#### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance for fitted linear regressor.                                                                                  |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted linear regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## prophet\_regressor

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint\_prior\_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality\_prior\_scale** (*int*) – Similar to changepoint\_prior\_scale. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays\_prior\_scale** (*int*) – Similar to changepoint\_prior\_scale. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality\_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan\_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval\_width** (*float*) – Determines the confidence of the prediction interval range when calling *get\_prediction\_intervals*. Accepts values in the range (0,1). Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>build_prophet_df</code>         | Build the Prophet data to pass fit and predict on.                                                                               |
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.                                     |
| <code>fit</code>                      | Fits Prophet regressor component to data.                                                                                        |
| <code>get_params</code>               | Get parameters for the Prophet regressor.                                                                                        |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted ProphetRegressor.                                                                 |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted Prophet regressor.                                                                                 |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**static** `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time\_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*) → dict

Returns the default parameters for this component.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name*=False, *return\_dict*=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property** `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature\_importance is not defined for Prophet regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_params**(*self*) → dict

Get parameters for the Prophet regressor.

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## rf\_regressor

    =
    -
    1,
    random_seed:
    Union[int,
    float]
    =
    0,
    **kwargs)
```

Random Forest Regressor.

#### Parameters

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted RandomForestRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## Contents

```
class evalml.pipelines.components.estimators.regressors.svm_regressor.SVMRegressor(C=1.0,
                                          kernel='rbf',
                                          gamma='auto',
                                          random_state=0,
                                          **kwargs)
```

Support Vector Machine Regressor.

#### Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses  $1 / (n\_features * X.var())$  as value of gamma - If “auto” (default), uses  $1 / n\_features$

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

**Returns** The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## time\_series\_baseline\_estimator

Time series estimator that predicts using the naive forecasting approach.

### Contents

```
class evalml.pipelines.components.estimators.regressors.time_series_baseline_estimator.TimeSeriesBaselineEstimator
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

#### Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast\_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                                |                                                                                                               |

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits time series baseline estimator to data.                                                                                     |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted time series baseline estimator.                                                                    |
| <code>predict_proba</code>            | Make prediction probabilities using fitted time series baseline estimator.                                                       |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

#### `property feature_importance(self)`

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** *self*

**Raises** **ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted time series baseline estimator.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises** **ValueError** – If input `y` is `None`.

**predict\_proba**(*self*, *X*)

Make prediction probabilities using fitted time series baseline estimator.

**Parameters** **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted probability values.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If input `y` is `None`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (`str`) – Location to save file.
- **pickle\_protocol** (`int`) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (`dict`) – A dict of parameters to update.
- **reset\_fit** (`bool`, *optional*) – If `True`, will set `_is_fitted` to `False`.

## vowpal\_wabbit\_regressor

## Contents

`class evalml.pipelines.components.estimators.regressors.vowpal_wabbit_regressor.VowpalWabbitRegressor` (*le*

Vowpal Wabbit Regressor.

**Parameters**

- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance(*self*)**

Feature importance for Vowpal Wabbit regressor.

**fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

xgboost\_regressor

XGBoost Regressor.

XGBoost Regressor.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

#### Attributes

|                                |                                                                                                                               |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted XGBoost regressor.                                                                                  |
| <i>fit</i>                      | Fits XGBoost regressor component to data.                                                                                        |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted XGBoostRegressor.                                                                 |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted XGBoost regressor.                                                                                 |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## Package Contents

### Classes Summary

|                                      |                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ARIMAREgressor</i>                | Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <a href="https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html">https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html</a> .                                   |
| <i>BaselineRegressor</i>             | Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.                                                                                                                                                                                                                                           |
| <i>CatBoostRegressor</i>             | CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                                                                 |
| <i>DecisionTreeRegressor</i>         | Decision Tree Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>ElasticNetRegressor</i>           | Elastic Net Regressor.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>ExponentialSmoothingRegressor</i> | Holt-Winters Exponential Smoothing Forecaster.                                                                                                                                                                                                                                                                                                                                                |
| <i>ExtraTreesRegressor</i>           | Extra Trees Regressor.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>LightGBMRegressor</i>             | LightGBM Regressor.                                                                                                                                                                                                                                                                                                                                                                           |
| <i>LinearRegressor</i>               | Linear Regressor.                                                                                                                                                                                                                                                                                                                                                                             |
| <i>ProphetRegressor</i>              | Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well. |
| <i>RandomForestRegressor</i>         | Random Forest Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>SVMRegressor</i>                  | Support Vector Machine Regressor.                                                                                                                                                                                                                                                                                                                                                             |
| <i>TimeSeriesBaselineEstimator</i>   | Time series estimator that predicts using the naive forecasting approach.                                                                                                                                                                                                                                                                                                                     |
| <i>VowpalWabbitRegressor</i>         | Vowpal Wabbit Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>XGBoostRegressor</i>              | XGBoost Regressor.                                                                                                                                                                                                                                                                                                                                                                            |

```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start\_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start\_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max\_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max\_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max\_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If "detect", this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.                                |
| <i>fit</i>                      | Fits ARIMA regressor to data.                                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted ARIMARegressor.                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted ARIMA regressor.                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature\_importance is not defined for ARIMA regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMARegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **ValueError** – If *X* was passed to *fit* but not passed in *predict*.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a *predict\_proba* method or a *component\_obj* that implements *predict\_proba*.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.estimators.regressors.BaselineRegressor`(*strategy='mean'*,  
*random\_seed=0*,  
*\*\*kwargs*)

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

**Parameters**

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|                                 |                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                                                      |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                                                         |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                                                   |
| <i>feature_importance</i>       | Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes. |
| <i>fit</i>                      | Fits baseline regression component to data.                                                                                                                |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                                                  |
| <i>load</i>                     | Loads component at file path.                                                                                                                              |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                           |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                        |
| <i>predict</i>                  | Make predictions using the baseline regression strategy.                                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                                                     |
| <i>save</i>                     | Saves component at file path.                                                                                                                              |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                         |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit(self, X, y=None)**

Fits baseline regression component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the baseline regression strategy.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X: pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.CatBoostRegressor(n_estimators=10,
                                                                    eta=0.03,
                                                                    max_depth=6, boot-
                                                                    strap_type=None,
                                                                    silent=False, al-
                                                                    low_writing_files=False,
                                                                    random_seed=0,
                                                                    n_jobs=-1,
                                                                    **kwargs)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

### Parameters

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance of fitted CatBoost regressor.                                                                                 |
| <code>fit</code>                      | Fits CatBoost regressor component to data.                                                                                       |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using the fitted CatBoost regressor.                                                                            |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance of fitted CatBoost regressor.

**fit(self, X, y=None)**

Fits CatBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted CatBoost regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

#### Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.DecisionTreeRegressor(criterion='squared_error',
                                                                              max_features='auto',
                                                                              max_depth=6,
                                                                              min_samples_split=2,
                                                                              min_weight_fraction_leaf=0.0,
                                                                              random_seed=0,
                                                                              **kwargs)
```

Decision Tree Regressor.

#### Parameters

- **`criterion`** (*{ "squared\_error", "friedman\_mse", "absolute\_error", "poisson" }*) – The function to measure the quality of a split. Supported criteria are:
  - “squared\_error” for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
  - “friedman\_mse”, which uses mean squared error with Friedman’s improvement score for potential splits
  - “absolute\_error” for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
  - “poisson” which uses reduction in Poisson deviance to find splits.
- **`max_features`** (*int, float or { "auto", "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
  - If int, then consider `max_features` features at each split.
  - If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
  - If “auto”, then `max_features=sqrt(n_features)`.
  - If “sqrt”, then `max_features=sqrt(n_features)`.
  - If “log2”, then `max_features=log2(n_features)`.
  - If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If *int*, then consider `min_samples_split` as the minimum number.
  - If *float*, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance(*self*) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**get\_prediction\_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.

- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self, X: pandas.DataFrame*) → pandas.Series

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self, X: pandas.DataFrame*) → pandas.Series

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.ElasticNetRegressor(alpha=0.0001,
                                                                           l1_ratio=0.15,
                                                                           max_iter=1000,
                                                                           random_seed=0,
                                                                           **kwargs)
```

Elastic Net Regressor.

#### Parameters

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1\_ratio** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if *penalty='elasticnet'*. Setting *l1\_ratio=0* is equivalent to using *penalty='l2'*, while setting *l1\_ratio=1* is equivalent to using *penalty='l1'*. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max\_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted ElasticNet regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.ExponentialSmoothingRegressor(trend:

```

Holt-Winters Exponential Smoothing Forecaster.

Currently `ExponentialSmoothingRegressor` isn't supported via conda install. It's recommended that it be installed via PyPI.

**Parameters**

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped\_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None.** (*but AutoMLSearch will not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns array of 0's with a length of 1 as feature_importance is not defined for Exponential Smoothing regressor.                |
| <i>fit</i>                      | Fits Exponential Smoothing Regressor to data.                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted ExponentialSmoothingRegressor.                                                    |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted Exponential Smoothing regressor.                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns array of 0's with a length of 1 as `feature_importance` is not defined for Exponential Smoothing regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits Exponential Smoothing Regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`. Ignored.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** *self*

**Raises** **ValueError** – If `y` was not passed in.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.ExtraTreesRegressor(n_estimators: int
                                                                           = 100,
                                                                           max_features: str
                                                                           = 'auto',
                                                                           max_depth: int =
                                                                           6,
                                                                           min_samples_split:
                                                                           int = 2,
                                                                           min_weight_fraction_leaf:
                                                                           float = 0.0,
                                                                           n_jobs: int = - 1,
                                                                           random_seed:
                                                                           Union[int, float]
                                                                           = 0, **kwargs)
```

Extra Trees Regressor.

#### Parameters

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_features** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If *int*, then consider *max\_features* features at each split.
  - If *float*, then *max\_features* is a fraction and  $\text{int}(\text{max\_features} * \text{n\_features})$  features are considered at each split.
  - If “auto”, then  $\text{max\_features}=\text{sqrt}(\text{n\_features})$ .
  - If “sqrt”, then  $\text{max\_features}=\text{sqrt}(\text{n\_features})$ .
  - If “log2”, then  $\text{max\_features}=\text{log2}(\text{n\_features})$ .
  - If *None*, then  $\text{max\_features} = \text{n\_features}$ .

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than *max\_features* features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If *int*, then consider *min\_samples\_split* as the minimum number.
  - If *float*, then *min\_samples\_split* is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.
- **2. (Defaults to) –**
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExtraTreesRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.LightGBMRegressor(boosting_type='gbdt',
                                                                    learning_rate=0.1,
                                                                    n_estimators=20,
                                                                    max_depth=0,
                                                                    num_leaves=31,
                                                                    min_child_samples=20,
                                                                    bag-
                                                                    ging_fraction=0.9,
                                                                    bagging_freq=0,
                                                                    n_jobs=- 1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

LightGBM Regressor.

**Parameters**

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select bagging\_fraction \* 100 % of the data to use for the next k iterations. Defaults to 0.
- **n\_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit(self, X, y=None)**

Fits LightGBM regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted LightGBM regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.estimators.regressors.LinearRegressor`(*fit\_intercept=True*,  
*n\_jobs=-1*,  
*random\_seed=0*,  
*\*\*kwargs*)

Linear Regressor.

**Parameters**

- **fit\_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Feature importance for fitted linear regressor.                                                                                  |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `property feature_importance(self)`

Feature importance for fitted linear regressor.

### `fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set `_is_fitted` to *False*.

                                                                    interval_width: float
                                                                    = 0.95,
                                                                    random_seed:
                                                                    Union[int, float] = 0,
                                                                    **kwargs)
```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

**Parameters**

- **time\_index** (*str*) – Specifies the name of the column in *X* that provides the datetime objects. Defaults to *None*.

- **changepoint\_prior\_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality\_prior\_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays\_prior\_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality\_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan\_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval\_width** (*float*) – Determines the confidence of the prediction interval range when calling `get_prediction_intervals`. Accepts values in the range (0,1). Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted ProphetRegressor.                                                                 |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted Prophet regressor.                                                                                 |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**static** `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time\_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*) → dict

Returns the default parameters for this component.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name*=False, *return\_dict*=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property** `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature\_importance is not defined for Prophet regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self**get\_params**(*self*) → dict

Get parameters for the Prophet regressor.

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.**Returns** ComponentBase object**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.

**Returns** Predicted values.**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.RandomForestRegressor(n_estimators:  
    int = 100,  
    max_depth:  
    int = 6,  
    n_jobs: int = -  
    1,  
    random_seed:  
    Union[int,  
    float] = 0,  
    **kwargs)
```

Random Forest Regressor.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted RandomForestRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.SVMRegressor(C=1.0, kernel='rbf',
                                                                    gamma='auto',
                                                                    random_seed=0,
                                                                    **kwargs)
```

Support Vector Machine Regressor.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** ({*"poly"*, *"rbf"*, *"sigmoid"*}) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** ({*"scale"*, *"auto"*} or *float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses 1 / (n\_features \* X.var()) as value of gamma - If “auto” (default), uses 1 / n\_features

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

**Returns** The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.TimeSeriesBaselineEstimator(gap=1,
                                                                                   fore-
                                                                                   cast_horizon=1,
                                                                                   ran-
                                                                                   dom_seed=0,
                                                                                   **kwargs)
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

**Parameters**

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast\_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static `load(file_path)`**

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** `ComponentBase` object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property `parameters(self)`**

Returns the parameters which were used to initialize the component.

**`predict(self, X)`**

Make predictions using fitted time series baseline estimator.

**Parameters** `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises `ValueError`** – If input `y` is `None`.

**`predict_proba(self, X)`**

Make prediction probabilities using fitted time series baseline estimator.

**Parameters** `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted probability values.

**Return type** `pd.DataFrame`

**Raises `ValueError`** – If input `y` is `None`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.estimators.regressors.VowpalWabbitRegressor(learning_rate=0.5,
                                                                              de-
                                                                              cay_learning_rate=1.0,
                                                                              power_t=0.5,
                                                                              passes=1, ran-
                                                                              dom_seed=0,
                                                                              **kwargs)
```

Vowpal Wabbit Regressor.

#### Parameters

- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance for Vowpal Wabbit regressor.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.XGBoostRegressor(eta: float = 0.1,
                                                                    max_depth: int = 6,
                                                                    min_child_weight:
                                                                    int = 1,
                                                                    n_estimators: int =
                                                                    100, random_seed:
                                                                    Union[int, float] = 0,
                                                                    n_jobs: int = 12,
                                                                    **kwargs)
```

XGBoost Regressor.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## Submodules

## Contents

```
class evalml.pipelines.components.estimators.estimator.Estimator(parameters: dict = None,
                                                                component_obj:
                                                                Type[evalml.pipelines.components.ComponentBase]
                                                                = None, random_seed:
                                                                Union[int, float] = 0,
                                                                **kwargs)
```

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>model_family</code>             | ModelFamily.NONE                                                                                                                 |
| <code>name</code>                     | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>supported_problem_types</code>  | Problem types this estimator supports.                                                                                           |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

#### **property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property model\_family**(*cls*)

Returns *ModelFamily* of this component.

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Package Contents

## Classes Summary

|                                         |                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ARIMAREgressor</i>                   | Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <a href="https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html">https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html</a> .                                   |
| <i>BaselineClassifier</i>               | Classifier that predicts using the specified strategy.                                                                                                                                                                                                                                                                                                                                        |
| <i>BaselineRegressor</i>                | Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.                                                                                                                                                                                                                                           |
| <i>CatBoostClassifier</i>               | CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                                                               |
| <i>CatBoostRegressor</i>                | CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                                                                 |
| <i>DecisionTreeClassifier</i>           | Decision Tree Classifier.                                                                                                                                                                                                                                                                                                                                                                     |
| <i>DecisionTreeRegressor</i>            | Decision Tree Regressor.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>ElasticNetClassifier</i>             | Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.                                                                                                                                                                                                                                                                                               |
| <i>ElasticNetRegressor</i>              | Elastic Net Regressor.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Estimator</i>                        | A component that fits and predicts given data.                                                                                                                                                                                                                                                                                                                                                |
| <i>ExponentialSmoothingRegressor</i>    | Holt-Winters Exponential Smoothing Forecaster.                                                                                                                                                                                                                                                                                                                                                |
| <i>ExtraTreesClassifier</i>             | Extra Trees Classifier.                                                                                                                                                                                                                                                                                                                                                                       |
| <i>ExtraTreesRegressor</i>              | Extra Trees Regressor.                                                                                                                                                                                                                                                                                                                                                                        |

| <i>LogisticRegressionClassifier</i>     | Logistic Regression Classifier.                                                                                                                                                                                                                                                                                                                                                               |
| <i>ProphetRegressor</i>                 | Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well. |

    bool = True, **kwargs)
```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start\_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start\_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max\_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max\_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max\_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If “detect”, this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.                                |
| <i>fit</i>                      | Fits ARIMA regressor to data.                                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted ARIMARegressor.                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted ARIMA regressor.                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature\_importance is not defined for ARIMA regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMAREgressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **ValueError** – If *X* was passed to *fit* but not passed in *predict*.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a *predict\_proba* method or a *component\_obj* that implements *predict\_proba*.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.estimators.BaselineClassifier*(*strategy='mode'*,  
*random\_seed=0*, *\*\*kwargs*)

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

**Parameters**

- **strategy** (*str*) – Method used to predict. Valid options are “mode”, “random” and “random\_weighted”. Defaults to “mode”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>classes_</i>                 | Returns class labels. Will return None before fitting.                                                                                                      |
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                                                       |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                                                          |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                                                    |
| <i>feature_importance</i>       | Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes. |
| <i>fit</i>                      | Fits baseline classifier component to data.                                                                                                                 |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                                               |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                            |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                         |
| <i>predict</i>                  | Make predictions using the baseline classification strategy.                                                                                                |
| <i>predict_proba</i>            | Make prediction probabilities using the baseline classification strategy.                                                                                   |
| <i>save</i>                     | Saves component at file path.                                                                                                                               |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                          |

### property `classes_(self)`

Returns class labels. Will return None before fitting.

**Returns** Class names

**Return type** list[str] or list(float)

### property `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### property `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes

**Return type** `pd.Series`

**fit**(*self*, *X*, *y=None*)

Fits baseline classifier component to data.

**Parameters**

- **X** (`pd.DataFrame`) – The input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If `y` is `None`.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – Target data. Ignored.
- **coverage** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (`pd.Series`) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**predict(*self*, *X*)**

Make predictions using the baseline classification strategy.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**predict\_proba(*self*, *X*)**

Make prediction probabilities using the baseline classification strategy.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** pd.DataFrame

**save(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.components.estimators.BaselineRegressor**(*strategy*='mean', *random\_seed*=0, *\*\*kwargs*)

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

**Parameters**

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|                                 |                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                                                      |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                                                         |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                                                   |
| <i>feature_importance</i>       | Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes. |
| <i>fit</i>                      | Fits baseline regression component to data.                                                                                                                |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                                                  |
| <i>load</i>                     | Loads component at file path.                                                                                                                              |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                           |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                        |
| <i>predict</i>                  | Make predictions using the baseline regression strategy.                                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                                                     |
| <i>save</i>                     | Saves component at file path.                                                                                                                              |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                         |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits baseline regression component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static `load(file_path)`**

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** `ComponentBase` object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property `parameters(self)`**

Returns the parameters which were used to initialize the component.

**`predict(self, X)`**

Make predictions using the baseline regression strategy.

**Parameters** `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

**Returns** Predicted values.

**Return type** `pd.Series`

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** `X` (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.estimators.CatBoostClassifier(n_estimators=10, eta=0.03,
                                                                max_depth=6,
                                                                bootstrap_type=None,
                                                                silent=True,
                                                                allow_writing_files=False,
                                                                random_seed=0, n_jobs=-1,
                                                                **kwargs)
```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

#### Parameters

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>predict</code>                  | Make predictions using the fitted CatBoost classifier.                                                                           |
| <code>predict_proba</code>            | Make prediction probabilities using the fitted CatBoost classifier.                                                              |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance of fitted CatBoost classifier.

**fit(self, X, y=None)**

Fits CatBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**predict\_proba**(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** `pd.DataFrame`

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.CatBoostRegressor(n_estimators=10, eta=0.03,
                                                             max_depth=6,
                                                             bootstrap_type=None,
                                                             silent=False,
                                                             allow_writing_files=False,
                                                             random_seed=0, n_jobs=-1,
                                                             **kwargs)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

**Parameters**

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance of fitted CatBoost regressor.                                                                                 |
| <i>fit</i>                      | Fits CatBoost regressor component to data.                                                                                       |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted CatBoost regressor.                                                                            |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted CatBoost regressor.

**fit**(*self, X, y=None*)

Fits CatBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict** `(self, X)`

Make predictions using the fitted CatBoost regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba** `(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save** `(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters** `(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.DecisionTreeClassifier(criterion='gini',
                                                                    max_features='auto',
                                                                    max_depth=6,
                                                                    min_samples_split=2,
                                                                    min_weight_fraction_leaf=0.0,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Decision Tree Classifier.

**Parameters**

- **criterion** (*{ "gini", "entropy" }*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max\_features** (*int, float or { "auto", "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
  - If int, then consider max\_features features at each split.
  - If float, then max\_features is a fraction and `int(max_features * n_features)` features are considered at each split.

- If “auto”, then `max_features=sqrt(n_features)`.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider `min_samples_split` as the minimum number.
  - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.DecisionTreeRegressor(criterion='squared_error',
                                                                    max_features='auto',
                                                                    max_depth=6,
                                                                    min_samples_split=2,
                                                                    min_weight_fraction_leaf=0.0,
                                                                    random_seed=0, **kwargs)
```

Decision Tree Regressor.

**Parameters**

- **`criterion`** (*{`"squared_error"`, `"friedman_mse"`, `"absolute_error"`, `"poisson"`}*) – The function to measure the quality of a split. Supported criteria are:
  - `"squared_error"` for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
  - `"friedman_mse"`, which uses mean squared error with Friedman’s improvement score for potential splits
  - `"absolute_error"` for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
  - `"poisson"` which uses reduction in Poisson deviance to find splits.
- **`max_features`** (*int, float or {`"auto"`, `"sqrt"`, `"log2"`}*) – The number of features to consider when looking for the best split:
  - If int, then consider `max_features` features at each split.

- If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
- If “auto”, then `max_features=sqrt(n_features)`.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider `min_samples_split` as the minimum number.
  - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ElasticNetClassifier(penalty='elasticnet', C=1.0,
                                                                l1_ratio=0.15,
                                                                multi_class='auto',
                                                                solver='saga', n_jobs=-1,
                                                                random_seed=0, **kwargs)
```

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

**Parameters**

- **`penalty`** (*{`"l1"`, `"l2"`, `"elasticnet"`, `"none"`}*) – The norm used in penalization. Defaults to “elasticnet”.
- **`C`** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **`l1_ratio`** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **`multi_class`** (*{`"auto"`, `"ovr"`, `"multinomial"`}*) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver='liblinear'`. “auto” selects “ovr” if the data is binary, or if `solver='liblinear'`, and otherwise selects “multinomial”. Defaults to “auto”.
- **`solver`** (*{`"newton-cg"`, `"lbfgs"`, `"liblinear"`, `"sag"`, `"saga"`}*) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.

- “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
- “liblinear” and “saga” also handle L1 penalty
- “saga” also supports “elasticnet” penalty
- “liblinear” does not support setting penalty=’none’

Defaults to “saga”.

- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance for fitted ElasticNet classifier.                                                                             |
| <i>fit</i>                      | Fits ElasticNet classifier component to data.                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance(*self*)**

Feature importance for fitted ElasticNet classifier.

**fit(*self*, *X*, *y*)**

Fits ElasticNet classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** *self*

**get\_prediction\_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.estimators.**ElasticNetRegressor**(*alpha*=0.0001, *l1\_ratio*=0.15, *max\_iter*=1000, *random\_seed*=0, *\*\*kwargs*)

Elastic Net Regressor.

### Parameters

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1\_ratio** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max\_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>predict</i>                  | Make predictions using selected features.                                                                                                                                                |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                                                                                   |
| <i>save</i>                     | Saves component at file path.                                                                                                                                                            |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**property feature\_importance(*self*)**

Feature importance for fitted ElasticNet regressor.

**fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**get\_prediction\_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.estimators.**Estimator**(*parameters*: *dict* = *None*, *component\_obj*: *Type*[evalml.pipelines.components.ComponentBase] = *None*, *random\_seed*: *Union*[*int*, *float*] = 0, *\*\*kwargs*)

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>model_family</code>             | ModelFamily.NONE                                                                                                                 |
| <code>name</code>                     | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>supported_problem_types</code>  | Problem types this estimator supports.                                                                                           |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property model\_family**(*cls*)

Returns ModelFamily of this component.

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.ExponentialSmoothingRegressor(trend:  
                                                                           Optional[str] =  
                                                                           None,  
                                                                           damped_trend:  
                                                                           bool = False,  
                                                                           seasonal:  
                                                                           Optional[str] =  
                                                                           None, sp: int = 2,  
                                                                           n_jobs: int = -1,  
                                                                           random_seed:  
                                                                           Union[int, float] =  
                                                                           0, **kwargs)
```

Holt-Winters Exponential Smoothing Forecaster.

Currently ExponentialSmoothingRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

#### Parameters

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped\_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None.** (*but AutoMLSearch wiill not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns array of 0's with a length of 1 as feature\_importance is not defined for Exponential Smoothing regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Exponential Smoothing Regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ExtraTreesClassifier(n_estimators=100,
                                                                max_features='auto',
                                                                max_depth=6,
                                                                min_samples_split=2,
                                                                min_weight_fraction_leaf=0.0,
                                                                n_jobs=-1, random_seed=0,
                                                                **kwargs)
```

Extra Trees Classifier.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_features** (*int*, *float* or {"auto", "sqrt", "log2"}) – The number of features to consider when looking for the best split:
  - If int, then consider `max_features` features at each split.

- If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
- If “auto”, then `max_features=sqrt(n_features)`.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider `min_samples_split` as the minimum number.
  - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a predict method or a `component_obj` that implements predict.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ExtraTreesRegressor(n_estimators: int = 100,
                                                                max_features: str = 'auto',
                                                                max_depth: int = 6,
                                                                min_samples_split: int = 2,
                                                                min_weight_fraction_leaf: float
                                                                = 0.0, n_jobs: int = -1,
                                                                random_seed: Union[int, float]
                                                                = 0, **kwargs)
```

Extra Trees Regressor.

**Parameters**

- **`n_estimators`** (*float*) – The number of trees in the forest. Defaults to 100.
- **`max_features`** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If `int`, then consider `max_features` features at each split.
  - If `float`, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
  - If “auto”, then `max_features=sqrt(n_features)`.
  - If “sqrt”, then `max_features=sqrt(n_features)`.
  - If “log2”, then `max_features=log2(n_features)`.
  - If `None`, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If *int*, then consider `min_samples_split` as the minimum number.
  - If *float*, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.
- **2.** (*Defaults to*) –
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ExtraTreesRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].**Returns** Predicted values.**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.KNeighborsClassifier(n_neighbors=5,
                                                                weights='uniform',
                                                                algorithm='auto',
                                                                leaf_size=30, p=2,
                                                                random_seed=0, **kwargs)
```

K-Nearest Neighbors Classifier.

#### Parameters

- **n\_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** (*{'uniform', 'distance'} or callable*) – Weight function used in prediction. Can be:
  - ‘uniform’ : uniform weights. All points in each neighborhood are weighted equally.
  - ‘distance’ : weight points by the inverse of their distance. in this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
  - [callable] : a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** (*{'auto', 'ball\_tree', 'kd\_tree', 'brute'}*) – Algorithm used to compute the nearest neighbors:
  - ‘ball\_tree’ will use BallTree
  - ‘kd\_tree’ will use KDTree
  - ‘brute’ will use a brute-force search.

‘auto’ will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf\_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.

- **p** (*int*) – Power parameter for the Minkowski metric. When  $p = 1$ , this is equivalent to using `manhattan_distance` (11), and `euclidean_distance` (12) for  $p = 2$ . For arbitrary  $p$ , `minkowski_distance (1_p)` is used. Defaults to 2.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                                                                                 |
| <i>feature_importance</i>       | Returns array of 0's matching the input number of features as <code>feature_importance</code> is not defined for KNN classifiers.                                                        |
| <i>fit</i>                      | Fits estimator to data.                                                                                                                                                                  |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                                                                                |
| <i>load</i>                     | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>predict</i>                  | Make predictions using selected features.                                                                                                                                                |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                                                                                   |
| <i>save</i>                     | Saves component at file path.                                                                                                                                                            |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns array of 0's matching the input number of features as feature\_importance is not defined for KNN classifiers.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.LightGBMClassifier(boosting_type='gbdt',
                                                                learning_rate=0.1,
                                                                n_estimators=100,
                                                                max_depth=0, num_leaves=31,
                                                                min_child_samples=20,
                                                                bagging_fraction=0.9,
                                                                bagging_freq=0, n_jobs=-1,
                                                                random_seed=0, **kwargs)
```

LightGBM Classifier.

#### Parameters

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select bagging\_fraction \* 100 % of the data to use for the next k iterations. Defaults to 0.
- **n\_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits LightGBM classifier component to data.                                                                                      |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted LightGBM classifier.                                                                           |
| <i>predict_proba</i>            | Make prediction probabilities using the fitted LightGBM classifier.                                                              |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted LightGBM classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.DataFrame

**predict\_proba**(*self*, *X*)

Make prediction probabilities using the fitted LightGBM classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** pd.DataFrame

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.LightGBMRegressor(boosting_type='gbdt',  
                                                             learning_rate=0.1,  
                                                             n_estimators=20, max_depth=0,  
                                                             num_leaves=31,  
                                                             min_child_samples=20,  
                                                             bagging_fraction=0.9,  
                                                             bagging_freq=0, n_jobs=- 1,  
                                                             random_seed=0, **kwargs)
```

LightGBM Regressor.

### Parameters

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select bagging\_fraction \* 100 % of the data to use for the next k iterations. Defaults to 0.
- **n\_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns importance associated with each feature.                                                                                 |
| <code>fit</code>                      | Fits LightGBM regressor to data.                                                                                                 |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted LightGBM regressor.                                                                                |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*, *y=None*)

Fits LightGBM regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted LightGBM regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.estimators.LinearRegressor`(*fit\_intercept=True*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Linear Regressor.

**Parameters**

- **fit\_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `property feature_importance(self)`

Feature importance for fitted linear regressor.

### `fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set `_is_fitted` to *False*.

```
class evalml.pipelines.components.estimators.LogisticRegressionClassifier(penalty='l2',
                                                                    C=1.0,
                                                                    multi_class='auto',
                                                                    solver='lbfgs',
                                                                    n_jobs=-1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Logistic Regression Classifier.

**Parameters**

- **penalty** (*{*"l1", "l2", "elasticnet", "none"*}*) – The norm used in penalization. Defaults to "l2".
- **C** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi\_class** (*{*"auto", "ovr", "multinomial"*}*) – If the option chosen is "ovr", then a binary problem is fit for each label. For "multinomial" the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. "multinomial" is unavailable when `solver="liblinear"`. "auto" selects "ovr" if the data is binary, or if `solver="liblinear"`, and otherwise selects "multinomial". Defaults to "auto".
- **solver** (*{*"newton-cg", "lbfgs", "liblinear", "sag", "saga"*}*) – Algorithm to use in the optimization problem. For small datasets, "liblinear" is a good choice, whereas "sag" and "saga" are faster for large ones. For multiclass problems, only "newton-cg", "sag", "saga" and "lbfgs" handle multinomial loss; "liblinear" is limited to one-versus-rest schemes.
  - "newton-cg", "lbfgs", "sag" and "saga" handle L2 or no penalty
  - "liblinear" and "saga" also handle L1 penalty
  - "saga" also supports "elasticnet" penalty
  - "liblinear" does not support setting `penalty='none'`

Defaults to “lbfgs”.

- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance for fitted logistic regression classifier.                                                                    |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted logistic regression classifier.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.ProphetRegressor(time_index: Optional[Hashable] =
    None, changepoint_prior_scale:
    float = 0.05,
    seasonality_prior_scale: int = 10,
    holidays_prior_scale: int = 10,
    seasonality_mode: str = 'additive',
    stan_backend: str =
    'CMDSTANPY', interval_width:
    float = 0.95, random_seed:
    Union[int, float] = 0, **kwargs)
```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint\_prior\_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality\_prior\_scale** (*int*) – Similar to changepoint\_prior\_scale. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays\_prior\_scale** (*int*) – Similar to changepoint\_prior\_scale. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality\_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan\_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval\_width** (*float*) – Determines the confidence of the prediction interval range when calling *get\_prediction\_intervals*. Accepts values in the range (0,1). Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>build_prophet_df</code>         | Build the Prophet data to pass fit and predict on.                                                                               |
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.                                     |
| <code>fit</code>                      | Fits Prophet regressor component to data.                                                                                        |
| <code>get_params</code>               | Get parameters for the Prophet regressor.                                                                                        |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted ProphetRegressor.                                                                 |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using fitted Prophet regressor.                                                                                 |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**static** `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time\_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*) → dict

Returns the default parameters for this component.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name*=False, *return\_dict*=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property** `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature\_importance is not defined for Prophet regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self**get\_params**(*self*) → dict

Get parameters for the Prophet regressor.

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.**Return type** dict**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.**Returns** ComponentBase object**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.

**Returns** Predicted values.**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.RandomForestClassifier(n_estimators=100,
                                                                    max_depth=6, n_jobs=-1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Random Forest Classifier.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (`pd.DataFrame`) – Features.

**Returns** Probability estimates.

**Return type** `pd.Series`

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (`str`) – Location to save file.
- **`pickle_protocol`** (`int`) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (`dict`) – A dict of parameters to update.
- **`reset_fit`** (`bool`, *optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.components.estimators.RandomForestRegressor`**(*n\_estimators: int = 100, max\_depth: int = 6, n\_jobs: int = -1, random\_seed: Union[int, float] = 0, \*\*kwargs*)

Random Forest Regressor.

**Parameters**

- **`n_estimators`** (`float`) – The number of trees in the forest. Defaults to 100.
- **`max_depth`** (`int`) – Maximum tree depth for base learners. Defaults to 6.
- **`n_jobs`** (`int` or `None`) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`random_seed`** (`int`) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted RandomForestRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.estimators.SVMClassifier(C=1.0, kernel='rbf', gamma='auto', probability=True, random_seed=0, **kwargs)`

Support Vector Machine Classifier.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses 1 / (n\_features \* X.var()) as value of gamma - If “auto” (default), uses 1 / n\_features
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

**Returns** Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.estimators.**SVMRegressor**(*C*=*1.0*, *kernel*='rbf', *gamma*='auto', *random\_seed*=*0*, *\*\*kwargs*)

Support Vector Machine Regressor.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** ({*"poly"*, *"rbf"*, *"sigmoid"*}) – Specifies the kernel type to be used in the algorithm. Defaults to "rbf".

- **gamma** (*{"scale", "auto"} or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses  $1 / (n\_features * X.var())$  as value of gamma - If “auto” (default), uses  $1 / n\_features$
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

**Returns** The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.TimeSeriesBaselineEstimator(gap=1,
                                                                    forecast_horizon=1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

#### Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast\_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <i>predict</i>                  | Make predictions using fitted time series baseline estimator.                                                                    |
| <i>predict_proba</i>            | Make prediction probabilities using fitted time series baseline estimator.                                                       |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self, X*)

Make predictions using fitted time series baseline estimator.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **ValueError** – If input y is None.

**predict\_proba**(*self, X*)

Make prediction probabilities using fitted time series baseline estimator.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input y is None.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.

- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.VowpalWabbitBinaryClassifier(loss_function='logistic',
                                                                    learning_rate=0.5,
                                                                    decay_
                                                                    cay_learning_rate=1.0,
                                                                    power_t=0.5,
                                                                    passes=1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Vowpal Wabbit Binary Classifier.

#### Parameters

- **loss\_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** `self`

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** *dict*

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a *component\_obj* that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.VowpalWabbitMulticlassClassifier(loss_function='logistic',
                                                                           learning_rate=0.5,
                                                                           decay_learning_rate=1.0,
                                                                           power_t=0.5,
                                                                           passes=1, random_seed=0,
                                                                           **kwargs)
```

Vowpal Wabbit Multiclass Classifier.

**Parameters**

- **loss\_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance for Vowpal Wabbit classifiers. This is not implemented.                                                       |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.estimators.VowpalWabbitRegressor(*learning\_rate*=0.5,  
 *decay\_learning\_rate*=1.0,  
 *power\_t*=0.5, *passes*=1,  
 *random\_seed*=0, *\*\*kwargs*)

Vowpal Wabbit Regressor.

**Parameters**

- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay\_learning\_rate** (*float*) – Decay factor for learning\_rate. Defaults to 1.0.
- **power\_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for Vowpal Wabbit regressor.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.estimators.XGBoostClassifier(eta=0.1, max_depth=6,
                                                             min_child_weight=1,
                                                             n_estimators=100,
                                                             random_seed=0,
                                                             eval_metric='logloss', n_jobs=12,
                                                             **kwargs)
```

XGBoost Classifier.

**Parameters**

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0

- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted XGBoost classifier.

**fit**(*self*, *X*, *y=None*)

Fits XGBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters`(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted XGBoost classifier.

**Parameters** `X` (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** `X` (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- `file_path` (*str*) – Location to save file.
- `pickle_protocol` (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- `update_dict` (*dict*) – A dict of parameters to update.
- `reset_fit` (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.estimators.XGBoostRegressor`(*eta: float = 0.1*, *max\_depth: int = 6*, *min\_child\_weight: int = 1*, *n\_estimators: int = 100*, *random\_seed: Union[int, float] = 0*, *n\_jobs: int = 12*, *\*\*kwargs*)

XGBoost Regressor.

**Parameters**

- `eta` (*float*) – Boosting learning rate. Defaults to 0.1.

- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min\_child\_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n\_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(self)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(self)**

Returns the parameters which were used to initialize the component.

**predict(self, X: pandas.DataFrame) → pandas.Series**

Make predictions using fitted XGBoost regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**predict\_proba(self, X: pandas.DataFrame) → pandas.Series**

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save(self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(self, update\_dict, reset\_fit=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**transformers**

Components that transform data.

## Subpackages

### dimensionality\_reduction

Transformers that reduce the dimensionality of the input data.

## Submodules

### lda

Component that reduces the number of features by using Linear Discriminant Analysis.

## Contents

**class** evalml.pipelines.components.transformers.dimensionality\_reduction.lda.**LinearDiscriminantAnalysis**(  
/

Reduces the number of features by using Linear Discriminant Analysis.

#### Parameters

- **n\_components** (*int*) – The number of features to maintain after computation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                          |
|-------------------------------|------------------------------------------|
| <b>hyper-parameter_ranges</b> | {}                                       |
| <b>modifies_features</b>      | True                                     |
| <b>modifies_target</b>        | False                                    |
| <b>name</b>                   | Linear Discriminant Analysis Transformer |
| <b>training_only</b>          | False                                    |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the LDA component.                                                                                                          |
| <code>fit_transform</code>      | Fit and transform data using the LDA component.                                                                                  |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted LDA component.                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform(self, X, y=None)**

Fit and transform data using the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

## pca

Component that reduces the number of features by using Principal Component Analysis (PCA).

|            |                                                                             |
|------------|-----------------------------------------------------------------------------|
| <i>PCA</i> | Reduces the number of features by using Principal Component Analysis (PCA). |
|------------|-----------------------------------------------------------------------------|

### Contents

```
class evalml.pipelines.components.transformers.dimensionality_reduction.pca.PCA(variance=0.95,
                                         n_components=None,
                                         random_seed=0,
                                         **kwargs)
```

Reduces the number of features by using Principal Component Analysis (PCA).

#### Parameters

- **variance** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **n\_components** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                   |
|-------------------------------|-----------------------------------|
| <b>hyper-parameter_ranges</b> | Real(0.25, 1)}:type: {"variance"} |
| <b>modifies_features</b>      | True                              |
| <b>modifies_target</b>        | False                             |
| <b>name</b>                   | PCA Transformer                   |
| <b>training_only</b>          | False                             |

#### Methods

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the PCA component.                                                                                                          |
| <code>fit_transform</code>      | Fit and transform data using the PCA component.                                                                                  |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using fitted PCA component.                                                                                       |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit**(*self*, *X*, *y=None*)

Fits the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted LDA component.                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform(self, X, y=None)**

Fit and transform data using the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.dimensionality\_reduction.PCA(*variance=0.95*,  
*n\_components=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Reduces the number of features by using Principal Component Analysis (PCA).

### Parameters

- **variance** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **n\_components** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                               |                                   |
|-------------------------------|-----------------------------------|
| <b>hyper-parameter_ranges</b> | Real(0.25, 1)}:type: {"variance"} |
| <b>modifies_features</b>      | True                              |
| <b>modifies_target</b>        | False                             |
| <b>name</b>                   | PCA Transformer                   |
| <b>training_only</b>          | False                             |

### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the PCA component.                                                                                                          |
| <i>fit_transform</i>      | Fit and transform data using the PCA component.                                                                                  |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using fitted PCA component.                                                                                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## encoders

Components used to encode the input data.

## Submodules

### label\_encoder

A transformer that encodes target labels using values between 0 and num\_classes - 1.

## Contents

**class** evalml.pipelines.components.transformers.encoders.label\_encoder.**LabelEncoder**(*positive\_label=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

A transformer that encodes target labels using values between 0 and num\_classes - 1.

**Parameters**

- **positive\_label** (*int*, *str*) – The label for the class that should be treated as positive (1) for binary classification problems. Ignored for multiclass problems. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0. Ignored.

#### Attributes

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the label encoder.                                                                                                          |
| <i>fit_transform</i>      | Fit and transform data using the label encoder.                                                                                  |
| <i>inverse_transform</i>  | Decodes the target data.                                                                                                         |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform the target using the fitted label encoder.                                                                             |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y*)

Fits the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**fit\_transform**(*self, X, y*)

Fit and transform data using the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** pd.DataFrame, pd.Series

**inverse\_transform**(*self, y*)

Decodes the target data.

**Parameters** **y** (*pd.Series*) – Target data.

**Returns** The decoded version of the target.

**Return type** pd.Series

**Raises** **ValueError** – If input y is None.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform the target using the fitted label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**Raises** **ValueError** – If input *y* is *None*.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

## onehot\_encoder

A transformer that encodes categorical features in a one-hot numeric array.

```

class evalml.pipelines.components.transformers.encoders.onehot_encoder.OneHotEncoder(top_n=10,
                                                                 features_to_encode=None,
                                                                 categories=None,
                                                                 drop='if_binary',
                                                                 handle_unknown='ignore',
                                                                 handle_missing='error',
                                                                 random_seed=0,
                                                                 **kwargs)

```

A transformer that encodes categorical features in a one-hot numeric array.

### Parameters

- **top\_n** (*int*) – Number of categories per column to encode. If *None*, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If *None*, all appropriate columns will be encoded. Defaults to *None*.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “auto” if *top\_n* is not *None*. Defaults to *None*.
- **drop** (*string, list*) – Method (“first” or “if\_binary”) to use to drop one category per feature. Can also be a list specifying which categories to drop for each feature. Defaults to “if\_binary”.
- **handle\_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top\_n* or *categories* is used to limit the number of categories per column, this must be “ignore”. Defaults to “ignore”.
- **handle\_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “as\_category” and NaN values are within the *n* most frequent, “nan” values will be encoded as their own column. If this is set to “error”, any missing values encountered will raise an error. Defaults to “error”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                        |                 |
|------------------------|-----------------|
| hyper-parameter_ranges | {}              |

| modifies_target        | False           |
| name                   | One Hot Encoder |
| training_only          | False           |

### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>categories</code>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the one-hot encoder component.                                                                                              |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>get_feature_names</code>  | Return feature names for the categorical features after fitting.                                                                 |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | One-hot encode the input data.                                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to one-hot encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to one-hot encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the one-hot encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**Raises** **ValueError** – If encoding a column failed.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the categorical features after fitting.

Feature names are formatted as {column name}\_{category name}. In the event of a duplicate name, an integer will be added at the end of the feature name to distinguish it.

For example, consider a dataframe with a column called “A” and category “x\_y” and another column called “A\_x” with “y”. In this example, the feature names would be “A\_x\_y” and “A\_x\_y\_1”.

**Returns** The feature names after encoding, provided in the same order as *input\_features*.

**Return type** *np.ndarray*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

One-hot encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to one-hot encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each categorical feature has been encoded into numerical columns using one-hot encoding.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.encoders.onehot_encoder.OneHotEncoderMeta`

A version of the ComponentBaseMeta class which includes validation on an additional one-hot-encoder-specific method *categories*.

**Attributes**

|                            |                          |
|----------------------------|--------------------------|
| <b>FIT_METHODS</b>         | ['fit', 'fit_transform'] |
| <b>METHODS_TO_CHECK</b>    | None                     |
| <b>PROPERTIES_TO_CHECK</b> | ['feature_importance']   |

**Methods**

|                            |                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------|
| <code>check_for_fit</code> | <i>check_for_fit</i> wraps a method that validates if <i>self._is_fitted</i> is <i>True</i> . |
| <code>register</code>      | Register a virtual subclass of an ABC.                                                        |
| <code>set_fit</code>       | Wrapper for the fit method.                                                                   |

**classmethod** **check\_for\_fit**(*cls*, *method*)

*check\_for\_fit* wraps a method that validates if *self.\_is\_fitted* is *True*.

It raises an exception if *False* and calls and returns the wrapped method if *True*.

**Parameters** **method** (*callable*) – Method to wrap.

**Returns** The wrapped method.

**Raises** **ComponentNotYetFittedError** – If component is not yet fitted.

**register**(*cls*, *subclass*)

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

```
classmethod set_fit(cls, method)
```

Wrapper for the fit method.

## ordinal\_encoder

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

|                           |                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>OrdinalEncoder</i>     | A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.              |
| <i>OrdinalEncoderMeta</i> | A version of the ComponentBaseMeta class which includes validation on an additional ordinal-encoder-specific method <i>categories</i> . |

## Contents

```
class evalml.pipelines.components.transformers.encoders.ordinal_encoder.OrdinalEncoder(features_to_encode=  
    cat-  
    e-  
    gories=None,  
    han-  
    dle_unknown='error',  
    un-  
    known_value=None,  
    en-  
    coded_missing_value=  
    ran-  
    dom_seed=0,  
    **kwargs)
```

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

### Parameters

- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None. The order of columns does not matter.
- **categories** (*dict[str, list[str]]*) – A dictionary mapping column names to their categories in the dataframes passed in at fit and transform. The order of categories specified for a column does not matter. Any category found in the data that is not present in categories will be handled as an unknown value. To not have unknown values raise an error, set `handle_unknown` to “use\_encoded\_value”. Defaults to None.
- **handle\_unknown** (“error” or “use\_encoded\_value”) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. When set to “error”, an error will be raised when an unknown category is found. When set to “use\_encoded\_value”,

unknown categories will be encoded as the value given for the parameter `unknown_value`. Defaults to “error.”

- **`unknown_value`** (*int or np.nan*) – The value to use for unknown categories seen during fit or transform. Required when the parameter `handle_unknown` is set to “`use_encoded_value`.” The value has to be distinct from the values used to encode any of the categories in fit. Defaults to `None`.
- **`encoded_missing_value`** (*int or np.nan*) – The value to use for missing (null) values seen during fit or transform. Defaults to `np.nan`.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                                            |                    |
|--------------------------------------------|--------------------|
| <b><code>hyper-parameter_ranges</code></b> | <code>{}</code>    |
| <b><code>modifies_features</code></b>      | <code>True</code>  |
| <b><code>modifies_target</code></b>        | <code>False</code> |
| <b><code>name</code></b>                   | Ordinal Encoder    |
| <b><code>training_only</code></b>          | <code>False</code> |

#### Methods

|                                        |                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i><code>categories</code></i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                                                                              |
| <i><code>clone</code></i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i><code>default_parameters</code></i> | Returns the default parameters for this component.                                                                                                                                       |
| <i><code>describe</code></i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i><code>fit</code></i>                | Fits the ordinal encoder component.                                                                                                                                                      |
| <i><code>fit_transform</code></i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i><code>get_feature_names</code></i>  | Return feature names for the ordinal features after fitting.                                                                                                                             |
| <i><code>load</code></i>               | Loads component at file path.                                                                                                                                                            |
| <i><code>needs_fitting</code></i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i><code>parameters</code></i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i><code>save</code></i>               | Saves component at file path.                                                                                                                                                            |
| <i><code>transform</code></i>          | Ordinally encode the input data.                                                                                                                                                         |
| <i><code>update_parameters</code></i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **`categories(self, feature_name)`**

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **`feature_name`** (*str*) – The name of any feature provided to ordinal encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to ordinal encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the ordinal encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** self

**Raises**

- **ValueError** – If encoding a column failed.
- **TypeError** – If non-Ordinal columns are specified in `features_to_encode`.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the ordinal features after fitting.

Feature names are formatted as {column name}\_ordinal\_encoding.

**Returns** The feature names after encoding, provided in the same order as `input_features`.

**Return type** np.ndarray

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Ordinally encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each ordinal feature has been encoded into a numerical column where ordinal integers represent the relative order of categories.

**Return type** pd.DataFrame

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class**

`evalml.pipelines.components.transformers.encoders.ordinal_encoder.OrdinalEncoderMeta`

A version of the ComponentBaseMeta class which includes validation on an additional ordinal-encoder-specific method `categories`.

**Attributes**

|                            |                          |
|----------------------------|--------------------------|

|                                      |                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#"><i>check_for_fit</i></a> | <i>check_for_fit</i> wraps a method that validates if <i>self._is_fitted</i> is <i>True</i> . |
| <a href="#"><i>register</i></a>      | Register a virtual subclass of an ABC.                                                        |
| <a href="#"><i>set_fit</i></a>       | Wrapper for the fit method.                                                                   |

**classmethod** `check_for_fit(cls, method)`

*check\_for\_fit* wraps a method that validates if *self.\_is\_fitted* is *True*.

It raises an exception if *False* and calls and returns the wrapped method if *True*.

**Parameters** `method` (*callable*) – Method to wrap.

**Returns** The wrapped method.

**Raises** **ComponentNotYetFittedError** – If component is not yet fitted.

**register**(*cls, subclass*)

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

**classmethod** `set_fit(cls, method)`

Wrapper for the fit method.

## target\_encoder

A transformer that encodes categorical features into target encodings.

|--------------------------------------|------------------------------------------------------------------------|
| <a href="#"><i>TargetEncoder</i></a> | A transformer that encodes categorical features into target encodings. |
|--------------------------------------|------------------------------------------------------------------------|

## Contents

```
class evalml.pipelines.components.transformers.encoders.target_encoder.TargetEncoder(cols=None,
                                             smoothing=1,
                                             handle_unknown='value',
                                             handle_missing='value',
                                             random_seed=0,
                                             **kwargs)
```

A transformer that encodes categorical features into target encodings.

### Parameters

- **cols** (*list*) – Columns to encode. If *None*, all string columns will be encoded, otherwise only the columns provided will be encoded. Defaults to *None*
- **smoothing** (*float*) – The smoothing factor to apply. The larger this value is, the more influence the expected target value has on the resulting target encodings. Must be strictly larger than 0. Defaults to 1.0
- **handle\_unknown** (*string*) – Determines how to handle unknown categories for a feature encountered. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **handle\_missing** (*string*) – Determines how to handle missing values encountered during *fit* or *transform*. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                        |                |
|------------------------|----------------|
| hyper-parameter_ranges | {}             |
| modifies_features      | True           |
| modifies_target        | False          |
| name                   | Target Encoder |
| training_only          | False          |

### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the target encoder.                                                                                                         |
| <code>fit_transform</code>      | Fit and transform data using the target encoder.                                                                                 |
| <code>get_feature_names</code>  | Return feature names for the input features after fitting.                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted target encoder.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y)**

Fit and transform data using the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_feature\_names**(*self*)

Return feature names for the input features after fitting.

**Returns** The feature names after encoding.

**Return type** *np.array*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Package Contents

### Classes Summary

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>LabelEncoder</i>   | A transformer that encodes target labels using values between 0 and num_classes - 1.                                       |
| <i>OneHotEncoder</i>  | A transformer that encodes categorical features in a one-hot numeric array.                                                |
| <i>OrdinalEncoder</i> | A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories. |
| <i>TargetEncoder</i>  | A transformer that encodes categorical features into target encodings.                                                     |

### Contents

```
class evalml.pipelines.components.transformers.encoders.LabelEncoder(positive_label=None,
                                                                    random_seed=0,
                                                                    **kwargs)
```

A transformer that encodes target labels using values between 0 and num\_classes - 1.

#### Parameters

- **positive\_label** (*int*, *str*) – The label for the class that should be treated as positive (1) for binary classification problems. Ignored for multiclass problems. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0. Ignored.

#### Attributes

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the label encoder.                                                                                                          |
| <code>fit_transform</code>      | Fit and transform data using the label encoder.                                                                                  |
| <code>inverse_transform</code>  | Decodes the target data.                                                                                                         |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform the target using the fitted label encoder.                                                                             |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**inverse\_transform**(*self*, *y*)

Decodes the target data.

**Parameters** **y** (*pd.Series*) – Target data.

**Returns** The decoded version of the target.

**Return type** *pd.Series*

**Raises** **ValueError** – If input *y* is None.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform the target using the fitted label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**Raises** **ValueError** – If input *y* is None.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.encoders.**OneHotEncoder**(*top\_n=10*, *features\_to\_encode=None*, *categories=None*, *drop='if\_binary'*, *handle\_unknown='ignore'*, *handle\_missing='error'*, *random\_seed=0*, *\*\*kwargs*)

A transformer that encodes categorical features in a one-hot numeric array.

#### Parameters

- **top\_n** (*int*) – Number of categories per column to encode. If None, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “*auto*” if *top\_n* is not None. Defaults to None.
- **drop** (*string*, *list*) – Method (“first” or “if\_binary”) to use to drop one category per feature. Can also be a list specifying which categories to drop for each feature. Defaults to ‘if\_binary’.
- **handle\_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top\_n* or *categories* is used to limit the number of categories per column, this must be “ignore”. Defaults to “ignore”.
- **handle\_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “as\_category” and NaN values are within the *n* most frequent, “nan” values will be encoded as their own column. If this is set to “error”, any missing values encountered will raise an error. Defaults to “error”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                        |                 |
|------------------------|-----------------|
| hyper-parameter_ranges | {}              |
| modifies_features      | True            |
| modifies_target        | False           |
| name                   | One Hot Encoder |
| training_only          | False           |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>categories</code>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the one-hot encoder component.                                                                                              |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>get_feature_names</code>  | Return feature names for the categorical features after fitting.                                                                 |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | One-hot encode the input data.                                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to one-hot encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to one-hot encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the one-hot encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**Raises** **ValueError** – If encoding a column failed.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the categorical features after fitting.

Feature names are formatted as {column name}\_{category name}. In the event of a duplicate name, an integer will be added at the end of the feature name to distinguish it.

For example, consider a dataframe with a column called “A” and category “x\_y” and another column called “A\_x” with “y”. In this example, the feature names would be “A\_x\_y” and “A\_x\_y\_1”.

**Returns** The feature names after encoding, provided in the same order as *input\_features*.

**Return type** *np.ndarray*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

One-hot encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to one-hot encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each categorical feature has been encoded into numerical columns using one-hot encoding.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.encoders.OrdinalEncoder(features_to_encode=None,
                                                                    categories=None, handle_unknown='error',
                                                                    unknown_value=None,
                                                                    encoded_missing_value=None,
                                                                    random_seed=0,
                                                                    **kwargs)
```

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

**Parameters**

- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None. The order of columns does not matter.
- **categories** (*dict[str, list[str]]*) – A dictionary mapping column names to their categories in the dataframes passed in at fit and transform. The order of categories specified for a column does not matter. Any category found in the data that is not present in categories will be handled as an unknown value. To not have unknown values raise an error, set *handle\_unknown* to “use\_encoded\_value”. Defaults to None.
- **handle\_unknown** (“error” or “use\_encoded\_value”) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. When set to “error”, an error will be raised when an unknown category is found. When set to “use\_encoded\_value”, unknown categories will be encoded as the value given for the parameter *unknown\_value*. Defaults to “error.”

- **unknown\_value** (*int or np.nan*) – The value to use for unknown categories seen during fit or transform. Required when the parameter `handle_unknown` is set to “`use_encoded_value`.” The value has to be distinct from the values used to encode any of the categories in fit. Defaults to `None`.
- **encoded\_missing\_value** (*int or np.nan*) – The value to use for missing (null) values seen during fit or transform. Defaults to `np.nan`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                                                                              |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits the ordinal encoder component.                                                                                                                                                      |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i>get_feature_names</i>  | Return feature names for the ordinal features after fitting.                                                                                                                             |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Ordinally encode the input data.                                                                                                                                                         |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to ordinal encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** `np.ndarray`

**Raises** **ValueError** – If feature was not provided to ordinal encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the ordinal encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** *self*

**Raises**

- **ValueError** – If encoding a column failed.
- **TypeError** – If non-Ordinal columns are specified in `features_to_encode`.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the ordinal features after fitting.

Feature names are formatted as {column name}\_ordinal\_encoding.

**Returns** The feature names after encoding, provided in the same order as `input_features`.

**Return type** np.ndarray

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Ordinally encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each ordinal feature has been encoded into a numerical column where ordinal integers represent the relative order of categories.

**Return type** pd.DataFrame

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.encoders.TargetEncoder(cols=None,
                                                                    smoothing=1, handle_
                                                                    unknown='value',
                                                                    handle_
                                                                    missing='value',
                                                                    random_seed=0,
                                                                    **kwargs)
```

A transformer that encodes categorical features into target encodings.

**Parameters**

- **cols** (*list*) – Columns to encode. If None, all string columns will be encoded, otherwise only the columns provided will be encoded. Defaults to None

- **smoothing** (*float*) – The smoothing factor to apply. The larger this value is, the more influence the expected target value has on the resulting target encodings. Must be strictly larger than 0. Defaults to 1.0
- **handle\_unknown** (*string*) – Determines how to handle unknown categories for a feature encountered. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **handle\_missing** (*string*) – Determines how to handle missing values encountered during *fit* or *transform*. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the target encoder.                                                                                                         |
| <i>fit_transform</i>      | Fit and transform data using the target encoder.                                                                                 |
| <i>get_feature_names</i>  | Return feature names for the input features after fitting.                                                                       |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted target encoder.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_feature\_names**(*self*)

Return feature names for the input features after fitting.

**Returns** The feature names after encoding.

**Return type** *np.array*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## feature\_selection

Components that select features.

### Submodules

#### feature\_selector

Component that selects top features based on importance weights.

## Module Contents

### Classes Summary

---

*FeatureSelector*

Selects top features based on importance weights.

---

## Contents

```
class evalml.pipelines.components.transformers.feature_selection.feature_selector.FeatureSelector(parameters,  
                                                component_obj,  
                                                random_seed)  
    """Selects top features based on importance weights.  
    **kwargs
```

Selects top features based on importance weights.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                          |       |
|--------------------------|-------|
| <b>modifies_features</b> | True  |
| <b>modifies_target</b>   | False |
| <b>training_only</b>     | False |

### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>name</i>               | Returns string name of this component.                                                                                                                   |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform(*self*, *X*, *y=None*)**

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names(*self*)**

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property** `name(cls)`

Returns string name of this component.

**property** `needs_fitting(self)`

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the `component_obj` does not have a `transform` method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed `X`

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a `transform` method or a `component_obj` that implements `transform`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

## recursive\_feature\_elimination\_selector

Components that select top features based on recursive feature elimination with a Random Forest model.

## Module Contents

### Classes Summary

| <b>modifies_features</b>      | True                         |
| <b>modifies_target</b>        | False                        |
| <b>training_only</b>          | False                        |

#### Methods

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>name</code>               | Returns string name of this component.                                                                                                                                |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a `component_obj` that implements transform

**`update_parameters`**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.transformers.feature\_selection.recursive\_feature\_elimination\_selector

Selects relevant features using recursive feature elimination with a Random Forest Classifier.

#### Parameters

- **`step`** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the `min_features_to_select` constraint. Defaults to 0.2.
- **`min_features_to_select`** (*int*) – The minimum number of features to return. Defaults to 1.
- **`cv`** (*int or None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **`scoring`** (*str, callable or None*) – A string or scorer callable object to specify the scoring method.
- **`n_jobs`** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`n_estimators`** (*int*) – The number of trees in the forest. Defaults to 10.
- **`max_depth`** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

|-------------------------------|---------------------------------|
| <b>hyper-parameter_ranges</b> | { “step”: Real(0.05, 0.25)}     |
| <b>modifies_features</b>      | True                            |
| <b>modifies_target</b>        | False                           |
| <b>name</b>                   | RFE Selector with RF Classifier |
| <b>training_only</b>          | False                           |

## Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

#### Parameters

- **print\_name** (bool, optional) – whether to print name of component
- **return\_dict** (bool, optional) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** `self`

**Raises** **MethodPropertyNotFoundError** – If component does not have a `fit` method or a `component_obj` that implements `fit`.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** `list[str]`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.feature\_selection.recursive\_feature\_elimination\_selector

Selects relevant features using recursive feature elimination with a Random Forest Regressor.

**Parameters**

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the *min\_features\_to\_select* constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.

- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self, X, y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## rf\_classifier\_feature\_selector

Component that selects top features based on importance weights using a Random Forest classifier.

## Contents

```
class evalml.pipelines.components.transformers.feature_selection.rf_classifier_feature_selector.RFClassifierFeatureSelector:
```

Selects top features based on importance weights using a Random Forest classifier.

#### Parameters

- **number\_features** (*int*) – The maximum number of features to select. If both percent\_features and number\_features are specified, take the greater number of features. Defaults to None.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both percent\_features and number\_features are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## rf\_regressor\_feature\_selector

Component that selects top features based on importance weights using a Random Forest regressor.

## Module Contents

### Classes Summary

---

*RFRegressorSelectFromModel*

Selects top features based on importance weights using a Random Forest regressor.

---

## Contents

`class evalml.pipelines.components.transformers.feature_selection.rf_regressor_feature_selector.RFRegressorSelectFromModel`

Selects top features based on importance weights using a Random Forest regressor.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.

- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self, X, y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## Classes Summary

|                                    |                                                                                                |
|------------------------------------|------------------------------------------------------------------------------------------------|
| <i>FeatureSelector</i>             | Selects top features based on importance weights.                                              |
| <i>RFClassifierRFSelector</i>      | Selects relevant features using recursive feature elimination with a Random Forest Classifier. |
| <i>RFClassifierSelectFromModel</i> | Selects top features based on importance weights using a Random Forest classifier.             |
| <i>RFRegressorRFSelector</i>       | Selects relevant features using recursive feature elimination with a Random Forest Regressor.  |
| <i>RFRegressorSelectFromModel</i>  | Selects top features based on importance weights using a Random Forest regressor.              |

## Contents

```
class evalml.pipelines.components.transformers.feature_selection.FeatureSelector(parameters=None,
                                         component_obj=None,
                                         random_seed=0,
                                         **kwargs)
```

Selects top features based on importance weights.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                          |       |
|--------------------------|-------|
| <b>modifies_features</b> | True  |
| <b>modifies_target</b>   | False |
| <b>training_only</b>     | False |

### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>name</i>               | Returns string name of this component.                                                                                                                   |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** `self`

**Raises** **MethodPropertyNotFoundError** – If component does not have a `fit` method or a `component_obj` that implements `fit`.

**fit\_transform(*self*, *X*, *y=None*)**

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**get\_names(*self*)**

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** `list[str]`

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**property name(*cls*)**

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.feature_selection.RFClassifierRFSelector(step=0.2,  
                                                                                     min_features_to_sel=  
                                                                                     cv=None,  
                                                                                     scoring=  
                                                                                     scoring=None,  
                                                                                     n_jobs=-  
                                                                                     1,  
                                                                                     n_estimators=10,  
                                                                                     max_depth=None,  
                                                                                     random_state=  
                                                                                     random_state=0,  
                                                                                     **kwargs)
```

Selects relevant features using recursive feature elimination with a Random Forest Classifier.

**Parameters**

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the `min_features_to_select` constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to *None* which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.feature\_selection.RFClassifierSelectFromModel(*number\_features*, *n\_estimators*, *max\_depth=None*, *percent\_features*, *threshold='median'*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Selects top features based on importance weights using a Random Forest classifier.

#### Parameters

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to None.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits component to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.feature\_selection.RFRegressorRFSelector(*step=0.2*,  
*min\_features\_to\_select*,  
*cv=None*,  
*scoring=None*,  
*n\_jobs=-1*,  
*n\_estimators=10*,  
*max\_depth=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Selects relevant features using recursive feature elimination with a Random Forest Regressor.

#### Parameters

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the *min\_features\_to\_select* constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

#### Parameters

- **print\_name** (bool, optional) – whether to print name of component
- **return\_dict** (bool, optional) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** `self`

**Raises** **MethodPropertyNotFoundError** – If component does not have a `fit` method or a `component_obj` that implements `fit`.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** `list[str]`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.feature\_selection.**RFRegressorSelectFromModel**(*number\_features*, *n\_estimators*, *max\_depth=None*, *percent\_features*, *threshold='median'*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Selects top features based on importance weights using a Random Forest regressor.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (bool, optional) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self, X, y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## imputers

Components that impute missing values in the input data.

## Submodules

### imputer

Component that imputes missing data according to a specified imputation strategy.

|----------------|--------------------------------------------------------------------|
| <i>Imputer</i> | Imputes missing data according to a specified imputation strategy. |
|----------------|--------------------------------------------------------------------|

## Contents

```
class evalml.pipelines.components.transformers.imputers.imputer.Imputer(categorical_impute_strategy='most_frequent',
                                categorical_fill_value=None,
                                numeric_impute_strategy='mean',
                                numeric_fill_value=None,
                                boolean_impute_strategy='most_frequent',
                                boolean_fill_value=None,
                                random_seed=0,
                                **kwargs)
```

Imputes missing data according to a specified imputation strategy.

### Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most\_frequent” and “constant”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “mean”, “median”, “most\_frequent”, and “constant”.
- **boolean\_impute\_strategy** (*string*) – Impute strategy to use for boolean columns. Valid values include “most\_frequent” and “constant”.
- **categorical\_fill\_value** (*string*) – When categorical\_impute\_strategy == “constant”, fill\_value is used to replace missing data. The default value of None will fill with the string “missing\_value”.
- **numeric\_fill\_value** (*int*, *float*) – When numeric\_impute\_strategy == “constant”, fill\_value is used to replace missing data. The default value of None will fill with 0.
- **boolean\_fill\_value** (*bool*) – When boolean\_impute\_strategy == “constant”, fill\_value is used to replace missing data. The default value of None will fill with True.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by imputing missing values.                                                                                    |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

## knn\_imputer

Component that imputes missing data according to a specified imputation strategy.

```
class evalml.pipelines.components.transformers.imputers.knn_imputer.KNNImputer(number_neighbors=3,
                                         random_seed=0,
                                         **kwargs)
```

Imputes missing data using KNN according to a specified number of neighbors. Natural language columns are ignored.

#### Parameters

- **number\_neighbors** (*int*) – Number of nearest neighbors for KNN to search for. Defaults to 3.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                          |             |
|--------------------------|-------------|
| <b>modifies_features</b> | True        |

| <b>name</b>              | KNN Imputer |
| <b>training_only</b>     | False       |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – the input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – the target training data of length [n\_samples]

**Returns** self

**Raises ValueError** – if the KNNImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. ‘None’ and *np.nan* values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

per\_column\_imputer

Component that imputes missing data according to a specified imputation strategy per column.

Contents

`class evalml.pipelines.components.transformers.imputers.per_column_imputer.PerColumnImputer(impute_strategy, random_seed=0, **kwargs)`

Imputes missing data according to a specified imputation strategy per column.

Parameters

- **impute\_strategies** (*dict*) – Column and {"impute\_strategy": strategy, "fill\_value":value} pairings. Valid values for impute strategy include "mean", "median", "most\_frequent", "constant" for numerical data, and "most\_frequent", "constant" for object data types. Defaults to None, which uses "most\_frequent" for all columns. When impute\_strategy == "constant", fill\_value is used to replace missing data. When None, uses 0 when imputing numerical data and "missing\_value" for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

|                        |                    |
|------------------------|--------------------|
| hyper-parameter_ranges | {}                 |
| modifies_features      | True               |
| modifies_target        | False              |
| name                   | Per Column Imputer |
| training_only          | False              |

Methods

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputers on input data.                                                                                                     |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input data by imputing missing values.                                                                                |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputers on input data.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features] to fit.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]` to transform.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## simple\_imputer

Component that imputes missing data according to a specified imputation strategy.

|                      |                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <i>SimpleImputer</i> | Imputes missing data according to a specified imputation strategy. Natural language columns are ignored. |
|----------------------|----------------------------------------------------------------------------------------------------------|

### Contents

```
class evalml.pipelines.components.transformers.imputers.simple_imputer.SimpleImputer(impute_strategy='most_frequent',
                                             fill_value=None,
                                             random_seed=0,
                                             **kwargs)
```

Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.

#### Parameters

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types.
- **fill\_value** (*string*) – When impute\_strategy == “constant”, fill\_value is used to replace missing data. Defaults to 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – the input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – the target training data of length [n\_samples]

**Returns** self

**Raises** **ValueError** – if the SimpleImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. ‘None’ and *np.nan* values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

## target\_imputer

Component that imputes missing target data according to a specified imputation strategy.

### Module Contents

### Classes Summary

|                          |                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------|
| <i>TargetImputer</i>     | Imputes missing target data according to a specified imputation strategy.           |
| <i>TargetImputerMeta</i> | A version of the ComponentBaseMeta class which handles when input features is None. |

### Contents

```
class evalml.pipelines.components.transformers.imputers.target_imputer.TargetImputer(impute_strategy='most_frequent',
fill_value=None,
random_seed=0,
**kwargs)
```

Imputes missing target data according to a specified imputation strategy.

#### Parameters

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types. Defaults to “most\_frequent”.
- **fill\_value** (*string*) – When impute\_strategy == “constant”, fill\_value is used to replace missing data. Defaults to None which uses 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                              |                                                           |
|------------------------------|-----------------------------------------------------------|
| <b>hyperparameter_ranges</b> | { “impute_strategy”: [“mean”, “median”, “most_frequent”]} |
| <b>modifies_features</b>     | False                                                     |
| <b>modifies_target</b>       | True                                                      |
| <b>name</b>                  | Target Imputer                                            |
| <b>training_only</b>         | False                                                     |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.                |
| <code>fit_transform</code>      | Fits on and transforms the input target data.                                                                                    |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input target data by imputing missing values. 'None' and np.nan values are treated as the same.                       |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises `TypeError`** – If target is filled with all null values.

**`fit_transform(self, X, y)`**

Fits on and transforms the input target data.

**Parameters**

- **`X`** (*pd.DataFrame*) – Features. Ignored.
- **`y`** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (*pd.DataFrame*, *pd.Series*)

**`static load(file_path)`**

Loads component at file path.

**Parameters** **`file_path`** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**`property parameters(self)`**

Returns the parameters which were used to initialize the component.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`transform(self, X, y)`**

Transforms input target data by imputing missing values. ‘None’ and `np.nan` values are treated as the same.

**Parameters**

- **`X`** (*pd.DataFrame*) – Features. Ignored.
- **`y`** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (*pd.DataFrame*, *pd.Series*)

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.transformers.imputers.target\_imputer.**TargetImputerMeta**

A version of the ComponentBaseMeta class which handles when input features is None.

#### Attributes

|                            |                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------|

#### Methods

|                      |                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------|
| <i>check_for_fit</i> | <i>check_for_fit</i> wraps a method that validates if <i>self.is_fitted</i> is <i>True</i> . |
| <i>register</i>      | Register a virtual subclass of an ABC.                                                       |
| <i>set_fit</i>       | Wrapper for the fit method.                                                                  |

**classmethod** *check\_for\_fit*(cls, method)

*check\_for\_fit* wraps a method that validates if *self.is\_fitted* is *True*.

**Parameters** *method* (callable) – Method to wrap.

**Raises** **ComponentNotYetFittedError** – If component is not fitted.

**Returns** The wrapped input method.

**register**(cls, subclass)

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

**classmethod** *set\_fit*(cls, method)

Wrapper for the fit method.

## time\_series\_imputer

Component that imputes missing data according to a specified timeseries-specific imputation strategy.

```
class evalml.pipelines.components.transformers.imputers.time_series_imputer.TimeSeriesImputer(categorical_
                                                                                               nu-
                                                                                               meric_impu
                                                                                               tar-
                                                                                               get_impute_
                                                                                               ran-
                                                                                               dom_seed=
                                                                                               **kwargs)
```

Imputes missing data according to a specified timeseries-specific imputation strategy.

This Transformer should be used after the *TimeSeriesRegularizer* in order to impute the missing values that were added to X and y (if passed).

Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “backwards\_fill” and “forwards\_fill”. Defaults to “forwards\_fill”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “interpolate”.
- **target\_impute\_strategy** (*string*) – Impute strategy to use for the target column. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “forwards\_fill”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Raises ValueError** – If *categorical\_impute\_strategy*, *numeric\_impute\_strategy*, or *target\_impute\_strategy* is not one of the valid values.

Attributes

|                        |                                                                                                                                                                                                                                      |

Methods

|                                 |                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                             |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                                |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                                          |
| <code>fit</code>                | Fits imputer to data.                                                                                                                                                             |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                                     |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                                  |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                               |
| <code>save</code>               | Saves component at file path.                                                                                                                                                     |
| <code>transform</code>          | Transforms data X by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data.

'None' values are converted to np.nan before imputation and are treated as the same. If a value is missing at the beginning or end of a column, that value will be imputed using backwards fill or forwards fill as necessary, respectively.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Optionally, target data to transform.

**Returns** Transformed *X* and *y*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

| <i>TimeSeriesImputer</i> | Imputes missing data according to a specified timeseries-specific imputation strategy.                             |

### Contents

```
class evalml.pipelines.components.transformers.imputers.Imputer(categorical_impute_strategy='most_frequent',
                                                                categorical_fill_value=None, numeric_impute_strategy='mean',
                                                                numeric_fill_value=None,
                                                                boolean_impute_strategy='most_frequent',
                                                                boolean_fill_value=None,
                                                                random_seed=0, **kwargs)
```

Imputes missing data according to a specified imputation strategy.

#### Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most\_frequent” and “constant”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “mean”, “median”, “most\_frequent”, and “constant”.
- **boolean\_impute\_strategy** (*string*) – Impute strategy to use for boolean columns. Valid values include “most\_frequent” and “constant”.
- **categorical\_fill\_value** (*string*) – When `categorical_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with the string “missing\_value”.
- **numeric\_fill\_value** (*int*, *float*) – When `numeric_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with 0.
- **boolean\_fill\_value** (*bool*) – When `boolean_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with `True`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <b>modifies_target</b>        | False                                                                                                                                                                     |
| <b>name</b>                   | Imputer                                                                                                                                                                   |
| <b>training_only</b>          | False                                                                                                                                                                     |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by imputing missing values.                                                                                    |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*, *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.imputers.KNNImputer`(*number\_neighbors=3*,  
*random\_seed=0*, *\*\*kwargs*)

Imputes missing data using KNN according to a specified number of neighbors. Natural language columns are ignored.

**Parameters**

- **number\_neighbors** (*int*) – Number of nearest neighbors for KNN to search for. Defaults to 3.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |             |
|--------------------------------|-------------|
| <b>modi-<br/>fies_features</b> | True        |
| <b>modi-<br/>fies_target</b>   | False       |
| <b>name</b>                    | KNN Imputer |
| <b>train-<br/>ing_only</b>     | False       |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit(*self*, *X*, *y=None*)**

Fits imputer to data. 'None' values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – the target training data of length `[n_samples]`

**Returns** *self*

**Raises** **ValueError** – if the KNNImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform(*self*, *X*, *y=None*)**

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** `pd.DataFrame`

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. ‘None’ and np.nan values are treated as the same.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.imputers.PerColumnImputer`(*impute\_strategies=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Imputes missing data according to a specified imputation strategy per column.

#### Parameters

- **impute\_strategies** (*dict*) – Column and {“impute\_strategy”: strategy, “fill\_value”:value} pairings. Valid values for impute strategy include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types. Defaults to None, which uses “most\_frequent” for all columns. When `impute_strategy == “constant”`, `fill_value` is used to replace missing data. When None, uses 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputers on input data.                                                                                                     |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input data by imputing missing values.                                                                                |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits imputers on input data.

#### Parameters

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features] to fit.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** self

### `fit_transform(self, X, y=None)`

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms input data by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features] to transform.
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.imputers.SimpleImputer(impute_strategy='most_frequent',
                                                                    fill_value=None,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.

#### Parameters

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types.
- **fill\_value** (*string*) – When impute\_strategy == “constant”, fill\_value is used to replace missing data. Defaults to 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <b>modifies_target</b>        | False                                                     |
| <b>name</b>                   | Simple Imputer                                            |
| <b>training_only</b>          | False                                                     |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit**(*self*, *X*, *y=None*)

Fits imputer to data. 'None' values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – the target training data of length `[n_samples]`

**Returns** *self*

**Raises** **ValueError** – if the SimpleImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** `pd.DataFrame`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. ‘None’ and np.nan values are treated as the same.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.imputers.TargetImputer`(*impute\_strategy='most\_frequent'*,  
*fill\_value=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Imputes missing target data according to a specified imputation strategy.

#### Parameters

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types. Defaults to “most\_frequent”.
- **fill\_value** (*string*) – When *impute\_strategy* == “constant”, *fill\_value* is used to replace missing data. Defaults to None which uses 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.                |
| <i>fit_transform</i>      | Fits on and transforms the input target data.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input target data by imputing missing values. 'None' and np.nan values are treated as the same.                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y*)

Fits imputer to target data. ‘None’ values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]`. Ignored.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** *self*

**Raises** **TypeError** – If target is filled with all null values.

**fit\_transform**(*self*, *X*, *y*)

Fits on and transforms the input target data.

**Parameters**

- **X** (*pd.DataFrame*) – Features. Ignored.
- **y** (*pd.Series*) – Target data to impute.

**Returns** The original *X*, transformed *y*

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*)

Transforms input target data by imputing missing values. ‘None’ and `np.nan` values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Features. Ignored.

- **y** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (pd.DataFrame, pd.Series)

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.imputers.TimeSeriesImputer(categorical_impute_strategy='forwards_fill',
numeric_impute_strategy='interpolate',
target_impute_strategy='forwards_fill',
random_seed=0,
**kwargs)
```

Imputes missing data according to a specified timeseries-specific imputation strategy.

This Transformer should be used after the *TimeSeriesRegularizer* in order to impute the missing values that were added to X and y (if passed).

**Parameters**

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “backwards\_fill” and “forwards\_fill”. Defaults to “forwards\_fill”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “interpolate”.
- **target\_impute\_strategy** (*string*) – Impute strategy to use for the target column. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “forwards\_fill”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Raises ValueError** – If *categorical\_impute\_strategy*, *numeric\_impute\_strategy*, or *target\_impute\_strategy* is not one of the valid values.

**Attributes**

| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                                     |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                                  |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                               |
| <code>save</code>               | Saves component at file path.                                                                                                                                                     |
| <code>transform</code>          | Transforms data X by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data.

'None' values are converted to np.nan before imputation and are treated as the same. If a value is missing at the beginning or end of a column, that value will be imputed using backwards fill or forwards fill as necessary, respectively.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Optionally, target data to transform.

**Returns** Transformed *X* and *y*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

preprocessing

Preprocessing transformer components.

Submodules

datetime\_featurizer

Transformer that can automatically extract features from datetime columns.

Module Contents

Contents

`class evalml.pipelines.components.transformers.preprocessing.datetime_featurizer.DateTimeFeaturizer` *(features\_to\_extract, encode\_as\_categories, time\_index, random\_seed, \*\*kwargs)*

Transformer that can automatically extract features from datetime columns.

Parameters

- **features\_to\_extract** (*list*) – List of features to extract. Valid options include “year”, “month”, “day\_of\_week”, “hour”. Defaults to None.
- **encode\_as\_categories** (*bool*) – Whether day-of-week and month features should be encoded as pandas “category” dtype. This allows OneHotEncoders to encode these features. Defaults to False.
- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

|-------------------------------|---------------------|
| <b>hyper-parameter_ranges</b> | {}                  |
| <b>modifies_features</b>      | True                |
| <b>modifies_target</b>        | False               |
| <b>name</b>                   | DateTime Featurizer |
| <b>training_only</b>          | False               |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fit the datetime featurizer component.                                                                                           |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Gets the categories of each datetime feature.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns.            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fit the datetime featurizer component.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**get\_feature\_names**(*self*)

Gets the categories of each datetime feature.

**Returns**

Dictionary, where each key-value pair is a column name and a dictionary mapping the unique feature values to their integer encoding.

**Return type** `dict`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by creating new features using existing DateTime columns, and then dropping those DateTime columns.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## decomposer

Component that removes trends from time series and returns the decomposed components.

## Module Contents

### Classes Summary

|                   |                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------|
| <i>Decomposer</i> | Component that removes trends and seasonality from time series and returns the decomposed components. |
|-------------------|-------------------------------------------------------------------------------------------------------|

## Contents

```
class evalml.pipelines.components.transformers.preprocessing.decomposer.Decomposer(component_obj=None,
                                          random_seed:
                                          int = 0,
                                          degree:
                                          int = 1,
                                          period:
                                          int = -1,
                                          seasonal_smoother:
                                          int = 7,
                                          time_index:
                                          str = None,
                                          **kwargs)
```

Component that removes trends and seasonality from time series and returns the decomposed components.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters to pass to component object.
- **component\_obj** (*class*) – Instance of a detrender/deseasonalizer class.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **degree** (*int*) – Currently the degree of the PolynomialDecomposer, not used for STLDecomposer.
- **period** (*int*) – The best guess, in units, for the period of the seasonal signal.
- **seasonal\_smoother** (*int*) – The seasonal smoothing parameter for STLDecomposer, not used for PolynomialDecomposer.
- **time\_index** (*str*) – The column name of the feature matrix (X) that the datetime information should be pulled from.

### Attributes

### Methods

|                                    |                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                 | Constructs a new component with the same parameters and random state.                                              |
| <code>default_parameters</code>    | Returns the default parameters for this component.                                                                 |
| <code>describe</code>              | Describe a component and its parameters.                                                                           |
| <code>determine_periodicity</code> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <code>fit</code>                   | Fits component to data.                                                                                            |
| <code>fit_transform</code>         | Removes fitted trend and seasonality from target variable.                                                         |
| <code>get_trend_dataframe</code>   | Return a list of dataframes, each with 3 columns: trend, seasonality, residual.                                    |
| <code>inverse_transform</code>     | Add the trend + seasonality back to y.                                                                             |
| <code>is_freq_valid</code>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <code>load</code>                  | Loads component at file path.                                                                                      |
| <code>parameters</code>            | Returns the parameters which were used to initialize the component.                                                |
| <code>plot_decomposition</code>    | Plots the decomposition of the target signal.                                                                      |
| <code>save</code>                  | Saves component at file path.                                                                                      |
| <code>set_period</code>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <code>transform</code>             | Transforms data X.                                                                                                 |
| <code>update_parameters</code>     | Updates the parameter dictionary of the component.                                                                 |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

#### `classmethod determine_periodicity(cls, X: pandas.DataFrame, y: pandas.Series, acf_threshold: float = 0.01, rel_max_order: int = 5)`

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**Returns**

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target's seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either "7" or "365", depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

**Return type** int

**fit**(*self, X, y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self, X: pandas.DataFrame, y: pandas.Series = None*) → tuple[pandas.DataFrame, pandas.Series]

Removes fitted trend and seasonality from target variable.

**Parameters**

- **X** (*pd.DataFrame, optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable y with the fitted trend removed.

**Return type** tuple of pd.DataFrame, pd.Series

**abstract get\_trend\_dataframe**(*self, y: pandas.Series*)

Return a list of dataframes, each with 3 columns: trend, seasonality, residual.

**abstract inverse\_transform**(*self, y: pandas.Series*)

Add the trend + seasonality back to y.

**classmethod is\_freq\_valid**(*cls, freq: str*)

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (*str*) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → *tuple*[*matplotlib.pyplot.Figure*, *list*]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** *matplotlib.pyplot.Figure*, *list*[*matplotlib.pyplot.Axes*]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**abstract transform**(*self*, *X*, *y*=*None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## drop\_nan\_rows\_transformer

Transformer to drop rows specified by row indices.

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data using fitted component.                                                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with NaN rows dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## drop\_null\_columns

Transformer to drop features whose percentage of NaN values exceeds a specified threshold.

## Contents

**class** evalml.pipelines.components.transformers.preprocessing.drop\_null\_columns.**DropNullColumns**(*pct\_null\_threshold*, *random\_seed=42*, *\*\*kwargs*)

Transformer to drop features whose percentage of NaN values exceeds a specified threshold.

#### Parameters

- **pct\_null\_threshold** (*float*) – The percentage of NaN values in an input feature to drop. Must be a value between [0, 1] inclusive. If equal to 0.0, will drop columns with any null values. If equal to 1.0, will drop columns with all null values. Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                               |
|-------------------------------|-------------------------------|
| <b>hyper-parameter_ranges</b> | {}                            |
| <b>modifies_features</b>      | True                          |
| <b>modifies_target</b>        | False                         |
| <b>name</b>                   | Drop Null Columns Transformer |
| <b>training_only</b>          | False                         |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by dropping columns that exceed the threshold of null values.                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms data X by dropping columns that exceed the threshold of null values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series, optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set `_is_fitted` to False.

## drop\_rows\_transformer

### Contents

`class evalml.pipelines.components.transformers.preprocessing.drop_rows_transformer.DropRowsTransformer()`

Transformer to drop rows specified by row indices.

#### Parameters

- **indices\_to\_drop** (*list*) – List of indices to drop in the input data. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

#### Attributes

|                               |                       |

| <b>name</b>                   | Drop Rows Transformer |
| <b>training_only</b>          | True                  |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data using fitted component.                                                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If indices to drop do not exist in input features or target.

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with row indices dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## featuretools

Featuretools DFS component that generates features for the input features.

### Classes Summary

---

*DFSTransformer*

Featuretools DFS component that generates features for the input features.

---

### Contents

```
class evalml.pipelines.components.transformers.preprocessing.featuretools.DFSTransformer(index='index',
                                                                                       fea-
                                                                                       tures=None,
                                                                                       ran-
                                                                                       dom_seed=0,
                                                                                       **kwargs)
```

Featuretools DFS component that generates features for the input features.

#### Parameters

- **index** (*string*) – The name of the column that contains the indices. If no column with this name exists, then `featuretools.EntitySet()` creates a column with this name to serve as the index column. Defaults to ‘index’.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **features** (*list*) – List of features to run DFS on. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input. If features is an empty list, no transformation will occur to inputted data.

#### Attributes

|                        |                 |
|------------------------|-----------------|
| hyper-parameter_ranges | {}              |
| modifies_features      | True            |
| modifies_target        | False           |
| name                   | DFS Transformer |
| training_only          | False           |

#### Methods

|                                             |                                                                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                          | Constructs a new component with the same parameters and random state.                                                            |
| <code>contains_pre_existing_features</code> | Determines whether or not features from a DFS Transformer match pipeline input features.                                         |
| <code>default_parameters</code>             | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                       | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                            | Fits the DFSTransformer Transformer component.                                                                                   |
| <code>fit_transform</code>                  | Fits on X and transforms X.                                                                                                      |
| <code>load</code>                           | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>                  | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>                     | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>                           | Saves component at file path.                                                                                                    |
| <code>transform</code>                      | Computes the feature matrix for the input X using featuretools' dfs algorithm.                                                   |
| <code>update_parameters</code>              | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**static contains\_pre\_existing\_features**(dfs\_features: *Optional[List[featuretools.feature\_base.FeatureBase]]*, input\_feature\_names: *List[str]*, target: *Optional[str] = None*)

Determines whether or not features from a DFS Transformer match pipeline input features.

**Parameters**

- **dfs\_features** (*Optional[List[FeatureBase]]*) – List of features output from a DFS Transformer.
- **input\_feature\_names** (*List[str]*) – List of input features into the DFS Transformer.
- **target** (*Optional[str]*) – The target whose values we are trying to predict. This is used to know which column to ignore if the target column is present in the list of features in the DFS Transformer's parameters.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits the DFSTransformer Transformer component.

**Parameters**

- **X** (*pd.DataFrame*, *np.array*) – The input data to transform, of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the feature matrix for the input *X* using featuretools' dfs algorithm.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data to transform. Has shape `[n_samples, n_features]`

- `y` (`pd.Series`, *optional*) – Ignored.

**Returns** Feature matrix

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

## log\_transformer

Component that applies a log transformation to the target data.

| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Log transforms the target variable.                                                                                              |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits the LogTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Ignored.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** self

**fit\_transform(*self*, *X*, *y=None*)**

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to log transform.

**Returns**

The input features are returned without modification. The target variable y is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**inverse\_transform**(*self*, *y*)

Apply exponential to target data.

**Parameters** **y** (*pd.Series*) – Target variable.

**Returns** Target with exponential applied.

**Return type** *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target data to log transform.

**Returns**

The input features are returned without modification. The target variable y is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the input data.                                                                                                             |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by applying the LSA pipeline.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the input data.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by applying the LSA pipeline.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns**

Transformed X. The original column is removed and replaced with two columns of the format *LSA(original\_column\_name)[feature\_number]*, where *feature\_number* is 0 or 1.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## natural\_language\_featurizer

Transformer that can automatically featurize text columns using featuretools' nlp\_primitives.

### Contents

`class evalml.pipelines.components.transformers.preprocessing.natural_language_featurizer.NaturalLanguageFeaturizer`

Transformer that can automatically featurize text columns using featuretools' nlp\_primitives.

Since models cannot handle non-numeric data, any text must be broken down into features that provide useful information about that text. This component splits each text column into several informative features: Diversity Score, Mean Characters per Word, Polarity Score, LSA (Latent Semantic Analysis), Number of Characters, and Number of Words. Calling transform on this component will replace any text columns in the given dataset with these numeric columns.

**Parameters** `random_seed` (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by creating new features using existing text columns.                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms data X by creating new features using existing text columns.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If `True`, will set `_is_fitted` to `False`.

## polynomial\_decomposer

Component that removes trends from time series by fitting a polynomial to the data.

### Contents

`class evalml.pipelines.components.transformers.preprocessing.polynomial_decomposer.PolynomialDecomposer`

Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.

**Scikit-learn's PolynomialForecaster is used to generate the additive trend portion of the target data. A polynomial** will be fit to the data during fit. That additive polynomial trend will be removed during fit so that statsmodel's seasonal\_decompose can determine the additive seasonality of the data by using rolling averages over the series' inferred periodicity.

For example, daily time series data will generate rolling averages over the first week of data, normalize out the mean and return those 7 averages repeated over the entire length of the given series. Those seven averages, repeated as many times as necessary to match the length of the given target data, will be used as the seasonal signal of the data.

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.

- **degree** (*int*) – Degree for the polynomial. If 1, linear model is fit to the data. If 2, quadratic model is fit, etc. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, period should be 7. For daily data with a yearly seasonal signal, period should be 365. Defaults to -1, which uses the statsmodels library’s `freq_to_period` function. <https://github.com/statsmodels/statsmodels/blob/main/statsmodels/tsa/tsatools.py>
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                            |
|-------------------------------|----------------------------|
| <b>hyper-parameter_ranges</b> | { “degree”: Integer(1, 3)} |
| <b>invalid_frequencies</b>    | []                         |
| <b>modifies_features</b>      | False                      |
| <b>modifies_target</b>        | True                       |
| <b>name</b>                   | Polynomial Decomposer      |
| <b>needs_fitting</b>          | True                       |
| <b>training_only</b>          | False                      |

#### Methods

|                              |                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                 | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>    | Returns the default parameters for this component.                                                                 |
| <i>describe</i>              | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                   | Fits the PolynomialDecomposer and determine the seasonal signal.                                                   |
| <i>fit_transform</i>         | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>   | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <i>inverse_transform</i>     | Adds back fitted trend and seasonality to target variable.                                                         |
| <i>is_freq_valid</i>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                  | Loads component at file path.                                                                                      |
| <i>parameters</i>            | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>    | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                  | Saves component at file path.                                                                                      |
| <i>set_period</i>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>             | Transforms the target data by removing the polynomial trend and rolling average seasonality.                       |
| <i>update_parameters</i>     | Updates the parameter dictionary of the component.                                                                 |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

##### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *PolynomialDecomposer*

Fits the *PolynomialDecomposer* and determine the seasonal signal.

Currently only fits the polynomial detrender. The seasonality is determined by removing the trend from the signal and using *statsmodels*’ *seasonal\_decompose()*. Both the trend and seasonality are currently assumed to be additive.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

##### Raises

- **NotImplementedError** – If the input data has a frequency of “month-begin”. This isn’t supported by *statsmodels* *decompose* as the freqstr “MS” is misinterpreted as milliseconds.
- **ValueError** – If *y* is None.
- **ValueError** – If target data doesn’t have *DatetimeIndex* AND no *Datetime* features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The first element are the input features returned without modification. The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**get\_trend\_dataframe**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*) → list[*pandas.DataFrame*]

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

Scikit-learn's `PolynomialForecaster` is used to generate the trend portion of the target data. `statsmodel`'s `seasonal_decompose` is used to generate the seasonality of the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,” with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **TypeError** – If `X` does not have time-series data in the index.
- **ValueError** – If time series index of `X` does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If `y` is not provided as a pandas Series or DataFrame.

**inverse\_transform**(*self*, *y\_t*: *pandas.Series*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Adds back fitted trend and seasonality to target variable.

The polynomial trend is added back into the signal, calling the detrender's `inverse_transform()`. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (*pd.Series*) – Target variable.

**Returns**

The first element are the input features returned without modification. The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If `y` is None.

**classmethod is\_freq\_valid**(*cls*, *freq*: *str*)

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (*str*) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

#### Parameters

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

#### Returns

The figure and axes that have the decompositions plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the polynomial trend and rolling average seasonality.

Applies the fit polynomial detrender to the target data, removing the additive polynomial trend. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable `y` is detrended and deseasonalized.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises `ValueError`** – If target data doesn’t have `DatetimeIndex` AND no `Datetime` features in features data

**`update_parameters`**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

## replace\_nullable\_types

Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.

### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Substitutes non-nullable types for the new pandas nullable types in the data and target data.                                    |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data by replacing columns that contain nullable types with the appropriate replacement type.                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Substitutes non-nullable types for the new pandas nullable types in the data and target data.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Input features.
- **y** (*pd.Series*) – Target data.

**Returns** The input features and target data with the non-nullable types set.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data by replacing columns that contain nullable types with the appropriate replacement type.

“float64” for nullable integers and “category” for nullable booleans.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Target data to transform

**Returns** Transformed X *pd.Series*: Transformed y

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## stl\_decomposer

Component that removes trends and seasonality from time series using STL.

### Module Contents

### Classes Summary

|                      |                                                                          |
|----------------------|--------------------------------------------------------------------------|
| <i>STLDecomposer</i> | Removes trends and seasonality from time series using the STL algorithm. |
|----------------------|--------------------------------------------------------------------------|

### Contents

```

class evalml.pipelines.components.transformers.preprocessing.stl_decomposer.STLDecomposer(time_index:
    str
    =

    **kwargs)

```

Removes trends and seasonality from time series using the STL algorithm.

<https://www.statsmodels.org/dev/generated/statsmodels.tsa.seasonal.STL.html>

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Not currently used. STL 3x “degree-like” values. None are able to be set at this time. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and

if the data is daily data, the period should likely be 7. For daily data with a yearly seasonal signal, the period should likely be 365. If None, statsmodels will infer the period based on the frequency. Defaults to None.

- **seasonal\_smoother** (*int*) – The length of the seasonal smoother used by the underlying STL algorithm. For compatibility, must be odd. If an even number is provided, the next, highest odd number will be used. Defaults to 7.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                |

| <b>hyper-parameter_ranges</b> | None           |
| <b>invalid_frequencies</b>    | []             |
| <b>modifies_features</b>      | False          |
| <b>modifies_target</b>        | True           |
| <b>name</b>                   | STL Decomposer |
| <b>needs_fitting</b>          | True           |
| <b>training_only</b>          | False          |

#### Methods

|                                             |                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                          | Constructs a new component with the same parameters and random state.                                              |
| <code>default_parameters</code>             | Returns the default parameters for this component.                                                                 |
| <code>describe</code>                       | Describe a component and its parameters.                                                                           |
| <code>determine_periodicity</code>          | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <code>fit</code>                            | Fits the STLDecomposer and determine the seasonal signal.                                                          |
| <code>fit_transform</code>                  | Removes fitted trend and seasonality from target variable.                                                         |
| <code>get_trend_dataframe</code>            | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <code>get_trend_prediction_intervals</code> | Calculate the prediction intervals for the trend data.                                                             |
| <code>inverse_transform</code>              | Adds back fitted trend and seasonality to target variable.                                                         |
| <code>is_freq_valid</code>                  | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <code>load</code>                           | Loads component at file path.                                                                                      |
| <code>parameters</code>                     | Returns the parameters which were used to initialize the component.                                                |
| <code>plot_decomposition</code>             | Plots the decomposition of the target signal.                                                                      |
| <code>save</code>                           | Saves component at file path.                                                                                      |
| <code>set_period</code>                     | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <code>transform</code>                      | Transforms the target data by removing the STL trend and seasonality.                                              |
| <code>update_parameters</code>              | Updates the parameter dictionary of the component.                                                                 |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *STLDecomposer*

Fits the STLDecomposer and determine the seasonal signal.

Instantiates a statsmodels STL decompose object with the component’s stored parameters and fits it. Since the statsmodels object does not fit the sklearn api, it is not saved during `__init__()` in `_component_obj` and will be re-instantiated each time fit is called.

To emulate the sklearn API, when the STL decomposer is fit, the full seasonal component, a single period sample of the seasonal component, the full trend-cycle component and the residual are saved.

$$y(t) = S(t) + T(t) + R(t)$$

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

#### Raises

- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have DatetimeIndex AND no Datetime features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**`get_trend_dataframe(self, X, y)`**

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

**Parameters**

- **`X`** (`pd.DataFrame`) – Input data with time series data in index.
- **`y`** (`pd.Series` or `pd.DataFrame`) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

**Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,”** with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **`TypeError`** – If `X` does not have time-series data in the index.
- **`ValueError`** – If time series index of `X` does not have an inferred frequency.
- **`ValueError`** – If the forecaster associated with the detrender has not been fit yet.
- **`TypeError`** – If `y` is not provided as a pandas Series or DataFrame.

**`get_trend_prediction_intervals(self, y, coverage=None)`**

Calculate the prediction intervals for the trend data.

**Parameters**

- **`y`** (`pd.Series`) – Target data.
- **`coverage`** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict of `pd.Series`

**`inverse_transform(self, y_t: pandas.Series) → tuple[pandas.DataFrame, pandas.Series]`**

Adds back fitted trend and seasonality to target variable.

The STL trend is projected to cover the entire requested target range, then added back into the signal. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **`y_t`** (`pd.Series`) – Target variable.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **`ValueError`** – If `y` is `None`.

**classmethod** `is_freq_valid(cls, freq: str)`

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** `freq (str)` – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path (str)` – Location to load file.

**Returns** ComponentBase object

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(self, X: pandas.DataFrame, y: pandas.Series, show: bool = False) → tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

**Parameters**

- **X** (pd.DataFrame) – Input data with time series data in index.
- **y** (pd.Series or pd.DataFrame) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (bool) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (str) – Location to save file.
- **pickle\_protocol** (int) – The pickle data stream format.

**set\_period**(self, X: pandas.DataFrame, y: pandas.Series, acf\_threshold: float = 0.01, rel\_max\_order: int = 5)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (pandas.DataFrame) – The feature data of the time series problem.
- **y** (pandas.Series) – The target data of a time series problem.
- **acf\_threshold** (float) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (int) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the STL trend and seasonality.

Uses an ARIMA model to project forward the additive trend and removes it. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable *y* is detrended and deseasonalized.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises ValueError** – If target data doesn't have *DatetimeIndex* AND no *Datetime* features in features data

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## text\_transformer

Base class for all transformers working with text features.

## Module Contents

### Classes Summary

## Contents

```
class evalml.pipelines.components.transformers.preprocessing.text_transformer.TextTransformer(component_
    ran-
    dom_seed=0,
    **kwargs)
```

Base class for all transformers working with text features.

#### Parameters

- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |       |
|--------------------------------|-------|
| <b>modi-<br/>fies_features</b> | True  |
| <b>modi-<br/>fies_target</b>   | False |
| <b>train-<br/>ing_only</b>     | False |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>name</i>               | Returns string name of this component.                                                                                           |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.

- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## time\_series\_featurizer

Transformer that delays input features and target variable for time series problems.

## Contents

**class** evalml.pipelines.components.transformers.preprocessing.time\_series\_featurizer.**TimeSeriesFeaturizer**

Transformer that delays input features and target variable for time series problems.

This component uses an algorithm based on the autocorrelation values of the target variable to determine which lags to select from the set of all possible lags.

The algorithm is based on the idea that the local maxima of the autocorrelation function indicate the lags that have the most impact on the present time.

The algorithm computes the autocorrelation values and finds the local maxima, called “peaks”, that are significant at the given `conf_level`. Since lags in the range `[0, 10]` tend to be predictive but not local maxima, the union of the peaks is taken with the significant lags in the range `[0, 10]`. At the end, only selected lags in the range `[0, max_delay]` are used.

Parametrizing the algorithm by `conf_level` lets the `AutoMLAlgorithm` tune the set of lags chosen so that the chances of finding a good set of lags is higher.

Using `conf_level` value of 1 selects all possible lags.

### Parameters

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **max\_delay** (*int*) – Maximum number of time units to delay each feature. Defaults to 2.
- **forecast\_horizon** (*int*) – The number of time periods the pipeline is expected to forecast.
- **conf\_level** (*float*) – Float in range `(0, 1]` that determines the confidence interval size used to select which lags to compute from the set of `[1, max_delay]`. A delay of 1 will always be computed. If 1, selects all possible lags in the set of `[1, max_delay]`, inclusive.
- **rolling\_window\_size** (*float*) – Float in range `(0, 1]` that determines the size of the window used for rolling features. Size is computed as `rolling_window_size * max_delay`.
- **delay\_features** (*bool*) – Whether to delay the input features. Defaults to True.
- **delay\_target** (*bool*) – Whether to delay the target. Defaults to True.
- **gap** (*int*) – The number of time units between when the features are collected and when the target is collected. For example, if you are predicting the next time step’s target, `gap=1`. This is only needed because when `gap=0`, we need to be sure to start the lagging of the target variable at 1. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

### Attributes

|                               |                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------|
| <b>hyper-parameter_ranges</b> | <code>Real(0.001, 1.0), “rolling_window_size”: Real(0.001, 1.0)}</code> :type: {“conf_level” |
| <b>modifies_features</b>      | True                                                                                         |

| <b>training_only</b>          | False                                                                                        |

### Methods

|                                 |                                                                       |
|---------------------------------|-----------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state. |
| <code>default_parameters</code> | Returns the default parameters for this component.                    |
| <code>describe</code>           | Describe a component and its parameters.                              |
| <code>fit</code>                | Fits the DelayFeatureTransformer.                                     |
| <code>fit_transform</code>      | Fit the component and transform the input data.                       |
| <code>load</code>               | Loads component at file path.                                         |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.   |
| <code>save</code>               | Saves component at file path.                                         |
| <code>transform</code>          | Computes the delayed values and rolling means for X and y.            |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                    |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the DelayFeatureTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **ValueError** – if `self.time_index` is None

**fit\_transform**(*self*, *X*, *y=None*)

Fit the component and transform the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the delayed values and rolling means for X and y.

The chosen delays are determined by the autocorrelation function of the target variable. See the class docstring for more information on how they are chosen. If y is None, all possible lags are chosen.

If y is not None, it will also compute the delayed values for the target variable.

The rolling means for all numeric features in X and y, if y is numeric, are also returned.

**Parameters**

- **X** (*pd.DataFrame* or *None*) – Data to transform. None is expected when only the target variable is being used.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X. No original features are returned.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## time\_series\_regularizer

Transformer that regularizes a dataset with an unferrable offset frequency for time series problems.

---

### Contents

```
class evalml.pipelines.components.transformers.preprocessing.time_series_regularizer.TimeSeriesRegularizer
```

Transformer that regularizes an inconsistently spaced datetime column.

If X is passed in to fit/transform, the column *time\_index* will be checked for an inferrable offset frequency. If the *time\_index* column is perfectly inferrable then this Transformer will do nothing and return the original X and y.

If X does not have a perfectly inferrable frequency but one can be estimated, then X and y will be reformatted based on the estimated frequency for *time\_index*. In the original X and y passed: - Missing datetime values will be added and will have their corresponding columns in X and y set to None. - Duplicate datetime values will be dropped. - Extra datetime values will be dropped. - If it can be determined that a duplicate or extra value is misaligned, then it will be repositioned to take the place of a missing value.

This Transformer should be used before the *TimeSeriesImputer* in order to impute the missing values that were added to X and y (if passed).

#### Parameters

- **time\_index** (*string*) – Name of the column containing the datetime information used to order the data, required. Defaults to None.
- **frequency\_payload** (*tuple*) – Payload returned from Woodwork’s `infer_frequency` function where `debug` is True. Defaults to None.
- **window\_length** (*int*) – The size of the rolling window over which inference is conducted to determine the prevalence of unferrable frequencies.
- **5.** (*Lower values make this component more sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **threshold** (*float*) – The minimum percentage of windows that need to have been able to infer a frequency. Lower values make this component more

- **0.8.** (sensitive to recognizing numerous faulty datetime values. Defaults to) –
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.
- **0.** (Defaults to) –

**Raises** **ValueError** – if the frequency\_payload parameter has not been passed a tuple

#### Attributes

| <b>training_only</b>          | True                    |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the TimeSeriesRegularizer.                                                                                                  |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Regularizes a dataframe and target data to an in-ferrable offset frequency.                                                      |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the TimeSeriesRegularizer.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – if self.time\_index is None, if X and y have different lengths, if *time\_index* in X does not have an offset frequency that can be estimated
- **TypeError** – if the *time\_index* column is not of type Datetime
- **KeyError** – if the *time\_index* column doesn't exist

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**save(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform(*self*, *X*, *y*=None)**

Regularizes a dataframe and target data to an inferrable offset frequency.

A ‘clean’ *X* and *y* (if *y* was passed in) are created based on an inferrable offset frequency and matching datetime values with the original *X* and *y* are imputed into the clean *X* and *y*. Datetime values identified as misaligned are shifted into their appropriate position.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Data with an inferrable *time\_index* offset frequency.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**transform\_primitive\_components**

Components that extract features from the input data.

## Contents

`class evalml.pipelines.components.transformers.preprocessing.transform_primitive_components.EmailFeaturizer`

Transformer that can automatically extract features from emails.

**Parameters** `random_seed` (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

| <b>training_only</b>          | False            |

### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.transform\_primitive\_components.**URLFeaturizer**

Transformer that can automatically extract features from URL.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                        |                |

| training_only          | False          |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

## Package Contents

### Classes Summary

|                                  |                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------|
| <i>DateTimeFeaturizer</i>        | Transformer that can automatically extract features from datetime columns.                              |
| <i>Decomposer</i>                | Component that removes trends and seasonality from time series and returns the decomposed components.   |
| <i>DFSTransformer</i>            | Featuretools DFS component that generates features for the input features.                              |
| <i>DropNaNRowsTransformer</i>    | Transformer to drop rows with NaN values.                                                               |
| <i>DropNullColumns</i>           | Transformer to drop features whose percentage of NaN values exceeds a specified threshold.              |
| <i>DropRowsTransformer</i>       | Transformer to drop rows specified by row indices.                                                      |
| <i>EmailFeaturizer</i>           | Transformer that can automatically extract features from emails.                                        |
| <i>LogTransformer</i>            | Applies a log transformation to the target data.                                                        |
| <i>LSA</i>                       | Transformer to calculate the Latent Semantic Analysis Values of text input.                             |
| <i>NaturalLanguageFeaturizer</i> | Transformer that can automatically featurize text columns using featuretools' nlp_primitives.           |
| <i>PolynomialDecomposer</i>      | Removes trends and seasonality from time series by fitting a polynomial and moving average to the data. |
| <i>ReplaceNullableTypes</i>      | Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML. |
| <i>STLDecomposer</i>             | Removes trends and seasonality from time series using the STL algorithm.                                |
| <i>TextTransformer</i>           | Base class for all transformers working with text features.                                             |
| <i>TimeSeriesFeaturizer</i>      | Transformer that delays input features and target variable for time series problems.                    |
| <i>TimeSeriesRegularizer</i>     | Transformer that regularizes an inconsistently spaced datetime column.                                  |
| <i>URLFeaturizer</i>             | Transformer that can automatically extract features from URL.                                           |

### Contents

```
class evalml.pipelines.components.transformers.preprocessing.DateTimeFeaturizer(features_to_extract=None,
en-
code_as_categories=False,
time_index=None,
ran-
dom_seed=0,
**kwargs)
```

Transformer that can automatically extract features from datetime columns.

#### Parameters

- **features\_to\_extract** (*list*) – List of features to extract. Valid options include “year”, “month”, “day\_of\_week”, “hour”. Defaults to None.

- **encode\_as\_categories** (*bool*) – Whether day-of-week and month features should be encoded as pandas “category” dtype. This allows OneHotEncoders to encode these features. Defaults to False.
- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                     |
|-------------------------------|---------------------|
| <b>hyper-parameter_ranges</b> | {}                  |
| <b>modifies_features</b>      | True                |
| <b>modifies_target</b>        | False               |
| <b>name</b>                   | DateTime Featurizer |
| <b>training_only</b>          | False               |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fit the datetime featurizer component.                                                                                           |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Gets the categories of each datetime feature.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns.            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fit the datetime featurizer component.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**get\_feature\_names**(*self*)

Gets the categories of each datetime feature.

**Returns**

**Dictionary, where each key-value pair is a column name and a dictionary mapping the unique feature values to their integer encoding.**

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

```
save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)
```

Saves component at file path.

## Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns.

## Parameters

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series, optional*) – Ignored.

Returns Transformed X

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

## Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *is\_fitted* to False.

```
class evalml.pipelines.components.transformers.preprocessing.Decomposer(component_obj=None,  
                                                                    random_seed: int = 0,  
                                                                    degree: int = 1,  
                                                                    period: int = - 1,  
                                                                    seasonal_smoother:  
int = 7, time_index:  
str = None, **kwargs)
```

Component that removes trends and seasonality from time series and returns the decomposed components.

## Parameters

- **parameters** (*dict*) – Dictionary of parameters to pass to component object.
- **component\_obj** (*class*) – Instance of a detrender/deseasonalizer class.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **degree** (*int*) – Currently the degree of the PolynomialDecomposer, not used for STLDecomposer.
- **period** (*int*) – The best guess, in units, for the period of the seasonal signal.
- **seasonal\_smoother** (*int*) – The seasonal smoothing parameter for STLDecomposer, not used for PolynomialDecomposer.
- **time\_index** (*str*) – The column name of the feature matrix (X) that the datetime information should be pulled from.

|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                 | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>    | Returns the default parameters for this component.                                                                 |
| <i>describe</i>              | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                   | Fits component to data.                                                                                            |
| <i>fit_transform</i>         | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>   | Return a list of dataframes, each with 3 columns: trend, seasonality, residual.                                    |
| <i>inverse_transform</i>     | Add the trend + seasonality back to y.                                                                             |
| <i>is_freq_valid</i>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                  | Loads component at file path.                                                                                      |
| <i>parameters</i>            | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>    | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                  | Saves component at file path.                                                                                      |
| <i>set_period</i>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>             | Transforms data X.                                                                                                 |
| <i>update_parameters</i>     | Updates the parameter dictionary of the component.                                                                 |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**classmethod determine\_periodicity**(*cls*, *X: pandas.DataFrame*, *y: pandas.Series*, *acf\_threshold: float = 0.01*, *rel\_max\_order: int = 5*)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**Returns**

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target's seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either "7" or "365", depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

**Return type** int

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X: pandas.DataFrame*, *y: pandas.Series = None*) → tuple[pandas.DataFrame, pandas.Series]

Removes fitted trend and seasonality from target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

The first element are the input features returned without modification. The second element is the target variable y with the fitted trend removed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**abstract** `get_trend_dataframe(self, y: pandas.Series)`

Return a list of dataframes, each with 3 columns: trend, seasonality, residual.

**abstract** `inverse_transform(self, y: pandas.Series)`

Add the trend + seasonality back to y.

**classmethod** `is_freq_valid(cls, freq: str)`

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (*str*) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** `load(file_path)`

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → *tuple*[*matplotlib.pyplot.Figure*, *list*]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** *matplotlib.pyplot.Figure*, *list*[*matplotlib.pyplot.Axes*]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

```
set_period(self, X: pandas.DataFrame, y: pandas.Series, acf_threshold: float = 0.01, rel_max_order: int = 5)
```

Function to set the component's seasonal period based on the target's seasonality.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

```
abstract transform(self, X, y=None)
```

Transforms data X.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series, optional*) – Target data.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

```
update_parameters(self, update_dict, reset_fit=True)
```

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.preprocessing.DFSTransformer(index='index',  
                                                                           features=None,  
                                                                           random_seed=0,  
                                                                           **kwargs)
```

Featuretools DFS component that generates features for the input features.

#### Parameters

- **index** (*string*) – The name of the column that contains the indices. If no column with this name exists, then `featuretools.EntitySet()` creates a column with this name to serve as the index column. Defaults to 'index'.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **features** (*list*) – List of features to run DFS on. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input. If features is an empty list, no transformation will occur to inputted data.

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                          | Constructs a new component with the same parameters and random state.                                                            |
| <i>contains_pre_existing_features</i> | Determines whether or not features from a DFS Transformer match pipeline input features.                                         |
| <i>default_parameters</i>             | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                       | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                            | Fits the DFSTransformer Transformer component.                                                                                   |
| <i>fit_transform</i>                  | Fits on X and transforms X.                                                                                                      |
| <i>load</i>                           | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>                  | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>                     | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>                           | Saves component at file path.                                                                                                    |
| <i>transform</i>                      | Computes the feature matrix for the input X using featuretools' dfs algorithm.                                                   |
| <i>update_parameters</i>              | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**static contains\_pre\_existing\_features**(dfs\_features: Optional[List[featuretools.feature\_base.FeatureBase]], input\_feature\_names: List[str], target: Optional[str] = None)

Determines whether or not features from a DFS Transformer match pipeline input features.

### Parameters

- **dfs\_features** (Optional[List[FeatureBase]]) – List of features output from a DFS Transformer.
- **input\_feature\_names** (List[str]) – List of input features into the DFS Transformer.
- **target** (Optional[str]) – The target whose values we are trying to predict. This is used to know which column to ignore if the target column is present in the list of features in the DFS Transformer's parameters.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit(*self*, *X*, *y=None*)**

Fits the DFSTransformer Transformer component.

**Parameters**

- **X** (*pd.DataFrame*, *np.array*) – The input data to transform, of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

**Returns** `self`

**fit\_transform(*self*, *X*, *y=None*)**

Fits on `X` and transforms `X`.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed `X`.

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the feature matrix for the input *X* using featuretools’ dfs algorithm.

#### Parameters

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data to transform. Has shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Feature matrix

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.preprocessing.DropNaNRowsTransformer`(*parameters=None*, *com-*  
*po-*  
*nent\_obj=None*, *ran-*  
*dom\_seed=0*, *\*\*kwargs*)

Transformer to drop rows with NaN values.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

#### Attributes

| <b>modifies_target</b>        | True                      |
| <b>name</b>                   | Drop NaN Rows Transformer |
| <b>training_only</b>          | False                     |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data using fitted component.                                                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(*self*, *X*, *y=None*)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with NaN rows dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.transformers.preprocessing.DropNullColumns*(*pct\_null\_threshold=1.0*,  
*ran-*  
*dom\_seed=0*,  
*\*\*kwargs*)

Transformer to drop features whose percentage of NaN values exceeds a specified threshold.

**Parameters**

- **pct\_null\_threshold** (*float*) – The percentage of NaN values in an input feature to drop. Must be a value between [0, 1] inclusive. If equal to 0.0, will drop columns with any null values. If equal to 1.0, will drop columns with all null values. Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by dropping columns that exceed the threshold of null values.                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by dropping columns that exceed the threshold of null values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.**DropRowsTransformer**(*indices\_to\_drop=None*,  
*random\_seed=0*)

Transformer to drop rows specified by row indices.

**Parameters**

- **indices\_to\_drop** (*list*) – List of indices to drop in the input data. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

**Attributes**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data using fitted component.                                                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If indices to drop do not exist in input features or target.

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with row indices dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.preprocessing.EmailFeaturizer`(*random\_seed=0*,  
\*\**kwargs*)

Transformer that can automatically extract features from emails.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                  |

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.

- `y` (`pd.Series`, *optional*) – Target data.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.preprocessing.LogTransformer`(*random\_seed=0*)

Applies a log transformation to the target data.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | False           |
| <b>modifies_target</b>        | True            |
| <b>name</b>                   | Log Transformer |
| <b>training_only</b>          | False           |

**Methods**

|                                 |                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                                       |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                                                 |
| <code>fit</code>                | Fits the LogTransformer.                                                                                                                                                                 |
| <code>fit_transform</code>      | Log transforms the target variable.                                                                                                                                                      |

| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <code>save</code>               | Saves component at file path.                                                                                                                                                            |
| <code>transform</code>          | Log transforms the target variable.                                                                                                                                                      |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                       |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit(*self*, *X*, *y=None*)**

Fits the LogTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Ignored.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** `self`

**fit\_transform(*self*, *X*, *y=None*)**

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to log transform.

**Returns**

**The input features are returned without modification. The target** variable `y` is log transformed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**inverse\_transform(*self*, *y*)**

Apply exponential to target data.

**Parameters** **y** (*pd.Series*) – Target variable.

**Returns** Target with exponential applied.

**Return type** `pd.Series`

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target data to log transform.

**Returns**

**The input features are returned without modification. The target** variable *y* is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.LSA(*random\_seed*=0, *\*\*kwargs*)

Transformer to calculate the Latent Semantic Analysis Values of text input.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <b>training_only</b>          | False           |

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the input data.                                                                                                             |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by applying the LSA pipeline.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits the input data.

#### Parameters

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** self

### `fit_transform(self, X, y=None)`

Fits on X and transforms X.

#### Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by applying the LSA pipeline.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns**

Transformed X. The original column is removed and replaced with two columns of the format `LSA(original_column_name)[feature_number]`, where `feature_number` is 0 or 1.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.preprocessing.NaturalLanguageFeaturizer(random_seed=0,  
                                                                                   **kwargs)
```

Transformer that can automatically featurize text columns using featuretools' nlp\_primitives.

Since models cannot handle non-numeric data, any text must be broken down into features that provide useful information about that text. This component splits each text column into several informative features: Diversity Score, Mean Characters per Word, Polarity Score, LSA (Latent Semantic Analysis), Number of Characters, and Number of Words. Calling transform on this component will replace any text columns in the given dataset with these numeric columns.

**Parameters** `random_seed` (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by creating new features using existing text columns.                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by creating new features using existing text columns.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.preprocessing.PolynomialDecomposer(time_index:  
    str =  
    None,  
    degree:  
    int = 1,  
    period:  
    int = - 1,  
    ran-  
    dom_seed:  
    int = 0,  
    **kwargs)
```

Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.

**Scikit-learn’s PolynomialForecaster is used to generate the additive trend portion of the target data. A polynomial** will be fit to the data during fit. That additive polynomial trend will be removed during fit so that statsmodel’s *seasonal\_decompose* can determine the additive seasonality of the data by using rolling averages over the series’ inferred periodicity.

For example, daily time series data will generate rolling averages over the first week of data, normalize out the mean and return those 7 averages repeated over the entire length of the given series. Those seven averages, repeated as many times as necessary to match the length of the given target data, will be used as the seasonal signal of the data.

**Parameters**

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Degree for the polynomial. If 1, linear model is fit to the data. If 2, quadratic model is fit, etc. Defaults to 1.

- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, period should be 7. For daily data with a yearly seasonal signal, period should be 365. Defaults to -1, which uses the statsmodels library’s `freq_to_period` function. <https://github.com/statsmodels/statsmodels/blob/main/statsmodels/tsa/tsatools.py>
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                              |                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                 | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>    | Returns the default parameters for this component.                                                                 |
| <i>describe</i>              | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                   | Fits the PolynomialDecomposer and determine the seasonal signal.                                                   |
| <i>fit_transform</i>         | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>   | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <i>inverse_transform</i>     | Adds back fitted trend and seasonality to target variable.                                                         |
| <i>is_freq_valid</i>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                  | Loads component at file path.                                                                                      |
| <i>parameters</i>            | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>    | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                  | Saves component at file path.                                                                                      |
| <i>set_period</i>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>             | Transforms the target data by removing the polynomial trend and rolling average seasonality.                       |
| <i>update_parameters</i>     | Updates the parameter dictionary of the component.                                                                 |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**classmethod determine\_periodicity**(*cls*, *X: pandas.DataFrame*, *y: pandas.Series*, *acf\_threshold: float = 0.01*, *rel\_max\_order: int = 5*)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**Returns**

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target's seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either "7" or "365", depending on which seasonality is more strongly autocorrelated. If no period is detected, returns `None`.

**Return type** int

**fit**(*self*, *X: pandas.DataFrame*, *y: pandas.Series = None*) → *PolynomialDecomposer*

Fits the `PolynomialDecomposer` and determine the seasonal signal.

Currently only fits the polynomial detrender. The seasonality is determined by removing the trend from the signal and using `statsmodels.seasonal_decompose()`. Both the trend and seasonality are currently assumed to be additive.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns** *self***Raises**

- **NotImplementedError** – If the input data has a frequency of “month-begin”. This isn’t supported by statsmodels decompose as the freqstr “MS” is misinterpreted as milliseconds.
- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have DatetimeIndex AND no Datetime features in features data

**fit\_transform**(*self*, *X: pandas.DataFrame*, *y: pandas.Series = None*) → tuple[pandas.DataFrame, pandas.Series]

Removes fitted trend and seasonality from target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable y with the fitted trend removed.

**Return type** tuple of pd.DataFrame, pd.Series

**get\_trend\_dataframe**(*self*, *X: pandas.DataFrame*, *y: pandas.Series*) → list[pandas.DataFrame]

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

Scikit-learn’s PolynomialForecaster is used to generate the trend portion of the target data. statsmodel’s seasonal\_decompose is used to generate the seasonality of the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

**Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,”** with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of pd.DataFrame

**Raises**

- **TypeError** – If X does not have time-series data in the index.
- **ValueError** – If time series index of X does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If y is not provided as a pandas Series or DataFrame.

**inverse\_transform**(*self*, *y\_t*: *pandas.Series*) → tuple[pandas.DataFrame, pandas.Series]

Adds back fitted trend and seasonality to target variable.

The polynomial trend is added back into the signal, calling the detrender's `inverse_transform()`. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** *y\_t* (*pd.Series*) – Target variable.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable *y* with the trend and seasonality added back in.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises** **ValueError** – If *y* is None.

**classmethod** **is\_freq\_valid**(*cls*, *freq*: *str*)

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (*str*) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** **load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property** **parameters**(*self*)

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

**The figure and axes that have the decompositions** plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the polynomial trend and rolling average seasonality.

Applies the fit polynomial detrender to the target data, removing the additive polynomial trend. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

**The input features are returned without modification. The target** variable *y* is detrended and deseasonalized.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises ValueError** – If target data doesn't have *DatetimeIndex* AND no *Datetime* features in features data

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.**ReplaceNullableTypes**(*random\_seed*=0, *\*\*kwargs*)

Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.

#### Attributes

|                               |                                    |
|-------------------------------|------------------------------------|
| <b>hyper-parameter_ranges</b> | None                               |
| <b>modifies_features</b>      | True                               |
| <b>modifies_target</b>        | {}                                 |
| <b>name</b>                   | Replace Nullable Types Transformer |
| <b>training_only</b>          | False                              |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Substitutes non-nullable types for the new pandas nullable types in the data and target data.                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data by replacing columns that contain nullable types with the appropriate replacement type.                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Substitutes non-nullable types for the new pandas nullable types in the data and target data.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Input features.
- **y** (*pd.Series*) – Target data.

**Returns** The input features and target data with the non-nullable types set.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data by replacing columns that contain nullable types with the appropriate replacement type.

“float64” for nullable integers and “category” for nullable booleans.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Target data to transform

**Returns** Transformed X *pd.Series*: Transformed y

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.preprocessing.STLDecomposer(time_index: str =  
None, degree: int  
= 1, period: int =  
None, seasonal_smoother:  
int = 7,  
random_seed: int  
= 0, **kwargs)
```

Removes trends and seasonality from time series using the STL algorithm.

<https://www.statsmodels.org/dev/generated/statsmodels.tsa.seasonal.STL.html>

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Not currently used. STL 3x “degree-like” values. None are able to be set at this time. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, the period should likely be 7. For daily data with a yearly seasonal signal, the period should likely be 365. If None, statsmodels will infer the period based on the frequency. Defaults to None.
- **seasonal\_smoother** (*int*) – The length of the seasonal smoother used by the underlying STL algorithm. For compatibility, must be odd. If an even number is provided, the next, highest odd number will be used. Defaults to 7.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                |
|-------------------------------|----------------|
| <b>hyper-parameter_ranges</b> | None           |
| <b>invalid_frequencies</b>    | []             |
| <b>modifies_features</b>      | False          |
| <b>modifies_target</b>        | True           |
| <b>name</b>                   | STL Decomposer |
| <b>needs_fitting</b>          | True           |
| <b>training_only</b>          | False          |

#### Methods

|                                       |                                                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                          | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>             | Returns the default parameters for this component.                                                                 |
| <i>describe</i>                       | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i>          | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                            | Fits the STLDecomposer and determine the seasonal signal.                                                          |
| <i>fit_transform</i>                  | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>            | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <i>get_trend_prediction_intervals</i> | Calculate the prediction intervals for the trend data.                                                             |
| <i>inverse_transform</i>              | Adds back fitted trend and seasonality to target variable.                                                         |
| <i>is_freq_valid</i>                  | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                           | Loads component at file path.                                                                                      |
| <i>parameters</i>                     | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>             | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                           | Saves component at file path.                                                                                      |
| <i>set_period</i>                     | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>                      | Transforms the target data by removing the STL trend and seasonality.                                              |
| <i>update_parameters</i>              | Updates the parameter dictionary of the component.                                                                 |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

*int*

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *STLDecomposer*

Fits the STLDecomposer and determine the seasonal signal.

Instantiates a statsmodels STL decompose object with the component’s stored parameters and fits it. Since the statsmodels object does not fit the sklearn api, it is not saved during `__init__()` in `_component_obj` and will be re-instantiated each time fit is called.

To emulate the sklearn API, when the STL decomposer is fit, the full seasonal component, a single period sample of the seasonal component, the full trend-cycle component and the residual are saved.

$y(t) = S(t) + T(t) + R(t)$

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

*self*

#### Raises

- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have DatetimeIndex AND no Datetime features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**get\_trend\_dataframe**(*self*, *X*, *y*)

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

**Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,”** with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **TypeError** – If `X` does not have time-series data in the index.
- **ValueError** – If time series index of `X` does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If `y` is not provided as a pandas Series or DataFrame.

**get\_trend\_prediction\_intervals**(*self*, *y*, *coverage=None*)

Calculate the prediction intervals for the trend data.

**Parameters**

- **y** (*pd.Series*) – Target data.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict of `pd.Series`

**inverse\_transform**(*self*, *y\_t*: *pandas.Series*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Adds back fitted trend and seasonality to target variable.

The STL trend is projected to cover the entire requested target range, then added back into the signal. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (*pd.Series*) – Target variable.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If `y` is None.

**classmethod** `is_freq_valid(cls, freq: str)`

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** `freq (str)` – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path (str)` – Location to load file.

**Returns** ComponentBase object

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(self, X: pandas.DataFrame, y: pandas.Series, show: bool = False) → tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(self, X: pandas.DataFrame, y: pandas.Series, acf\_threshold: float = 0.01, rel\_max\_order: int = 5)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the STL trend and seasonality.

Uses an ARIMA model to project forward the additive trend and removes it. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable *y* is detrended and deseasonalized.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises ValueError** – If target data doesn't have *DatetimeIndex* AND no *Datetime* features in features data

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.**TextTransformer**(*component\_obj=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Base class for all transformers working with text features.

#### Parameters

- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                          |       |
|--------------------------|-------|
| <b>modifies_features</b> | True  |
| <b>modifies_target</b>   | False |
| <b>training_only</b>     | False |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>name</code>               | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.preprocessing.TimeSeriesFeaturizer(time_index=None,  
                                                                           max_delay=2,  
                                                                           gap=0,  
                                                                           fore-  
                                                                           cast_horizon=1,  
                                                                           conf_level=0.05,  
                                                                           rolling_window_size=0.25,  
                                                                           de-  
                                                                           lay_features=True,  
                                                                           de-  
                                                                           lay_target=True,  
                                                                           ran-  
                                                                           dom_seed=0,  
                                                                           **kwargs)
```

Transformer that delays input features and target variable for time series problems.

This component uses an algorithm based on the autocorrelation values of the target variable to determine which lags to select from the set of all possible lags.

The algorithm is based on the idea that the local maxima of the autocorrelation function indicate the lags that have the most impact on the present time.

The algorithm computes the autocorrelation values and finds the local maxima, called “peaks”, that are significant at the given *conf\_level*. Since lags in the range [0, 10] tend to be predictive but not local maxima, the union of the peaks is taken with the significant lags in the range [0, 10]. At the end, only selected lags in the range [0, *max\_delay*] are used.

Parametrizing the algorithm by *conf\_level* lets the AutoMLAlgorithm tune the set of lags chosen so that the chances of finding a good set of lags is higher.

Using *conf\_level* value of 1 selects all possible lags.

**Parameters**

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **max\_delay** (*int*) – Maximum number of time units to delay each feature. Defaults to 2.
- **forecast\_horizon** (*int*) – The number of time periods the pipeline is expected to forecast.
- **conf\_level** (*float*) – Float in range (0, 1] that determines the confidence interval size used to select which lags to compute from the set of [1, *max\_delay*]. A delay of 1 will always be computed. If 1, selects all possible lags in the set of [1, *max\_delay*], inclusive.
- **rolling\_window\_size** (*float*) – Float in range (0, 1] that determines the size of the window used for rolling features. Size is computed as *rolling\_window\_size* \* *max\_delay*.
- **delay\_features** (*bool*) – Whether to delay the input features. Defaults to True.
- **delay\_target** (*bool*) – Whether to delay the target. Defaults to True.

- **gap** (*int*) – The number of time units between when the features are collected and when the target is collected. For example, if you are predicting the next time step’s target, gap=1. This is only needed because when gap=0, we need to be sure to start the lagging of the target variable at 1. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that Component.default\_parameters == Component().parameters.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the DelayFeatureTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **ValueError** – if self.time\_index is None

**fit\_transform**(*self*, *X*, *y=None*)

Fit the component and transform the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X.

**Return type** pd.DataFrame

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the delayed values and rolling means for X and y.

The chosen delays are determined by the autocorrelation function of the target variable. See the class docstring for more information on how they are chosen. If y is None, all possible lags are chosen.

If y is not None, it will also compute the delayed values for the target variable.

The rolling means for all numeric features in X and y, if y is numeric, are also returned.

**Parameters**

- **X** (*pd.DataFrame* or *None*) – Data to transform. *None* is expected when only the target variable is being used.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X. No original features are returned.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

```
class evalml.pipelines.components.transformers.preprocessing.TimeSeriesRegularizer(time_index=None,
                                                                              frequency_payload=None,
                                                                              window_length=4,
                                                                              threshold=0.4,
                                                                              random_seed=0,
                                                                              **kwargs)
```

Transformer that regularizes an inconsistently spaced datetime column.

If X is passed in to fit/transform, the column *time\_index* will be checked for an inferrable offset frequency. If the *time\_index* column is perfectly inferrable then this Transformer will do nothing and return the original X and y.

If X does not have a perfectly inferrable frequency but one can be estimated, then X and y will be reformatted based on the estimated frequency for *time\_index*. In the original X and y passed: - Missing datetime values will be added and will have their corresponding columns in X and y set to *None*. - Duplicate datetime values will be dropped. - Extra datetime values will be dropped. - If it can be determined that a duplicate or extra value is misaligned, then it will be repositioned to take the place of a missing value.

This Transformer should be used before the *TimeSeriesImputer* in order to impute the missing values that were added to X and y (if passed).

**Parameters**

- **time\_index** (*string*) – Name of the column containing the datetime information used to order the data, required. Defaults to *None*.
- **frequency\_payload** (*tuple*) – Payload returned from Woodwork's *infer\_frequency* function where *debug* is *True*. Defaults to *None*.
- **window\_length** (*int*) – The size of the rolling window over which inference is conducted to determine the prevalence of uninferrable frequencies.
- **5.** (*Lower values make this component more sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **threshold** (*float*) – The minimum percentage of windows that need to have been able to infer a frequency. Lower values make this component more
- **0.8.** (*sensitive to recognizing numerous faulty datetime values. Defaults to*) –

- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.
- **0**. (*Defaults to*) –

Raises **ValueError** – if the frequency\_payload parameter has not been passed a tuple

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the TimeSeriesRegularizer.                                                                                                  |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Regularizes a dataframe and target data to an in-ferrable offset frequency.                                                      |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the TimeSeriesRegularizer.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – if self.time\_index is None, if X and y have different lengths, if *time\_index* in X does not have an offset frequency that can be estimated
- **TypeError** – if the *time\_index* column is not of type Datetime
- **KeyError** – if the *time\_index* column doesn't exist

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Regularizes a dataframe and target data to an inferrable offset frequency.

A ‘clean’ X and y (if y was passed in) are created based on an inferrable offset frequency and matching datetime values with the original X and y are imputed into the clean X and y. Datetime values identified as misaligned are shifted into their appropriate position.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Data with an inferrable *time\_index* offset frequency.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.preprocessing.**URLFeaturizer**(*random\_seed*=0, *\*\*kwargs*)

Transformer that can automatically extract features from URL.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                |
|-------------------------------|----------------|
| <b>hyper-parameter_ranges</b> | { }            |
| <b>modifies_features</b>      | True           |
| <b>modifies_target</b>        | False          |
| <b>name</b>                   | URL Featurizer |
| <b>training_only</b>          | False          |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

## samplers

Sampler components.

### Submodules

#### base\_sampler

Base Sampler component. Used as the base class of all sampler components.

### Module Contents

#### Classes Summary

### Contents

```
class evalml.pipelines.components.transformers.samplers.base_sampler.BaseSampler(parameters=None,
                                          component_obj=None,
                                          random_seed=0,
                                          **kwargs)
```

Base Sampler component. Used as the base class of all sampler components.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                          |      |
|--------------------------|------|
| <b>modifies_features</b> | True |
| <b>modifies_target</b>   | True |
| <b>training_only</b>     | True |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the sampler to the data.                                                                                                    |
| <code>fit_transform</code>      | Fit and transform data using the sampler component.                                                                              |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>name</code>               | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms the input data by sampling the data.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits the sampler to the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Target.

**Returns** self

**Raises** **ValueError** – If y is None.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*)

Transforms the input data by sampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## oversampler

SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.

                                         sampling_ratio_dict=None,
                                         k_neighbors_default=5,
                                         n_jobs=-1,
                                         random_seed=0,
                                         **kwargs)
```

SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.

### Parameters

- **sampling\_ratio** (*float*) – This is the goal ratio of the minority to majority class, with range (0, 1]. A value of 0.25 means we want a 1:4 ratio of the minority to majority class after oversampling. We will create the a sampling dictionary using this ratio, with the keys corresponding to the class and the values responding to the number of samples. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: `sampling_ratio_dict={0: 0.5, 1: 1}`, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don't sample class 1. Overrides `sampling_ratio` if provided. Defaults to None.
- **k\_neighbors\_default** (*int*) – The number of nearest neighbors used to construct synthetic samples. This is the default value used, but the actual `k_neighbors` value might be smaller if there are less samples. Defaults to 5.
- **n\_jobs** (*int*) – The number of CPU cores to use. Defaults to -1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

### Attributes

|                               |             |
|-------------------------------|-------------|
| <b>hyper-parameter_ranges</b> | None        |
| <b>modifies_features</b>      | True        |
| <b>modifies_target</b>        | True        |
| <b>name</b>                   | Oversampler |
| <b>training_only</b>          | True        |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits oversampler to data.                                                                                                        |
| <i>fit_transform</i>      | Fit and transform data using the sampler component.                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms the input data by Oversampling the data.                                                                              |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits oversampler to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by Oversampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## undersampler

An undersampling transformer to downsample the majority classes in the dataset.

|---------------------|---------------------------------------------------------------------------------------------|
| <i>Undersampler</i> | Initializes an undersampling transformer to downsample the majority classes in the dataset. |
|---------------------|---------------------------------------------------------------------------------------------|

## Contents

```
class evalml.pipelines.components.transformers.samplers.undersampler.Undersampler(sampling_ratio=0.25,
                                                                              sampling_ratio_dict=None,
                                                                              min_samples=100,
                                                                              min_percentage=0.1,
                                                                              random_seed=0,
                                                                              **kwargs)
```

Initializes an undersampling transformer to downsample the majority classes in the dataset.

This component is only run during training and not during predict.

#### Parameters

- **sampling\_ratio** (*float*) – The smallest minority:majority ratio that is accepted as ‘balanced’. For instance, a 1:4 ratio would be represented as 0.25, while a 1:1 ratio is 1.0. Must be between 0 and 1, inclusive. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: *sampling\_ratio\_dict={0: 0.5, 1: 1}*, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don’t sample class 1. Overrides *sampling\_ratio* if provided. Defaults to None.
- **min\_samples** (*int*) – The minimum number of samples that we must have for any class, pre or post sampling. If a class must be downsampled, it will not be downsampled past this value. To determine severe imbalance, the minority class must occur less often than this and must have a class ratio below *min\_percentage*. Must be greater than 0. Defaults to 100.
- **min\_percentage** (*float*) – The minimum percentage of the minimum class to total dataset that we tolerate, as long as it is above *min\_samples*. If *min\_percentage* and *min\_samples*

are not met, treat this as severely imbalanced, and we will not resample the data. Must be between 0 and 0.5, inclusive. Defaults to 0.1.

- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

#### Raises

- **ValueError** – If `sampling_ratio` is not in the range (0, 1].
- **ValueError** – If `min_sample` is not greater than 0.
- **ValueError** – If `min_percentage` is not between 0 and 0.5, inclusive.

#### Attributes

| <b>modifies_target</b>        | True         |
| <b>name</b>                   | Undersampler |
| <b>training_only</b>          | True         |

#### Methods

|                           |                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits the sampler to the data.                                                                                                                                                            |
| <i>fit_resample</i>       | Resampling technique for this sampler.                                                                                                                                                   |
| <i>fit_transform</i>      | Fit and transform data using the sampler component.                                                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Transforms the input data by sampling the data.                                                                                                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the sampler to the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Target.

**Returns** self

**Raises** **ValueError** – If y is None.

**fit\_resample**(*self*, *X*, *y*)

Resampling technique for this sampler.

**Parameters**

- **X** (*pd.DataFrame*) – Training data to fit and resample.
- **y** (*pd.Series*) – Training data targets to fit and resample.

**Returns** Indices to keep for training data.

**Return type** list

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (pd.DataFrame, pd.Series)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by sampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Contents

```
class evalml.pipelines.components.transformers.samplers.Oversampler(sampling_ratio=0.25,  
                                                                    sampling_ratio_dict=None,  
                                                                    k_neighbors_default=5,  
                                                                    n_jobs=-1,  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.

**Parameters**

- **sampling\_ratio** (*float*) – This is the goal ratio of the minority to majority class, with range (0, 1]. A value of 0.25 means we want a 1:4 ratio of the minority to majority class after oversampling. We will create the a sampling dictionary using this ratio, with the keys corresponding to the class and the values responding to the number of samples. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: `sampling_ratio_dict={0: 0.5, 1: 1}`, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don't sample class 1. Overrides `sampling_ratio` if provided. Defaults to None.
- **k\_neighbors\_default** (*int*) – The number of nearest neighbors used to construct synthetic samples. This is the default value used, but the actual `k_neighbors` value might be smaller if there are less samples. Defaults to 5.
- **n\_jobs** (*int*) – The number of CPU cores to use. Defaults to -1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

#### Attributes

| <b>hyper-parameter_ranges</b> | None        |
| <b>modifies_features</b>      | True        |
| <b>modifies_target</b>        | True        |
| <b>name</b>                   | Oversampler |
| <b>training_only</b>          | True        |

#### Methods

|                                 |                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                                       |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                                                 |
| <code>fit</code>                | Fits oversampler to data.                                                                                                                                                                |
| <code>fit_transform</code>      | Fit and transform data using the sampler component.                                                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                                                                            |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <code>save</code>               | Saves component at file path.                                                                                                                                                            |
| <code>transform</code>          | Transforms the input data by Oversampling the data.                                                                                                                                      |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit(*self*, *X*, *y*)**

Fits oversampler to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**fit\_transform(*self*, *X*, *y*)**

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by Oversampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.samplers.Undersampler(sampling_ratio=0.25,
                                                                    sam-
                                                                    pling_ratio_dict=None,
                                                                    min_samples=100,
                                                                    min_percentage=0.1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Initializes an undersampling transformer to downsample the majority classes in the dataset.

This component is only run during training and not during predict.

**Parameters**

- **sampling\_ratio** (*float*) – The smallest minority:majority ratio that is accepted as ‘balanced’. For instance, a 1:4 ratio would be represented as 0.25, while a 1:1 ratio is 1.0. Must be between 0 and 1, inclusive. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: *sampling\_ratio\_dict*={0: 0.5, 1: 1}, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don’t sample class 1. Overrides *sampling\_ratio* if provided. Defaults to None.
- **min\_samples** (*int*) – The minimum number of samples that we must have for any class, pre or post sampling. If a class must be downsampled, it will not be downsampled past this value. To determine severe imbalance, the minority class must occur less often than this and must have a class ratio below *min\_percentage*. Must be greater than 0. Defaults to 100.
- **min\_percentage** (*float*) – The minimum percentage of the minimum class to total dataset that we tolerate, as long as it is above *min\_samples*. If *min\_percentage* and *min\_samples* are not met, treat this as severely imbalanced, and we will not resample the data. Must be between 0 and 0.5, inclusive. Defaults to 0.1.

- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

**Raises**

- **ValueError** – If sampling\_ratio is not in the range (0, 1].
- **ValueError** – If min\_sample is not greater than 0.
- **ValueError** – If min\_percentage is not between 0 and 0.5, inclusive.

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the sampler to the data.                                                                                                    |
| <i>fit_resample</i>       | Resampling technique for this sampler.                                                                                           |
| <i>fit_transform</i>      | Fit and transform data using the sampler component.                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms the input data by sampling the data.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the sampler to the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Target.

**Returns** self

**Raises** **ValueError** – If y is None.

**fit\_resample**(*self*, *X*, *y*)

Resampling technique for this sampler.

**Parameters**

- **X** (*pd.DataFrame*) – Training data to fit and resample.
- **y** (*pd.Series*) – Training data targets to fit and resample.

**Returns** Indices to keep for training data.

**Return type** list

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (pd.DataFrame, pd.Series)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by sampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## scalers

Components that scale input data.

## Submodules

### standard\_scaler

A transformer that standardizes input features by removing the mean and scaling to unit variance.

## Module Contents

### Classes Summary

---

*StandardScaler*

A transformer that standardizes input features by removing the mean and scaling to unit variance.

---

## Contents

**class** evalml.pipelines.components.transformers.scalers.standard\_scaler.**StandardScaler**(*random\_seed=0*,  
\*\**kwargs*)

A transformer that standardizes input features by removing the mean and scaling to unit variance.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |

| <b>training_only</b>          | False           |

### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the standard scalar on the given data.                                                                                      |
| <i>fit_transform</i>      | Fit and transform data using the standard scaler component.                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted standard scaler.                                                                                 |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the standard scalar on the given data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the standard scaler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted standard scaler.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Package Contents

## Classes Summary

---

*StandardScaler*

A transformer that standardizes input features by removing the mean and scaling to unit variance.

---

## Contents

**class** `evalml.pipelines.components.transformers.scalers.StandardScaler`(*random\_seed=0*,  
\*\**kwargs*)

A transformer that standardizes input features by removing the mean and scaling to unit variance.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | True            |
| <b>modifies_target</b>        | False           |
| <b>name</b>                   | Standard Scaler |
| <b>training_only</b>          | False           |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the standard scalar on the given data.                                                                                      |
| <code>fit_transform</code>      | Fit and transform data using the standard scaler component.                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted standard scaler.                                                                                 |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the standard scalar on the given data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Fit and transform data using the standard scaler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted standard scaler.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Submodules

### column\_selectors

Initializes an transformer that selects specified columns in input data.

## Module Contents

### Classes Summary

|                       |                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------|
| <i>ColumnSelector</i> | Initializes an transformer that selects specified columns in input data.          |
| <i>DropColumns</i>    | Drops specified columns in input data.                                            |
| <i>SelectByType</i>   | Selects columns by specified Woodwork logical type or semantic tag in input data. |
| <i>SelectColumns</i>  | Selects specified columns in input data.                                          |

## Contents

```
class evalml.pipelines.components.transformers.column_selectors.ColumnSelector(columns=None,  
                                                                              random_seed=0,  
                                                                              **kwargs)
```

Initializes an transformer that selects specified columns in input data.

#### Parameters

- **columns** (*list(string)*) – List of column names, used to determine which columns to select.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                          |       |
|--------------------------|-------|
| <b>modifies_features</b> | True  |
| <b>modifies_target</b>   | False |
| <b>training_only</b>     | False |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the transformer by checking if column names are present in the dataset.                                                     |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>name</i>               | Returns string name of this component.                                                                                           |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using fitted column selector component.                                                                           |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series, ignored*) – Targets.

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted column selector component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.

- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.column\_selectors.**DropColumns**(*columns=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Drops specified columns in input data.

#### Parameters

- **columns** (*list(string)*) – List of column names, used to determine which columns to drop.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                          |
|-------------------------------|--------------------------|
| <b>hyper-parameter_ranges</b> | {}                       |
| <b>modifies_features</b>      | True                     |
| <b>modifies_target</b>        | False                    |
| <b>name</b>                   | Drop Columns Transformer |
| <b>needs_fitting</b>          | False                    |
| <b>training_only</b>          | False                    |

#### Methods

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.        |
| <i>default_parameters</i> | Returns the default parameters for this component.                           |
| <i>describe</i>           | Describe a component and its parameters.                                     |
| <i>fit</i>                | Fits the transformer by checking if column names are present in the dataset. |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                  |
| <i>load</i>               | Loads component at file path.                                                |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.          |
| <i>save</i>               | Saves component at file path.                                                |
| <i>transform</i>          | Transforms data X by dropping columns.                                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                           |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *ignored*) – Targets.

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by dropping columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.

- **y** (*pd.Series*, *optional*) – Targets.

**Returns** Transformed X.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.column_selectors.SelectByType(column_types=None,  
                                                                           exclude=False,  
                                                                           ran-  
                                                                           dom_seed=0,  
                                                                           **kwargs)
```

Selects columns by specified Woodwork logical type or semantic tag in input data.

**Parameters**

- **column\_types** (*string*, *ww.LogicalType*, *list(string)*, *list(ww.LogicalType)*) – List of Woodwork types or tags, used to determine which columns to select or exclude.
- **exclude** (*bool*) – If true, exclude the *column\_types* instead of including them. Defaults to False.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                                    |
|-------------------------------|------------------------------------|
| <b>hyper-parameter_ranges</b> | { }                                |
| <b>modifies_features</b>      | True                               |
| <b>modifies_target</b>        | False                              |
| <b>name</b>                   | Select Columns By Type Transformer |
| <b>needs_fitting</b>          | False                              |
| <b>training_only</b>          | False                              |

**Methods**

|                                 |                                                                              |
|---------------------------------|------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.        |
| <code>default_parameters</code> | Returns the default parameters for this component.                           |
| <code>describe</code>           | Describe a component and its parameters.                                     |
| <code>fit</code>                | Fits the transformer by checking if column names are present in the dataset. |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                  |
| <code>load</code>               | Loads component at file path.                                                |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.          |
| <code>save</code>               | Saves component at file path.                                                |
| <code>transform</code>          | Transforms data X by selecting columns.                                      |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                           |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *ignored*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by selecting columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** Transformed X.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.column_selectors.SelectColumns(columns=None,
                                                                           random_seed=0,
                                                                           **kwargs)
```

Selects specified columns in input data.

**Parameters**

- **columns** (*list(string)*) – List of column names, used to determine which columns to select. If columns are not present, they will not be selected.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                            |
|-------------------------------|----------------------------|
| <b>hyper-parameter_ranges</b> | {}                         |
| <b>modifies_features</b>      | True                       |
| <b>modifies_target</b>        | False                      |
| <b>name</b>                   | Select Columns Transformer |
| <b>needs_fitting</b>          | False                      |
| <b>training_only</b>          | False                      |

## Methods

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.        |
| <i>default_parameters</i> | Returns the default parameters for this component.                           |
| <i>describe</i>           | Describe a component and its parameters.                                     |
| <i>fit</i>                | Fits the transformer by checking if column names are present in the dataset. |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                  |
| <i>load</i>               | Loads component at file path.                                                |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.          |
| <i>save</i>               | Saves component at file path.                                                |
| <i>transform</i>          | Transform data using fitted column selector component.                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                           |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted column selector component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## transformer

A component that may or may not need fitting that transforms data. These components are used before an estimator.

## Module Contents

### Classes Summary

---

*Transformer*

A component that may or may not need fitting that transforms data. These components are used before an estimator.

---

## Contents

```
class evalml.pipelines.components.transformers.transformer.Transformer(parameters=None,
                                                                    component_obj=None,
                                                                    random_seed=0,
                                                                    **kwargs)
```

A component that may or may not need fitting that transforms data. These components are used before an estimator.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Transformer component.

### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                          |       |
|--------------------------|-------|
| <b>modifies_features</b> | True  |
| <b>modifies_target</b>   | False |
| <b>training_only</b>     | False |

### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>name</code>               | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Package Contents

### Classes Summary

|                                   |                                                                                                                                    |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>DateTimeFeaturizer</i>         | Transformer that can automatically extract features from datetime columns.                                                         |
| <i>DFSTransformer</i>             | Featuretools DFS component that generates features for the input features.                                                         |
| <i>DropColumns</i>                | Drops specified columns in input data.                                                                                             |
| <i>DropNaNRowsTransformer</i>     | Transformer to drop rows with NaN values.                                                                                          |
| <i>DropNullColumns</i>            | Transformer to drop features whose percentage of NaN values exceeds a specified threshold.                                         |
| <i>DropRowsTransformer</i>        | Transformer to drop rows specified by row indices.                                                                                 |
| <i>EmailFeaturizer</i>            | Transformer that can automatically extract features from emails.                                                                   |
| <i>FeatureSelector</i>            | Selects top features based on importance weights.                                                                                  |
| <i>Imputer</i>                    | Imputes missing data according to a specified imputation strategy.                                                                 |
| <i>LabelEncoder</i>               | A transformer that encodes target labels using values between 0 and num_classes - 1.                                               |
| <i>LinearDiscriminantAnalysis</i> | Reduces the number of features by using Linear Discriminant Analysis.                                                              |
| <i>LogTransformer</i>             | Applies a log transformation to the target data.                                                                                   |
| <i>LSA</i>                        | Transformer to calculate the Latent Semantic Analysis Values of text input.                                                        |
| <i>NaturalLanguageFeaturizer</i>  | Transformer that can automatically featurize text columns using featuretools' nlp_primitives.                                      |
| <i>OneHotEncoder</i>              | A transformer that encodes categorical features in a one-hot numeric array.                                                        |
| <i>OrdinalEncoder</i>             | A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.         |
| <i>Oversampler</i>                | SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMO-TENC based on inputs to the component. |
| <i>PCA</i>                        | Reduces the number of features by using Principal Component Analysis (PCA).                                                        |
| <i>PerColumnImputer</i>           | Imputes missing data according to a specified imputation strategy per column.                                                      |
| <i>PolynomialDecomposer</i>       | Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.                            |

|                                    |                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>ReplaceNullableTypes</i>        | Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.           |
| <i>RFClassifierRFSelector</i>      | Selects relevant features using recursive feature elimination with a Random Forest Classifier.                    |
| <i>RFClassifierSelectFromModel</i> | Selects top features based on importance weights using a Random Forest classifier.                                |
| <i>RFRegressorRFSelector</i>       | Selects relevant features using recursive feature elimination with a Random Forest Regressor.                     |
| <i>RFRegressorSelectFromModel</i>  | Selects top features based on importance weights using a Random Forest regressor.                                 |
| <i>SelectByType</i>                | Selects columns by specified Woodwork logical type or semantic tag in input data.                                 |
| <i>SelectColumns</i>               | Selects specified columns in input data.                                                                          |
| <i>SimpleImputer</i>               | Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.          |
| <i>StandardScaler</i>              | A transformer that standardizes input features by removing the mean and scaling to unit variance.                 |
| <i>STLDecomposer</i>               | Removes trends and seasonality from time series using the STL algorithm.                                          |
| <i>TargetEncoder</i>               | A transformer that encodes categorical features into target encodings.                                            |
| <i>TargetImputer</i>               | Imputes missing target data according to a specified imputation strategy.                                         |
| <i>TimeSeriesFeaturizer</i>        | Transformer that delays input features and target variable for time series problems.                              |
| <i>TimeSeriesImputer</i>           | Imputes missing data according to a specified timeseries-specific imputation strategy.                            |
| <i>TimeSeriesRegularizer</i>       | Transformer that regularizes an inconsistently spaced datetime column.                                            |
| <i>Transformer</i>                 | A component that may or may not need fitting that transforms data. These components are used before an estimator. |
| <i>Undersampler</i>                | Initializes an undersampling transformer to downsample the majority classes in the dataset.                       |
| <i>URLFeaturizer</i>               | Transformer that can automatically extract features from URL.                                                     |

## Contents

```
class evalml.pipelines.components.transformers.DateTimeFeaturizer(features_to_extract=None,
                                                                encode_as_categories=False,
                                                                time_index=None,
                                                                random_seed=0, **kwargs)
```

Transformer that can automatically extract features from datetime columns.

### Parameters

- **features\_to\_extract** (*list*) – List of features to extract. Valid options include “year”, “month”, “day\_of\_week”, “hour”. Defaults to None.
- **encode\_as\_categories** (*bool*) – Whether day-of-week and month features should be encoded as pandas “category” dtype. This allows OneHotEncoders to encode these features.

Defaults to False.

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                     |
|-------------------------------|---------------------|
| <b>hyper-parameter_ranges</b> | {}                  |
| <b>modifies_features</b>      | True                |
| <b>modifies_target</b>        | False               |
| <b>name</b>                   | DateTime Featurizer |
| <b>training_only</b>          | False               |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fit the datetime featurizer component.                                                                                           |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Gets the categories of each datetime feature.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns.            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fit the datetime featurizer component.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**get\_feature\_names**(*self*)

Gets the categories of each datetime feature.

**Returns**

**Dictionary, where each key-value pair is a column name and a dictionary mapping the unique feature values to their integer encoding.**

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transforms data *X* by creating new features using existing DateTime columns, and then dropping those DateTime columns.

#### Parameters

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.DFSTransformer`(*index*='index', *features*=*None*, *random\_seed*=0, *\*\*kwargs*)

Featuretools DFS component that generates features for the input features.

#### Parameters

- **index** (*string*) – The name of the column that contains the indices. If no column with this name exists, then `featuretools.EntitySet()` creates a column with this name to serve as the index column. Defaults to 'index'.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **features** (*list*) – List of features to run DFS on. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input. If features is an empty list, no transformation will occur to inputted data.

#### Attributes

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | True            |
| <b>modifies_target</b>        | False           |
| <b>name</b>                   | DFS Transformer |
| <b>training_only</b>          | False           |

## Methods

|                                             |                                                                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                          | Constructs a new component with the same parameters and random state.                                                            |
| <code>contains_pre_existing_features</code> | Determines whether or not features from a DFS Transformer match pipeline input features.                                         |
| <code>default_parameters</code>             | Returns the default parameters for this component.                                                                               |
| <code>describe</code>                       | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                            | Fits the DFSTransformer Transformer component.                                                                                   |
| <code>fit_transform</code>                  | Fits on X and transforms X.                                                                                                      |
| <code>load</code>                           | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>                  | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>                     | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>                           | Saves component at file path.                                                                                                    |
| <code>transform</code>                      | Computes the feature matrix for the input X using featuretools' dfs algorithm.                                                   |
| <code>update_parameters</code>              | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `static contains_pre_existing_features(dfs_features:`

*Optional[List[featuretools.feature\_base.FeatureBase]],*  
*input\_feature\_names: List[str], target: Optional[str] =*  
*None)*

Determines whether or not features from a DFS Transformer match pipeline input features.

#### Parameters

- **dfs\_features** (*Optional[List[FeatureBase]]*) – List of features output from a DFS Transformer.
- **input\_feature\_names** (*List[str]*) – List of input features into the DFS Transformer.
- **target** (*Optional[str]*) – The target whose values we are trying to predict. This is used to know which column to ignore if the target column is present in the list of features in the DFS Transformer's parameters.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits the DFSTransformer Transformer component.

**Parameters**

- **X** (*pd.DataFrame, np.array*) – The input data to transform, of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the feature matrix for the input *X* using featuretools' dfs algorithm.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data to transform. Has shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Feature matrix

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.**DropColumns**(*columns=None*, *random\_seed=0*,  
\*\**kwargs*)

Drops specified columns in input data.

**Parameters**

- **columns** (*list(string)*) – List of column names, used to determine which columns to drop.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                          |
|-------------------------------|--------------------------|
| <b>hyper-parameter_ranges</b> | {}                       |
| <b>modifies_features</b>      | True                     |
| <b>modifies_target</b>        | False                    |
| <b>name</b>                   | Drop Columns Transformer |
| <b>needs_fitting</b>          | False                    |
| <b>training_only</b>          | False                    |

**Methods**

|                                 |                                                                              |
|---------------------------------|------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.        |
| <code>default_parameters</code> | Returns the default parameters for this component.                           |
| <code>describe</code>           | Describe a component and its parameters.                                     |
| <code>fit</code>                | Fits the transformer by checking if column names are present in the dataset. |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                  |
| <code>load</code>               | Loads component at file path.                                                |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.          |
| <code>save</code>               | Saves component at file path.                                                |
| <code>transform</code>          | Transforms data X by dropping columns.                                       |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                           |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *ignored*) – Targets.

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by dropping columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** Transformed X.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.DropNaNRowsTransformer(parameters=None,  
                                                                    component_obj=None,  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

Transformer to drop rows with NaN values.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

**Attributes**

|                               |                           |
|-------------------------------|---------------------------|
| <b>hyper-parameter_ranges</b> | {}                        |
| <b>modifies_features</b>      | True                      |
| <b>modifies_target</b>        | True                      |
| <b>name</b>                   | Drop NaN Rows Transformer |
| <b>training_only</b>          | False                     |

| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data using fitted component.                                                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with NaN rows dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.**DropNullColumns**(*pct\_null\_threshold=1.0*,  
*random\_seed=0*, *\*\*kwargs*)

Transformer to drop features whose percentage of NaN values exceeds a specified threshold.

#### Parameters

- **pct\_null\_threshold** (*float*) – The percentage of NaN values in an input feature to drop. Must be a value between [0, 1] inclusive. If equal to 0.0, will drop columns with any null values. If equal to 1.0, will drop columns with all null values. Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                               |
|-------------------------------|-------------------------------|
| <b>hyper-parameter_ranges</b> | {}                            |
| <b>modifies_features</b>      | True                          |
| <b>modifies_target</b>        | False                         |
| <b>name</b>                   | Drop Null Columns Transformer |
| <b>training_only</b>          | False                         |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by dropping columns that exceed the threshold of null values.                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by dropping columns that exceed the threshold of null values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.DropRowsTransformer`(*indices\_to\_drop=None*,  
*random\_seed=0*)

Transformer to drop rows specified by row indices.

**Parameters**

- **indices\_to\_drop** (*list*) – List of indices to drop in the input data. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

**Attributes**

|                               |                       |
|-------------------------------|-----------------------|
| <b>hyper-parameter_ranges</b> | { }                   |
| <b>modifies_features</b>      | True                  |
| <b>modifies_target</b>        | True                  |
| <b>name</b>                   | Drop Rows Transformer |
| <b>training_only</b>          | True                  |

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data using fitted component.                                                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If indices to drop do not exist in input features or target.

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with row indices dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.transformers.**EmailFeaturizer**(*random\_seed=0*, *\*\*kwargs*)

Transformer that can automatically extract features from emails.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.

- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.FeatureSelector`(*parameters=None*,  
*component\_obj=None*,  
*random\_seed=0*, *\*\*kwargs*)

Selects top features based on importance weights.

**Parameters**

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                |       |
|--------------------------------|-------|
| <b>modi-<br/>fies_features</b> | True  |
| <b>modi-<br/>fies_target</b>   | False |
| <b>train-<br/>ing_only</b>     | False |

**Methods**

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>name</code>               | Returns string name of this component.                                                                                                                                |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(self, X, y=None)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(self)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(file\_path)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(cls)

Returns string name of this component.

**needs\_fitting**(self)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(self)

Returns the parameters which were used to initialize the component.

**save**(self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(self, X, y=None)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series, optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** pd.DataFrame

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a `component_obj` that implements transform

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.Imputer(categorical_impute_strategy='most_frequent',
                                                    categorical_fill_value=None,
                                                    numeric_impute_strategy='mean',
                                                    numeric_fill_value=None,
                                                    boolean_impute_strategy='most_frequent',
                                                    boolean_fill_value=None, random_seed=0,
                                                    **kwargs)
```

Imputes missing data according to a specified imputation strategy.

#### Parameters

- **`categorical_impute_strategy`** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most\_frequent” and “constant”.
- **`numeric_impute_strategy`** (*string*) – Impute strategy to use for numeric columns. Valid values include “mean”, “median”, “most\_frequent”, and “constant”.
- **`boolean_impute_strategy`** (*string*) – Impute strategy to use for boolean columns. Valid values include “most\_frequent” and “constant”.
- **`categorical_fill_value`** (*string*) – When `categorical_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with the string “missing\_value”.
- **`numeric_fill_value`** (*int, float*) – When `numeric_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with 0.
- **`boolean_fill_value`** (*bool*) – When `boolean_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of None will fill with True.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                                                                                                                                                          |

| <b>hyper-parameter_ranges</b> | { “categorical_impute_strategy”: [“most_frequent”], “numeric_impute_strategy”: [“mean”, “median”, “most_frequent”, “knn”], “boolean_impute_strategy”: [“most_frequent”]} |
| <b>modifies_features</b>      | True                                                                                                                                                                     |
| <b>modifies_target</b>        | False                                                                                                                                                                    |
| <b>name</b>                   | Imputer                                                                                                                                                                  |
| <b>training_only</b>          | False                                                                                                                                                                    |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by imputing missing values.                                                                                    |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

**class** `evalml.pipelines.components.transformers.LabelEncoder`(*positive\_label=None*,  
*random\_seed=0*, *\*\*kwargs*)

A transformer that encodes target labels using values between 0 and `num_classes - 1`.

**Parameters**

- **positive\_label** (*int*, *str*) – The label for the class that should be treated as positive (1) for binary classification problems. Ignored for multiclass problems. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0. Ignored.

**Attributes**

|                               |               |
|-------------------------------|---------------|
| <b>hyper-parameter_ranges</b> | {}            |
| <b>modifies_features</b>      | False         |
| <b>modifies_target</b>        | True          |
| <b>name</b>                   | Label Encoder |
| <b>training_only</b>          | False         |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the label encoder.                                                                                                          |
| <i>fit_transform</i>      | Fit and transform data using the label encoder.                                                                                  |
| <i>inverse_transform</i>  | Decodes the target data.                                                                                                         |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform the target using the fitted label encoder.                                                                             |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input y is None.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** pd.DataFrame, pd.Series

**inverse\_transform**(*self*, *y*)

Decodes the target data.

**Parameters** **y** (*pd.Series*) – Target data.

**Returns** The decoded version of the target.

**Return type** pd.Series

**Raises** **ValueError** – If input y is None.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform the target using the fitted label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**Raises** **ValueError** – If input *y* is *None*.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

**class** evalml.pipelines.components.transformers.**LinearDiscriminantAnalysis**(*n\_components=None*,  
*random\_seed=0*,  
*\*\*kwargs*)

Reduces the number of features by using Linear Discriminant Analysis.

**Parameters**

- **n\_components** (*int*) – The number of features to maintain after computation. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                                          |                                          |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the LDA component.                                                                                                          |
| <code>fit_transform</code>      | Fit and transform data using the LDA component.                                                                                  |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted LDA component.                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y*)**

Fits the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform(*self*, *X*, *y=None*)**

Fit and transform data using the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.**LogTransformer**(*random\_seed=0*)

Applies a log transformation to the target data.

**Attributes**

|                               |                 |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the LogTransformer.                                                                                                         |
| <i>fit_transform</i>      | Log transforms the target variable.                                                                                              |
| <i>inverse_transform</i>  | Apply exponential to target data.                                                                                                |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Log transforms the target variable.                                                                                              |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the LogTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – Ignored.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to log transform.

**Returns**

**The input features are returned without modification. The target** variable *y* is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**inverse\_transform**(*self*, *y*)

Apply exponential to target data.

**Parameters** **y** (*pd.Series*) – Target variable.

**Returns** Target with exponential applied.

**Return type** *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target data to log transform.

**Returns**

The input features are returned without modification. The target variable *y* is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.LSA(*random\_seed=0*, *\*\*kwargs*)

Transformer to calculate the Latent Semantic Analysis Values of text input.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | True            |
| <b>modifies_target</b>        | False           |
| <b>name</b>                   | LSA Transformer |
| <b>training_only</b>          | False           |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the input data.                                                                                                             |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by applying the LSA pipeline.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the input data.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms data X by applying the LSA pipeline.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns**

Transformed X. The original column is removed and replaced with two columns of the format *LSA(original\_column\_name)[feature\_number]*, where *feature\_number* is 0 or 1.

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.NaturalLanguageFeaturizer(*random\_seed=0, \*\*kwargs*)

Transformer that can automatically featurize text columns using featuretools' `nlp_primitives`.

Since models cannot handle non-numeric data, any text must be broken down into features that provide useful information about that text. This component splits each text column into several informative features: Diversity Score, Mean Characters per Word, Polarity Score, LSA (Latent Semantic Analysis), Number of Characters, and Number of Words. Calling `transform` on this component will replace any text columns in the given dataset with these numeric columns.

**Parameters** `random_seed` (*int*) – Seed for the random number generator. Defaults to 0.

| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Transforms data X by creating new features using existing text columns.                                                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – The target training data of length [n\_samples]

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by creating new features using existing text columns.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.OneHotEncoder(top_n=10,
                                                            features_to_encode=None,
                                                            categories=None, drop='if_binary',
                                                            handle_unknown='ignore',
                                                            handle_missing='error',
                                                            random_seed=0, **kwargs)
```

A transformer that encodes categorical features in a one-hot numeric array.

**Parameters**

- **top\_n** (*int*) – Number of categories per column to encode. If None, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “auto” if *top\_n* is not None. Defaults to None.
- **drop** (*string*, *list*) – Method (“first” or “if\_binary”) to use to drop one category per feature. Can also be a list specifying which categories to drop for each feature. Defaults to “if\_binary”.
- **handle\_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top\_n* or *categories* is used to limit the number of categories per column, this must be “ignore”. Defaults to “ignore”.
- **handle\_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “as\_category” and NaN values are within the *n* most frequent, “nan” values will be encoded as their own column. If this is set to “error”, any missing values encountered will raise an error. Defaults to “error”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | True            |
| <b>modifies_target</b>        | False           |
| <b>name</b>                   | One Hot Encoder |
| <b>training_only</b>          | False           |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the one-hot encoder component.                                                                                              |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Return feature names for the categorical features after fitting.                                                                 |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | One-hot encode the input data.                                                                                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to one-hot encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to one-hot encoder as a training feature.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the one-hot encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If encoding a column failed.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the categorical features after fitting.

Feature names are formatted as {column name}\_{category name}. In the event of a duplicate name, an integer will be added at the end of the feature name to distinguish it.

For example, consider a dataframe with a column called "A" and category "x\_y" and another column called "A\_x" with "y". In this example, the feature names would be "A\_x\_y" and "A\_x\_y\_1".

**Returns** The feature names after encoding, provided in the same order as input\_features.

**Return type** np.ndarray

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

One-hot encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to one-hot encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each categorical feature has been encoded into numerical columns using one-hot encoding.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.OrdinalEncoder(features_to_encode=None,
                                                            categories=None,
                                                            handle_unknown='error',
                                                            unknown_value=None,
                                                            encoded_missing_value=None,
                                                            random_seed=0, **kwargs)
```

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

**Parameters**

- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None. The order of columns does not matter.
- **categories** (*dict[str, list[str]]*) – A dictionary mapping column names to their categories in the dataframes passed in at fit and transform. The order of categories specified for a column does not matter. Any category found in the data that is not present in categories will be handled as an unknown value. To not have unknown values raise an error, set *handle\_unknown* to “use\_encoded\_value”. Defaults to None.

- **handle\_unknown** ("error" or "use\_encoded\_value") – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. When set to "error", an error will be raised when an unknown category is found. When set to "use\_encoded\_value", unknown categories will be encoded as the value given for the parameter `unknown_value`. Defaults to "error."
- **unknown\_value** (*int* or *np.nan*) – The value to use for unknown categories seen during fit or transform. Required when the parameter `handle_unknown` is set to "use\_encoded\_value." The value has to be distinct from the values used to encode any of the categories in fit. Defaults to None.
- **encoded\_missing\_value** (*int* or *np.nan*) – The value to use for missing (null) values seen during fit or transform. Defaults to *np.nan*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                                                                              |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits the ordinal encoder component.                                                                                                                                                      |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i>get_feature_names</i>  | Return feature names for the ordinal features after fitting.                                                                                                                             |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Ordinally encode the input data.                                                                                                                                                         |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### **categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to ordinal encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** `np.ndarray`

**Raises** **ValueError** – If feature was not provided to ordinal encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** `dict`

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits the ordinal encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises**

- **ValueError** – If encoding a column failed.
- **TypeError** – If non-Ordinal columns are specified in `features_to_encode`.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on `X` and transforms `X`.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed `X`.

**Return type** `pd.DataFrame`

**Raises `MethodPropertyNotFoundError`** – If transformer does not have a transform method or a `component_obj` that implements transform.

**`get_feature_names(self)`**

Return feature names for the ordinal features after fitting.

Feature names are formatted as {column name}\_ordinal\_encoding.

**Returns** The feature names after encoding, provided in the same order as `input_features`.

**Return type** `np.ndarray`

**`static load(file_path)`**

Loads component at file path.

**Parameters** **`file_path`** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**`property parameters(self)`**

Returns the parameters which were used to initialize the component.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`transform(self, X, y=None)`**

Ordinally encode the input data.

**Parameters**

- **`X`** (*pd.DataFrame*) – Features to encode.
- **`y`** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each ordinal feature has been encoded into a numerical column where ordinal integers represent the relative order of categories.

**Return type** `pd.DataFrame`

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.Oversampler(sampling_ratio=0.25,
                                                         sampling_ratio_dict=None,
                                                         k_neighbors_default=5, n_jobs=- 1,
                                                         random_seed=0, **kwargs)
```

SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.

#### Parameters

- **sampling\_ratio** (*float*) – This is the goal ratio of the minority to majority class, with range (0, 1]. A value of 0.25 means we want a 1:4 ratio of the minority to majority class after oversampling. We will create the a sampling dictionary using this ratio, with the keys corresponding to the class and the values responding to the number of samples. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: *sampling\_ratio\_dict={0: 0.5, 1: 1}*, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don't sample class 1. Overrides *sampling\_ratio* if provided. Defaults to None.
- **k\_neighbors\_default** (*int*) – The number of nearest neighbors used to construct synthetic samples. This is the default value used, but the actual *k\_neighbors* value might be smaller if there are less samples. Defaults to 5.
- **n\_jobs** (*int*) – The number of CPU cores to use. Defaults to -1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

#### Attributes

|                               |             |
|-------------------------------|-------------|
| <b>hyper-parameter_ranges</b> | None        |
| <b>modifies_features</b>      | True        |
| <b>modifies_target</b>        | True        |
| <b>name</b>                   | Oversampler |
| <b>training_only</b>          | True        |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits oversampler to data.                                                                                                        |
| <code>fit_transform</code>      | Fit and transform data using the sampler component.                                                                              |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms the input data by Oversampling the data.                                                                              |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y*)**

Fits oversampler to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(*self*, *X*, *y*)**

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (pd.DataFrame, pd.Series)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by Oversampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** pd.DataFrame, pd.Series

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.PCA(*variance=0.95*, *n\_components=None*, *random\_seed=0*, *\*\*kwargs*)

Reduces the number of features by using Principal Component Analysis (PCA).

**Parameters**

- **variance** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **n\_components** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                                   |
|-------------------------------|-----------------------------------|
| <b>hyper-parameter_ranges</b> | Real(0.25, 1)}:type: {"variance"} |
| <b>modifies_features</b>      | True                              |
| <b>modifies_target</b>        | False                             |
| <b>name</b>                   | PCA Transformer                   |
| <b>training_only</b>          | False                             |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the PCA component.                                                                                                          |
| <i>fit_transform</i>      | Fit and transform data using the PCA component.                                                                                  |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using fitted PCA component.                                                                                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.PerColumnImputer`(*impute\_strategies=None*,  
*random\_seed=0*, *\*\*kwargs*)

Imputes missing data according to a specified imputation strategy per column.

**Parameters**

- **impute\_strategies** (*dict*) – Column and {"impute\_strategy": strategy, "fill\_value":value} pairings. Valid values for impute strategy include "mean", "median", "most\_frequent", "constant" for numerical data, and "most\_frequent", "constant" for object data types. Defaults to None, which uses "most\_frequent" for all columns. When *impute\_strategy* == "constant", *fill\_value* is used to replace missing data. When None, uses 0 when imputing numerical data and "missing\_value" for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                    |
|-------------------------------|--------------------|
| <b>hyper-parameter_ranges</b> | {}                 |
| <b>modifies_features</b>      | True               |
| <b>modifies_target</b>        | False              |
| <b>name</b>                   | Per Column Imputer |
| <b>training_only</b>          | False              |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputers on input data.                                                                                                     |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input data by imputing missing values.                                                                                |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputers on input data.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features] to fit.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape `[n_samples, n_features]` to transform.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.PolynomialDecomposer(time_index: str = None,  
                                                                degree: int = 1, period: int  
                                                                = -1, random_seed: int =  
                                                                0, **kwargs)
```

Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.

**Scikit-learn’s PolynomialForecaster is used to generate the additive trend portion of the target data. A polynomial** will be fit to the data during fit. That additive polynomial trend will be removed during fit so that statsmodel’s seasonal\_decompose can determine the additive seasonality of the data by using rolling averages over the series’ inferred periodicity.

For example, daily time series data will generate rolling averages over the first week of data, normalize out the mean and return those 7 averages repeated over the entire length of the given series. Those seven averages, repeated as many times as necessary to match the length of the given target data, will be used as the seasonal signal of the data.

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Degree for the polynomial. If 1, linear model is fit to the data. If 2, quadratic model is fit, etc. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, period should be 7. For daily data with a yearly seasonal signal, period should be 365. Defaults to -1, which uses the statsmodels library’s freq\_to\_period function. <https://github.com/statsmodels/statsmodels/blob/main/statsmodels/tsa/tsatools.py>
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                            |
|-------------------------------|----------------------------|
| <b>hyper-parameter_ranges</b> | { “degree”: Integer(1, 3)} |
| <b>in-valid_frequencies</b>   | []                         |
| <b>modifies_features</b>      | False                      |
| <b>modifies_target</b>        | True                       |
| <b>name</b>                   | Polynomial Decomposer      |
| <b>needs_fitting</b>          | True                       |
| <b>training_only</b>          | False                      |

#### Methods

|                              |                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                 | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>    | Returns the default parameters for this component.                                                                 |
| <i>describe</i>              | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                   | Fits the PolynomialDecomposer and determine the seasonal signal.                                                   |
| <i>fit_transform</i>         | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>   | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <i>inverse_transform</i>     | Adds back fitted trend and seasonality to target variable.                                                         |
| <i>is_freq_valid</i>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                  | Loads component at file path.                                                                                      |
| <i>parameters</i>            | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>    | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                  | Saves component at file path.                                                                                      |
| <i>set_period</i>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>             | Transforms the target data by removing the polynomial trend and rolling average seasonality.                       |
| <i>update_parameters</i>     | Updates the parameter dictionary of the component.                                                                 |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

##### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *PolynomialDecomposer*

Fits the PolynomialDecomposer and determine the seasonal signal.

Currently only fits the polynomial detrender. The seasonality is determined by removing the trend from the signal and using statsmodels’ `seasonal_decompose()`. Both the trend and seasonality are currently assumed to be additive.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

##### Raises

- **NotImplementedError** – If the input data has a frequency of “month-begin”. This isn’t supported by statsmodels `decompose` as the freqstr “MS” is misinterpreted as milliseconds.
- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have `DatetimeIndex` AND no `Datetime` features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The first element are the input features returned without modification. The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**get\_trend\_dataframe**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*) → list[*pandas.DataFrame*]

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

Scikit-learn's `PolynomialForecaster` is used to generate the trend portion of the target data. `statsmodel`'s `seasonal_decompose` is used to generate the seasonality of the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

Each **DataFrame** contains the columns “signal”, “trend”, “seasonality” and “residual,” with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **TypeError** – If `X` does not have time-series data in the index.
- **ValueError** – If time series index of `X` does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If `y` is not provided as a pandas Series or DataFrame.

**inverse\_transform**(*self*, *y\_t*: *pandas.Series*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Adds back fitted trend and seasonality to target variable.

The polynomial trend is added back into the signal, calling the detrender's `inverse_transform()`. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (*pd.Series*) – Target variable.

**Returns**

The first element are the input features returned without modification. The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If `y` is None.

**classmethod** **is\_freq\_valid**(*cls*, *freq*: *str*)

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (*str*) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** **load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → *tuple*[*matplotlib.pyplot.Figure*, *list*]

Plots the decomposition of the target signal.

#### Parameters

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

#### Returns

The figure and axes that have the decompositions plotted on them

**Return type** *matplotlib.pyplot.Figure*, *list*[*matplotlib.pyplot.Axes*]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → *tuple*[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the polynomial trend and rolling average seasonality.

Applies the fit polynomial detrender to the target data, removing the additive polynomial trend. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable `y` is de-trended and deseasonalized.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises `ValueError`** – If target data doesn't have `DatetimeIndex` AND no `Datetime` features in features data

**`update_parameters`**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

**`class evalml.pipelines.components.transformers.ReplaceNullableTypes`**(*random\_seed=0*, *\*\*kwargs*)

Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.

**Attributes**

| <code>save</code>               | Saves component at file path.                                                                                                                                                            |
| <code>transform</code>          | Transforms data by replacing columns that contain nullable types with the appropriate replacement type.                                                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                       |

**`clone`**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Substitutes non-nullable types for the new pandas nullable types in the data and target data.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Input features.
- **y** (*pd.Series*) – Target data.

**Returns** The input features and target data with the non-nullable types set.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transforms data by replacing columns that contain nullable types with the appropriate replacement type.

“float64” for nullable integers and “category” for nullable booleans.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Target data to transform

**Returns** Transformed X *pd.Series*: Transformed y

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.RFClassifierRFSelector(step=0.2,  
                                                                    min_features_to_select=1,  
                                                                    cv=None,  
                                                                    scoring=None,  
                                                                    n_jobs=-1,  
                                                                    n_estimators=10,  
                                                                    max_depth=None,  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

Selects relevant features using recursive feature elimination with a Random Forest Classifier.

**Parameters**

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the *min\_features\_to\_select* constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to *None* which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.

- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <b>modifies_target</b>        | False                           |
| <b>name</b>                   | RFE Selector with RF Classifier |
| <b>training_only</b>          | False                           |

#### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.RFClassifierSelectFromModel(number_features=None,
                                                                           n_estimators=10,
                                                                           max_depth=None,
                                                                           per-
                                                                           cent_features=0.5,
                                                                           thresh-
                                                                           old='median',
                                                                           n_jobs=- 1,
                                                                           random_seed=0,
                                                                           **kwargs)
```

Selects top features based on importance weights using a Random Forest classifier.

#### Parameters

- **number\_features** (*int*) – The maximum number of features to select. If both `percent_features` and `number_features` are specified, take the greater number of features. Defaults to None.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both `percent_features` and `number_features` are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.

- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.RFRegressorRFSelector(step=0.2,  
                                                                    min_features_to_select=1,  
                                                                    cv=None, scoring=None,  
                                                                    n_jobs=-1,  
                                                                    n_estimators=10,  
                                                                    max_depth=None,  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

Selects relevant features using recursive feature elimination with a Random Forest Regressor.

**Parameters**

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the `min_features_to_select` constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.

- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                |
|-------------------------------|--------------------------------|
| <b>hyper-parameter_ranges</b> | { “step”: Real(0.05, 0.25)}    |
| <b>modifies_features</b>      | True                           |
| <b>modifies_target</b>        | False                          |
| <b>name</b>                   | RFE Selector with RF Regressor |
| <b>training_only</b>          | False                          |

#### Methods

|                           |                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                 |
| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.RFRegressorSelectFromModel(number_features=None,
                                                                    n_estimators=10,
                                                                    max_depth=None,
                                                                    per-
                                                                    cent_features=0.5,
                                                                    threshold='median',
                                                                    n_jobs=- 1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Selects top features based on importance weights using a Random Forest regressor.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both `percent_features` and `number_features` are specified, take the greater number of features. Defaults to 0.5.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both `percent_features` and `number_features` are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.

- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.SelectByType`(*column\_types=None*, *exclude=False*, *random\_seed=0*, *\*\*kwargs*)

Selects columns by specified Woodwork logical type or semantic tag in input data.

**Parameters**

- **column\_types** (*string*, *ww.LogicalType*, *list(string)*, *list(ww.LogicalType)*) – List of Woodwork types or tags, used to determine which columns to select or exclude.
- **exclude** (*bool*) – If true, exclude the column\_types instead of including them. Defaults to False.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits the transformer by checking if column names are present in the dataset.

#### Parameters

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series, ignored*) – Targets.

**Returns** self

### `fit_transform(self, X, y=None)`

Fits on X and transforms X.

#### Parameters

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms data X by selecting columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series, optional*) – Targets.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.transformers.SelectColumns`(*columns=None, random\_seed=0, \*\*kwargs*)

Selects specified columns in input data.

**Parameters**

- **columns** (*list(string)*) – List of column names, used to determine which columns to select. If columns are not present, they will not be selected.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                            |
|-------------------------------|----------------------------|
| <b>hyper-parameter_ranges</b> | {}                         |
| <b>modifies_features</b>      | True                       |
| <b>modifies_target</b>        | False                      |
| <b>name</b>                   | Select Columns Transformer |

| <i>fit_transform</i>      | Fits on X and transforms X.                                                  |
| <i>load</i>               | Loads component at file path.                                                |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.          |
| <i>save</i>               | Saves component at file path.                                                |
| <i>transform</i>          | Transform data using fitted column selector component.                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                           |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using fitted column selector component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.SimpleImputer(impute_strategy='most_frequent',
                                                            fill_value=None, random_seed=0,
                                                            **kwargs)
```

Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.

#### Parameters

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types.
- **fill\_value** (*string*) – When impute\_strategy == “constant”, fill\_value is used to replace missing data. Defaults to 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                                           |
|-------------------------------|-----------------------------------------------------------|
| <b>hyper-parameter_ranges</b> | { “impute_strategy”: [“mean”, “median”, “most_frequent”]} |
| <b>modifies_features</b>      | True                                                      |
| <b>modifies_target</b>        | False                                                     |
| <b>name</b>                   | Simple Imputer                                            |
| <b>training_only</b>          | False                                                     |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit**(*self*, *X*, *y=None*)

Fits imputer to data. 'None' values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – the target training data of length `[n_samples]`

**Returns** *self*

**Raises** **ValueError** – if the SimpleImputer receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** `pd.DataFrame`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

#### Parameters

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. ‘None’ and np.nan values are treated as the same.

#### Parameters

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.transformers.StandardScaler`(*random\_seed=0*, *\*\*kwargs*)

A transformer that standardizes input features by removing the mean and scaling to unit variance.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                 |

| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted standard scaler.                                                                                 |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the standard scalar on the given data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Fit and transform data using the standard scaler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted standard scaler.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.transformers.STLDecomposer*(*time\_index: str = None*, *degree: int = 1*, *period: int = None*, *seasonal\_smoother: int = 7*, *random\_seed: int = 0*, *\*\*kwargs*)

Removes trends and seasonality from time series using the STL algorithm.

<https://www.statsmodels.org/dev/generated/statsmodels.tsa.seasonal.STL.html>

**Parameters**

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Not currently used. STL 3x “degree-like” values. None are able to be set at this time. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, the period should likely be 7. For daily data with a yearly seasonal signal, the period should likely be 365. If None, statsmodels will infer the period based on the frequency. Defaults to None.
- **seasonal\_smoother** (*int*) – The length of the seasonal smoother used by the underlying STL algorithm. For compatibility, must be odd. If an even number is provided, the next, highest odd number will be used. Defaults to 7.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                          | Constructs a new component with the same parameters and random state.                                              |
| <i>default_parameters</i>             | Returns the default parameters for this component.                                                                 |
| <i>describe</i>                       | Describe a component and its parameters.                                                                           |
| <i>determine_periodicity</i>          | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <i>fit</i>                            | Fits the STLDecomposer and determine the seasonal signal.                                                          |
| <i>fit_transform</i>                  | Removes fitted trend and seasonality from target variable.                                                         |
| <i>get_trend_dataframe</i>            | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <i>get_trend_prediction_intervals</i> | Calculate the prediction intervals for the trend data.                                                             |
| <i>inverse_transform</i>              | Adds back fitted trend and seasonality to target variable.                                                         |
| <i>is_freq_valid</i>                  | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <i>load</i>                           | Loads component at file path.                                                                                      |
| <i>parameters</i>                     | Returns the parameters which were used to initialize the component.                                                |
| <i>plot_decomposition</i>             | Plots the decomposition of the target signal.                                                                      |
| <i>save</i>                           | Saves component at file path.                                                                                      |
| <i>set_period</i>                     | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <i>transform</i>                      | Transforms the target data by removing the STL trend and seasonality.                                              |
| <i>update_parameters</i>              | Updates the parameter dictionary of the component.                                                                 |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *STLDecomposer*

Fits the STLDecomposer and determine the seasonal signal.

Instantiates a statsmodels STL decompose object with the component’s stored parameters and fits it. Since the statsmodels object does not fit the sklearn api, it is not saved during `__init__()` in `_component_obj` and will be re-instantiated each time fit is called.

To emulate the sklearn API, when the STL decomposer is fit, the full seasonal component, a single period sample of the seasonal component, the full trend-cycle component and the residual are saved.

$y(t) = S(t) + T(t) + R(t)$

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

#### Raises

- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have DatetimeIndex AND no Datetime features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable *y* with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**`get_trend_dataframe(self, X, y)`**

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

**Parameters**

- **X** (`pd.DataFrame`) – Input data with time series data in index.
- **y** (`pd.Series` or `pd.DataFrame`) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

**Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,”** with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **TypeError** – If *X* does not have time-series data in the index.
- **ValueError** – If time series index of *X* does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If *y* is not provided as a pandas Series or DataFrame.

**`get_trend_prediction_intervals(self, y, coverage=None)`**

Calculate the prediction intervals for the trend data.

**Parameters**

- **y** (`pd.Series`) – Target data.
- **coverage** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict of `pd.Series`

**`inverse_transform(self, y_t: pandas.Series) → tuple[pandas.DataFrame, pandas.Series]`**

Adds back fitted trend and seasonality to target variable.

The STL trend is projected to cover the entire requested target range, then added back into the signal. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (`pd.Series`) – Target variable.

**Returns**

**The first element are the input features returned without modification.** The second element is the target variable *y* with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If *y* is None.

**classmethod** `is_freq_valid(cls, freq: str)`

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** `freq (str)` – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path (str)` – Location to load file.

**Returns** ComponentBase object

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool = False*) →  
tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float = 0.01*, *rel\_max\_order*: *int = 5*)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the STL trend and seasonality.

Uses an ARIMA model to project forward the additive trend and removes it. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable *y* is detrended and deseasonalized.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises ValueError** – If target data doesn't have *DatetimeIndex* AND no *Datetime* features in features data

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.TargetEncoder(cols=None, smoothing=1,
                                                            handle_unknown='value',
                                                            handle_missing='value',
                                                            random_seed=0, **kwargs)
```

A transformer that encodes categorical features into target encodings.

#### Parameters

- **cols** (*list*) – Columns to encode. If None, all string columns will be encoded, otherwise only the columns provided will be encoded. Defaults to None
- **smoothing** (*float*) – The smoothing factor to apply. The larger this value is, the more influence the expected target value has on the resulting target encodings. Must be strictly larger than 0. Defaults to 1.0
- **handle\_unknown** (*string*) – Determines how to handle unknown categories for a feature encountered. Options are 'value', 'error', and 'return\_nan'. Defaults to 'value', which replaces with the target mean
- **handle\_missing** (*string*) – Determines how to handle missing values encountered during *fit* or *transform*. Options are 'value', 'error', and 'return\_nan'. Defaults to 'value', which replaces with the target mean
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_feature\_names**(*self*)

Return feature names for the input features after fitting.

**Returns** The feature names after encoding.

**Return type** *np.array*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted target encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.TargetImputer(impute_strategy='most_frequent',
                                                            fill_value=None, random_seed=0,
                                                            **kwargs)
```

Imputes missing target data according to a specified imputation strategy.

**Parameters**

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types. Defaults to “most\_frequent”.
- **fill\_value** (*string*) – When *impute\_strategy* == “constant”, *fill\_value* is used to replace missing data. Defaults to None which uses 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.                |
| <code>fit_transform</code>      | Fits on and transforms the input target data.                                                                                    |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms input target data by imputing missing values. 'None' and np.nan values are treated as the same.                       |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y)**

Fits imputer to target data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises `TypeError`** – If target is filled with all null values.

**`fit_transform(self, X, y)`**

Fits on and transforms the input target data.

**Parameters**

- **`X`** (*pd.DataFrame*) – Features. Ignored.
- **`y`** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (*pd.DataFrame*, *pd.Series*)

**`static load(file_path)`**

Loads component at file path.

**Parameters** **`file_path`** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**`needs_fitting(self)`**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**`property parameters(self)`**

Returns the parameters which were used to initialize the component.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`transform(self, X, y)`**

Transforms input target data by imputing missing values. ‘None’ and `np.nan` values are treated as the same.

**Parameters**

- **`X`** (*pd.DataFrame*) – Features. Ignored.
- **`y`** (*pd.Series*) – Target data to impute.

**Returns** The original X, transformed y

**Return type** (*pd.DataFrame*, *pd.Series*)

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.transformers.TimeSeriesFeaturizer(time_index=None,
                                                                max_delay=2, gap=0,
                                                                forecast_horizon=1,
                                                                conf_level=0.05,
                                                                rolling_window_size=0.25,
                                                                delay_features=True,
                                                                delay_target=True,
                                                                random_seed=0,
                                                                **kwargs)
```

Transformer that delays input features and target variable for time series problems.

This component uses an algorithm based on the autocorrelation values of the target variable to determine which lags to select from the set of all possible lags.

The algorithm is based on the idea that the local maxima of the autocorrelation function indicate the lags that have the most impact on the present time.

The algorithm computes the autocorrelation values and finds the local maxima, called “peaks”, that are significant at the given `conf_level`. Since lags in the range `[0, 10]` tend to be predictive but not local maxima, the union of the peaks is taken with the significant lags in the range `[0, 10]`. At the end, only selected lags in the range `[0, max_delay]` are used.

Parametrizing the algorithm by `conf_level` lets the AutoMLAlgorithm tune the set of lags chosen so that the chances of finding a good set of lags is higher.

Using `conf_level` value of 1 selects all possible lags.

#### Parameters

- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **max\_delay** (*int*) – Maximum number of time units to delay each feature. Defaults to 2.
- **forecast\_horizon** (*int*) – The number of time periods the pipeline is expected to forecast.
- **conf\_level** (*float*) – Float in range (0, 1] that determines the confidence interval size used to select which lags to compute from the set of `[1, max_delay]`. A delay of 1 will always be computed. If 1, selects all possible lags in the set of `[1, max_delay]`, inclusive.
- **rolling\_window\_size** (*float*) – Float in range (0, 1] that determines the size of the window used for rolling features. Size is computed as `rolling_window_size * max_delay`.
- **delay\_features** (*bool*) – Whether to delay the input features. Defaults to True.
- **delay\_target** (*bool*) – Whether to delay the target. Defaults to True.
- **gap** (*int*) – The number of time units between when the features are collected and when the target is collected. For example, if you are predicting the next time step’s target, `gap=1`. This is only needed because when `gap=0`, we need to be sure to start the lagging of the target variable at 1. Defaults to 1.
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the DelayFeatureTransformer.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, optional) – The target training data of length [n\_samples]

**Returns** *self*

**Raises** **ValueError** – if *self.time\_index* is None

**fit\_transform**(*self*, *X*, *y=None*)

Fit the component and transform the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Computes the delayed values and rolling means for X and y.

The chosen delays are determined by the autocorrelation function of the target variable. See the class docstring for more information on how they are chosen. If y is None, all possible lags are chosen.

If y is not None, it will also compute the delayed values for the target variable.

The rolling means for all numeric features in X and y, if y is numeric, are also returned.

**Parameters**

- **X** (*pd.DataFrame* or *None*) – Data to transform. None is expected when only the target variable is being used.
- **y** (*pd.Series*, or *None*) – Target.

**Returns** Transformed X. No original features are returned.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.TimeSeriesImputer(categorical_impute_strategy='forwards_fill',
                                                                nu-
                                                                meric_impute_strategy='interpolate',
                                                                tar-
                                                                get_impute_strategy='forwards_fill',
                                                                random_seed=0, **kwargs)
```

Imputes missing data according to a specified timeseries-specific imputation strategy.

This Transformer should be used after the *TimeSeriesRegularizer* in order to impute the missing values that were added to X and y (if passed).

#### Parameters

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “backwards\_fill” and “forwards\_fill”. Defaults to “forwards\_fill”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “interpolate”.
- **target\_impute\_strategy** (*string*) – Impute strategy to use for the target column. Valid values include “backwards\_fill”, “forwards\_fill”, and “interpolate”. Defaults to “forwards\_fill”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Raises ValueError** – If *categorical\_impute\_strategy*, *numeric\_impute\_strategy*, or *target\_impute\_strategy* is not one of the valid values.

#### Attributes

|                               |                                                                                                                                                                                                                                      |

#### Methods

|                                 |                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                             |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                                |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                                          |
| <code>fit</code>                | Fits imputer to data.                                                                                                                                                             |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                                     |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                                  |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                               |
| <code>save</code>               | Saves component at file path.                                                                                                                                                     |
| <code>transform</code>          | Transforms data X by imputing missing values using specified timeseries-specific strategies. 'None' values are converted to np.nan before imputation and are treated as the same. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                                |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits imputer to data.

'None' values are converted to np.nan before imputation and are treated as the same. If a value is missing at the beginning or end of a column, that value will be imputed using backwards fill or forwards fill as necessary, respectively.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values using specified timeseries-specific strategies. ‘None’ values are converted to *np.nan* before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Optionally, target data to transform.

**Returns** Transformed *X* and *y*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.

- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.TimeSeriesRegularizer(time_index=None,
                                                                    frequency_payload=None,
                                                                    window_length=4,
                                                                    threshold=0.4,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Transformer that regularizes an inconsistently spaced datetime column.

If X is passed in to fit/transform, the column *time\_index* will be checked for an inferrable offset frequency. If the *time\_index* column is perfectly inferrable then this Transformer will do nothing and return the original X and y.

If X does not have a perfectly inferrable frequency but one can be estimated, then X and y will be reformatted based on the estimated frequency for *time\_index*. In the original X and y passed: - Missing datetime values will be added and will have their corresponding columns in X and y set to None. - Duplicate datetime values will be dropped. - Extra datetime values will be dropped. - If it can be determined that a duplicate or extra value is misaligned, then it will be repositioned to take the place of a missing value.

This Transformer should be used before the *TimeSeriesImputer* in order to impute the missing values that were added to X and y (if passed).

#### Parameters

- **time\_index** (*string*) – Name of the column containing the datetime information used to order the data, required. Defaults to None.
- **frequency\_payload** (*tuple*) – Payload returned from Woodwork’s *infer\_frequency* function where *debug* is True. Defaults to None.
- **window\_length** (*int*) – The size of the rolling window over which inference is conducted to determine the prevalence of uninferrable frequencies.
- **5.** (*Lower values make this component more sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **threshold** (*float*) – The minimum percentage of windows that need to have been able to infer a frequency. Lower values make this component more
- **0.8.** (*sensitive to recognizing numerous faulty datetime values. Defaults to*) –
- **random\_seed** (*int*) – Seed for the random number generator. This transformer performs the same regardless of the random seed provided.
- **0.** (*Defaults to*) –

**Raises ValueError** – if the *frequency\_payload* parameter has not been passed a tuple

| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Regularizes a dataframe and target data to an in-ferrable offset frequency.                                                      |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits the TimeSeriesRegularizer.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – if `self.time_index` is `None`, if `X` and `y` have different lengths, if `time_index` in `X` does not have an offset frequency that can be estimated
- **TypeError** – if the `time_index` column is not of type `Datetime`
- **KeyError** – if the `time_index` column doesn't exist

**fit\_transform**(*self*, *X*, *y=None*)

Fits on `X` and transforms `X`.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed `X`.

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Regularizes a dataframe and target data to an inferrable offset frequency.

A 'clean' `X` and `y` (if `y` was passed in) are created based on an inferrable offset frequency and matching datetime values with the original `X` and `y` are imputed into the clean `X` and `y`. Datetime values identified as misaligned are shifted into their appropriate position.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series, optional*) – The target training data of length `[n_samples]`.

**Returns** Data with an inferrable `time_index` offset frequency.

**Return type** (`pd.DataFrame`, `pd.Series`)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.**Transformer**(*parameters=None*,  
*component\_obj=None*,  
*random\_seed=0*, *\*\*kwargs*)

A component that may or may not need fitting that transforms data. These components are used before an estimator.

To implement a new Transformer, define your own class which is a subclass of Transformer, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Transformer component.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>name</code>               | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X.                                                                                                               |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**abstract transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.transformers.Undersampler(sampling_ratio=0.25,
                                                         sampling_ratio_dict=None,
                                                         min_samples=100,
                                                         min_percentage=0.1,
                                                         random_seed=0, **kwargs)
```

Initializes an undersampling transformer to downsample the majority classes in the dataset.

This component is only run during training and not during predict.

#### Parameters

- **sampling\_ratio** (*float*) – The smallest minority:majority ratio that is accepted as ‘balanced’. For instance, a 1:4 ratio would be represented as 0.25, while a 1:1 ratio is 1.0. Must be between 0 and 1, inclusive. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: *sampling\_ratio\_dict={0: 0.5, 1: 1}*, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don’t sample class 1. Overrides *sampling\_ratio* if provided. Defaults to None.
- **min\_samples** (*int*) – The minimum number of samples that we must have for any class, pre or post sampling. If a class must be downsampled, it will not be downsampled past this value. To determine severe imbalance, the minority class must occur less often than this and must have a class ratio below *min\_percentage*. Must be greater than 0. Defaults to 100.
- **min\_percentage** (*float*) – The minimum percentage of the minimum class to total dataset that we tolerate, as long as it is above *min\_samples*. If *min\_percentage* and *min\_samples* are not met, treat this as severely imbalanced, and we will not resample the data. Must be between 0 and 0.5, inclusive. Defaults to 0.1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

#### Raises

- **ValueError** – If *sampling\_ratio* is not in the range (0, 1].
- **ValueError** – If *min\_sample* is not greater than 0.
- **ValueError** – If *min\_percentage* is not between 0 and 0.5, inclusive.

#### Attributes

| <b>name</b>                   | Undersampler      |
| <b>training_only</b>          | <code>True</code> |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the sampler to the data.                                                                                                    |
| <i>fit_resample</i>       | Resampling technique for this sampler.                                                                                           |
| <i>fit_transform</i>      | Fit and transform data using the sampler component.                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms the input data by sampling the data.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format `{"name": name, "parameters": parameters}`

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or dict

**fit**(*self*, *X*, *y*)

Fits the sampler to the data.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*) – Target.

**Returns** *self*

**Raises** **ValueError** – If *y* is None.

**fit\_resample**(*self*, *X*, *y*)

Resampling technique for this sampler.

**Parameters**

- **X** (*pd.DataFrame*) – Training data to fit and resample.
- **y** (*pd.Series*) – Training data targets to fit and resample.

**Returns** Indices to keep for training data.

**Return type** *list*

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Transformed data.

**Return type** (*pd.DataFrame*, *pd.Series*)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms the input data by sampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.transformers.**URLFeaturizer**(*random\_seed=0*, *\*\*kwargs*)

Transformer that can automatically extract features from URL.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                |
|-------------------------------|----------------|
| <b>hyper-parameter_ranges</b> | { }            |
| <b>modifies_features</b>      | True           |
| <b>modifies_target</b>        | False          |
| <b>name</b>                   | URL Featurizer |
| <b>training_only</b>          | False          |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X.                                                                                                               |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform(*self*, *X*, *y=None*)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Transforms data X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed X

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## Submodules

### component\_base

Base class for all components.

| <i>ComponentBase</i> | Base class for all components. |
|----------------------|--------------------------------|

### Contents

```
class evalml.pipelines.components.component_base.ComponentBase(parameters=None,
                                                                component_obj=None,
                                                                random_seed=0, **kwargs)
```

Base class for all components.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                             |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                |
| <i>describe</i>           | Describe a component and its parameters.                                                                                          |
| <i>fit</i>                | Fits component to data.                                                                                                           |
| <i>load</i>               | Loads component at file path.                                                                                                     |
| <i>modifies_features</i>  | Returns whether this component modifies (subsets or transforms) the features variable during transform.                           |
| <i>modifies_target</i>    | Returns whether this component modifies (subsets or transforms) the target variable during transform.                             |
| <i>name</i>               | Returns string name of this component.                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.  |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                               |
| <i>save</i>               | Saves component at file path.                                                                                                     |
| <i>training_only</i>      | Returns whether or not this component should be evaluated during training-time only, or during both training and prediction time. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`

**Returns** `self`

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property modifies\_features(*cls*)**

Returns whether this component modifies (subsets or transforms) the features variable during transform.

For Estimator objects, this attribute determines if the return value from `predict` or `predict_proba` should be used as features or targets.

**property modifies\_target(*cls*)**

Returns whether this component modifies (subsets or transforms) the target variable during transform.

For Estimator objects, this attribute determines if the return value from `predict` or `predict_proba` should be used as features or targets.

**property name(*cls*)**

Returns string name of this component.

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property training\_only**(*cls*)

Returns whether or not this component should be evaluated during training-time only, or during both training and prediction time.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

## component\_base\_meta

Metaclass that overrides creating a new component by wrapping methods with validators and setters.

*ComponentBaseMeta*

Metaclass that overrides creating a new component by wrapping methods with validators and setters.

---

## Contents

**class** evalml.pipelines.components.component\_base\_meta.**ComponentBaseMeta**

Metaclass that overrides creating a new component by wrapping methods with validators and setters.

**Attributes**

|                            |                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------|
| <b>FIT_METHODS</b>         | ['fit', 'fit_transform']                                                              |
| <b>METHODS_TO_CHECK</b>    | ['predict', 'predict_proba', 'transform', 'inverse_transform', 'get_trend_dataframe'] |
| <b>PROPERTIES_TO_CHECK</b> | ['feature_importance']                                                                |

**Methods**

|                            |                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>check_for_fit</code> | <code>check_for_fit</code> wraps a method that validates if <code>self._is_fitted</code> is <code>True</code> . |
| <code>register</code>      | Register a virtual subclass of an ABC.                                                                          |
| <code>set_fit</code>       | Wrapper for the fit method.                                                                                     |

**classmethod** `check_for_fit(cls, method)`

`check_for_fit` wraps a method that validates if `self._is_fitted` is `True`.

It raises an exception if `False` and calls and returns the wrapped method if `True`.

**Parameters** `method` (*callable*) – Method to wrap.

**Returns** The wrapped method.

**Raises** **ComponentNotYetFittedError** – If component is not yet fitted.

**register**(*cls, subclass*)

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

**classmethod** `set_fit(cls, method)`

Wrapper for the fit method.

## utils

Utility methods for EvalML components.

|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>all_components</code>                               | Get all available components.                                                                                                                                                                                                                        |
| <code>allowed_model_families</code>                       | List the model types allowed for a particular problem type.                                                                                                                                                                                          |
| <code>estimator_unable_to_handle_nans</code>              | If True, provided estimator class is unable to handle NaN values as an input.                                                                                                                                                                        |
| <code>generate_component_code</code>                      | Creates and returns a string that contains the Python imports and code required for running the EvalML component.                                                                                                                                    |
| <code>get_estimators</code>                               | Returns the estimators allowed for a particular problem type.                                                                                                                                                                                        |
| <code>get_prediction_intervals_for_tree_regressors</code> | Find the prediction intervals for tree-based regressors.                                                                                                                                                                                             |
| <code>handle_component_class</code>                       | Standardizes input from a string name to a ComponentBase subclass if necessary.                                                                                                                                                                      |
| <code>handle_float_categories_for_catboost</code>         | Updates input data to be compatible with CatBoost estimators.                                                                                                                                                                                        |
| <code>make_balancing_dictionary</code>                    | Makes dictionary for oversampler components. Find ratio of each class to the majority. If the ratio is smaller than the <code>sampling_ratio</code> , we want to oversample, otherwise, we don't want to sample at all, and we leave the data as is. |
| <code>scikit_learn_wrapped_estimator</code>               | Wraps an EvalML object as a scikit-learn estimator.                                                                                                                                                                                                  |

## Contents

`evalml.pipelines.components.utils.all_components()`

Get all available components.

`evalml.pipelines.components.utils.allowed_model_families(problem_type)`

List the model types allowed for a particular problem type.

**Parameters** `problem_type` (*ProblemTypes* or *str*) – ProblemTypes enum or string.

**Returns** A list of model families.

**Return type** list[ModelFamily]

`evalml.pipelines.components.utils.estimator_unable_to_handle_nans(estimator_class)`

If True, provided estimator class is unable to handle NaN values as an input.

**Parameters** `estimator_class` (*Estimator*) – Estimator class

**Raises** **ValueError** – If estimator is not a valid estimator class.

**Returns** True if estimator class is unable to process NaN values, False otherwise.

**Return type** bool

`evalml.pipelines.components.utils.generate_component_code(element)`

Creates and returns a string that contains the Python imports and code required for running the EvalML component.

**Parameters** `element` (*component instance*) – The instance of the component to generate string Python code for.

**Returns** String representation of Python code that can be run separately in order to recreate the component instance. Does not include code for custom component implementation.

**Raises** **ValueError** – If the input element is not a component instance.

## Examples

```
>>> from evalml.pipelines.components.estimators.regressors.decision_tree_regressor_
↳ import DecisionTreeRegressor
>>> assert generate_component_code(DecisionTreeRegressor()) == "from evalml.
↳ pipelines.components.estimators.regressors.decision_tree_regressor import_
↳ DecisionTreeRegressor\n\ndecisionTreeRegressor = DecisionTreeRegressor(**{
↳ 'criterion': 'squared_error', 'max_features': 'auto', 'max_depth': 6, 'min_
↳ samples_split': 2, 'min_weight_fraction_leaf': 0.0})"
...
>>> from evalml.pipelines.components.transformers.imputers.simple_imputer import_
↳ SimpleImputer
>>> assert generate_component_code(SimpleImputer()) == "from evalml.pipelines.
↳ components.transformers.imputers.simple_imputer import SimpleImputer\n\
↳ nsimpleImputer = SimpleImputer(**{'impute_strategy': 'most_frequent', 'fill_value
↳ ': None})"
```

`evalml.pipelines.components.utils.get_estimators(problem_type, model_families=None, excluded_model_families=None)`

Returns the estimators allowed for a particular problem type.

Can also optionally filter by a list of model types.

### Parameters

- **problem\_type** (*ProblemTypes* or *str*) – Problem type to filter for.
- **model\_families** (*list[ModelFamily]* or *list[str]*) – Model families to filter for.
- **excluded\_model\_families** (*list[ModelFamily]*) – A list of model families to exclude from the results.

**Returns** A list of estimator subclasses.

**Return type** `list[class]`

### Raises

- **TypeError** – If the `model_families` parameter is not a list.
- **RuntimeError** – If a model family is not valid for the problem type.

`evalml.pipelines.components.utils.get_prediction_intervals_for_tree_regressors(X: pandas.DataFrame, predictions: pandas.Series, coverage: List[float], estimators: List[evalml.pipelines.components_ → Dict[str, pandas.Series])`

Find the prediction intervals for tree-based regressors.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **predictions** (*pd.Series*) – Predictions from the regressor.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **estimators** (*list*) – Collection of fitted sub-estimators.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

`evalml.pipelines.components.utils.handle_component_class(component_class)`

Standardizes input from a string name to a ComponentBase subclass if necessary.

If a str is provided, will attempt to look up a ComponentBase class by that name and return a new instance. Otherwise if a ComponentBase subclass or Component instance is provided, will return that without modification.

**Parameters** **component\_class** (*str*, *ComponentBase*) – Input to be standardized.

**Returns** ComponentBase

**Raises**

- **ValueError** – If input is not a valid component class.
- **MissingComponentError** – If the component cannot be found.

**Examples**

```
>>> from evalml.pipelines.components.estimators.regressors.decision_tree_regressor_
↳ import DecisionTreeRegressor
>>> handle_component_class(DecisionTreeRegressor)
<class 'evalml.pipelines.components.estimators.regressors.decision_tree_regressor_
↳ DecisionTreeRegressor'>
>>> handle_component_class("Random Forest Regressor")
<class 'evalml.pipelines.components.estimators.regressors.rf_regressor_
↳ RandomForestRegressor'>
```

`evalml.pipelines.components.utils.handle_float_categories_for_catboost(X)`

Updates input data to be compatible with CatBoost estimators.

CatBoost cannot handle data in X that is the Categorical Woodwork logical type with floating point categories. This utility determines if the floating point categories can be converted to integers without truncating any data, and if they can be, converts them to int64 categories. Will not attempt to use values that are truly floating points.

**Parameters** **X** (*pd.DataFrame*) – Input data to CatBoost that has Woodwork initialized

**Returns**

**Input data with exact same Woodwork typing info as the original but with any float categories converted to be int64 when possible.**

**Return type** DataFrame

**Raises** **ValueError** – if the numeric categories are actual floats that cannot be converted to integers without truncating data

`evalml.pipelines.components.utils.make_balancing_dictionary(y, sampling_ratio)`

Makes dictionary for oversampler components. Find ratio of each class to the majority. If the ratio is smaller than the `sampling_ratio`, we want to oversample, otherwise, we don't want to sample at all, and we leave the data as is.

**Parameters**

- **y** (*pd.Series*) – Target data.
- **sampling\_ratio** (*float*) – The balanced ratio we want the samples to meet.

**Returns** Dictionary where keys are the classes, and the corresponding values are the counts of samples for each class that will satisfy `sampling_ratio`.

**Return type** dict

**Raises** **ValueError** – If sampling ratio is not in the range (0, 1] or the target is empty.

**Examples**

```
>>> import pandas as pd
>>> y = pd.Series([1] * 4 + [2] * 8 + [3])
>>> assert make_balancing_dictionary(y, 0.5) == {2: 8, 1: 4, 3: 4}
>>> assert make_balancing_dictionary(y, 0.9) == {2: 8, 1: 7, 3: 7}
>>> assert make_balancing_dictionary(y, 0.1) == {2: 8, 1: 4, 3: 1}
```

`evalml.pipelines.components.utils.scikit_learn_wrapped_estimator(evalml_obj)`

Wraps an EvalML object as a scikit-learn estimator.

**class** `evalml.pipelines.components.utils.WrappedSKClassifier(pipeline)`

Scikit-learn classifier wrapper class.

**Methods**

|                            |                                                             |
|----------------------------|-------------------------------------------------------------|
| <code>fit</code>           | Fits component to data.                                     |
| <code>get_params</code>    | Get parameters for this estimator.                          |
| <code>predict</code>       | Make predictions using selected features.                   |
| <code>predict_proba</code> | Make probability estimates for labels.                      |
| <code>score</code>         | Return the mean accuracy on the given test data and labels. |
| <code>set_params</code>    | Set the parameters of this estimator.                       |

**fit**(*self*, *X*, *y*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_params**(*self*, *deep=True*)

Get parameters for this estimator.

**Parameters** **deep** (*bool*, *default=True*) – If True, will return the parameters for this estimator and contained subobjects that are estimators.

**Returns** **params** – Parameter names mapped to their values.

**Return type** dict

**predict**(*self*, *X*)

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Features

**Returns** Predicted values.

**Return type** np.ndarray

**predict\_proba**(*self*, *X*)

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** np.ndarray

**score**(*self*, *X*, *y*, *sample\_weight=None*)

Return the mean accuracy on the given test data and labels.

In multi-label classification, this is the subset accuracy which is a harsh metric since you require for each sample that each label set be correctly predicted.

**Parameters**

- **X** (*array-like of shape (n\_samples, n\_features)*) – Test samples.
- **y** (*array-like of shape (n\_samples,) or (n\_samples, n\_outputs)*) – True labels for *X*.
- **sample\_weight** (*array-like of shape (n\_samples,)*, *default=None*) – Sample weights.

**Returns** **score** – Mean accuracy of *self.predict(X)* w.r.t. *y*.

**Return type** float

**set\_params**(*self*, *\*\*params*)

Set the parameters of this estimator.

The method works on simple estimators as well as on nested objects (such as Pipeline). The latter have parameters of the form <component>\_\_<parameter> so that it's possible to update each component of a nested object.

**Parameters** **\*\*params** (*dict*) – Estimator parameters.

**Returns** **self** – Estimator instance.

**Return type** estimator instance

**class** evalml.pipelines.components.utils.**WrappedSKRegressor**(*pipeline*)

Scikit-learn regressor wrapper class.

**Methods**

|                         |                                                            |
|-------------------------|------------------------------------------------------------|
| <code>fit</code>        | Fits component to data.                                    |
| <code>get_params</code> | Get parameters for this estimator.                         |
| <code>predict</code>    | Make predictions using selected features.                  |
| <code>score</code>      | Return the coefficient of determination of the prediction. |
| <code>set_params</code> | Set the parameters of this estimator.                      |

**fit**(*self*, *X*, *y*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – the target training data of length [n\_samples]

**Returns** *self*

**get\_params**(*self*, *deep=True*)

Get parameters for this estimator.

**Parameters** **deep** (*bool*, *default=True*) – If True, will return the parameters for this estimator and contained subobjects that are estimators.

**Returns** **params** – Parameter names mapped to their values.

**Return type** dict

**predict**(*self*, *X*)

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Predicted values.

**Return type** *np.ndarray*

**score**(*self*, *X*, *y*, *sample\_weight=None*)

Return the coefficient of determination of the prediction.

The coefficient of determination  $R^2$  is defined as  $(1 - \frac{u}{v})$ , where  $u$  is the residual sum of squares  $((y\_true - y\_pred) ** 2).sum()$  and  $v$  is the total sum of squares  $((y\_true - y\_true.mean()) ** 2).sum()$ . The best possible score is 1.0 and it can be negative (because the model can be arbitrarily worse). A constant model that always predicts the expected value of  $y$ , disregarding the input features, would get a  $R^2$  score of 0.0.

**Parameters**

- **X** (*array-like of shape (n\_samples, n\_features)*) – Test samples. For some estimators this may be a precomputed kernel matrix or a list of generic objects instead with shape (n\_samples, n\_samples\_fitted), where n\_samples\_fitted is the number of samples used in the fitting for the estimator.
- **y** (*array-like of shape (n\_samples,) or (n\_samples, n\_outputs)*) – True values for *X*.
- **sample\_weight** (*array-like of shape (n\_samples,)*, *default=None*) – Sample weights.

**Returns** **score** –  $R^2$  of *self.predict(X)* w.r.t. *y*.

**Return type** float

## Notes

The  $R^2$  score used when calling `score` on a regressor uses `multioutput='uniform_average'` from version 0.23 to keep consistent with default value of `r2_score()`. This influences the `score` method of all the multioutput regressors (except for `MultiOutputRegressor`).

**set\_params**(*self*, **\*\*params**)

Set the parameters of this estimator.

The method works on simple estimators as well as on nested objects (such as `Pipeline`). The latter have parameters of the form `<component>__<parameter>` so that it's possible to update each component of a nested object.

**Parameters** **\*\*params** (*dict*) – Estimator parameters.

**Returns** **self** – Estimator instance.

**Return type** estimator instance

### Classes Summary

|                                               |                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#"><i>ARIMAREgressor</i></a>         | Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <a href="https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html">https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html</a> . |
| <a href="#"><i>BaselineClassifier</i></a>     | Classifier that predicts using the specified strategy.                                                                                                                                                                                                                                                                                                      |
| <a href="#"><i>BaselineRegressor</i></a>      | Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.                                                                                                                                                                                                         |
| <a href="#"><i>CatBoostClassifier</i></a>     | CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                             |
| <a href="#"><i>CatBoostRegressor</i></a>      | CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.                                                                                                                                                                                               |
| <a href="#"><i>ComponentBase</i></a>          | Base class for all components.                                                                                                                                                                                                                                                                                                                              |
| <a href="#"><i>ComponentBaseMeta</i></a>      | Metaclass that overrides creating a new component by wrapping methods with validators and setters.                                                                                                                                                                                                                                                          |
| <a href="#"><i>DateTimeFeaturizer</i></a>     | Transformer that can automatically extract features from datetime columns.                                                                                                                                                                                                                                                                                  |
| <a href="#"><i>DecisionTreeClassifier</i></a> | Decision Tree Classifier.                                                                                                                                                                                                                                                                                                                                   |
| <a href="#"><i>DecisionTreeRegressor</i></a>  | Decision Tree Regressor.                                                                                                                                                                                                                                                                                                                                    |
| <a href="#"><i>DFSTransformer</i></a>         | Featuretools DFS component that generates features for the input features.                                                                                                                                                                                                                                                                                  |
| <a href="#"><i>DropColumns</i></a>            | Drops specified columns in input data.                                                                                                                                                                                                                                                                                                                      |
| <a href="#"><i>DropNaNRowsTransformer</i></a> | Transformer to drop rows with NaN values.                                                                                                                                                                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>DropNullColumns</i>               | Transformer to drop features whose percentage of NaN values exceeds a specified threshold.                                                                                                                                                                                                                                                                                                    |
| <i>DropRowsTransformer</i>           | Transformer to drop rows specified by row indices.                                                                                                                                                                                                                                                                                                                                            |
| <i>ElasticNetClassifier</i>          | Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.                                                                                                                                                                                                                                                                                               |
| <i>ElasticNetRegressor</i>           | Elastic Net Regressor.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>EmailFeaturizer</i>               | Transformer that can automatically extract features from emails.                                                                                                                                                                                                                                                                                                                              |
| <i>Estimator</i>                     | A component that fits and predicts given data.                                                                                                                                                                                                                                                                                                                                                |
| <i>ExponentialSmoothingRegressor</i> | Holt-Winters Exponential Smoothing Forecaster.                                                                                                                                                                                                                                                                                                                                                |
| <i>ExtraTreesClassifier</i>          | Extra Trees Classifier.                                                                                                                                                                                                                                                                                                                                                                       |
| <i>ExtraTreesRegressor</i>           | Extra Trees Regressor.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>FeatureSelector</i>               | Selects top features based on importance weights.                                                                                                                                                                                                                                                                                                                                             |
| <i>Imputer</i>                       | Imputes missing data according to a specified imputation strategy.                                                                                                                                                                                                                                                                                                                            |
| <i>KNeighborsClassifier</i>          | K-Nearest Neighbors Classifier.                                                                                                                                                                                                                                                                                                                                                               |
| <i>LabelEncoder</i>                  | A transformer that encodes target labels using values between 0 and num_classes - 1.                                                                                                                                                                                                                                                                                                          |
| <i>LightGBMClassifier</i>            | LightGBM Classifier.                                                                                                                                                                                                                                                                                                                                                                          |
| <i>LightGBMRegressor</i>             | LightGBM Regressor.                                                                                                                                                                                                                                                                                                                                                                           |
| <i>LinearDiscriminantAnalysis</i>    | Reduces the number of features by using Linear Discriminant Analysis.                                                                                                                                                                                                                                                                                                                         |
| <i>LinearRegressor</i>               | Linear Regressor.                                                                                                                                                                                                                                                                                                                                                                             |
| <i>LogisticRegressionClassifier</i>  | Logistic Regression Classifier.                                                                                                                                                                                                                                                                                                                                                               |
| <i>LogTransformer</i>                | Applies a log transformation to the target data.                                                                                                                                                                                                                                                                                                                                              |
| <i>LSA</i>                           | Transformer to calculate the Latent Semantic Analysis Values of text input.                                                                                                                                                                                                                                                                                                                   |
| <i>NaturalLanguageFeaturizer</i>     | Transformer that can automatically featurize text columns using featuretools' nlp_primitives.                                                                                                                                                                                                                                                                                                 |
| <i>OneHotEncoder</i>                 | A transformer that encodes categorical features in a one-hot numeric array.                                                                                                                                                                                                                                                                                                                   |
| <i>OrdinalEncoder</i>                | A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.                                                                                                                                                                                                                                                                    |
| <i>Oversampler</i>                   | SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMO-TENC based on inputs to the component.                                                                                                                                                                                                                                                            |
| <i>PCA</i>                           | Reduces the number of features by using Principal Component Analysis (PCA).                                                                                                                                                                                                                                                                                                                   |
| <i>PerColumnImputer</i>              | Imputes missing data according to a specified imputation strategy per column.                                                                                                                                                                                                                                                                                                                 |
| <i>PolynomialDecomposer</i>          | Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.                                                                                                                                                                                                                                                                                       |
| <i>ProphetRegressor</i>              | Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well. |
| <i>RandomForestClassifier</i>        | Random Forest Classifier.                                                                                                                                                                                                                                                                                                                                                                     |

|                                         |                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>RandomForestRegressor</i>            | Random Forest Regressor.                                                                                          |
| <i>ReplaceNullableTypes</i>             | Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.           |
| <i>RFClassifierRFSelector</i>           | Selects relevant features using recursive feature elimination with a Random Forest Classifier.                    |
| <i>RFClassifierSelectFromModel</i>      | Selects top features based on importance weights using a Random Forest classifier.                                |
| <i>RFRegressorRFSelector</i>            | Selects relevant features using recursive feature elimination with a Random Forest Regressor.                     |
| <i>RFRegressorSelectFromModel</i>       | Selects top features based on importance weights using a Random Forest regressor.                                 |
| <i>SelectByType</i>                     | Selects columns by specified Woodwork logical type or semantic tag in input data.                                 |
| <i>SelectColumns</i>                    | Selects specified columns in input data.                                                                          |
| <i>SimpleImputer</i>                    | Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.          |
| <i>StackedEnsembleBase</i>              | Stacked Ensemble Base Class.                                                                                      |
| <i>StackedEnsembleClassifier</i>        | Stacked Ensemble Classifier.                                                                                      |
| <i>StackedEnsembleRegressor</i>         | Stacked Ensemble Regressor.                                                                                       |
| <i>StandardScaler</i>                   | A transformer that standardizes input features by removing the mean and scaling to unit variance.                 |
| <i>STLDecomposer</i>                    | Removes trends and seasonality from time series using the STL algorithm.                                          |
| <i>SVMClassifier</i>                    | Support Vector Machine Classifier.                                                                                |
| <i>SVMRegressor</i>                     | Support Vector Machine Regressor.                                                                                 |
| <i>TargetEncoder</i>                    | A transformer that encodes categorical features into target encodings.                                            |
| <i>TargetImputer</i>                    | Imputes missing target data according to a specified imputation strategy.                                         |
| <i>TimeSeriesBaselineEstimator</i>      | Time series estimator that predicts using the naive forecasting approach.                                         |
| <i>TimeSeriesFeaturizer</i>             | Transformer that delays input features and target variable for time series problems.                              |
| <i>TimeSeriesImputer</i>                | Imputes missing data according to a specified timeseries-specific imputation strategy.                            |
| <i>TimeSeriesRegularizer</i>            | Transformer that regularizes an inconsistently spaced datetime column.                                            |
| <i>Transformer</i>                      | A component that may or may not need fitting that transforms data. These components are used before an estimator. |
| <i>Undersampler</i>                     | Initializes an undersampling transformer to downsample the majority classes in the dataset.                       |
| <i>URLFeaturizer</i>                    | Transformer that can automatically extract features from URL.                                                     |
| <i>VowpalWabbitBinaryClassifier</i>     | Vowpal Wabbit Binary Classifier.                                                                                  |
| <i>VowpalWabbitMulticlassClassifier</i> | Vowpal Wabbit Multiclass Classifier.                                                                              |
| <i>VowpalWabbitRegressor</i>            | Vowpal Wabbit Regressor.                                                                                          |
| <i>XGBoostClassifier</i>                | XGBoost Classifier.                                                                                               |
| <i>XGBoostRegressor</i>                 | XGBoost Regressor.                                                                                                |

## Contents

```
class evalml.pipelines.components.ARIMAREgressor(time_index: Optional[Hashable] = None, trend: Optional[str] = None, start_p: int = 2, d: int = 0, start_q: int = 2, max_p: int = 5, max_d: int = 2, max_q: int = 5, seasonal: bool = True, sp: int = 1, n_jobs: int = -1, random_seed: Union[int, float] = 0, maxiter: int = 10, use_covariates: bool = True, **kwargs)
```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start\_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start\_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max\_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max\_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max\_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If “detect”, this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                                |                                                                                                                                                                                  |

| <b>model_family</b>            | ModelFamily.ARIMA                                                                                                                                                                |
| <b>modifies_features</b>       | True                                                                                                                                                                             |
| <b>modifies_target</b>         | False                                                                                                                                                                            |
| <b>name</b>                    | ARIMA Regressor                                                                                                                                                                  |
| <b>supported_problem_types</b> | [ProblemTypes.TIME_SERIES_REGRESSION]                                                                                                                                            |
| <b>training_only</b>           | False                                                                                                                                                                            |

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.                                |
| <i>fit</i>                      | Fits ARIMA regressor to data.                                                                                                    |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted ARIMARegressor.                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using fitted ARIMA regressor.                                                                                   |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(self)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(self, print\_name=False, return\_dict=False)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature\_importance is not defined for ARIMA regressor.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMARegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **ValueError** – If X was passed to *fit* but not passed in *predict*.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a *predict\_proba* method or a *component\_obj* that implements *predict\_proba*.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.BaselineClassifier*(*strategy='mode'*, *random\_seed=0*, *\*\*kwargs*)

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

**Parameters**

- **strategy** (*str*) – Method used to predict. Valid options are “mode”, “random” and “random\_weighted”. Defaults to “mode”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <b>training_only</b>           | False                                          |

## Methods

|                                 |                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>classes_</i>                 | Returns class labels. Will return None before fitting.                                                                                                      |
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                                                       |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                                                          |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                                                    |
| <i>feature_importance</i>       | Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes. |
| <i>fit</i>                      | Fits baseline classifier component to data.                                                                                                                 |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                                                   |
| <i>load</i>                     | Loads component at file path.                                                                                                                               |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                            |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                                                         |
| <i>predict</i>                  | Make predictions using the baseline classification strategy.                                                                                                |
| <i>predict_proba</i>            | Make prediction probabilities using the baseline classification strategy.                                                                                   |
| <i>save</i>                     | Saves component at file path.                                                                                                                               |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                                                          |

### property `classes_(self)`

Returns class labels. Will return None before fitting.

**Returns** Class names

**Return type** list[str] or list(float)

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes

**Return type** `pd.Series`

**fit**(*self*, *X*, *y=None*)

Fits baseline classifier component to data.

**Parameters**

- **X** (`pd.DataFrame`) – The input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If `y` is `None`.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – Target data. Ignored.
- **coverage** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (`pd.Series`) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**predict(*self*, *X*)**

Make predictions using the baseline classification strategy.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**predict\_proba(*self*, *X*)**

Make prediction probabilities using the baseline classification strategy.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** pd.DataFrame

**save(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.components.BaselineRegressor(*strategy*='mean', *random\_seed*=0, *\*\*kwargs*)**

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

**Parameters**

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.

- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

**Returns** An array of zeroes.

**Return type** np.ndarray (float)

**fit**(*self*, *X*, *y=None*)

Fits baseline regression component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If input y is None.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters`(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the baseline regression strategy.

**Parameters** `X` (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** `X` (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.CatBoostClassifier`(*n\_estimators*=10, *eta*=0.03, *max\_depth*=6, *bootstrap\_type*=None, *silent*=True, *allow\_writing\_files*=False, *random\_seed*=0, *n\_jobs*=-1, *\*\*kwargs*)

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

### Parameters

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Feature importance of fitted CatBoost classifier.

**fit(self, X, y=None)**

Fits CatBoost classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**predict\_proba**(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** `pd.DataFrame`

**save**(*self*, *file\_path*, *pickle\_protocol*=`cloudpickle.DEFAULT_PROTOCOL`)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=`True`)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.CatBoostRegressor`(*n\_estimators*=10, *eta*=0.03, *max\_depth*=6, *bootstrap\_type*=None, *silent*=False, *allow\_writing\_files*=False, *random\_seed*=0, *n\_jobs*=-1, *\*\*kwargs*)

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

**Parameters**

- **n\_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max\_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap\_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are 'Bayesian', 'Bernoulli', 'MVS'. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow\_writing\_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted CatBoost regressor.

**fit**(*self, X, y=None*)

Fits CatBoost regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted CatBoost regressor.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.ComponentBase(parameters=None, component_obj=None, random_seed=0, **kwargs)`

Base class for all components.

**Parameters**

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Methods**

|                                 |                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                             |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                |
| <code>describe</code>           | Describe a component and its parameters.                                                                                          |
| <code>fit</code>                | Fits component to data.                                                                                                           |
| <code>load</code>               | Loads component at file path.                                                                                                     |
| <code>modifies_features</code>  | Returns whether this component modifies (subsets or transforms) the features variable during transform.                           |
| <code>modifies_target</code>    | Returns whether this component modifies (subsets or transforms) the target variable during transform.                             |
| <code>name</code>               | Returns string name of this component.                                                                                            |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.  |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                               |
| <code>save</code>               | Saves component at file path.                                                                                                     |
| <code>training_only</code>      | Returns whether or not this component should be evaluated during training-time only, or during both training and prediction time. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**static load(*file\_path*)**

Loads component at file path.

**Parameters** `file_path` (*str*) – Location to load file.

**Returns** ComponentBase object

**property modifies\_features(*cls*)**

Returns whether this component modifies (subsets or transforms) the features variable during transform.

For Estimator objects, this attribute determines if the return value from *predict* or *predict\_proba* should be used as features or targets.

**property modifies\_target(*cls*)**

Returns whether this component modifies (subsets or transforms) the target variable during transform.

For Estimator objects, this attribute determines if the return value from *predict* or *predict\_proba* should be used as features or targets.

**property name(*cls*)**

Returns string name of this component.

**needs\_fitting(*self*)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(*self*)**

Returns the parameters which were used to initialize the component.

**save(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property training\_only(*cls*)**

Returns whether or not this component should be evaluated during training-time only, or during both training and prediction time.

**update\_parameters(*self*, *update\_dict*, *reset\_fit*=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class evalml.pipelines.components.ComponentBaseMeta**

Metaclass that overrides creating a new component by wrapping methods with validators and setters.

**Attributes**

|                            |                                                                                       |

## Methods

|                            |                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------|
| <code>check_for_fit</code> | <code>check_for_fit</code> wraps a method that validates if <code>self.is_fitted</code> is <code>True</code> . |
| <code>register</code>      | Register a virtual subclass of an ABC.                                                                         |
| <code>set_fit</code>       | Wrapper for the fit method.                                                                                    |

**classmethod** `check_for_fit(cls, method)`

`check_for_fit` wraps a method that validates if `self.is_fitted` is `True`.

It raises an exception if `False` and calls and returns the wrapped method if `True`.

**Parameters** `method` (*callable*) – Method to wrap.

**Returns** The wrapped method.

**Raises** `ComponentNotYetFittedError` – If component is not yet fitted.

**register**(*cls, subclass*)

Register a virtual subclass of an ABC.

Returns the subclass, to allow usage as a class decorator.

**classmethod** `set_fit(cls, method)`

Wrapper for the fit method.

**class** `evalml.pipelines.components.DateTimeFeaturizer(features_to_extract=None, encode_as_categories=False, time_index=None, random_seed=0, **kwargs)`

Transformer that can automatically extract features from datetime columns.

### Parameters

- **features\_to\_extract** (*list*) – List of features to extract. Valid options include “year”, “month”, “day\_of\_week”, “hour”. Defaults to `None`.
- **encode\_as\_categories** (*bool*) – Whether day-of-week and month features should be encoded as pandas “category” dtype. This allows OneHotEncoders to encode these features. Defaults to `False`.
- **time\_index** (*str*) – Name of the column containing the datetime information used to order the data. Ignored.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <b>hyper-parameter_ranges</b> | {}                  |
| <b>modifies_features</b>      | True                |
| <b>modifies_target</b>        | False               |
| <b>name</b>                   | DateTime Featurizer |
| <b>training_only</b>          | False               |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fit the datetime featurizer component.                                                                                           |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Gets the categories of each datetime feature.                                                                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by creating new features using existing DateTime columns, and then dropping those DateTime columns.            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### **Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fit the datetime featurizer component.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**get\_feature\_names**(*self*)

Gets the categories of each datetime feature.

**Returns**

Dictionary, where each key-value pair is a column name and a dictionary mapping the unique feature values to their integer encoding.

**Return type** `dict`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by creating new features using existing DateTime columns, and then dropping those DateTime columns.

**Parameters**

- **X** (*pd.DataFrame*) – Input features.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.DecisionTreeClassifier(criterion='gini', max_features='auto',  
                                                         max_depth=6, min_samples_split=2,  
                                                         min_weight_fraction_leaf=0.0,  
                                                         random_seed=0, **kwargs)
```

Decision Tree Classifier.

**Parameters**

- **criterion** (*{'gini', 'entropy'}*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max\_features** (*int, float or {'auto', 'sqrt', 'log2'}*) – The number of features to consider when looking for the best split:
  - If *int*, then consider *max\_features* features at each split.
  - If *float*, then *max\_features* is a fraction and *int(max\_features \* n\_features)* features are considered at each split.
  - If “auto”, then *max\_features=sqrt(n\_features)*.
  - If “sqrt”, then *max\_features=sqrt(n\_features)*.
  - If “log2”, then *max\_features=log2(n\_features)*.
  - If *None*, then *max\_features = n\_features*.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than *max\_features* features. Defaults to “auto”.

- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If *int*, then consider *min\_samples\_split* as the minimum number.
  - If *float*, then *min\_samples\_split* is a fraction and *ceil(min\_samples\_split \* n\_samples)* are the minimum number of samples for each split.

Defaults to 2.

- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.DecisionTreeRegressor(criterion='squared_error',
                                                         max_features='auto', max_depth=6,
                                                         min_samples_split=2,
                                                         min_weight_fraction_leaf=0.0,
                                                         random_seed=0, **kwargs)
```

Decision Tree Regressor.

### Parameters

- **criterion** (*{"squared\_error", "friedman\_mse", "absolute\_error", "poisson"}*) – The function to measure the quality of a split. Supported criteria are:
  - "squared\_error" for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
  - "friedman\_mse", which uses mean squared error with Friedman's improvement score for potential splits
  - "absolute\_error" for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
  - "poisson" which uses reduction in Poisson deviance to find splits.
- **max\_features** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If int, then consider max\_features features at each split.
  - If float, then max\_features is a fraction and  $\text{int}(\text{max\_features} * \text{n\_features})$  features are considered at each split.
  - If "auto", then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If "sqrt", then  $\text{max\_features} = \text{sqrt}(\text{n\_features})$ .
  - If "log2", then  $\text{max\_features} = \text{log2}(\text{n\_features})$ .
  - If None, then  $\text{max\_features} = \text{n\_features}$ .

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max\_features features.
- **max\_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider min\_samples\_split as the minimum number.
  - If float, then min\_samples\_split is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.

Defaults to 2.
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting(self)**

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters(self)**

Returns the parameters which were used to initialize the component.

**predict(self, X: pandas.DataFrame) → pandas.Series**

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba(self, X: pandas.DataFrame) → pandas.Series**

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save(self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL)**

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters(self, update\_dict, reset\_fit=True)**

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**DFSTransformer**(*index='index', features=None, random\_seed=0, \*\*kwargs*)

Featuretools DFS component that generates features for the input features.

**Parameters**

- **index** (*string*) – The name of the column that contains the indices. If no column with this name exists, then featuretools.EntitySet() creates a column with this name to serve as the index column. Defaults to 'index'.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

- **features** (*List*) – List of features to run DFS on. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input. If features is an empty list, no transformation will occur to inputted data.

#### Methods

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                          | Constructs a new component with the same parameters and random state.                                                            |
| <i>contains_pre_existing_features</i> | Determines whether or not features from a DFS Transformer match pipeline input features.                                         |
| <i>default_parameters</i>             | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                       | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                            | Fits the DFSTransformer Transformer component.                                                                                   |
| <i>fit_transform</i>                  | Fits on X and transforms X.                                                                                                      |
| <i>load</i>                           | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>                  | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>                     | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>                           | Saves component at file path.                                                                                                    |
| <i>transform</i>                      | Computes the feature matrix for the input X using featuretools' dfs algorithm.                                                   |
| <i>update_parameters</i>              | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**static contains\_pre\_existing\_features**(*dfs\_features*: *Optional*[*List*[*featuretools.feature\_base.FeatureBase*]], *input\_feature\_names*: *List*[*str*], *target*: *Optional*[*str*] = *None*)

Determines whether or not features from a DFS Transformer match pipeline input features.

#### **Parameters**

- **dfs\_features** (*Optional*[*List*[*FeatureBase*]]) – List of features output from a DFS Transformer.
- **input\_feature\_names** (*List*[*str*]) – List of input features into the DFS Transformer.

- **target** (*Optional[str]*) – The target whose values we are trying to predict. This is used to know which column to ignore if the target column is present in the list of features in the DFS Transformer’s parameters.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the DFSTransformer Transformer component.

**Parameters**

- **X** (*pd.DataFrame*, *np.array*) – The input data to transform, of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Computes the feature matrix for the input X using featuretools' dfs algorithm.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data to transform. Has shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Feature matrix

**Return type** pd.DataFrame

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**DropColumns**(*columns*=None, *random\_seed*=0, *\*\*kwargs*)

Drops specified columns in input data.

**Parameters**

- **columns** (*list(string)*) – List of column names, used to determine which columns to drop.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                          |

| <b>modifies_target</b>        | False                    |
| <b>name</b>                   | Drop Columns Transformer |
| <b>needs_fitting</b>          | False                    |
| <b>training_only</b>          | False                    |

## Methods

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.        |
| <i>default_parameters</i> | Returns the default parameters for this component.                           |
| <i>describe</i>           | Describe a component and its parameters.                                     |
| <i>fit</i>                | Fits the transformer by checking if column names are present in the dataset. |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                  |
| <i>load</i>               | Loads component at file path.                                                |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.          |
| <i>save</i>               | Saves component at file path.                                                |
| <i>transform</i>          | Transforms data X by dropping columns.                                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                           |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *ignored*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by dropping columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**DropNaNRowsTransformer**(*parameters=None, component\_obj=None, random\_seed=0, \*\*kwargs*)

Transformer to drop rows with NaN values.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

#### Attributes

| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data using fitted component.                                                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self, print\_name=False, return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with NaN rows dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**DropNullColumns**(*pct\_null\_threshold=1.0*, *random\_seed=0*,  
\*\**kwargs*)

Transformer to drop features whose percentage of NaN values exceeds a specified threshold.

**Parameters**

- **pct\_null\_threshold** (*float*) – The percentage of NaN values in an input feature to drop. Must be a value between [0, 1] inclusive. If equal to 0.0, will drop columns with any null values. If equal to 1.0, will drop columns with all null values. Defaults to 0.95.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                        |                               |
|------------------------|-------------------------------|
| hyper-parameter_ranges | {}                            |
| modifies_features      | True                          |
| modifies_target        | False                         |
| name                   | Drop Null Columns Transformer |
| training_only          | False                         |

| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by dropping columns that exceed the threshold of null values.                                                  |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data X by dropping columns that exceed the threshold of null values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.**DropRowsTransformer**(*indices\_to\_drop=None*, *random\_seed=0*)

Transformer to drop rows specified by row indices.

**Parameters**

- **indices\_to\_drop** (*list*) – List of indices to drop in the input data. Defaults to None.

- **random\_seed** (*int*) – Seed for the random number generator. Is not used by this component. Defaults to 0.

#### Attributes

| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data using fitted component.                                                                                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** `self`

**Raises** **ValueError** – If indices to drop do not exist in input features or target.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** `pd.DataFrame`

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data using fitted component.

**Parameters**

- **X** (*pd.DataFrame*) – Features.

- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Data with row indices dropped.

**Return type** (*pd.DataFrame*, *pd.Series*)

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**ElasticNetClassifier**(*penalty='elasticnet'*, *C=1.0*, *l1\_ratio=0.15*,  
*multi\_class='auto'*, *solver='saga'*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

**Parameters**

- **penalty** (*{ "l1", "l2", "elasticnet", "none" }*) – The norm used in penalization. Defaults to “elasticnet”.
- **C** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **l1\_ratio** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if *penalty='elasticnet'*. Setting *l1\_ratio=0* is equivalent to using *penalty='l2'*, while setting *l1\_ratio=1* is equivalent to using *penalty='l1'*. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **multi\_class** (*{ "auto", "ovr", "multinomial" }*) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when *solver='liblinear'*. “auto” selects “ovr” if the data is binary, or if *solver='liblinear'*, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (*{ "newton-cg", "lbfgs", "liblinear", "sag", "saga" }*) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
  - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
  - “liblinear” and “saga” also handle L1 penalty
  - “saga” also supports “elasticnet” penalty
  - “liblinear” does not support setting *penalty='none'*Defaults to “saga”.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted ElasticNet classifier.

**fit**(*self, X, y*)

Fits ElasticNet classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.ElasticNetRegressor(alpha=0.0001, l1_ratio=0.15, max_iter=1000, random_seed=0, **kwargs)`

Elastic Net Regressor.

**Parameters**

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1\_ratio** (*float*) – The mixing parameter, with  $0 \leq \text{l1\_ratio} \leq 1$ . Only used if *penalty*='elasticnet'. Setting *l1\_ratio*=0 is equivalent to using *penalty*='l2', while setting *l1\_ratio*=1 is equivalent to using *penalty*='l1'. For  $0 < \text{l1\_ratio} < 1$ , the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max\_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance for fitted ElasticNet regressor.                                                                              |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted ElasticNet regressor.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.EmailFeaturizer(random_seed=0, **kwargs)`

Transformer that can automatically extract features from emails.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on <i>X</i> and transforms <i>X</i> .                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data <i>X</i> .                                                                                                       |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

### `fit(self, X, y=None)`

Fits component to data.

#### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.

- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.Estimator(parameters: dict = None, component_obj:  

Type[evalml.pipelines.components.ComponentBase] =  

None, random_seed: Union[int, float] = 0, **kwargs)
```

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>name</i>                     | Returns string name of this component.                                                                                           |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>supported_problem_types</i>  | Problem types this estimator supports.                                                                                           |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

**fit**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.

- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property model\_family**(*cls*)

Returns ModelFamily of this component.

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self, X: pandas.DataFrame*) → pandas.Series

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self, X: pandas.DataFrame*) → pandas.Series

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.ExponentialSmoothingRegressor(trend: Optional[str] = None,
                                                                damped_trend: bool = False,
                                                                seasonal: Optional[str] = None,
                                                                sp: int = 2, n_jobs: int = -1,
                                                                random_seed: Union[int, float]
                                                                = 0, **kwargs)
```

Holt-Winters Exponential Smoothing Forecaster.

Currently ExponentialSmoothingRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

**Parameters**

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped\_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None**. (*but AutoMLSearch will not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n\_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns array of 0's with a length of 1 as feature\_importance is not defined for Exponential Smoothing regressor.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits Exponential Smoothing Regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**Raises ValueError** – If y was not passed in.

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.ExtraTreesClassifier(n_estimators=100, max_features='auto',
                                                    max_depth=6, min_samples_split=2,
                                                    min_weight_fraction_leaf=0.0, n_jobs=-1,
                                                    random_seed=0, **kwargs)
```

Extra Trees Classifier.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_features** (*int*, *float* or {"auto", "sqrt", "log2"}) – The number of features to consider when looking for the best split:
  - If int, then consider max\_features features at each split.
  - If float, then max\_features is a fraction and int(max\_features \* n\_features) features are considered at each split.

- If “auto”, then `max_features=sqrt(n_features)`.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features. Defaults to “auto”.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider `min_samples_split` as the minimum number.
  - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`n_jobs`** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

**`predict_proba(self, X: pandas.DataFrame) → pandas.Series`**

Make probability estimates for labels.

**Parameters** **`X`** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`**

Saves component at file path.

**Parameters**

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

**`update_parameters(self, update_dict, reset_fit=True)`**

Updates the parameter dictionary of the component.

**Parameters**

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

**`class evalml.pipelines.components.ExtraTreesRegressor`**(*n\_estimators: int = 100, max\_features: str = 'auto', max\_depth: int = 6, min\_samples\_split: int = 2, min\_weight\_fraction\_leaf: float = 0.0, n\_jobs: int = -1, random\_seed: Union[int, float] = 0, \*\*kwargs*)

Extra Trees Regressor.

**Parameters**

- **`n_estimators`** (*float*) – The number of trees in the forest. Defaults to 100.
- **`max_features`** (*int, float or {"auto", "sqrt", "log2"}*) – The number of features to consider when looking for the best split:
  - If *int*, then consider `max_features` features at each split.
  - If *float*, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
  - If “auto”, then `max_features=sqrt(n_features)`.
  - If “sqrt”, then `max_features=sqrt(n_features)`.
  - If “log2”, then `max_features=log2(n_features)`.
  - If *None*, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features. Defaults to “auto”.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.

- **min\_samples\_split** (*int or float*) – The minimum number of samples required to split an internal node:
  - If int, then consider min\_samples\_split as the minimum number.
  - If float, then min\_samples\_split is a fraction and  $\text{ceil}(\text{min\_samples\_split} * \text{n\_samples})$  are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **min\_weight\_fraction\_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a *feature\_importance* method or a *component\_obj* that implements *feature\_importance*.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExtraTreesRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.FeatureSelector(parameters=None, component_obj=None,
                                                  random_seed=0, **kwargs)
```

Selects top features based on importance weights.

#### Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component\_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

| <i>fit</i>                | Fits component to data.                                                                                                                                  |
| <i>fit_transform</i>      | Fit and transform data using the feature selector.                                                                                                       |
| <i>get_names</i>          | Get names of selected features.                                                                                                                          |
| <i>load</i>               | Loads component at file path.                                                                                                                            |
| <i>name</i>               | Returns string name of this component.                                                                                                                   |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                         |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                            |
| <i>transform</i>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an MethodPropertyNotFoundError exception. |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                       |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises** **MethodPropertyNotFoundError** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** list[str]

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=*None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an `MethodPropertyNotFoundError` exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**Raises** `MethodPropertyNotFoundError` – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.Imputer(categorical_impute_strategy='most_frequent',
                                           categorical_fill_value=None,
                                           numeric_impute_strategy='mean', numeric_fill_value=None,
                                           boolean_impute_strategy='most_frequent',
                                           boolean_fill_value=None, random_seed=0, **kwargs)
```

Imputes missing data according to a specified imputation strategy.

**Parameters**

- **categorical\_impute\_strategy** (*string*) – Impute strategy to use for string, object, boolean, categorical dtypes. Valid values include “most\_frequent” and “constant”.
- **numeric\_impute\_strategy** (*string*) – Impute strategy to use for numeric columns. Valid values include “mean”, “median”, “most\_frequent”, and “constant”.
- **boolean\_impute\_strategy** (*string*) – Impute strategy to use for boolean columns. Valid values include “most\_frequent” and “constant”.
- **categorical\_fill\_value** (*string*) – When `categorical_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with the string “missing\_value”.
- **numeric\_fill\_value** (*int*, *float*) – When `numeric_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with 0.

- **boolean\_fill\_value** (*bool*) – When `boolean_impute_strategy == “constant”`, `fill_value` is used to replace missing data. The default value of `None` will fill with `True`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                                                                                    |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                                                                                       |
| <i>describe</i>           | Describe a component and its parameters.                                                                                                                                                 |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to <code>np.nan</code> before imputation and are treated as the same.                                                                  |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                                                                            |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> . |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                                                                                      |
| <i>save</i>               | Saves component at file path.                                                                                                                                                            |
| <i>transform</i>          | Transforms data X by imputing missing values.                                                                                                                                            |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                                                                                       |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame, np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** Transformed *X*

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.KNeighborsClassifier(n_neighbors=5, weights='uniform',  
                                                    algorithm='auto', leaf_size=30, p=2,  
                                                    random_seed=0, **kwargs)
```

K-Nearest Neighbors Classifier.

**Parameters**

- **n\_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** (*{'uniform', 'distance'}* or *callable*) – Weight function used in prediction. Can be:
  - ‘uniform’ : uniform weights. All points in each neighborhood are weighted equally.
  - ‘distance’ : weight points by the inverse of their distance. in this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
  - [*callable*] : a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** (*{'auto', 'ball\_tree', 'kd\_tree', 'brute'}*) – Algorithm used to compute the nearest neighbors:
  - ‘ball\_tree’ will use BallTree
  - ‘kd\_tree’ will use KDTree
  - ‘brute’ will use a brute-force search.‘auto’ will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf\_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.
- **p** (*int*) – Power parameter for the Minkowski metric. When *p* = 1, this is equivalent to using *manhattan\_distance* (l1), and *euclidean\_distance* (l2) for *p* = 2. For arbitrary *p*, *minkowski\_distance* (l\_p) is used. Defaults to 2.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Returns array of 0's matching the input number of features as feature\_importance is not defined for KNN classifiers.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]**

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load(file\_path)**

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**LabelEncoder**(*positive\_label*=*None*, *random\_seed*=*0*, *\*\*kwargs*)

A transformer that encodes target labels using values between 0 and num\_classes - 1.

**Parameters**

- **positive\_label** (*int*, *str*) – The label for the class that should be treated as positive (1) for binary classification problems. Ignored for multiclass problems. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0. Ignored.

| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform the target using the fitted label encoder.                                                                             |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y*)

Fits the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** *self*

**Raises** **ValueError** – If input *y* is None.

**fit\_transform**(*self*, *X*, *y*)

Fit and transform data using the label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**inverse\_transform**(*self*, *y*)

Decodes the target data.

**Parameters** **y** (*pd.Series*) – Target data.

**Returns** The decoded version of the target.

**Return type** *pd.Series*

**Raises** **ValueError** – If input *y* is None.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform the target using the fitted label encoder.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*]. Ignored.
- **y** (*pd.Series*) – The target training data of length [*n\_samples*].

**Returns** The original features and an encoded version of the target.

**Return type** *pd.DataFrame*, *pd.Series*

**Raises** **ValueError** – If input *y* is *None*.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set *\_is\_fitted* to *False*.

```
class evalml.pipelines.components.LightGBMClassifier(boosting_type='gbdt', learning_rate=0.1,  
                                                    n_estimators=100, max_depth=0,  
                                                    num_leaves=31, min_child_samples=20,  
                                                    bagging_fraction=0.9, bagging_freq=0,  
                                                    n_jobs=-1, random_seed=0, **kwargs)
```

LightGBM Classifier.

**Parameters**

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners,  $\leq 0$  means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. *k* means perform bagging at every *k* iteration. Every *k*-th iteration, LightGBM will randomly select *bagging\_fraction* \* 100 % of the data to use for the next *k* iterations. Defaults to 0.
- **n\_jobs** (*int* or *None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits LightGBM classifier component to data.                                                                                      |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using the fitted LightGBM classifier.                                                                           |
| <i>predict_proba</i>            | Make prediction probabilities using the fitted LightGBM classifier.                                                              |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using the fitted LightGBM classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.DataFrame*

**predict\_proba**(*self*, *X*)

Make prediction probabilities using the fitted LightGBM classifier.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted probability values.

**Return type** *pd.DataFrame*

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**LightGBMRegressor**(*boosting\_type='gbdt'*, *learning\_rate=0.1*,  
*n\_estimators=20*, *max\_depth=0*,  
*num\_leaves=31*, *min\_child\_samples=20*,  
*bagging\_fraction=0.9*, *bagging\_freq=0*,  
*n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

LightGBM Regressor.

**Parameters**

- **boosting\_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning\_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n\_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num\_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min\_child\_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging\_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging\_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next k iterations. Defaults to 0.
- **n\_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self) → pandas.Series**

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit(self, X, y=None)**

Fits LightGBM regressor to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*)

Make predictions using fitted LightGBM regressor.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If *True*, will set `_is_fitted` to *False*.

**class** `evalml.pipelines.components.LinearDiscriminantAnalysis`(*n\_components*=*None*,  
*random\_seed*=0, *\*\*kwargs*)

Reduces the number of features by using Linear Discriminant Analysis.

**Parameters**

- **n\_components** (*int*) – The number of features to maintain after computation. Defaults to *None*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transform data using the fitted LDA component.                                                                                   |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y*)**

Fits the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform(*self*, *X*, *y=None*)**

Fit and transform data using the LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**Raises** **ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**LinearRegressor**(*fit\_intercept=True*, *n\_jobs=-1*, *random\_seed=0*,  
\*\**kwargs*)

Linear Regressor.

**Parameters**

- **fit\_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance for fitted linear regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.LogisticRegressionClassifier(penalty='l2', C=1.0,  
                                                             multi_class='auto', solver='lbfgs',  
                                                             n_jobs=- 1, random_seed=0,  
                                                             **kwargs)
```

Logistic Regression Classifier.

**Parameters**

- **penalty** ({*"l1"*, *"l2"*, *"elasticnet"*, *"none"*}) – The norm used in penalization. Defaults to *"l2"*.

- **C** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi\_class** (*{ "auto", "ovr", "multinomial" }*) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when solver=“liblinear”. “auto” selects “ovr” if the data is binary, or if solver=“liblinear”, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (*{ "newton-cg", "lbfgs", "liblinear", "sag", "saga" }*) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
  - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
  - “liblinear” and “saga” also handle L1 penalty
  - “saga” also supports “elasticnet” penalty
  - “liblinear” does not support setting penalty=’none’
 Defaults to “lbfgs”.
- **n\_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

#### `property feature_importance(self)`

Feature importance for fitted logistic regression classifier.

#### `fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

##### Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: pandas.DataFrame) → pandas.Series

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** pd.Series

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.LogTransformer`(*random\_seed=0*)

Applies a log transformation to the target data.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | False           |
| <b>modifies_target</b>        | True            |
| <b>name</b>                   | Log Transformer |
| <b>training_only</b>          | False           |

**Methods**

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits the LogTransformer.                                                                                                         |
| <code>fit_transform</code>      | Log transforms the target variable.                                                                                              |
| <code>inverse_transform</code>  | Apply exponential to target data.                                                                                                |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Log transforms the target variable.                                                                                              |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits the LogTransformer.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – Ignored.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** self

**fit\_transform(self, X, y=None)**

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to log transform.

**Returns**

**The input features are returned without modification. The target** variable **y** is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**inverse\_transform**(*self*, *y*)

Apply exponential to target data.

**Parameters** **y** (*pd.Series*) – Target variable.

**Returns** Target with exponential applied.

**Return type** *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Log transforms the target variable.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target data to log transform.

**Returns**

**The input features are returned without modification. The target** variable **y** is log transformed.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.LSA(*random\_seed=0*, *\*\*kwargs*)

Transformer to calculate the Latent Semantic Analysis Values of text input.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |
| <b>modifies_features</b>      | True            |
| <b>modifies_target</b>        | False           |
| <b>name</b>                   | LSA Transformer |
| <b>training_only</b>          | False           |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the input data.                                                                                                             |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data X by applying the LSA pipeline.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the input data.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

**Returns** self

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by applying the LSA pipeline.

#### Parameters

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series*, *optional*) – Ignored.

#### Returns

**Transformed X. The original column is removed and replaced with two columns of the format *LSA(original\_column\_name)[feature\_number]*, where *feature\_number* is 0 or 1.**

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.NaturalLanguageFeaturizer`(*random\_seed=0*, *\*\*kwargs*)

Transformer that can automatically featurize text columns using featuretools' *nlp\_primitives*.

Since models cannot handle non-numeric data, any text must be broken down into features that provide useful information about that text. This component splits each text column into several informative features: Diversity Score, Mean Characters per Word, Polarity Score, LSA (Latent Semantic Analysis), Number of Characters, and Number of Words. Calling *transform* on this component will replace any text columns in the given dataset with these numeric columns.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                             |
|-------------------------------|-----------------------------|
| <b>hyper-parameter_ranges</b> | { }                         |
| <b>modifies_features</b>      | True                        |
| <b>modifies_target</b>        | False                       |
| <b>name</b>                   | Natural Language Featurizer |
| <b>training_only</b>          | False                       |

#### Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                               |
| <code>describe</code>           | Describe a component and its parameters.                                                                                         |
| <code>fit</code>                | Fits component to data.                                                                                                          |
| <code>fit_transform</code>      | Fits on X and transforms X.                                                                                                      |
| <code>load</code>               | Loads component at file path.                                                                                                    |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                              |
| <code>save</code>               | Saves component at file path.                                                                                                    |
| <code>transform</code>          | Transforms data X by creating new features using existing text columns.                                                          |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame or np.ndarray*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*) – The target training data of length [n\_samples]

**Returns** self

**fit\_transform(self, X, y=None)**

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms data X by creating new features using existing text columns.

**Parameters**

- **X** (*pd.DataFrame*) – The data to transform.
- **y** (*pd.Series, optional*) – Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool, optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.OneHotEncoder(top_n=10, features_to_encode=None,
                                              categories=None, drop='if_binary',
                                              handle_unknown='ignore', handle_missing='error',
                                              random_seed=0, **kwargs)
```

A transformer that encodes categorical features in a one-hot numeric array.

#### Parameters

- **top\_n** (*int*) – Number of categories per column to encode. If *None*, all categories will be encoded. Otherwise, the *n* most frequent will be encoded and all others will be dropped. Defaults to 10.
- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If *None*, all appropriate columns will be encoded. Defaults to *None*.
- **categories** (*list*) – A two dimensional list of categories, where *categories[i]* is a list of the categories for the column at index *i*. This can also be *None*, or “*auto*” if *top\_n* is not *None*. Defaults to *None*.
- **drop** (*string, list*) – Method (“*first*” or “*if\_binary*”) to use to drop one category per feature. Can also be a list specifying which categories to drop for each feature. Defaults to “*if\_binary*”.
- **handle\_unknown** (*string*) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. If either *top\_n* or *categories* is used to limit the number of categories per column, this must be “*ignore*”. Defaults to “*ignore*”.
- **handle\_missing** (*string*) – Options for how to handle missing (NaN) values encountered during *fit* or *transform*. If this is set to “*as\_category*” and NaN values are within the *n* most frequent, “*nan*” values will be encoded as their own column. If this is set to “*error*”, any missing values encountered will raise an error. Defaults to “*error*”.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                         |                 |
|-------------------------|-----------------|
| hyper-param-eter_ranges | {}              |

| modi-fies_target        | False           |
| name                    | One Hot Encoder |
| train-ing_only          | False           |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the one-hot encoder component.                                                                                              |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Return feature names for the categorical features after fitting.                                                                 |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | One-hot encode the input data.                                                                                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to one-hot encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to one-hot encoder as a training feature.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the one-hot encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** *self*

**Raises** **ValueError** – If encoding a column failed.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the categorical features after fitting.

Feature names are formatted as {column name}\_{category name}. In the event of a duplicate name, an integer will be added at the end of the feature name to distinguish it.

For example, consider a dataframe with a column called “A” and category “x\_y” and another column called “A\_x” with “y”. In this example, the feature names would be “A\_x\_y” and “A\_x\_y\_1”.

**Returns** The feature names after encoding, provided in the same order as *input\_features*.

**Return type** *np.ndarray*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.

- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

One-hot encode the input data.

#### Parameters

- **X** (*pd.DataFrame*) – Features to one-hot encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each categorical feature has been encoded into numerical columns using one-hot encoding.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.OrdinalEncoder(features_to_encode=None, categories=None,  
                                                handle_unknown='error', unknown_value=None,  
                                                encoded_missing_value=None, random_seed=0,  
                                                **kwargs)
```

A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

#### Parameters

- **features\_to\_encode** (*list[str]*) – List of columns to encode. All other columns will remain untouched. If None, all appropriate columns will be encoded. Defaults to None. The order of columns does not matter.
- **categories** (*dict[str, list[str]]*) – A dictionary mapping column names to their categories in the dataframes passed in at fit and transform. The order of categories specified for a column does not matter. Any category found in the data that is not present in categories will be handled as an unknown value. To not have unknown values raise an error, set *handle\_unknown* to “use\_encoded\_value”. Defaults to None.
- **handle\_unknown** (“error” or “use\_encoded\_value”) – Whether to ignore or error for unknown categories for a feature encountered during *fit* or *transform*. When set to “error”, an error will be raised when an unknown category is found. When set to “use\_encoded\_value”, unknown categories will be encoded as the value given for the parameter *unknown\_value*. Defaults to “error.”
- **unknown\_value** (*int* or *np.nan*) – The value to use for unknown categories seen during fit or transform. Required when the parameter *handle\_unknown* is set to “use\_encoded\_value.” The value has to be distinct from the values used to encode any of the categories in fit. Defaults to None.
- **encoded\_missing\_value** (*int* or *np.nan*) – The value to use for missing (null) values seen during fit or transform. Defaults to *np.nan*.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                 |
|-------------------------------|-----------------|
| <b>hyper-parameter_ranges</b> | {}              |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>categories</i>         | Returns a list of the unique categories to be encoded for the particular feature, in order.                                      |
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the ordinal encoder component.                                                                                              |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>get_feature_names</i>  | Return feature names for the ordinal features after fitting.                                                                     |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Ordinally encode the input data.                                                                                                 |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **categories**(*self*, *feature\_name*)

Returns a list of the unique categories to be encoded for the particular feature, in order.

**Parameters** **feature\_name** (*str*) – The name of any feature provided to ordinal encoder during fit.

**Returns** The unique categories, in the same dtype as they were provided during fit.

**Return type** np.ndarray

**Raises** **ValueError** – If feature was not provided to ordinal encoder as a training feature.

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the ordinal encoder component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**Raises**

- **ValueError** – If encoding a column failed.
- **TypeError** – If non-Ordinal columns are specified in features\_to\_encode.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** pd.DataFrame

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a component\_obj that implements transform.

**get\_feature\_names**(*self*)

Return feature names for the ordinal features after fitting.

Feature names are formatted as {column name}\_ordinal\_encoding.

**Returns** The feature names after encoding, provided in the same order as input\_features.

**Return type** np.ndarray

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Ordinally encode the input data.

**Parameters**

- **X** (*pd.DataFrame*) – Features to encode.
- **y** (*pd.Series*) – Ignored.

**Returns** Transformed data, where each ordinal feature has been encoded into a numerical column where ordinal integers represent the relative order of categories.

**Return type** pd.DataFrame

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.Oversampler(*sampling\_ratio*=0.25, *sampling\_ratio\_dict*=None, *k\_neighbors\_default*=5, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.

**Parameters**

- **sampling\_ratio** (*float*) – This is the goal ratio of the minority to majority class, with range (0, 1]. A value of 0.25 means we want a 1:4 ratio of the minority to majority class after oversampling. We will create the a sampling dictionary using this ratio, with the keys corresponding to the class and the values responding to the number of samples. Defaults to 0.25.
- **sampling\_ratio\_dict** (*dict*) – A dictionary specifying the desired balanced ratio for each target value. For instance, in a binary case where class 1 is the minority, we could specify: *sampling\_ratio\_dict*={0: 0.5, 1: 1}, which means we would undersample class 0 to have twice the number of samples as class 1 (minority:majority ratio = 0.5), and don't sample class 1. Overrides *sampling\_ratio* if provided. Defaults to None.

- **k\_neighbors\_default** (*int*) – The number of nearest neighbors used to construct synthetic samples. This is the default value used, but the actual k\_neighbors value might be smaller if there are less samples. Defaults to 5.
- **n\_jobs** (*int*) – The number of CPU cores to use. Defaults to -1.
- **random\_seed** (*int*) – The seed to use for random sampling. Defaults to 0.

| <b>modifies_target</b>        | True        |
| <b>name</b>                   | Oversampler |
| <b>training_only</b>          | True        |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits oversampler to data.                                                                                                        |
| <i>fit_transform</i>      | Fit and transform data using the sampler component.                                                                              |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms the input data by Oversampling the data.                                                                              |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y*)

Fits oversampler to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y*)

Fit and transform data using the sampler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** (pd.DataFrame, pd.Series)

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transforms the input data by Oversampling the data.

**Parameters**

- **X** (*pd.DataFrame*) – Training features.

- **y** (*pd.Series*) – Target.

**Returns** Transformed features and target.

**Return type** *pd.DataFrame*, *pd.Series*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.PCA`(*variance=0.95*, *n\_components=None*, *random\_seed=0*, *\*\*kwargs*)

Reduces the number of features by using Principal Component Analysis (PCA).

**Parameters**

- **variance** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **n\_components** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                                   |
|-------------------------------|-----------------------------------|
| <b>hyper-parameter_ranges</b> | Real(0.25, 1)}:type: {"variance"} |
| <b>modifies_features</b>      | True                              |
| <b>modifies_target</b>        | False                             |
| <b>name</b>                   | PCA Transformer                   |
| <b>training_only</b>          | False                             |

**Methods**

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the PCA component.                                                                                                          |
| <i>fit_transform</i>      | Fit and transform data using the PCA component.                                                                                  |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using fitted PCA component.                                                                                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** *self*

**Raises** **ValueError** – If input data is not all numeric.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**Raises** **ValueError** – If input data is not all numeric.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol*=cloudpickle.DEFAULT\_PROTOCOL)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y*=None)

Transform data using fitted PCA component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**Raises ValueError** – If input data is not all numeric.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=True)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**PerColumnImputer**(*impute\_strategies*=None, *random\_seed*=0, *\*\*kwargs*)

Imputes missing data according to a specified imputation strategy per column.

**Parameters**

- **impute\_strategies** (*dict*) – Column and {"impute\_strategy": strategy, "fill\_value":value} pairings. Valid values for impute strategy include "mean", "median", "most\_frequent", "constant" for numerical data, and "most\_frequent", "constant" for object data types. Defaults to None, which uses "most\_frequent" for all columns. When impute\_strategy == "constant", fill\_value is used to replace missing data. When None, uses 0 when imputing numerical data and "missing\_value" for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputers on input data.                                                                                                     |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input data by imputing missing values.                                                                                |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits imputers on input data.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features] to fit.
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict\_proba*, *transform*, or *feature\_importances*.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by imputing missing values.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – The input training data of shape [n\_samples, n\_features] to transform.
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]. Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.PolynomialDecomposer`(*time\_index: str = None*, *degree: int = 1*, *period: int = -1*, *random\_seed: int = 0*, *\*\*kwargs*)

Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.

Scikit-learn’s `PolynomialForecaster` is used to generate the additive trend portion of the target data. A polynomial will be fit to the data during fit. That additive polynomial trend will be removed during fit so that `statsmodel`’s `seasonal_decompose` can determine the additive seasonality of the data by using rolling averages over the series’ inferred periodicity.

For example, daily time series data will generate rolling averages over the first week of data, normalize out the mean and return those 7 averages repeated over the entire length of the given series. Those seven averages, repeated as many times as necessary to match the length of the given target data, will be used as the seasonal signal of the data.

#### Parameters

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Degree for the polynomial. If 1, linear model is fit to the data. If 2, quadratic model is fit, etc. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, period should be 7. For daily data with a yearly seasonal signal, period should be 365. Defaults to -1, which uses the `statsmodels` library’s `freq_to_period` function. <https://github.com/statsmodels/statsmodels/blob/main/statsmodels/tsa/tsatools.py>
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

## Methods

|                                    |                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                 | Constructs a new component with the same parameters and random state.                                              |
| <code>default_parameters</code>    | Returns the default parameters for this component.                                                                 |
| <code>describe</code>              | Describe a component and its parameters.                                                                           |
| <code>determine_periodicity</code> | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <code>fit</code>                   | Fits the PolynomialDecomposer and determine the seasonal signal.                                                   |
| <code>fit_transform</code>         | Removes fitted trend and seasonality from target variable.                                                         |
| <code>get_trend_dataframe</code>   | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <code>inverse_transform</code>     | Adds back fitted trend and seasonality to target variable.                                                         |
| <code>is_freq_valid</code>         | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <code>load</code>                  | Loads component at file path.                                                                                      |
| <code>parameters</code>            | Returns the parameters which were used to initialize the component.                                                |
| <code>plot_decomposition</code>    | Plots the decomposition of the target signal.                                                                      |
| <code>save</code>                  | Saves component at file path.                                                                                      |
| <code>set_period</code>            | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <code>transform</code>             | Transforms the target data by removing the polynomial trend and rolling average seasonality.                       |
| <code>update_parameters</code>     | Updates the parameter dictionary of the component.                                                                 |

### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

`int`

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *PolynomialDecomposer*

Fits the *PolynomialDecomposer* and determine the seasonal signal.

Currently only fits the polynomial detrender. The seasonality is determined by removing the trend from the signal and using statsmodels’ `seasonal_decompose()`. Both the trend and seasonality are currently assumed to be additive.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

`self`

#### Raises

- **NotImplementedError** – If the input data has a frequency of “month-begin”. This isn’t supported by statsmodels `decompose` as the freqstr “MS” is misinterpreted as milliseconds.
- **ValueError** – If *y* is None.
- **ValueError** – If target data doesn’t have `DatetimeIndex` AND no `Datetime` features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The first element are the input features returned without modification. The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**get\_trend\_dataframe**(*self*, *X*: `pandas.DataFrame`, *y*: `pandas.Series`) → list[`pandas.DataFrame`]

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

Scikit-learn's `PolynomialForecaster` is used to generate the trend portion of the target data. `statsmodel`'s `seasonal_decompose` is used to generate the seasonality of the data.

**Parameters**

- **X** (`pd.DataFrame`) – Input data with time series data in index.
- **y** (`pd.Series` or `pd.DataFrame`) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

**Returns**

Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,” with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

**Raises**

- **TypeError** – If `X` does not have time-series data in the index.
- **ValueError** – If time series index of `X` does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If `y` is not provided as a pandas Series or DataFrame.

**inverse\_transform**(*self*, *y\_t*: `pandas.Series`) → tuple[`pandas.DataFrame`, `pandas.Series`]

Adds back fitted trend and seasonality to target variable.

The polynomial trend is added back into the signal, calling the detrender's `inverse_transform()`. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (`pd.Series`) – Target variable.

**Returns**

The first element are the input features returned without modification. The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If `y` is None.

**classmethod** **is\_freq\_valid**(*cls*, *freq*: `str`)

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** **freq** (`str`) – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** **load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (`str`) – Location to load file.

**Returns** ComponentBase object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) → *tuple*[*matplotlib.pyplot.Figure*, *list*]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** *matplotlib.pyplot.Figure*, *list*[*matplotlib.pyplot.Axes*]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → *tuple*[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the polynomial trend and rolling average seasonality.

Applies the fit polynomial detrender to the target data, removing the additive polynomial trend. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

**Returns**

The input features are returned without modification. The target variable `y` is detrended and deseasonalized.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises `ValueError`** – If target data doesn’t have `DatetimeIndex` AND no `Datetime` features in features data

**`update_parameters`**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.ProphetRegressor(time_index: Optional[Hashable] = None,
                                                    changepoint_prior_scale: float = 0.05,
                                                    seasonality_prior_scale: int = 10,
                                                    holidays_prior_scale: int = 10,
                                                    seasonality_mode: str = 'additive', stan_backend:
                                                    str = 'CMDSTANPY', interval_width: float = 0.95,
                                                    random_seed: Union[int, float] = 0, **kwargs)
```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

#### Parameters

- **`time_index`** (*str*) – Specifies the name of the column in `X` that provides the datetime objects. Defaults to `None`.
- **`changepoint_prior_scale`** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **`seasonality_prior_scale`** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **`holidays_prior_scale`** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **`seasonality_mode`** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **`stan_backend`** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **`interval_width`** (*float*) – Determines the confidence of the prediction interval range when calling `get_prediction_intervals`. Accepts values in the range (0,1). Defaults to 0.95.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

**static build\_prophet\_df**(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time\_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*) → dict

Returns the default parameters for this component.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature\_importance is not defined for Prophet regressor.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits Prophet regressor component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – The target training data of length [n\_samples].

**Returns** self

**get\_params**(*self*) → dict

Get parameters for the Prophet regressor.

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ProphetRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.

**Returns** Predicted values.

**Return type** *pd.Series*

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.RandomForestClassifier`(*n\_estimators=100*, *max\_depth=6*,  
*n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Random Forest Classifier.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Returns importance associated with each feature.                                                                                 |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

```
class evalml.pipelines.components.RandomForestRegressor(n_estimators: int = 100, max_depth: int = 6, n_jobs: int = -1, random_seed: Union[int, float] = 0, **kwargs)
```

Random Forest Regressor.

**Parameters**

- **n\_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.

- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*) → pandas.Series

Returns importance associated with each feature.

**Returns** Importance associated with each feature.

**Return type** np.ndarray

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a feature\_importance method or a component\_obj that implements feature\_importance.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted RandomForestRegressor.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**ReplaceNullableTypes**(*random\_seed*=0, *\*\*kwargs*)

Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.

**Attributes**

|                               |                                    |
|-------------------------------|------------------------------------|
| <b>hyper-parameter_ranges</b> | None                               |
| <b>modifies_features</b>      | True                               |
| <b>modifies_target</b>        | {}                                 |

## Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits component to data.                                                                                                          |
| <i>fit_transform</i>      | Substitutes non-nullable types for the new pandas nullable types in the data and target data.                                    |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms data by replacing columns that contain nullable types with the appropriate replacement type.                          |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

#### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Substitutes non-nullable types for the new pandas nullable types in the data and target data.

**Parameters**

- **X** (*pd.DataFrame*, *optional*) – Input features.
- **y** (*pd.Series*) – Target data.

**Returns** The input features and target data with the non-nullable types set.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data by replacing columns that contain nullable types with the appropriate replacement type.

“float64” for nullable integers and “category” for nullable booleans.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform
- **y** (*pd.Series*, *optional*) – Target data to transform

**Returns** Transformed X *pd.Series*: Transformed y

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.RFClassifierRFESelector(*step=0.2*, *min\_features\_to\_select=1*, *cv=None*, *scoring=None*, *n\_jobs=-1*, *n\_estimators=10*, *max\_depth=None*, *random\_seed=0*, *\*\*kwargs*)

Selects relevant features using recursive feature elimination with a Random Forest Classifier.

#### Parameters

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the *min\_features\_to\_select* constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int* or *None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **scoring** (*str*, *callable* or *None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

|                               |                                 |
|-------------------------------|---------------------------------|
| <b>hyper-parameter_ranges</b> | { "step": Real(0.05, 0.25) }    |
| <b>modifies_features</b>      | True                            |
| <b>modifies_target</b>        | False                           |
| <b>name</b>                   | RFE Selector with RF Classifier |
| <b>training_only</b>          | False                           |

#### Methods

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.RFClassifierSelectFromModel(*number\_features=None*,  
*n\_estimators=10*,  
*max\_depth=None*,  
*percent\_features=0.5*,  
*threshold='median'*, *n\_jobs=-1*,  
*random\_seed=0*, *\*\*kwargs*)

Selects top features based on importance weights using a Random Forest classifier.

**Parameters**

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to None.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**RFRegressorRFSelector**(*step=0.2*, *min\_features\_to\_select=1*, *cv=None*, *scoring=None*, *n\_jobs=-1*, *n\_estimators=10*, *max\_depth=None*, *random\_seed=0*, *\*\*kwargs*)

Selects relevant features using recursive feature elimination with a Random Forest Regressor.

#### Parameters

- **step** (*int*, *float*) – The number of features to eliminate in each iteration. If an integer is specified this will represent the number of features to eliminate. If a float is specified this represents the percentage of features to eliminate each iteration. The last iteration may drop fewer than this number of features in order to satisfy the *min\_features\_to\_select* constraint. Defaults to 0.2.
- **min\_features\_to\_select** (*int*) – The minimum number of features to return. Defaults to 1.
- **cv** (*int or None*) – Number of folds to use for the cross-validation splitting strategy. Defaults to None which will use 5 folds.
- **scoring** (*str, callable or None*) – A string or scorer callable object to specify the scoring method.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

#### Methods

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>              | Constructs a new component with the same parameters and random state.                                                                                                 |
| <code>default_parameters</code> | Returns the default parameters for this component.                                                                                                                    |
| <code>describe</code>           | Describe a component and its parameters.                                                                                                                              |
| <code>fit</code>                | Fits component to data.                                                                                                                                               |
| <code>fit_transform</code>      | Fit and transform data using the feature selector.                                                                                                                    |
| <code>get_names</code>          | Get names of selected features.                                                                                                                                       |
| <code>load</code>               | Loads component at file path.                                                                                                                                         |
| <code>needs_fitting</code>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.                                      |
| <code>parameters</code>         | Returns the parameters which were used to initialize the component.                                                                                                   |
| <code>save</code>               | Saves component at file path.                                                                                                                                         |
| <code>transform</code>          | Transforms input data by selecting features. If the component_obj does not have a transform method, will raise an <code>MethodPropertyNotFoundError</code> exception. |
| <code>update_parameters</code>  | Updates the parameter dictionary of the component.                                                                                                                    |

**clone(*self*)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(*cls*)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(*self*, *print\_name=False*, *return\_dict=False*)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(*self*, *X*, *y=None*)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.RFRegressorSelectFromModel(*number\_features=None*,  
*n\_estimators=10*, *max\_depth=None*,  
*percent\_features=0.5*,  
*threshold='median'*, *n\_jobs=-1*,  
*random\_seed=0*, *\*\*kwargs*)

Selects top features based on importance weights using a Random Forest regressor.

#### Parameters

- **number\_features** (*int*) – The maximum number of features to select. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **n\_estimators** (*int*) – The number of trees in the forest. Defaults to 10.
- **max\_depth** (*int*) – Maximum tree depth for base learners. Defaults to None.
- **percent\_features** (*float*) – Percentage of features to use. If both *percent\_features* and *number\_features* are specified, take the greater number of features. Defaults to 0.5.
- **threshold** (*string or float*) – The threshold value to use for feature selection. Features whose importance is greater or equal are kept while the others are discarded. If “median”, then the threshold value is the median of the feature importances. A scaling factor (e.g., “1.25\*mean”) may also be used. Defaults to median.
- **n\_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit(self, X, y=None)**

Fits component to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features]
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples]

**Returns** self

**Raises `MethodPropertyNotFoundError`** – If component does not have a fit method or a component\_obj that implements fit.

**fit\_transform**(*self*, *X*, *y=None*)

Fit and transform data using the feature selector.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**get\_names**(*self*)

Get names of selected features.

**Returns** List of the names of features selected.

**Return type** *list[str]*

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** *True*.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input data by selecting features. If the component\_obj does not have a transform method, will raise an *MethodPropertyNotFoundError* exception.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Target data. Ignored.

**Returns** Transformed X

**Return type** *pd.DataFrame*

**Raises `MethodPropertyNotFoundError`** – If feature selector does not have a transform method or a component\_obj that implements transform

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** evalml.pipelines.components.**SelectByType**(*column\_types=None*, *exclude=False*, *random\_seed=0*, *\*\*kwargs*)

Selects columns by specified Woodwork logical type or semantic tag in input data.

#### Parameters

- **column\_types** (*string*, *ww.LogicalType*, *list(string)*, *list(ww.LogicalType)*) – List of Woodwork types or tags, used to determine which columns to select or exclude.
- **exclude** (*bool*) – If true, exclude the `column_types` instead of including them. Defaults to False.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### Attributes

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *ignored*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.
- **y** (*pd.Series*) – Target data.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a `component_obj` that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms data *X* by selecting columns.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** Transformed *X*.

**Return type** *pd.DataFrame*

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** `evalml.pipelines.components.SelectColumns`(*columns=None*, *random\_seed=0*, *\*\*kwargs*)

Selects specified columns in input data.

**Parameters**

- **columns** (*list(string)*) – List of column names, used to determine which columns to select. If columns are not present, they will not be selected.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                               |                            |
|-------------------------------|----------------------------|
| <b>hyper-parameter_ranges</b> | { }                        |
| <b>modifies_features</b>      | True                       |
| <b>modifies_target</b>        | False                      |
| <b>name</b>                   | Select Columns Transformer |
| <b>needs_fitting</b>          | False                      |
| <b>training_only</b>          | False                      |

**Methods**

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.        |
| <i>default_parameters</i> | Returns the default parameters for this component.                           |
| <i>describe</i>           | Describe a component and its parameters.                                     |
| <i>fit</i>                | Fits the transformer by checking if column names are present in the dataset. |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                  |
| <i>load</i>               | Loads component at file path.                                                |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.          |
| <i>save</i>               | Saves component at file path.                                                |
| <i>transform</i>          | Transform data using fitted column selector component.                       |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                           |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if *return\_dict* is True, else None.

**Return type** None or dict

**fit**(*self*, *X*, *y=None*)

Fits the transformer by checking if column names are present in the dataset.

**Parameters**

- **X** (*pd.DataFrame*) – Data to check.
- **y** (*pd.Series*, *optional*) – Targets.

**Returns** *self*

**fit\_transform**(*self*, *X*, *y=None*)

Fits on X and transforms X.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform.

- **y** (*pd.Series*) – Target data.

**Returns** Transformed X.

**Return type** *pd.DataFrame*

**Raises** **MethodPropertyNotFoundError** – If transformer does not have a transform method or a *component\_obj* that implements transform.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** *ComponentBase* object

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transform data using fitted column selector component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [*n\_samples*, *n\_features*].
- **y** (*pd.Series*, *optional*) – The target training data of length [*n\_samples*].

**Returns** Transformed data.

**Return type** *pd.DataFrame*

**update\_parameters**(*self, update\_dict, reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** *evalml.pipelines.components.SimpleImputer*(*impute\_strategy='most\_frequent', fill\_value=None, random\_seed=0, \*\*kwargs*)

Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.

**Parameters**

- **impute\_strategy** (*string*) – Impute strategy to use. Valid values include “mean”, “median”, “most\_frequent”, “constant” for numerical data, and “most\_frequent”, “constant” for object data types.
- **fill\_value** (*string*) – When *impute\_strategy* == “constant”, *fill\_value* is used to replace missing data. Defaults to 0 when imputing numerical data and “missing\_value” for strings or object data types.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

### Attributes

|                               |                                                            |
|-------------------------------|------------------------------------------------------------|
| <b>hyper-parameter_ranges</b> | { "impute_strategy": ["mean", "median", "most_frequent"] } |
| <b>modifies_features</b>      | True                                                       |
| <b>modifies_target</b>        | False                                                      |
| <b>name</b>                   | Simple Imputer                                             |
| <b>training_only</b>          | False                                                      |

### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits imputer to data. 'None' values are converted to np.nan before imputation and are treated as the same.                       |
| <i>fit_transform</i>      | Fits on X and transforms X.                                                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transforms input by imputing missing values. 'None' and np.nan values are treated as the same.                                   |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

**Returns** Returns dictionary if `return_dict` is `True`, else `None`.

**Return type** `None` or `dict`

**fit**(*self*, *X*, *y=None*)

Fits imputer to data. 'None' values are converted to `np.nan` before imputation and are treated as the same.

**Parameters**

- **X** (*pd.DataFrame* or *np.ndarray*) – the input training data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *optional*) – the target training data of length `[n_samples]`

**Returns** `self`

**Raises** **ValueError** – if the `SimpleImputer` receives a dataframe with both Boolean and Categorical data.

**fit\_transform**(*self*, *X*, *y=None*)

Fits on *X* and transforms *X*.

**Parameters**

- **X** (*pd.DataFrame*) – Data to fit and transform
- **y** (*pd.Series*, *optional*) – Target data.

**Returns** Transformed *X*

**Return type** `pd.DataFrame`

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** `ComponentBase` object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

**Returns** `True`.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self*, *file\_path*, *pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self*, *X*, *y=None*)

Transforms input by imputing missing values. 'None' and `np.nan` values are treated as the same.

**Parameters**

- **X** (*pd.DataFrame*) – Data to transform.

- `y` (`pd.Series`, *optional*) – Ignored.

**Returns** Transformed X

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.StackedEnsembleBase`(*final\_estimator=None*, *n\_jobs=-1*, *random\_seed=0*, *\*\*kwargs*)

Stacked Ensemble Base Class.

**Parameters**

- **final\_estimator** (`Estimator` or *subclass*) – The estimator used to combine the base estimators.
- **n\_jobs** (*int* or *None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` greater than -1, (`n_cpus + 1 + n_jobs`) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of `n_jobs != 1`. If this is the case, please use `n_jobs = 1`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|                          |                      |
|--------------------------|----------------------|
| <b>model_family</b>      | ModelFamily.ENSEMBLE |
| <b>modifies_features</b> | True                 |
| <b>modifies_target</b>   | False                |
| <b>training_only</b>     | False                |

**Methods**

|                                       |                                                                                                                                  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                    | Constructs a new component with the same parameters and random state.                                                            |
| <code>default_parameters</code>       | Returns the default parameters for stacked ensemble classes.                                                                     |
| <code>describe</code>                 | Describe a component and its parameters.                                                                                         |
| <code>feature_importance</code>       | Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.                                                      |
| <code>fit</code>                      | Fits estimator to data.                                                                                                          |
| <code>get_prediction_intervals</code> | Find the prediction intervals using the fitted regressor.                                                                        |
| <code>load</code>                     | Loads component at file path.                                                                                                    |
| <code>name</code>                     | Returns string name of this component.                                                                                           |
| <code>needs_fitting</code>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <code>parameters</code>               | Returns the parameters which were used to initialize the component.                                                              |
| <code>predict</code>                  | Make predictions using selected features.                                                                                        |
| <code>predict_proba</code>            | Make probability estimates for labels.                                                                                           |
| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>supported_problem_types</code>  | Problem types this estimator supports.                                                                                           |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**property name**(*cls*)

Returns string name of this component.

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**property supported\_problem\_types**(*cls*)

Problem types this estimator supports.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.StackedEnsembleClassifier`(*final\_estimator*=*None*, *n\_jobs*=-1, *random\_seed*=0, *\*\*kwargs*)

Stacked Ensemble Classifier.

**Parameters**

- **final\_estimator** (*Estimator* or *subclass*) – The classifier used to combine the base estimators. If None, uses `ElasticNetClassifier`.
- **n\_jobs** (*int* or *None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` below -1, (`n_cpus + 1 + n_jobs`) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of `n_jobs` != 1. If this is the case, please use `n_jobs = 1`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.classifiers.decision_tree_
↳ classifier import DecisionTreeClassifier
>>> from evalml.pipelines.components.estimators.classifiers.elasticnet_classifier_
↳ import ElasticNetClassifier
...
>>> component_graph = {
...     "Decision Tree": [DecisionTreeClassifier(random_seed=3), "X", "y"],
...     "Decision Tree B": [DecisionTreeClassifier(random_seed=4), "X", "y"],
```

| <code>save</code>                     | Saves component at file path.                                                                                                    |
| <code>update_parameters</code>        | Updates the parameter dictionary of the component.                                                                               |

**clone(self)**

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters(cls)**

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe(self, print\_name=False, return\_dict=False)**

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance(self)**

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)**

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

#### Parameters

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.StackedEnsembleRegressor`(*final\_estimator*=*None*, *n\_jobs*=*-1*, *random\_seed*=*0*, *\*\*kwargs*)

Stacked Ensemble Regressor.

**Parameters**

- **final\_estimator** (*Estimator* or *subclass*) – The regressor used to combine the base estimators. If None, uses `ElasticNetRegressor`.
- **n\_jobs** (*int* or *None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` greater than -1, (`n_cpus + 1 + n_jobs`) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of `n_jobs` != 1. If this is the case, please use `n_jobs = 1`.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.regressors.rf_regressor import
↳ RandomForestRegressor
>>> from evalml.pipelines.components.estimators.regressors.elasticnet_regressor
↳ import ElasticNetRegressor
...
>>> component_graph = {
...     "Random Forest": [RandomForestRegressor(random_seed=3), "X", "y"],
...     "Random Forest B": [RandomForestRegressor(random_seed=4), "X", "y"],
...     "Stacked Ensemble": [
...         StackedEnsembleRegressor(n_jobs=1, final_
↳ estimator=RandomForestRegressor()),
```

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for stacked ensemble classes.

**Returns** default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises `MethodPropertyNotFoundError`** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** *file\_path* (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises `MethodPropertyNotFoundError`** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**StandardScaler**(*random\_seed=0, \*\*kwargs*)

A transformer that standardizes input features by removing the mean and scaling to unit variance.

**Parameters** **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the standard scalar on the given data.                                                                                      |
| <i>fit_transform</i>      | Fit and transform data using the standard scaler component.                                                                      |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted standard scaler.                                                                                 |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

**clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

**default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self, print\_name=False, return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool, optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**fit**(*self, X, y=None*)

Fits the standard scalar on the given data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**fit\_transform**(*self, X, y=None*)

Fit and transform data using the standard scaler component.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** pd.DataFrame

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**save**(*self, file\_path, pickle\_protocol=cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**transform**(*self, X, y=None*)

Transform data using the fitted standard scaler.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** Transformed data.

**Return type** `pd.DataFrame`

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

**class** `evalml.pipelines.components.STLDecomposer`(*time\_index: str = None*, *degree: int = 1*, *period: int = None*, *seasonal\_smoother: int = 7*, *random\_seed: int = 0*, *\*\*kwargs*)

Removes trends and seasonality from time series using the STL algorithm.

<https://www.statsmodels.org/dev/generated/statsmodels.tsa.seasonal.STL.html>

**Parameters**

- **time\_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **degree** (*int*) – Not currently used. STL 3x “degree-like” values. None are able to be set at this time. Defaults to 1.
- **period** (*int*) – The number of entries in the time series data that corresponds to one period of a cyclic signal. For instance, if data is known to possess a weekly seasonal signal, and if the data is daily data, the period should likely be 7. For daily data with a yearly seasonal signal, the period should likely be 365. If None, statsmodels will infer the period based on the frequency. Defaults to None.
- **seasonal\_smoother** (*int*) – The length of the seasonal smoother used by the underlying STL algorithm. For compatibility, must be odd. If an even number is provided, the next, highest odd number will be used. Defaults to 7.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

**Attributes**

|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>clone</code>                          | Constructs a new component with the same parameters and random state.                                              |
| <code>default_parameters</code>             | Returns the default parameters for this component.                                                                 |
| <code>describe</code>                       | Describe a component and its parameters.                                                                           |
| <code>determine_periodicity</code>          | Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal. |
| <code>fit</code>                            | Fits the STLDecomposer and determine the seasonal signal.                                                          |
| <code>fit_transform</code>                  | Removes fitted trend and seasonality from target variable.                                                         |
| <code>get_trend_dataframe</code>            | Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.                                  |
| <code>get_trend_prediction_intervals</code> | Calculate the prediction intervals for the trend data.                                                             |
| <code>inverse_transform</code>              | Adds back fitted trend and seasonality to target variable.                                                         |
| <code>is_freq_valid</code>                  | Determines if the given string represents a valid frequency for this decomposer.                                   |
| <code>load</code>                           | Loads component at file path.                                                                                      |
| <code>parameters</code>                     | Returns the parameters which were used to initialize the component.                                                |
| <code>plot_decomposition</code>             | Plots the decomposition of the target signal.                                                                      |
| <code>save</code>                           | Saves component at file path.                                                                                      |
| <code>set_period</code>                     | Function to set the component's seasonal period based on the target's seasonality.                                 |
| <code>transform</code>                      | Transforms the target data by removing the STL trend and seasonality.                                              |
| <code>update_parameters</code>              | Updates the parameter dictionary of the component.                                                                 |

#### `clone(self)`

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### `default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

#### `describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

##### Parameters

- **print\_name** (*bool, optional*) – whether to print name of component
- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if `return_dict` is True, else None.

**Return type** None or dict

**classmethod** `determine_periodicity`(*cls*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function that uses autocorrelative methods to determine the likely most significant period of the seasonal signal.

#### Parameters

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

#### Returns

**The integer number of entries in time series data over which the seasonal part of the target data repeats.** If the time series data is in days, then this is the number of days that it takes the target’s seasonal signal to repeat. Note: the target data can contain multiple seasonal signals. This function will only return the stronger. E.g. if the target has both weekly and yearly seasonality, the function may return either “7” or “365”, depending on which seasonality is more strongly autocorrelated. If no period is detected, returns None.

#### Return type

**fit**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → *STLDecomposer*

Fits the STLDecomposer and determine the seasonal signal.

Instantiates a statsmodels STL decompose object with the component’s stored parameters and fits it. Since the statsmodels object does not fit the sklearn api, it is not saved during `__init__()` in `_component_obj` and will be re-instantiated each time fit is called.

To emulate the sklearn API, when the STL decomposer is fit, the full seasonal component, a single period sample of the seasonal component, the full trend-cycle component and the residual are saved.

$$y(t) = S(t) + T(t) + R(t)$$

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

#### Raises

- **ValueError** – If y is None.
- **ValueError** – If target data doesn’t have DatetimeIndex AND no Datetime features in features data

**fit\_transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = None) → tuple[*pandas.DataFrame*, *pandas.Series*]

Removes fitted trend and seasonality from target variable.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Ignored.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

### Returns

**The first element are the input features returned without modification.** The second element is the target variable `y` with the fitted trend removed.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**get\_trend\_dataframe**(*self*, *X*, *y*)

Return a list of dataframes with 4 columns: signal, trend, seasonality, residual.

### Parameters

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.

### Returns

**Each DataFrame contains the columns “signal”, “trend”, “seasonality” and “residual,”** with the latter 3 column values being the decomposed elements of the target data. The “signal” column is simply the input target signal but reindexed with a datetime index to match the input features.

**Return type** list of `pd.DataFrame`

### Raises

- **TypeError** – If `X` does not have time-series data in the index.
- **ValueError** – If time series index of `X` does not have an inferred frequency.
- **ValueError** – If the forecaster associated with the detrender has not been fit yet.
- **TypeError** – If `y` is not provided as a pandas Series or DataFrame.

**get\_trend\_prediction\_intervals**(*self*, *y*, *coverage=None*)

Calculate the prediction intervals for the trend data.

### Parameters

- **y** (*pd.Series*) – Target data.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

**Returns** Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

**Return type** dict of `pd.Series`

**inverse\_transform**(*self*, *y\_t*: *pandas.Series*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Adds back fitted trend and seasonality to target variable.

The STL trend is projected to cover the entire requested target range, then added back into the signal. Then, the seasonality is projected forward to and added back into the signal.

**Parameters** **y\_t** (*pd.Series*) – Target variable.

### Returns

**The first element are the input features returned without modification.** The second element is the target variable `y` with the trend and seasonality added back in.

**Return type** tuple of `pd.DataFrame`, `pd.Series`

**Raises** **ValueError** – If `y` is `None`.

**classmethod** `is_freq_valid(cls, freq: str)`

Determines if the given string represents a valid frequency for this decomposer.

**Parameters** `freq (str)` – A frequency to validate. See the pandas docs at [https://pandas.pydata.org/pandas-docs/stable/user\\_guide/timeseries.html#offset-aliases](https://pandas.pydata.org/pandas-docs/stable/user_guide/timeseries.html#offset-aliases) for options.

**Returns** boolean representing whether the frequency is valid or not.

**static** `load(file_path)`

Loads component at file path.

**Parameters** `file_path (str)` – Location to load file.

**Returns** ComponentBase object

**property** `parameters(self)`

Returns the parameters which were used to initialize the component.

**plot\_decomposition**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *show*: *bool* = *False*) →  
tuple[matplotlib.pyplot.Figure, list]

Plots the decomposition of the target signal.

**Parameters**

- **X** (*pd.DataFrame*) – Input data with time series data in index.
- **y** (*pd.Series* or *pd.DataFrame*) – Target variable data provided as a Series for univariate problems or a DataFrame for multivariate problems.
- **show** (*bool*) – Whether to display the plot or not. Defaults to False.

**Returns**

The figure and axes that have the decompositions plotted on them

**Return type** matplotlib.pyplot.Figure, list[matplotlib.pyplot.Axes]

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**set\_period**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series*, *acf\_threshold*: *float* = 0.01, *rel\_max\_order*: *int* = 5)

Function to set the component's seasonal period based on the target's seasonality.

**Parameters**

- **X** (*pandas.DataFrame*) – The feature data of the time series problem.
- **y** (*pandas.Series*) – The target data of a time series problem.
- **acf\_threshold** (*float*) – The threshold for the autocorrelation function to determine the period. Any values below the threshold are considered to be 0 and will not be considered for the period. Defaults to 0.01.
- **rel\_max\_order** (*int*) – The order of the relative maximum to determine the period. Defaults to 5.

**transform**(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*) → tuple[*pandas.DataFrame*, *pandas.Series*]

Transforms the target data by removing the STL trend and seasonality.

Uses an ARIMA model to project forward the additive trend and removes it. Then, utilizes the first period's worth of seasonal data determined in the .fit() function to extrapolate the seasonal signal of the data to be transformed. This seasonal signal is also assumed to be additive and is removed.

#### Parameters

- **X** (*pd.DataFrame*, *optional*) – Conditionally used to build datetime index.
- **y** (*pd.Series*) – Target variable to detrend and deseasonalize.

#### Returns

The input features are returned without modification. The target variable *y* is detrended and deseasonalized.

**Return type** tuple of *pd.DataFrame*, *pd.Series*

**Raises ValueError** – If target data doesn't have *DatetimeIndex* AND no *Datetime* features in features data

**update\_parameters**(*self*, *update\_dict*, *reset\_fit=True*)

Updates the parameter dictionary of the component.

#### Parameters

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**SVMClassifier**(*C=1.0*, *kernel='rbf'*, *gamma='auto'*, *probability=True*, *random\_seed=0*, *\*\*kwargs*)

Support Vector Machine Classifier.

#### Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** ({*"poly"*, *"rbf"*, *"sigmoid"*}) – Specifies the kernel type to be used in the algorithm. Defaults to *"rbf"*.
- **gamma** ({*"scale"*, *"auto"*} or *float*) – Kernel coefficient for *"rbf"*, *"poly"* and *"sigmoid"*. Defaults to *"auto"*. - If *gamma='scale'* is passed then it uses  $1 / (n\_features * X.var())$  as value of gamma - If *"auto"* (default), uses  $1 / n\_features$
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

## Methods

|                                 |                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>                    | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i>       | Returns the default parameters for this component.                                                                               |
| <i>describe</i>                 | Describe a component and its parameters.                                                                                         |
| <i>feature_importance</i>       | Feature importance only works with linear kernels.                                                                               |
| <i>fit</i>                      | Fits estimator to data.                                                                                                          |
| <i>get_prediction_intervals</i> | Find the prediction intervals using the fitted regressor.                                                                        |
| <i>load</i>                     | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>            | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>               | Returns the parameters which were used to initialize the component.                                                              |
| <i>predict</i>                  | Make predictions using selected features.                                                                                        |
| <i>predict_proba</i>            | Make probability estimates for labels.                                                                                           |
| <i>save</i>                     | Saves component at file path.                                                                                                    |
| <i>update_parameters</i>        | Updates the parameter dictionary of the component.                                                                               |

### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

### **describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component

- **return\_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

**Returns** Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

**fit**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series, optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** *X* (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** *X* (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**SVMRegressor**(*C*=*1.0*, *kernel*=*'rbf'*, *gamma*=*'auto'*, *random\_seed*=*0*,  
\*\**kwargs*)

Support Vector Machine Regressor.

**Parameters**

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** ({*"poly"*, *"rbf"*, *"sigmoid"*}) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.

- **gamma** (*{"scale", "auto"} or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses  $1 / (n\_features * X.var())$  as value of gamma - If “auto” (default), uses  $1 / n\_features$
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.

#### **default\_parameters**(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

**Returns** Default parameters for this component.

**Return type** dict

**describe**(*self*, *print\_name=False*, *return\_dict=False*)

Describe a component and its parameters.

**Parameters**

- **print\_name** (*bool*, *optional*) – whether to print name of component
- **return\_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

**Returns** Returns dictionary if return\_dict is True, else None.

**Return type** None or dict

**property feature\_importance**(*self*)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

**Returns** The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

**fit**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

**Parameters**

- **X** (*pd.DataFrame*) – The input training data of shape [n\_samples, n\_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n\_samples].

**Returns** self

**get\_prediction\_intervals**(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

**Parameters**

- **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

**Returns** Prediction intervals, keys are in the format {coverage}\_lower or {coverage}\_upper.

**Return type** dict

**Raises** **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

**static load**(*file\_path*)

Loads component at file path.

**Parameters** **file\_path** (*str*) – Location to load file.

**Returns** ComponentBase object

**needs\_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict\_proba, transform, or feature\_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

**Returns** True.

**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

**predict**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

**Parameters** **X** (*pd.DataFrame*) – Data of shape [n\_samples, n\_features].

**Returns** Predicted values.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component\_obj that implements predict.

**predict\_proba**(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

**Parameters** **X** (*pd.DataFrame*) – Features.

**Returns** Probability estimates.

**Return type** *pd.Series*

**Raises** **MethodPropertyNotFoundError** – If estimator does not have a predict\_proba method or a component\_obj that implements predict\_proba.

**save**(*self*, *file\_path*, *pickle\_protocol*=*cloudpickle.DEFAULT\_PROTOCOL*)

Saves component at file path.

**Parameters**

- **file\_path** (*str*) – Location to save file.
- **pickle\_protocol** (*int*) – The pickle data stream format.

**update\_parameters**(*self*, *update\_dict*, *reset\_fit*=*True*)

Updates the parameter dictionary of the component.

**Parameters**

- **update\_dict** (*dict*) – A dict of parameters to update.
- **reset\_fit** (*bool*, *optional*) – If True, will set *\_is\_fitted* to False.

**class** evalml.pipelines.components.**TargetEncoder**(*cols*=*None*, *smoothing*=*1*, *handle\_unknown*='value', *handle\_missing*='value', *random\_seed*=*0*, *\*\*kwargs*)

A transformer that encodes categorical features into target encodings.

**Parameters**

- **cols** (*list*) – Columns to encode. If None, all string columns will be encoded, otherwise only the columns provided will be encoded. Defaults to None
- **smoothing** (*float*) – The smoothing factor to apply. The larger this value is, the more influence the expected target value has on the resulting target encodings. Must be strictly larger than 0. Defaults to 1.0
- **handle\_unknown** (*string*) – Determines how to handle unknown categories for a feature encountered. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **handle\_missing** (*string*) – Determines how to handle missing values encountered during *fit* or *transform*. Options are ‘value’, ‘error’, and ‘return\_nan’. Defaults to ‘value’, which replaces with the target mean
- **random\_seed** (*int*) – Seed for the random number generator. Defaults to 0.

| <b>train-only</b>             | False          |

#### Methods

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>clone</i>              | Constructs a new component with the same parameters and random state.                                                            |
| <i>default_parameters</i> | Returns the default parameters for this component.                                                                               |
| <i>describe</i>           | Describe a component and its parameters.                                                                                         |
| <i>fit</i>                | Fits the target encoder.                                                                                                         |
| <i>fit_transform</i>      | Fit and transform data using the target encoder.                                                                                 |
| <i>get_feature_names</i>  | Return feature names for the input features after fitting.                                                                       |
| <i>load</i>               | Loads component at file path.                                                                                                    |
| <i>needs_fitting</i>      | Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances. |
| <i>parameters</i>         | Returns the parameters which were used to initialize the component.                                                              |
| <i>save</i>               | Saves component at file path.                                                                                                    |
| <i>transform</i>          | Transform data using the fitted target encoder.                                                                                  |
| <i>update_parameters</i>  | Updates the parameter dictionary of the component.                                                                               |

#### **clone**(*self*)

Constructs a new component with the same parameters and random state.

**Returns** A new instance of this component with identical parameters and random state.
