woodwork`’s `to_pandas()` to `to_series()` and `to_dataframe()` #1428
  - Fixed bug in OHE where column names were not guaranteed to be unique #1349
  - Fixed bug with percent improvement of `ExpVariance` objective on data with highly skewed target #1467
  - Fix `SimpleImputer` error which occurs when all features are bool type #1215
- **Changes**
  - Changed `OutliersDataCheck` to return the list of columns, rather than rows, that contain outliers #1377
  - Simplified and cleaned output for Code Generation #1371
  - Reverted changes from #1337 #1409
  - Updated data checks to return dictionary of warnings and errors instead of a list #1448
  - Updated `AutoMLSearch` to pass `Woodwork` data structures to every pipeline (instead of pandas DataFrames) #1450
  - Update `AutoMLSearch` to default to `max_batches=1` instead of `max_iterations=5` #1452
  - Updated `_evaluate_pipelines` to consolidate side effects #1410
- **Documentation Changes**
  - Added description of CLA to contributing guide, updated description of draft PRs #1402
  - Updated documentation to include all data checks, `DataChecks`, and usage of data checks in AutoML #1412
  - Updated docstrings from `np.array` to `np.ndarray` #1417
  - Added section on stacking ensembles in `AutoMLSearch` documentation #1425
- **Testing Changes**
  - Removed `category_encoders` from `test-requirements.txt` #1373
  - Tweak `codecov.io` settings again to avoid flakes #1413
  - Modified `make lint` to check notebook versions in the docs #1431
  - Modified `make lint-fix` to standardize notebook versions in the docs #1431
  - Use new version of pull request Github Action for dependency check (#1443)
  - Reduced number of workers for tests to 4 #1447

**Warning:**

**Breaking Changes**

- The `top_k` and `top_k_features` parameters in `explain_predictions_*` functions now return `k` features as opposed to `2 * k` features [#1374](#)
- Renamed `problem_type` to `problem_types` in `RegressionObjective`, `BinaryClassificationObjective`, and `MulticlassClassificationObjective` [#1319](#)
- Data checks now return a dictionary of warnings and errors instead of a list [#1448](#)

**v0.15.0 Oct. 29, 2020**

- **Enhancements**

- Added stacked ensemble component classes (`StackedEnsembleClassifier`, `StackedEnsembleRegressor`) [#1134](#)
- Added stacked ensemble components to `AutoMLSearch` [#1253](#)
- Added `DecisionTreeClassifier` and `DecisionTreeRegressor` to `AutoML` [#1255](#)
- Added `graph_prediction_vs_actual` in `model_understanding` for regression problems [#1252](#)
- Added parameter to `OneHotEncoder` to enable filtering for features to encode for [#1249](#)
- Added percent-better-than-baseline for all objectives to `automl.results` [#1244](#)
- Added `HighVarianceCVDDataCheck` and replaced synonymous warning in `AutoMLSearch` [#1254](#)
- Added *PCA Transformer* component for dimensionality reduction [#1270](#)
- Added `generate_pipeline_code` and `generate_component_code` to allow for code generation given a pipeline or component instance [#1306](#)
- Added *PCA Transformer* component for dimensionality reduction [#1270](#)
- Updated `AutoMLSearch` to support Woodwork data structures [#1299](#)
- Added `cv_folds` to `ClassImbalanceDataCheck` and added this check to `DefaultDataChecks` [#1333](#)
- Make `max_batches` argument to `AutoMLSearch.search` public [#1320](#)
- Added text support to `automl search` [#1062](#)
- Added `_pipelines_per_batch` as a private argument to `AutoMLSearch` [#1355](#)

- **Fixes**

- Fixed ML performance issue with ordered datasets: always shuffle data in `automl`'s default CV splits [#1265](#)
- Fixed broken `evalml info` CLI command [#1293](#)
- Fixed `boosting type='rf'` for `LightGBM Classifier`, as well as `num_leaves` error [#1302](#)
- Fixed bug in `explain_predictions_best_worst` where a custom index in the target variable would cause a `ValueError` [#1318](#)
- Added stacked ensemble estimators to `evalml.pipelines.__init__` file [#1326](#)
- Fixed bug in OHE where calls to transform were not deterministic if `top_n` was less than the number of categories in a column [#1324](#)
- Fixed `LightGBM` warning messages during `AutoMLSearch` [#1342](#)

- Fix warnings thrown during AutoMLSearch in HighVarianceCVDataCheck #1346
- Fixed bug where TrainingValidationSplit would return invalid location indices for dataframes with a custom index #1348
- Fixed bug where the AutoMLSearch `random_state` was not being passed to the created pipelines #1321

- **Changes**

- Allow `add_to_rankings` to be called before AutoMLSearch is called #1250
- Removed Graphviz from test-requirements to add to requirements.txt #1327
- Removed `max_pipelines` parameter from AutoMLSearch #1264
- Include editable installs in all install make targets #1335
- Made pip dependencies *featuretools* and *nlp\_primitives* core dependencies #1062
- Removed *PartOfSpeechCount* from *TextFeaturizer* transform primitives #1062
- Added warning for `partial_dependency` when the feature includes null values #1352

- **Documentation Changes**

- Fixed and updated code blocks in Release Notes #1243
- Added DecisionTree estimators to API Reference #1246
- Changed class inheritance display to flow vertically #1248
- Updated cost-benefit tutorial to use a holdout/test set #1159
- Added `evalml info` command to documentation #1293
- Miscellaneous doc updates #1269
- Removed conda pre-release testing from the release process document #1282
- Updates to contributing guide #1310
- Added Alteryx footer to docs with Twitter and Github link #1312
- Added documentation for evalml installation for Python 3.6 #1322
- Added documentation changes to make the API Docs easier to understand #1323
- Fixed documentation for `feature_importance` #1353
- Added tutorial for running *AutoML* with text data #1357
- Added documentation for woodwork integration with automl search #1361

- **Testing Changes**

- Added tests for `jupyter_check` to handle IPython #1256
- Cleaned up `make_pipeline` tests to test for all estimators #1257
- Added a test to check conda build after merge to main #1247
- Removed code that was lacking codecov for `__main__.py` and unnecessary #1293
- Codecov: round coverage up instead of down #1334
- Add DockerHub credentials to CI testing environment #1356
- Add DockerHub credentials to conda testing environment #1363

**Warning:****Breaking Changes**

- Renamed `LabelLeakageDataCheck` to `TargetLeakageDataCheck` #1319
- `max_pipelines` parameter has been removed from `AutoMLSearch`. Please use `max_iterations` instead. #1264
- `AutoMLSearch.search()` will now log a warning if the input is not a Woodwork data structure (pandas, numpy) #1299
- Make `max_batches` argument to `AutoMLSearch.search` public #1320
- Removed unused argument `feature_types` from `AutoMLSearch.search` #1062

**v0.14.1 Sep. 29, 2020**• **Enhancements**

- Updated partial dependence methods to support calculating numeric columns in a dataset with non-numeric columns #1150
- Added `get_feature_names` on `OneHotEncoder` #1193
- Added `detect_problem_type` to `problem_type/utils.py` to automatically detect the problem type given targets #1194
- Added LightGBM to `AutoMLSearch` #1199
- Updated `scikit-learn` and `scikit-optimize` to use latest versions - 0.23.2 and 0.8.1 respectively #1141
- Added `__str__` and `__repr__` for pipelines and components #1218
- Included internal target check for both training and validation data in `AutoMLSearch` #1226
- Added `ProblemTypes.all_problem_types` helper to get list of supported problem types #1219
- Added `DecisionTreeClassifier` and `DecisionTreeRegressor` classes #1223
- Added `ProblemTypes.all_problem_types` helper to get list of supported problem types #1219
- `DataChecks` can now be parametrized by passing a list of `DataCheck` classes and a parameter dictionary #1167
- Added first CV fold score as validation score in `AutoMLSearch.rankings` #1221
- Updated `flake8` configuration to enable linting on `__init__.py` files #1234
- Refined `make_pipeline_from_components` implementation #1204

• **Fixes**

- Updated GitHub URL after migration to Alteryx GitHub org #1207
- Changed Problem Type enum to be more similar to the string name #1208
- Wrapped call to `scikit-learn`'s partial dependence method in a `try/finally` block #1232

• **Changes**

- Added `allow_writing_files` as a named argument to `CatBoost` estimators. #1202
- Added `solver` and `multi_class` as named arguments to `LogisticRegressionClassifier` #1202

- Replaced pipeline’s `._transform` method to evaluate all the preprocessing steps of a pipeline with `.compute_estimator_features` #1231
- Changed default large dataset train/test splitting behavior #1205
- **Documentation Changes**
  - Included description of how to access the component instances and features for pipeline user guide #1163
  - Updated API docs to refer to target as “target” instead of “labels” for non-classification tasks and minor docs cleanup #1160
  - Added Class Imbalance Data Check to `api_reference.rst` #1190 #1200
  - Added pipeline properties to API reference #1209
  - Clarified what the objective parameter in AutoML is used for in AutoML API reference and AutoML user guide #1222
  - Updated API docs to include `skopt.space.Categorical` option for component hyperparameter range definition #1228
  - Added install documentation for `libomp` in order to use LightGBM on Mac #1233
  - Improved description of `max_iterations` in documentation #1212
  - Removed unused code from sphinx conf #1235
- **Testing Changes**

**Warning:**

**Breaking Changes**

- `DefaultDataChecks` now accepts a `problem_type` parameter that must be specified #1167
- Pipeline’s `._transform` method to evaluate all the preprocessing steps of a pipeline has been replaced with `.compute_estimator_features` #1231
- `get_objectives` has been renamed to `get_core_objectives`. This function will now return a list of valid objective instances #1230

**v0.13.2 Sep. 17, 2020**

- **Enhancements**
  - Added `output_format` field to explain predictions functions #1107
  - Modified `get_objective` and `get_objectives` to be able to return any objective in `evalml.objectives` #1132
  - Added a `return_instance` boolean parameter to `get_objective` #1132
  - Added `ClassImbalanceDataCheck` to determine whether target imbalance falls below a given threshold #1135
  - Added label encoder to LightGBM for binary classification #1152
  - Added labels for the row index of confusion matrix #1154
  - Added `AutoMLSearch` object as another parameter in search callbacks #1156
  - Added the corresponding probability threshold for each point displayed in `graph_roc_curve` #1161

- Added `__eq__` for `ComponentBase` and `PipelineBase` #1178
- Added support for multiclass classification for `roc_curve` #1164
- Added `categories` accessor to `OneHotEncoder` for listing the categories associated with a feature #1182
- Added utility function to create pipeline instances from a list of component instances #1176
- **Fixes**
  - Fixed XGBoost column names for partial dependence methods #1104
  - Removed dead code validating column type from `TextFeaturizer` #1122
  - Fixed issue where `Imputer` cannot fit when there is `None` in a categorical or boolean column #1144
  - `OneHotEncoder` preserves the custom index in the input data #1146
  - Fixed representation for `ModelFamily` #1165
  - Removed duplicate `nbsphinx` dependency in `dev-requirements.txt` #1168
  - Users can now pass in any valid kwargs to all estimators #1157
  - Remove broken accessor `OneHotEncoder.get_feature_names` and unneeded base class #1179
  - Removed LightGBM Estimator from AutoML models #1186
- **Changes**
  - Pinned `scikit-optimize` version to 0.7.4 #1136
  - Removed `tqdm` as a dependency #1177
  - Added `lightgbm` version 3.0.0 to `latest_dependency_versions.txt` #1185
  - Rename `max_pipelines` to `max_iterations` #1169
- **Documentation Changes**
  - Fixed API docs for `AutoMLSearch.add_result_callback` #1113
  - Added a step to our release process for pushing our latest version to conda-forge #1118
  - Added warning for missing `ipywidgets` dependency for using `PipelineSearchPlots` on Jupyterlab #1145
  - Updated `README.md` example to load demo dataset #1151
  - Swapped mapping of breast cancer targets in `model_understanding.ipynb` #1170
- **Testing Changes**
  - Added test confirming `TextFeaturizer` never outputs null values #1122
  - Changed Python version of `Update Dependencies` action to 3.8.x #1137
  - Fixed release notes check-in test for `Update Dependencies` actions #1172

**Warning:****Breaking Changes**

- `get_objective` will now return a class definition rather than an instance by default #1132
- Deleted `OPTIONS` dictionary in `evalml.objectives.utils.py` #1132

- If specifying an objective by string, the string must now match the objective's name field, case-insensitive [#1132](#)
- Passing “Cost Benefit Matrix”, “Fraud Cost”, “Lead Scoring”, “Mean Squared Log Error”, “Recall”, “Recall Macro”, “Recall Micro”, “Recall Weighted”, or “Root Mean Squared Log Error” to `AutoMLSearch` will now result in a `ValueError` rather than an `ObjectiveNotFoundError` [#1132](#)
- Search callbacks `start_iteration_callback` and `add_results_callback` have changed to include a copy of the `AutoMLSearch` object as a third parameter [#1156](#)
- Deleted `OneHotEncoder.get_feature_names` method which had been broken for a while, in favor of pipelines' `input_feature_names` [#1179](#)
- Deleted empty base class `CategoricalEncoder` which `OneHotEncoder` component was inheriting from [#1176](#)
- Results from `roc_curve` will now return as a list of dictionaries with each dictionary representing a class [#1164](#)
- `max_pipelines` now raises a `DeprecationWarning` and will be removed in the next release. `max_iterations` should be used instead. [#1169](#)

#### v0.13.1 Aug. 25, 2020

- **Enhancements**

- Added Cost-Benefit Matrix objective for binary classification [#1038](#)
- Split `fill_value` into `categorical_fill_value` and `numeric_fill_value` for `Imputer` [#1019](#)
- Added `explain_predictions` and `explain_predictions_best_worst` for explaining multiple predictions with SHAP [#1016](#)
- Added new LSA component for text featurization [#1022](#)
- Added guide on installing with conda [#1041](#)
- Added a “cost-benefit curve” util method to graph cost-benefit matrix scores vs. binary classification thresholds [#1081](#)
- Standardized error when calling `transform/predict` before `fit` for pipelines [#1048](#)
- Added `percent_better_than_baseline` to `AutoML` search rankings and full rankings table [#1050](#)
- Added one-way partial dependence and partial dependence plots [#1079](#)
- Added “Feature Value” column to prediction explanation reports. [#1064](#)
- Added `LightGBM` classification estimator [#1082](#), [#1114](#)
- Added `max_batches` parameter to `AutoMLSearch` [#1087](#)

- **Fixes**

- Updated `TextFeaturizer` component to no longer require an internet connection to run [#1022](#)
- Fixed non-deterministic element of `TextFeaturizer` transformations [#1022](#)
- Added a `StandardScaler` to all `ElasticNet` pipelines [#1065](#)
- Updated cost-benefit matrix to normalize score [#1099](#)
- Fixed logic in `calculate_percent_difference` so that it can handle negative values [#1100](#)

- **Changes**

- Added `needs_fitting` property to `ComponentBase` #1044
- Updated references to data types to use datatype lists defined in `evalml.utils.gen_utils` #1039
- Remove maximum version limit for SciPy dependency #1051
- Moved `all_components` and other component importers into runtime methods #1045
- Consolidated graphing utility methods under `evalml.utils.graph_utils` #1060
- Made slight tweaks to how `TextFeaturizer` uses `featuretools`, and did some refactoring of that and of LSA #1090
- Changed `show_all_features` parameter into `importance_threshold`, which allows for thresholding feature importance #1097, #1103

- **Documentation Changes**

- Update `setup.py` URL to point to the github repo #1037
- Added tutorial for using the cost-benefit matrix objective #1088
- Updated `model_understanding.ipynb` to include documentation for using plotly on Jupyter Lab #1108

- **Testing Changes**

- Refactor CircleCI tests to use matrix jobs (#1043)
- Added a test to check that all test directories are included in evalml package #1054

**Warning:****Breaking Changes**

- `confusion_matrix` and `normalize_confusion_matrix` have been moved to `evalml.utils` #1038
- All graph utility methods previously under `evalml.pipelines.graph_utils` have been moved to `evalml.utils.graph_utils` #1060

**v0.12.2 Aug. 6, 2020**

- **Enhancements**

- Add save/load method to components #1023
- Expose pickle protocol as optional arg to save/load #1023
- Updated estimators used in AutoML to include `ExtraTrees` and `ElasticNet` estimators #1030

- **Fixes**

- **Changes**

- Removed `DeprecationWarning` for `SimpleImputer` #1018

- **Documentation Changes**

- Add note about version numbers to release process docs #1034

- **Testing Changes**

- Test files are now included in the evalml package #1029

v0.12.0 Aug. 3, 2020

- **Enhancements**

- Added string and categorical targets support for binary and multiclass pipelines and check for numeric targets for `DetectLabelLeakage` data check [#932](#)
- Added clear exception for regression pipelines if target datatype is string or categorical [#960](#)
- Added target column names and class labels in `predict` and `predict_proba` output for pipelines [#951](#)
- Added `_compute_shap_values` and `normalize_values` to `pipelines/explanations` module [#958](#)
- Added `explain_prediction` feature which explains single predictions with SHAP [#974](#)
- Added `Imputer` to allow different imputation strategies for numerical and categorical dtypes [#991](#)
- Added support for configuring logfile path using env var, and don't create logger if there are filesystem errors [#975](#)
- Updated catboost estimators' default parameters and automl hyperparameter ranges to speed up fit time [#998](#)

- **Fixes**

- Fixed `ReadtheDocs` warning failure regarding embedded gif [#943](#)
- Removed incorrect parameter passed to pipeline classes in `_add_baseline_pipelines` [#941](#)
- Added universal error for calling `predict`, `predict_proba`, `transform`, and `feature_importances` before fitting [#969](#), [#994](#)
- Made `TextFeaturizer` component and pip dependencies `featuretools` and `nlp_primitives` optional [#976](#)
- Updated imputation strategy in automl to no longer limit impute strategy to `most_frequent` for all features if there are any categorical columns [#991](#)
- Fixed `UnboundLocalError` for `cv_pipeline` when automl search errors [#996](#)
- Fixed `Imputer` to reset dataframe index to preserve behavior expected from `SimpleImputer` [#1009](#)

- **Changes**

- Moved `get_estimators` to `evalml.pipelines.components.utils` [#934](#)
- Modified `Pipelines` to raise `PipelineScoreError` when they encounter an error during scoring [#936](#)
- Moved `evalml.model_families.list_model_families` to `evalml.pipelines.components.allowed_model_families` [#959](#)
- Renamed `DateTimeFeaturization` to `DateTimeFeaturizer` [#977](#)
- Added check to stop search and raise an error if all pipelines in a batch return NaN scores [#1015](#)

- **Documentation Changes**

- Updated `README.md` [#963](#)
- Reworded message when errors are returned from data checks in search [#982](#)
- Added section on understanding model predictions with `explain_prediction` to User Guide [#981](#)

- Added a section to the user guide and api reference about how XGBoost and CatBoost are not fully supported. [#992](#)
- Added custom components section in user guide [#993](#)
- Updated FAQ section formatting [#997](#)
- Updated release process documentation [#1003](#)
- **Testing Changes**
  - Moved `predict_proba` and `predict` tests regarding string / categorical targets to `test_pipelines.py` [#972](#)
  - Fixed dependency update bot by updating python version to 3.7 to avoid frequent github version updates [#1002](#)

**Warning:****Breaking Changes**

- `get_estimators` has been moved to `evalml.pipelines.components.utils` (previously was under `evalml.pipelines.utils`) [#934](#)
- Removed the `raise_errors` flag in AutoML search. All errors during pipeline evaluation will be caught and logged. [#936](#)
- `evalml.model_families.list_model_families` has been moved to `evalml.pipelines.components.allowed_model_families` [#959](#)
- `TextFeaturizer`: the `featuretools` and `nlp_primitives` packages must be installed after installing `evalml` in order to use this component [#976](#)
- Renamed `DateTimeFeaturization` to `DateTimeFeaturizer` [#977](#)

**v0.11.2 July 16, 2020**

- **Enhancements**
  - Added `NoVarianceDataCheck` to `DefaultDataChecks` [#893](#)
  - Added text processing and featurization component `TextFeaturizer` [#913](#), [#924](#)
  - Added additional checks to `InvalidTargetDataCheck` to handle invalid target data types [#929](#)
  - `AutoMLSearch` will now handle `KeyboardInterrupt` and prompt user for confirmation [#915](#)
- **Fixes**
  - Makes `automl` results a read-only property [#919](#)
- **Changes**
  - Deleted static pipelines and refactored tests involving static pipelines, removed `all_pipelines()` and `get_pipelines()` [#904](#)
  - Moved `list_model_families` to `evalml.model_family.utils` [#903](#)
  - Updated `all_pipelines`, `all_estimators`, `all_components` to use the same mechanism for dynamically generating their elements [#898](#)
  - Rename master branch to main [#918](#)
  - Add pypi release github action [#923](#)
  - Updated `AutoMLSearch.search` stdout output and logging and removed `tqdm` progress bar [#921](#)

- Moved automl config checks previously in `search()` to `init` #933
- **Documentation Changes**
  - Reorganized and rewrote documentation #937
  - Updated to use pydata sphinx theme #937
  - Updated docs to use `release_notes` instead of `changelog` #942
- **Testing Changes**
  - Cleaned up fixture names and usages in tests #895

**Warning:**

**Breaking Changes**

- `list_model_families` has been moved to `evalml.model_family.utils` (previously was under `evalml.pipelines.utils`) #903
- `get_estimators` has been moved to `evalml.pipelines.components.utils` (previously was under `evalml.pipelines.utils`) #934
- Static pipeline definitions have been removed, but similar pipelines can still be constructed via creating an instance of `PipelineBase` #904
- `all_pipelines()` and `get_pipelines()` utility methods have been removed #904

**v0.11.0 June 30, 2020**

- **Enhancements**
  - Added multiclass support for ROC curve graphing #832
  - Added preprocessing component to drop features whose percentage of NaN values exceeds a specified threshold #834
  - Added data check to check for problematic target labels #814
  - Added `PerColumnImputer` that allows imputation strategies per column #824
  - Added transformer to drop specific columns #827
  - Added support for `categories`, `handle_error`, and `drop` parameters in `OneHotEncoder` #830 #897
  - Added preprocessing component to handle `DateTime` columns featurization #838
  - Added ability to clone pipelines and components #842
  - Define getter method for component `parameters` #847
  - Added utility methods to calculate and graph permutation importances #860, #880
  - Added new utility functions necessary for generating dynamic preprocessing pipelines #852
  - Added `kwargs` to all components #863
  - Updated `AutoSearchBase` to use dynamically generated preprocessing pipelines #870
  - Added `SelectColumns` transformer #873
  - Added ability to evaluate additional pipelines for automl search #874
  - Added `default_parameters` class property to components and pipelines #879

- Added better support for disabling data checks in automl search [#892](#)
- Added ability to save and load AutoML objects to file [#888](#)
- Updated `AutoSearchBase.get_pipelines` to return an untrained pipeline instance [#876](#)
- Saved learned binary classification thresholds in automl results cv data dict [#876](#)
- **Fixes**
  - Fixed bug where `SimpleImputer` cannot handle dropped columns [#846](#)
  - Fixed bug where `PerColumnImputer` cannot handle dropped columns [#855](#)
  - Enforce requirement that builtin components save all inputted values in their parameters dict [#847](#)
  - Don't list base classes in `all_components` output [#847](#)
  - Standardize all components to output pandas data structures, and accept either pandas or numpy [#853](#)
  - Fixed rankings and `full_rankings` error when search has not been run [#894](#)
- **Changes**
  - Update `all_pipelines` and `all_components` to try initializing pipelines/components, and on failure exclude them [#849](#)
  - Refactor `handle_components` to `handle_components_class`, standardize to `ComponentBase` subclass instead of instance [#850](#)
  - Refactor “blacklist”/“whitelist” to “allow”/“exclude” lists [#854](#)
  - Replaced `AutoClassificationSearch` and `AutoRegressionSearch` with `AutoMLSearch` [#871](#)
  - Renamed `feature_importances` and `permutation_importances` methods to use singular names (`feature_importance` and `permutation_importance`) [#883](#)
  - Updated automl default data splitter to train/validation split for large datasets [#877](#)
  - Added open source license, update some repo metadata [#887](#)
  - Removed dead code in `_get_preprocessing_components` [#896](#)
- **Documentation Changes**
  - Fix some typos and update the EvalML logo [#872](#)
- **Testing Changes**
  - Update the changelog check job to expect the new branching pattern for the deps update bot [#836](#)
  - Check that all components output pandas datastructures, and can accept either pandas or numpy [#853](#)
  - Replaced `AutoClassificationSearch` and `AutoRegressionSearch` with `AutoMLSearch` [#871](#)

**Warning:****Breaking Changes**

- Pipelines' static `component_graph` field must contain either `ComponentBase` subclasses or `str`, instead of `ComponentBase` subclass instances [#850](#)

- Rename `handle_component` to `handle_component_class`. Now standardizes to `ComponentBase` subclasses instead of `ComponentBase` subclass instances [#850](#)
- Renamed `automl`'s `cv` argument to `data_split` [#877](#)
- Pipelines' and classifiers' `feature_importances` is renamed `feature_importance`, `graph_feature_importances` is renamed `graph_feature_importance` [#883](#)
- Passing `data_checks=None` to `automl` search will not perform any data checks as opposed to default checks. [#892](#)
- Pipelines to search for in AutoML are now determined automatically, rather than using the statically-defined pipeline classes. [#870](#)
- Updated `AutoSearchBase.get_pipelines` to return an untrained pipeline instance, instead of one which happened to be trained on the final cross-validation fold [#876](#)

**v0.10.0 May 29, 2020****• Enhancements**

- Added baseline models for classification and regression, add functionality to calculate baseline models before searching in AutoML [#746](#)
- Port over highly-null guardrail as a data check and define `DefaultDataChecks` and `DisableDataChecks` classes [#745](#)
- Update Tuner classes to work directly with pipeline parameters dicts instead of flat parameter lists [#779](#)
- Add Elastic Net as a pipeline option [#812](#)
- Added new Pipeline option `ExtraTrees` [#790](#)
- Added precision-recall curve metrics and plot for binary classification problems in `evalml.pipeline.graph_utils` [#794](#)
- Update the default `automl` algorithm to search in batches, starting with default parameters for each pipeline and iterating from there [#793](#)
- Added `AutoMLAlgorithm` class and `IterativeAlgorithm` impl, separated from `AutoSearchBase` [#793](#)

**• Fixes**

- Update pipeline score to return nan score for any objective which throws an exception during scoring [#787](#)
- Fixed bug introduced in [#787](#) where binary classification metrics requiring predicted probabilities error in scoring [#798](#)
- CatBoost and XGBoost classifiers and regressors can no longer have a learning rate of 0 [#795](#)

**• Changes**

- Cleanup pipeline score code, and cleanup codecov [#711](#)
- Remove `pass` for abstract methods for codecov [#730](#)
- Added `__str__` for `AutoSearch` object [#675](#)
- Add util methods to graph ROC and confusion matrix [#720](#)
- Refactor `AutoBase` to `AutoSearchBase` [#758](#)

- Updated AutoBase with `data_checks` parameter, removed previous `detect_label_leakage` parameter, and added functionality to run data checks before search in AutoML #765
- Updated our logger to use Python’s logging utils #763
- Refactor most of `AutoSearchBase._do_iteration` impl into `AutoSearchBase._evaluate` #762
- Port over all guardrails to use the new `DataCheck` API #789
- Expanded `import_or_raise` to catch all exceptions #759
- Adds RMSE, MSLE, RMSLE as standard metrics #788
- Don’t allow `Recall` to be used as an objective for AutoML #784
- Removed feature selection from pipelines #819
- Update default estimator parameters to make automl search faster and more accurate #793
- **Documentation Changes**
  - Add instructions to freeze `master` on `release.md` #726
  - Update release instructions with more details #727 #733
  - Add objective base classes to API reference #736
  - Fix components API to match other modules #747
- **Testing Changes**
  - Delete `codecov.yml`, use `codecov.io`’s default #732
  - Added unit tests for fraud cost, lead scoring, and standard metric objectives #741
  - Update `codecov` client #782
  - Updated AutoBase `__str__` test to include no parameters case #783
  - Added unit tests for `ExtraTrees` pipeline #790
  - If `codecov` fails to upload, fail build #810
  - Updated Python version of dependency action #816
  - Update the dependency update bot to use a suffix when creating branches #817

**Warning:****Breaking Changes**

- The `detect_label_leakage` parameter for AutoML classes has been removed and replaced by a `data_checks` parameter #765
- Moved ROC and confusion matrix methods from `evalml.pipeline.plot_utils` to `evalml.pipeline.graph_utils` #720
- `Tuner` classes require a pipeline hyperparameter range dict as an init arg instead of a space definition #779
- `Tuner.propose` and `Tuner.add` work directly with pipeline parameters dicts instead of flat parameter lists #779
- `PipelineBase.hyperparameters` and `custom_hyperparameters` use pipeline parameters dict format instead of being represented as a flat list #779

- All guardrail functions previously under `evalml.guardrails.utils` will be removed and replaced by data checks #789
- Recall disallowed as an objective for AutoML #784
- AutoSearchBase parameter tuner has been renamed to `tuner_class` #793
- AutoSearchBase parameter `possible_pipelines` and `possible_model_families` have been renamed to `allowed_pipelines` and `allowed_model_families` #793

**v0.9.0 Apr. 27, 2020**

- **Enhancements**

- Added Accuracy as a standard objective #624
- Added verbose parameter to `load_fraud` #560
- Added Balanced Accuracy metric for binary, multiclass #612 #661
- Added XGBoost regressor and XGBoost regression pipeline #666
- Added Accuracy metric for multiclass #672
- Added objective name in `AutoBase.describe_pipeline` #686
- Added `DataCheck` and `DataChecks`, `Message` classes and relevant subclasses #739

- **Fixes**

- Removed direct access to `cls.component_graph` #595
- Add testing files to `.gitignore` #625
- Remove circular dependencies from `Makefile` #637
- Add error case for `normalize_confusion_matrix()` #640
- Fixed `XGBoostClassifier` and `XGBoostRegressor` bug with feature names that contain `[ , ]`, or `<` #659
- Update `make_pipeline_graph` to not accidentally create empty file when testing if path is valid #649
- Fix pip installation warning about `docsutils` version, from `boto` dependency #664
- Removed zero division warning for F1/precision/recall metrics #671
- Fixed `summary` for pipelines without estimators #707

- **Changes**

- Updated default objective for binary/multiclass classification to log loss #613
- Created classification and regression pipeline subclasses and removed objective as an attribute of pipeline classes #405
- Changed the output of `score` to return one dictionary #429
- Created binary and multiclass objective subclasses #504
- Updated objectives API #445
- Removed call to `get_plot_data` from AutoML #615
- Set `raise_error` to default to `True` for AutoML classes #638
- Remove unnecessary “u” prefixes on some unicode strings #641

- Changed one-hot encoder to return uint8 dtypes instead of ints #653
- Pipeline `_name` field changed to `custom_name` #650
- Removed `graphs.py` and moved methods into `PipelineBase` #657, #665
- Remove `s3fs` as a dev dependency #664
- Changed `requirements-parser` to be a core dependency #673
- Replace `supported_problem_types` field on pipelines with `problem_type` attribute on base classes #678
- Changed AutoML to only show best results for a given pipeline template in rankings, added `full_rankings` property to show all #682
- Update `ModelFamily` values: don't list `xgboost/catboost` as classifiers now that we have regression pipelines for them #677
- Changed AutoML's `describe_pipeline` to get problem type from pipeline instead #685
- Standardize `import_or_raise` error messages #683
- Updated argument order of objectives to align with `sklearn`'s #698
- Renamed `pipeline.feature_importance_graph` to `pipeline.graph_feature_importances` #700
- Moved ROC and confusion matrix methods to `evalml.pipelines.plot_utils` #704
- Renamed `MultiClassificationObjective` to `MulticlassClassificationObjective`, to align with pipeline naming scheme #715

- **Documentation Changes**

- Fixed some sphinx warnings #593
- Fixed docstring for `AutoClassificationSearch` with correct command #599
- Limit `readthedocs` formats to pdf, not `htmlzip` and `epub` #594 #600
- Clean up objectives API documentation #605
- Fixed function on Exploring search results page #604
- Update release process doc #567
- `AutoClassificationSearch` and `AutoRegressionSearch` show inherited methods in API reference #651
- Fixed improperly formatted code in breaking changes for changelog #655
- Added configuration to treat Sphinx warnings as errors #660
- Removed separate plotting section for pipelines in API reference #657, #665
- Have leads example notebook load S3 files using `https`, so we can delete `s3fs` dev dependency #664
- Categorized components in API reference and added descriptions for each category #663
- Fixed Sphinx warnings about `BalancedAccuracy` objective #669
- Updated API reference to include missing components and clean up pipeline docstrings #689
- Reorganize API ref, and clarify pipeline sub-titles #688
- Add and update preprocessing utils in API reference #687
- Added inheritance diagrams to API reference #695

- Documented which default objective AutoML optimizes for #699
- Create separate install page #701
- Include more utils in API ref, like `import_or_raise` #704
- Add more color to pipeline documentation #705
- **Testing Changes**
  - Matched install commands of `check_latest_dependencies` test and it's GitHub action #578
  - Added Github app to auto assign PR author as assignee #477
  - Removed unneeded conda installation of xgboost in windows checkin tests #618
  - Update graph tests to always use tmpfile dir #649
  - Changelog checkin test workaround for release PRs: If 'future release' section is empty of PR refs, pass check #658
  - Add changelog checkin test exception for `dep-update` branch #723

#### Warning: Breaking Changes

- Pipelines will now no longer take an objective parameter during instantiation, and will no longer have an objective attribute.
- `fit()` and `predict()` now use an optional objective parameter, which is only used in binary classification pipelines to fit for a specific objective.
- `score()` will now use a required `objectives` parameter that is used to determine all the objectives to score on. This differs from the previous behavior, where the pipeline's objective was scored on regardless.
- `score()` will now return one dictionary of all objective scores.
- ROC and ConfusionMatrix plot methods via `Auto(*).plot` have been removed by #615 and are replaced by `roc_curve` and `confusion_matrix` in `evalml.pipelines.plot_utils` in #704
- `normalize_confusion_matrix` has been moved to `evalml.pipelines.plot_utils` #704
- Pipelines `_name` field changed to `custom_name`
- Pipelines `supported_problem_types` field is removed because it is no longer necessary #678
- Updated argument order of objectives' `objective_function` to align with sklearn #698
- `pipeline.feature_importance_graph` has been renamed to `pipeline.graph_feature_importances` in #700
- Removed unsupported MSLE objective #704

#### v0.8.0 Apr. 1, 2020

- **Enhancements**
  - Add normalization option and information to confusion matrix #484
  - Add util function to drop rows with NaN values #487
  - Renamed `PipelineBase.name` as `PipelineBase.summary` and redefined `PipelineBase.name` as class property #491
  - Added access to parameters in Pipelines with `PipelineBase.parameters` (used to be return of `PipelineBase.describe`) #501

- Added `fill_value` parameter for `SimpleImputer` #509
- Added functionality to override component hyperparameters and made pipelines take hyperparameters from components #516
- Allow `numpy.random.RandomState` for `random_state` parameters #556
- **Fixes**
  - Removed unused dependency `matplotlib`, and move `category_encoders` to test reqs #572
- **Changes**
  - Undo version cap in `XGBoost` placed in #402 and allowed all released of `XGBoost` #407
  - Support `pandas 1.0.0` #486
  - Made all references to the logger static #503
  - Refactored `model_type` parameter for components and pipelines to `model_family` #507
  - Refactored `problem_types` for pipelines and components into `supported_problem_types` #515
  - Moved `pipelines/utils.save_pipeline` and `pipelines/utils.load_pipeline` to `PipelineBase.save` and `PipelineBase.load` #526
  - Limit number of categories encoded by `OneHotEncoder` #517
- **Documentation Changes**
  - Updated API reference to remove `PipelinePlot` and added moved `PipelineBase` plotting methods #483
  - Add code style and github issue guides #463 #512
  - Updated API reference for to surface class variables for pipelines and components #537
  - Fixed README documentation link #535
  - Unhid PR references in changelog #656
- **Testing Changes**
  - Added automated dependency check PR #482, #505
  - Updated automated dependency check comment #497
  - Have `build_docs` job use python executor, so that env vars are set properly #547
  - Added simple test to make sure `OneHotEncoder`'s `top_n` works with large number of categories #552
  - Run windows unit tests on PRs #557

#### Warning: Breaking Changes

- `AutoClassificationSearch` and `AutoRegressionSearch`'s `model_types` parameter has been refactored into `allowed_model_families`
- `ModelTypes` enum has been changed to `ModelFamily`
- Components and Pipelines now have a `model_family` field instead of `model_type`
- `get_pipelines` utility function now accepts `model_families` as an argument instead of `model_types`

- `PipelineBase.name` no longer returns structure of pipeline and has been replaced by `PipelineBase.summary`
- `PipelineBase.problem_types` and `Estimator.problem_types` has been renamed to `supported_problem_types`
- `pipelines/utils.save_pipeline` and `pipelines/utils.load_pipeline` moved to `PipelineBase.save` and `PipelineBase.load`

**v0.7.0 Mar. 9, 2020****• Enhancements**

- Added emacs buffers to `.gitignore` [#350](#)
- Add CatBoost (gradient-boosted trees) classification and regression components and pipelines [#247](#)
- Added Tuner abstract base class [#351](#)
- Added `n_jobs` as parameter for `AutoClassificationSearch` and `AutoRegressionSearch` [#403](#)
- Changed colors of confusion matrix to shades of blue and updated axis order to match scikit-learn's [#426](#)
- Added `PipelineBase.graph` and `.feature_importance_graph` methods, moved from previous location [#423](#)
- Added support for python 3.8 [#462](#)

**• Fixes**

- Fixed ROC and confusion matrix plots not being calculated if user passed own additional\_objectives [#276](#)
- Fixed `ReadtheDocs FileNotFoundError` exception for fraud dataset [#439](#)

**• Changes**

- Added `n_estimators` as a tunable parameter for `XGBoost` [#307](#)
- Remove unused parameter `ObjectiveBase.fit_needs_proba` [#320](#)
- Remove extraneous parameter `component_type` from all components [#361](#)
- Remove unused `rankings.csv` file [#397](#)
- Downloaded demo and test datasets so unit tests can run offline [#408](#)
- Remove `_needs_fitting` attribute from `Components` [#398](#)
- Changed `plot.feature_importance` to show only non-zero feature importances by default, added optional parameter to show all [#413](#)
- Refactored `PipelineBase` to take in parameter dictionary and moved pipeline metadata to class attribute [#421](#)
- Dropped support for Python 3.5 [#438](#)
- Removed unused `apply.py` file [#449](#)
- Clean up `requirements.txt` to remove unused deps [#451](#)
- Support installation without all required dependencies [#459](#)

- **Documentation Changes**

- Update release.md with instructions to release to internal license key [#354](#)

- **Testing Changes**

- Added tests for utils (and moved current utils to gen\_utils) [#297](#)
- Moved XGBoost install into it's own separate step on Windows using Conda [#313](#)
- Rewind pandas version to before 1.0.0, to diagnose test failures for that version [#325](#)
- Added dependency update checkin test [#324](#)
- Rewind XGBoost version to before 1.0.0 to diagnose test failures for that version [#402](#)
- Update dependency check to use a whitelist [#417](#)
- Update unit test jobs to not install dev deps [#455](#)

**Warning: Breaking Changes**

- Python 3.5 will not be actively supported.

**v0.6.0 Dec. 16, 2019**

- **Enhancements**

- Added ability to create a plot of feature importances [#133](#)
- Add early stopping to AutoML using patience and tolerance parameters [#241](#)
- Added ROC and confusion matrix metrics and plot for classification problems and introduce PipelineSearchPlots class [#242](#)
- Enhanced AutoML results with search order [#260](#)
- Added utility function to show system and environment information [#300](#)

- **Fixes**

- Lower botocore requirement [#235](#)
- Fixed decision\_function calculation for FraudCost objective [#254](#)
- Fixed return value of Recall metrics [#264](#)
- Components return self on fit [#289](#)

- **Changes**

- Renamed automl classes to AutoRegressionSearch and AutoClassificationSearch [#287](#)
- Updating demo datasets to retain column names [#223](#)
- Moving pipeline visualization to PipelinePlot class [#228](#)
- Standarizing inputs as pd.DataFrame / pd.Series [#130](#)
- Enforcing that pipelines must have an estimator as last component [#277](#)
- Added ipywidgets as a dependency in requirements.txt [#278](#)
- Added Random and Grid Search Tuners [#240](#)

- **Documentation Changes**

- Adding class properties to API reference [#244](#)

- Fix and filter FutureWarnings from scikit-learn #249, #257
- Adding Linear Regression to API reference and cleaning up some Sphinx warnings #227
- **Testing Changes**
  - Added support for testing on Windows with CircleCI #226
  - Added support for doctests #233

**Warning: Breaking Changes**

- The `fit()` method for `AutoClassifier` and `AutoRegressor` has been renamed to `search()`.
- `AutoClassifier` has been renamed to `AutoClassificationSearch`
- `AutoRegressor` has been renamed to `AutoRegressionSearch`
- `AutoClassificationSearch.results` and `AutoRegressionSearch.results` now is a dictionary with `pipeline_results` and `search_order` keys. `pipeline_results` can be used to access a dictionary that is identical to the old `.results` dictionary. Whereas, `search_order` returns a list of the search order in terms of `pipeline_id`.
- Pipelines now require an estimator as the last component in `component_list`. Slicing pipelines now throws an `NotImplementedError` to avoid returning pipelines without an estimator.

**v0.5.2 Nov. 18, 2019**

- **Enhancements**
  - Adding basic pipeline structure visualization #211
- **Documentation Changes**
  - Added notebooks to build process #212

**v0.5.1 Nov. 15, 2019**

- **Enhancements**
  - Added basic outlier detection guardrail #151
  - Added basic ID column guardrail #135
  - Added support for unlimited pipelines with a `max_time` limit #70
  - Updated `.readthedocs.yaml` to successfully build #188
- **Fixes**
  - Removed MSLE from default additional objectives #203
  - Fixed `random_state` passed in pipelines #204
  - Fixed slow down in `RFRegressor` #206
- **Changes**
  - Pulled information for `describe_pipeline` from pipeline's new `describe` method #190
  - Refactored pipelines #108
  - Removed guardrails from `Auto(*)` #202, #208
- **Documentation Changes**
  - Updated documentation to show `max_time` enhancements #189

- Updated release instructions for RTD #193
- Added notebooks to build process #212
- Added contributing instructions #213
- Added new content #222

**v0.5.0 Oct. 29, 2019****• Enhancements**

- Added basic one hot encoding #73
- Use enums for `model_type` #110
- Support for splitting regression datasets #112
- Auto-infer multiclass classification #99
- Added support for other units in `max_time` #125
- Detect highly null columns #121
- Added additional regression objectives #100
- Show an interactive iteration vs. score plot when using `fit()` #134

**• Fixes**

- Reordered `describe_pipeline` #94
- Added type check for `model_type` #109
- Fixed `s` units when setting string `max_time` #132
- Fix objectives not appearing in API documentation #150

**• Changes**

- Reorganized tests #93
- Moved logging to its own module #119
- Show progress bar history #111
- Using `cloudpickle` instead of `pickle` to allow unloading of custom objectives #113
- Removed `render.py` #154

**• Documentation Changes**

- Update release instructions #140
- Include `additional_objectives` parameter #124
- Added Changelog #136

**• Testing Changes**

- Code coverage #90
- Added CircleCI tests for other Python versions #104
- Added doc notebooks as tests #139
- Test metadata for CircleCI and 2 core parallelism #137

**v0.4.1 Sep. 16, 2019****• Enhancements**

- Added AutoML for classification and regressor using Autobase and Skopt #7 #9
- Implemented standard classification and regression metrics #7
- Added logistic regression, random forest, and XGBoost pipelines #7
- Implemented support for custom objectives #15
- Feature importance for pipelines #18
- Serialization for pipelines #19
- Allow fitting on objectives for optimal threshold #27
- Added detect label leakage #31
- Implemented callbacks #42
- Allow for multiclass classification #21
- Added support for additional objectives #79
- **Fixes**
  - Fixed feature selection in pipelines #13
  - Made `random_seed` usage consistent #45
- **Documentation Changes**
  - Documentation Changes
  - Added docstrings #6
  - Created notebooks for docs #6
  - Initialized readthedocs EvalML #6
  - Added favicon #38
- **Testing Changes**
  - Added testing for loading data #39

**v0.2.0 Aug. 13, 2019**

- **Enhancements**
  - Created fraud detection objective #4

**v0.1.0 July. 31, 2019**

- *First Release*
- **Enhancements**
  - Added lead scoring objective #1
  - Added basic classifier #1
- **Documentation Changes**
  - Initialized Sphinx for docs #1
