	Index	2087

EvalML is an AutoML library that builds, optimizes, and evaluates machine learning pipelines using domain-specific objective functions.

Combined with [Featuretools](#) and [Compose](#), EvalML can be used to create end-to-end supervised machine learning solutions.

INSTALL

EvalML is available for Python 3.8 and 3.9. It can be installed from [pypi](#), [conda-forge](#), or from [source](#).

To install EvalML on your platform, run one of the following commands:

```
$ pip install evalml
```

```
$ conda install -c conda-forge evalml
```

```
# See the EvalML with core dependencies only section
$ pip install evalml --no-dependencies
$ pip install -r core-requirements.txt
```

```
# See the EvalML with core dependencies only section
$ conda install -c conda-forge evalml-core
```

1.1 EvalML with core dependencies only

EvalML includes several optional dependencies. The `xgboost` and `catboost` packages support pipelines built around those modeling libraries. The `plotly` and `ipywidgets` packages support plotting functionality in `automl` searches. These dependencies are recommended, and are included with EvalML by default but are not required in order to install and use EvalML.

EvalML's core dependencies are listed in `core-requirements.txt` in the source code, while the default collection of requirements is specified in `pyproject.toml`'s dependencies.

To install EvalML with only the core-required dependencies with pypi, first download the EvalML source [from pypi](#) or [github](#) to access the requirements files before running the following command.

```
$ pip install evalml --no-dependencies
$ pip install -r core-requirements.txt
```

```
$ conda install -c conda-forge evalml-core
```

1.2 Add-ons

EvalML allows users to install add-ons individually or all at once:

- **Update Checker:** Receive automatic notifications of new EvalML releases
- **Time Series:** Use EvalML with Facebook’s Prophet library for time series support.

```
$ pip install evalml[complete]
```

```
$ pip install evalml[prophet]
```

```
$ pip install evalml[updater]
```

```
$ conda install -c conda-forge alteryx-open-src-update-checker
```

1.3 Time Series support with Facebook’s Prophet

To support the Prophet time series estimator, be sure to install it as an extra requirement. Please note that this may take a few minutes.

```
pip install evalml[prophet]
```

Another option for installing Prophet with CmdStan as a backend is to use `make installdeps-prophet`.

1.4 Windows Additional Requirements & Troubleshooting

If you are using `pip` to install EvalML on Windows, it is recommended you first install the following packages using `conda`:

- `numba` (needed for `shap` and prediction explanations). Install with `conda install -c conda-forge numba`
- `graphviz` if you’re using EvalML’s plotting utilities. Install with `conda install -c conda-forge python-graphviz`

The `XGBoost` library may not be `pip`-installable in some Windows environments. If you are encountering installation issues, please try installing XGBoost from [Github](#) before installing EvalML or install `evalml` with `conda`.

1.5 Mac Additional Requirements & Troubleshooting

In order to run on Mac, `LightGBM` requires the `OpenMP` library to be installed, which can be done with `HomeBrew` by running:

```
brew install libomp
```

Additionally, `graphviz` can be installed by running:

```
brew install graphviz
```

1.5.1 Installing EvalML on an M1 Mac

Not all of EvalML's dependencies support Apple's new M1 chip. For this reason, `pip` or `conda` installing EvalML will fail. The core set of EvalML dependencies can be installed in the M1 chip, so we recommend you install EvalML with core dependencies.

Alternatively, there is experimental support for M1 chips with the Rosetta terminal. After setting up a Rosetta terminal, you should be able to `pip` or `conda` install EvalML.

For Docker fans, an included `Dockerfile.arm` can be built and run to provide an environment for testing. Details are included within.

START

In this guide, we'll show how you can use EvalML to automatically find the best pipeline for predicting whether or not a credit card transaction is fraudulent. Along the way, we'll highlight EvalML's built-in tools and features for understanding and interacting with the search process.

```
[1]: import evalml
      from evalml import AutoMLSearch
      from evalml.utils import infer_feature_types
```

First, we load in the features and outcomes we want to use to train our model.

```
[2]: X, y = evalml.demos.load_fraud(n_rows=250)
```

```

      Number of Features
Boolean                               1
Categorical                           6
Numeric                               5

Number of training examples: 250
Targets
False    88.40%
True     11.60%
Name: count, dtype: object
```

First, we will clean the data. Since EvalML accepts a pandas input, it can run type inference on this data directly. Since we'd like to change the types inferred by EvalML, we can use the `infer_feature_types` utility method. Here's what we're going to do with the following dataset:

- Reformat the `expiration_date` column so it reflects a more familiar date format.
- Cast the `lat` and `lng` columns from float to str.
- Use `infer_feature_types` to specify what types certain columns should be. For example, to avoid having the `provider` column be inferred as natural language text, we have specified it as a categorical column instead.

The `infer_feature_types` utility method takes a pandas or numpy input and converts it to a pandas dataframe with a `Woodwork` accessor, providing us with flexibility to cast the data as necessary.

```
[3]: X.ww["expiration_date"] = X["expiration_date"].apply(
      lambda x: "20{}-01-{}".format(x.split("/")[1], x.split("/")[0])
    )
X = infer_feature_types(
    X,
    feature_types={
```

(continues on next page)

(continued from previous page)

```

        "store_id": "categorical",
        "expiration_date": "datetime",
        "lat": "categorical",
        "lng": "categorical",
        "provider": "categorical",
    },
)
X.ww

```

[3]:

	Physical Type	Logical Type	Semantic Tag(s)
Column			
card_id	int64	Integer	['numeric']
store_id	int64	Integer	['numeric']
datetime	datetime64[ns]	Datetime	[]
amount	int64	Integer	['numeric']
currency	string	Unknown	[]
customer_present	bool	Boolean	[]
expiration_date	datetime64[ns]	Datetime	[]
provider	category	Categorical	['category']
lat	float64	Double	['numeric']
lng	float64	Double	['numeric']
region	category	Categorical	['category']
country	category	Categorical	['category']

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

```

[4]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
      X, y, problem_type="binary", test_size=0.2
    )

```

Note: To provide data to EvalML, it is recommended that you initialize a woodwork accessor so that you control how EvalML will treat each feature, such as as a numeric feature, a categorical feature, a text feature or other type of feature. Consult the [the Woodwork project](#) for help on how to do this. Here, `split_data()` returns dataframes with woodwork accessors.

EvalML has many options to configure the pipeline search. At the minimum, we need to define an objective function. For simplicity, we will use the F1 score in this example. However, the real power of EvalML is in using domain-specific *objective functions* or *building your own*.

Below EvalML utilizes Bayesian optimization (EvalML's default optimizer) to search and find the best pipeline defined by the given objective.

EvalML provides a number of parameters to control the search process. `max_batches` is one of the parameters which controls the stopping criterion for the AutoML search. It indicates the maximum number of rounds of AutoML to evaluate, where each round may train and score a variable number of pipelines. In this example, `max_batches` is set to 1.

** Graphing methods, like AutoMLSearch, on Jupyter Notebook and Jupyter Lab require [ipywidgets](#) to be installed.

** If graphing on Jupyter Lab, [jupyterlab-plotly](#) required. To download this, make sure you have [npm](#) installed.

```

[5]: automl = AutoMLSearch(
      X_train=X_train,
      y_train=y_train,

```

(continues on next page)

(continued from previous page)

```

problem_type="binary",
objective="f1",
max_batches=2,
verbose=True,
)

```

AutoMLSearch will use mean CV score to rank pipelines.
 Removing columns ['currency'] because they are of 'Unknown' type

When we call `search()`, the search for the best pipeline will begin. There is no need to wrangle with missing data or categorical variables as EvalML includes various preprocessing steps (like imputation, one-hot encoding, feature selection) to ensure you're getting the best results. As long as your data is in a single table, EvalML can handle it. If not, you can reduce your data to a single table by utilizing [Featuretools](#) and its Entity Sets.

You can find more information on pipeline components and how to integrate your own custom pipelines into EvalML [here](#).

[6]: `automl.search(interactive_plot=False)`

```

*****
* Beginning pipeline search *
*****

```

```

Optimizing for F1.
Greater score is better.

```

```

Using SequentialEngine to train and score pipelines.
Searching up to 2 batches for a total of None pipelines.

```

If you would like to suppress stdout output, set `verbose=False`. This is also the default behavior for `AutoMLSearch` if `verbose` is not specified.

Also, if you would like to see the interactive plot update dynamically over time as the search progresses, either remove the parameter or set `interactive_plot=True`. This is the default setting for `search()` if `interactive_plot` is not specified (it is set to `False` here due to documentation workaround).

```
[7]: automl = AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="binary",
    objective="f1",
    max_batches=2,
    verbose=False,
)
automl.search()

```

We also provide a standalone search *method* which does all of the above in a single line, and returns the `AutoMLSearch`

instance and data check results. If there were data check errors, AutoML will not be run and no `AutoMLSearch` instance will be returned.

After the search is finished we can view all of the pipelines searched, ranked by score. Internally, EvalML performs cross validation to score the pipelines. If it notices a high variance across cross validation folds, it will warn you. EvalML also provides additional *data checks* to analyze your data to assist you in producing the best performing pipeline.

Training

=====

Training for binary problems.

Objective to optimize binary classification pipeline thresholds for: <evalml.objectives.

→ standard_metrics.F1 object at 0x7f559079d1f0>

Total training time (including CV): 3.7 seconds

Cross Validation

	F1	MCC Binary	Log Loss Binary	Gini	AUC	Precision	Balanced Accuracy
→ Binary Accuracy	Binary #	Training #	Validation #				
0	0.462	0.421		0.342	0.394	0.697	0.600
→ 0.671		0.896	133	67			
1	0.333	0.296		0.341	0.352	0.676	0.500
→ 0.608		0.881	133	67			
2	0.333	0.273		0.355	0.361	0.680	0.400
→ 0.617		0.879	134	66			
mean	0.376	0.330		0.346	0.369	0.684	0.500
→ 0.632		0.885	-	-			
std	0.074	0.080		0.008	0.022	0.011	0.100
→ 0.034		0.009	-	-			
coef of var	0.197	0.241		0.023	0.060	0.016	0.200
→ 0.053		0.010	-	-			

We can also view the pipeline parameters directly:

```
[10]: pipeline = automl.get_pipeline(3)
print(pipeline.parameters)
```

```

{'Label Encoder': {'positive_label': None}, 'Numeric Pipeline - Select Columns By Type
→ Transformer': {'column_types': ['category', 'EmailAddress', 'URL'], 'exclude': True},
→ 'Numeric Pipeline - Label Encoder': {'positive_label': None}, 'Numeric Pipeline - Drop

(continued from previous page)

We can now select the best pipeline and score it on our holdout data:

```
[11]: pipeline = automl.best_pipeline
      pipeline.score(X_holdout, y_holdout, ["f1"])
[11]: OrderedDict([('F1', 0.6666666666666666)])
```

We can also visualize the structure of the components contained by the pipeline:

```
[12]: pipeline.graph()
[12]:
```

TUTORIALS

Below are examples of how to apply EvalML to a variety of problems:

3.1 Building a Fraud Prediction Model with EvalML

In this demo, we will build an optimized fraud prediction model using EvalML. To optimize the pipeline, we will set up an objective function to minimize the percentage of total transaction value lost to fraud. At the end of this demo, we also show you how introducing the right objective during the training results in a much better than using a generic machine learning metric like AUC.

```
[1]: import evalml
      from evalml import AutoMLSearch
      from evalml.objectives import FraudCost
```

3.1.1 Configure “Cost of Fraud”

To optimize the pipelines toward the specific business needs of this model, we can set our own assumptions for the cost of fraud. These parameters are

- `retry_percentage` - what percentage of customers will retry a transaction if it is declined?
- `interchange_fee` - how much of each successful transaction do you collect?
- `fraud_payout_percentage` - the percentage of fraud will you be unable to collect
- `amount_col` - the column in the data the represents the transaction amount

Using these parameters, EvalML determines attempt to build a pipeline that will minimize the financial loss due to fraud.

```
[2]: fraud_objective = FraudCost(
      retry_percentage=0.5,
      interchange_fee=0.02,
      fraud_payout_percentage=0.75,
      amount_col="amount",
      )
```

3.1.2 Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as the holdout set.

```
[3]: X, y = evalml.demos.load_fraud(n_rows=5000)
```

```

                Number of Features
Boolean                      1
Categorical                   6
Numeric                       5

Number of training examples: 5000
Targets
False    86.20%
True     13.80%
Name: count, dtype: object

```

EvalML natively supports one-hot encoding. Here we keep 1 out of the 6 categorical columns to decrease computation time.

```
[4]: cols_to_drop = ["datetime", "expiration_date", "country", "region", "provider"]
    for col in cols_to_drop:
        X.ww.pop(col)
```

```

X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
    X, y, problem_type="binary", test_size=0.2, random_seed=0
)

```

```
X.ww
```

```
[4]:
```

	Physical Type	Logical Type	Semantic Tag(s)
Column			
card_id	int64	Integer	['numeric']
store_id	int64	Integer	['numeric']
amount	int64	Integer	['numeric']
currency	category	Categorical	['category']
customer_present	bool	Boolean	[]
lat	float64	Double	['numeric']
lng	float64	Double	['numeric']

Because the fraud labels are binary, we will use `AutoMLSearch(X_train=X_train, y_train=y_train, problem_type='binary')`. When we call `.search()`, the search for the best pipeline will begin.

```
[5]: automl = AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="binary",
    objective=fraud_objective,
    additional_objectives=["auc", "f1", "precision"],
    allowed_model_families=["random_forest", "linear_model"],
    max_batches=1,
    optimize_thresholds=True,
    verbose=True,
)
```

(continues on next page)

(continued from previous page)

```
automl.search(interactive_plot=False)
```

AutoMLSearch will use mean CV score to rank pipelines.

```

```

View rankings and select pipelines

Once the fitting process is done, we can see all of the pipelines that were searched, ranked by their score on the fraud detection objective we defined.

```
[6]: automl.rankings
[6]:
```

	id	pipeline_name	search_order	\
0	1	Random Forest Classifier w/ Label Encoder + Im...	1	
1	0	Mode Baseline Binary Classification Pipeline	0	

	ranking_score	mean_cv_score	standard_deviation_cv_score	\
0	0.008649	0.008649	0.000789	
1	0.789648	0.789648	0.001136	

	percent_better_than_baseline	high_variance_cv	\
0	78.099995	False	
1	0.000000	False	

	parameters
0	{'Label Encoder': {'positive_label': None}, 'I...
1	{'Label Encoder': {'positive_label': None}, 'B...

To select the best pipeline we can call `automl.best_pipeline`.

```
[7]: best_pipeline = automl.best_pipeline
```

Describe pipelines

We can get more details about any pipeline created during the search process, including how it performed on other objective functions, by calling the `describe_pipeline` method and passing the id of the pipeline of interest.

```
[8]: automl.describe_pipeline(automl.rankings.iloc[1]["id"])

*****

3.1.3 Evaluate on holdout data

Finally, since the best pipeline is already trained, we evaluate it on the holdout data.

Now, we can score the pipeline on the holdout data using both our fraud cost objective and the AUC (Area under the ROC Curve) objective.

```
[9]: best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])
```

```
[9]: OrderedDict([('AUC', 0.8673290964726453),
                  ('Fraud Cost', 0.008257252890414273)])
```

3.1.4 Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the fraud cost objective to see how the best pipelines compare.

```
[10]: automl_auc = AutoMLSearch(
        X_train=X_train,
        y_train=y_train,
        problem_type="binary",
        objective="auc",
        additional_objectives=["f1", "precision"],
        max_batches=1,
        allowed_model_families=["random_forest", "linear_model"],
        optimize_thresholds=True,
        verbose=True,
    )
```

```
automl_auc.search(interactive_plot=False)
```

AutoMLSearch will use mean CV score to rank pipelines.

```

   percent_better_than_baseline  high_variance_cv \
0                        35.20905                False
1                        0.00000                False

                                parameters
0  {'Label Encoder': {'positive_label': None}, 'I...
1  {'Label Encoder': {'positive_label': None}, 'B...
```

```
[12]: best_pipeline_auc = automl_auc.best_pipeline

[13]: # get the fraud score on holdout data
best_pipeline_auc.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])

[13]: OrderedDict([('AUC', 0.8673290964726453),
                  ('Fraud Cost', 0.025729330840169453)])

[14]: # fraud score on fraud optimized again
best_pipeline.score(X_holdout, y_holdout, objectives=["auc", fraud_objective])

[14]: OrderedDict([('AUC', 0.8673290964726453),
                  ('Fraud Cost', 0.008257252890414273)])
```

When we optimize for AUC, we can see that the AUC score from this pipeline performs better compared to the AUC score from the pipeline optimized for fraud cost; however, the losses due to fraud are a much larger percentage of the total transaction amount when optimized for AUC and much smaller when optimized for fraud cost. As a result, we lose a noticeable percentage of the total transaction amount by not optimizing for fraud cost specifically.

Optimizing for AUC does not take into account the user-specified `retry_percentage`, `interchange_fee`, `fraud_payout_percentage` values, which could explain the decrease in fraud performance. Thus, the best pipelines may produce the highest AUC but may not actually reduce the amount loss due to your specific type fraud.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

3.2 Building a Lead Scoring Model with EvalML

In this demo, we will build an optimized lead scoring model using EvalML. To optimize the pipeline, we will set up an objective function to maximize the revenue generated with true positives while taking into account the cost of false positives. At the end of this demo, we also show you how introducing the right objective during the training is significantly better than using a generic machine learning metric like AUC.

```
[1]: import evalml
from evalml import AutoMLSearch
from evalml.objectives import LeadScoring
```

3.2.1 Configure LeadScoring

To optimize the pipelines toward the specific business needs of this model, you can set your own assumptions for how much value is gained through true positives and the cost associated with false positives. These parameters are

- `true_positive` - dollar amount to be gained with a successful lead
- `false_positive` - dollar amount to be lost with an unsuccessful lead

Using these parameters, EvalML builds a pipeline that will maximize the amount of revenue per lead generated.

```
[2]: lead_scoring_objective = LeadScoring(true_positives=100, false_positives=-5)
```

3.2.2 Dataset

We will be utilizing a dataset detailing a customer's job, country, state, zip, online action, the dollar amount of that action and whether they were a successful lead.

```
[3]: from urllib.request import urlopen
import pandas as pd
import woodwork as ww

customers_data = urlopen(
    "https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_apps/customers.csv"
)
interactions_data = urlopen(
    "https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_apps/interactions.csv"
)
leads_data = urlopen(
    "https://featurelabs-static.s3.amazonaws.com/lead_scoring_ml_apps/previous_leads.csv"
)
customers = pd.read_csv(customers_data)
interactions = pd.read_csv(interactions_data)
leads = pd.read_csv(leads_data)

X = customers.merge(interactions, on="customer_id").merge(leads, on="customer_id")
y = X["label"]
X = X.drop(
    [
        "customer_id",
        "date_registered",
        "birthday",
        "phone",
        "email",
        "owner",
        "company",
        "id",
        "time_x",
        "session",
        "referrer",
        "time_y",
        "label",
        "country",
    ],
    axis=1,
)
display(X.head())
```

	job	state	zip	action	amount
0	Engineer, mining	NY	60091.0	page_view	NaN
1	Psychologist, forensic	CA	NaN	purchase	135.23
2	Psychologist, forensic	CA	NaN	page_view	NaN
3	Air cabin crew	NaN	60091.0	download	NaN
4	Air cabin crew	NaN	60091.0	page_view	NaN

We will convert our data into Woodwork data structures. Doing so enables us to have more control over the types passed to and inferred by AutoML.

```
[4]: X.ww.init(semantic_tags={"job": "category"}, logical_types={"job": "Categorical"})
      y = ww.init_series(y)
      X.ww
```

```
[4]:
```

	Physical Type	Logical Type	Semantic Tag(s)
Column			
job	category	Categorical	['category']
state	category	Categorical	['category']
zip	Int64	IntegerNullable	['numeric']
action	category	Categorical	['category']
amount	float64	Double	['numeric']

3.2.3 Search for the best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

EvalML natively supports one-hot encoding and imputation so the above NaN and categorical values will be taken care of.

```
[5]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
      X, y, problem_type="binary", test_size=0.2, random_seed=0
    )

X.ww
```

```
[5]:
```

	Physical Type	Logical Type	Semantic Tag(s)
Column			
job	category	Categorical	['category']
state	category	Categorical	['category']
zip	Int64	IntegerNullable	['numeric']
action	category	Categorical	['category']
amount	float64	Double	['numeric']

Because the lead scoring labels are binary, we will use set the problem type to “binary”. When we call `.search()`, the search for the best pipeline will begin.

```
[6]: automl = AutoMLSearch(
      X_train=X_train,
      y_train=y_train,
      problem_type="binary",
      objective=lead_scoring_objective,
      additional_objectives=["auc"],
      allowed_model_families=["extra_trees", "linear_model"],
      max_batches=2,
      verbose=True,
    )

automl.search(interactive_plot=False)

AutoMLSearch will use mean CV score to rank pipelines.

Training
=====
Training for binary problems.
Objective to optimize binary classification pipeline thresholds for: <evalml.objectives.
↳ lead_scoring.LeadScoring object at 0x7f2f066f95b0>
Total training time (including CV): 4.4 seconds

Cross Validation
-----

```

	Lead Scoring	AUC	# Training	# Validation
0	2.032	0.700	3,099	1,550
1	0.923	0.593	3,099	1,550
2	1.127	0.643	3,100	1,549
mean	1.360	0.646	-	-
std	0.591	0.053	-	-
coef of var	0.434	0.083	-	-

3.2.4 Evaluate on hold out

Finally, since the best pipeline was trained on all of the training data, we evaluate it on the holdout dataset.

```

[10]: best_pipeline_score = best_pipeline.score(
      X_holdout, y_holdout, objectives=["auc", lead_scoring_objective]
    )
      best_pipeline_score

[10]: OrderedDict([('AUC', 0.6425506195225144),
                  ('Lead Scoring', 1.5219260533104042)])

```

3.2.5 Why optimize for a problem-specific objective?

To demonstrate the importance of optimizing for the right objective, let's search for another pipeline using AUC, a common machine learning metric. After that, we will score the holdout data using the lead scoring objective to see how the best pipelines compare.

```

[11]: automl_auc = evalml.AutoMLSearch(
      X_train=X_train,
      y_train=y_train,
      problem_type="binary",
      objective="auc",
      additional_objectives=[lead_scoring_objective],
      allowed_model_families=["extra_trees", "linear_model"],

```

(continues on next page)

(continued from previous page)

```

    max_batches=2,
    verbose=True,
)

automl_auc.search(interactive_plot=False)

```

AutoMLSearch will use mean CV score to rank pipelines.

```

Like before, we can look at the rankings and pick the best pipeline.

```
[13]: best_pipeline_auc = automl_auc.best_pipeline
```

```
[14]: # get the AUC and lead scoring score on holdout data
best_pipeline_auc_score = best_pipeline_auc.score(
    X_holdout, y_holdout, objectives=["auc", lead_scoring_objective]
)
best_pipeline_auc_score
```

```
[14]: OrderedDict([('AUC', 0.6407071622846781),
                  ('Lead Scoring', 0.21066208082545143)])
```

```
[15]: assert best_pipeline_score["Lead Scoring"] >= best_pipeline_auc_score["Lead Scoring"]
assert best_pipeline_auc_score["Lead Scoring"] >= 0
```

When we optimize for AUC, we can see that the AUC score from this pipeline is similar to the AUC score from the pipeline optimized for lead scoring. However, the revenue per lead is much smaller per lead when optimized for AUC and was much larger when optimized for lead scoring. As a result, we would have a huge gain on the amount of revenue if we optimized for lead scoring.

This happens because optimizing for AUC does not take into account the user-specified `true_positive` (dollar amount to be gained with a successful lead) and `false_positive` (dollar amount to be lost with an unsuccessful lead) values. Thus, the best pipelines may produce the highest AUC but may not actually generate the most revenue through lead scoring.

This example highlights how performance in the real world can diverge greatly from machine learning metrics.

3.3 Using the Cost-Benefit Matrix Objective

The Cost-Benefit Matrix (`CostBenefitMatrix`) objective is an objective that assigns costs to each of the quadrants of a confusion matrix to quantify the cost of being correct or incorrect.

3.3.1 Confusion Matrix

[Confusion matrices](#) are tables that summarize the number of correct and incorrectly-classified predictions, broken down by each class. They allow us to quickly understand the performance of a classification model and where the model gets “confused” when it is making predictions. For the binary classification problem, there are four possible combinations of prediction and actual target values possible:

- true positives (correct positive assignments)
- true negatives (correct negative assignments)
- false positives (incorrect positive assignments)
- false negatives (incorrect negative assignments)

An example of how to calculate a confusion matrix can be found [here](#).

3.3.2 Cost-Benefit Matrix

Although the confusion matrix is an incredibly useful visual for understanding our model, each prediction that is correctly or incorrectly classified is treated equally. For example, for detecting breast cancer, the confusion matrix does not take into consideration that it could be much more costly to incorrectly classify a malignant tumor as benign than it is to incorrectly classify a benign tumor as malignant. This is where the cost-benefit matrix shines: it uses the cost of each of the four possible outcomes to weigh each outcome differently. By scoring using the cost-benefit matrix, we can measure the score of the model by a concrete unit that is more closely related to the goal of the model. In the below example, we will show how the cost-benefit matrix objective can be used, and how it can give us better real-world impact when compared to using other standard machine learning objectives.

3.3.3 Customer Churn Example

Data

In this example, we will be using a customer churn data set taken from [Kaggle](#).

This dataset includes records of over 7000 customers, and includes customer account information, demographic information, services they signed up for, and whether or not the customer “churned” or left within the last month.

The target we want to predict is whether the customer churned (“Yes”) or did not churn (“No”). In the dataset, approximately 73.5% of customers did not churn, and 26.5% did. We will refer to the customers who churned as the “positive” class and the customers who did not churn as the “negative” class.

```
[1]: from evalml.demos.churn import load_churn
from evalml.preprocessing import split_data

X, y = load_churn()
X.ww.set_types(
    {"PaymentMethod": "Categorical", "Contract": "Categorical"}
) # Update data types Woodwork did not correctly infer
X_train, X_holdout, y_train, y_holdout = split_data(
    X, y, problem_type="binary", test_size=0.3, random_seed=0
)
```

```

                Number of Features
Categorical                16
Numeric                    3

Number of training examples: 7043
Targets
No      73.46%
Yes     26.54%
Name: count, dtype: object
```

In this example, let’s say that correctly identifying customers who will churn (true positive case) will give us a net profit of \$400, because it allows us to intervene, incentivize the customer to stay, and sign a new contract. Incorrectly classifying customers who were not going to churn as customers who will churn (false positive case) will cost \$100 to represent the marketing and effort used to try to retain the user. Not identifying customers who will churn (false negative case) will cost us \$200 to represent the lost in revenue from losing a customer. Finally, correctly identifying customers who will not churn (true negative case) will not cost us anything (\$0), as nothing needs to be done for that customer.

We can represent these values in our `CostBenefitMatrix` objective, where a negative value represents a cost and a positive value represents a profit—note that this means that the greater the score, the more profit we will make.

```
[2]: from evalml.objectives import CostBenefitMatrix

cost_benefit_matrix = CostBenefitMatrix(
    true_positive=400, true_negative=0, false_positive=-100, false_negative=-200
)
```

AutoML Search with Log Loss

First, let us run AutoML search to train pipelines using the default objective for binary classification (log loss).

```
[3]: from evalml import AutoMLSearch

automl = AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="binary",
    objective="log loss binary",
    max_iterations=5,
    verbose=True,
)
automl.search(interactive_plot=False)

ll_pipeline = automl.best_pipeline
ll_pipeline.score(X_holdout, y_holdout, ["log loss binary"])
```

AutoMLSearch will use mean CV score to rank pipelines.

[3]: OrderedDict([('Log Loss Binary', 0.4180258787635931)])
```

When we train our pipelines using log loss as our primary objective, we try to find pipelines that minimize log loss. However, our ultimate goal in training models is to find a model that gives us the most profit, so let's score our pipeline on the cost benefit matrix (using the costs outlined above) to determine the profit we would earn from the predictions made by this model:

```
[4]: ll_pipeline_score = ll_pipeline.score(X_holdout, y_holdout, [cost_benefit_matrix])
print(ll_pipeline_score)

OrderedDict([('Cost Benefit Matrix', 31.187884524372926)])
```

```
[5]: # Calculate total profit across all customers using pipeline optimized for Log Loss
total_profit_ll = ll_pipeline_score["Cost Benefit Matrix"] * len(X)
print(total_profit_ll)

219656.27070515853
```

AutoML Search with Cost-Benefit Matrix

Let's try rerunning our AutoML search, but this time using the cost-benefit matrix as our primary objective to optimize.

```
[6]: automl = AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="binary",
    objective=cost_benefit_matrix,
    max_iterations=5,
    verbose=True,
)
automl.search(interactive_plot=False)

cbm_pipeline = automl.best_pipeline
```

AutoMLSearch will use mean CV score to rank pipelines.

```
*****

Best pipeline Cost Benefit Matrix: 58.743007

```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Now, if we calculate the cost-benefit matrix score on our best pipeline, we see that with this pipeline optimized for our cost-benefit matrix objective, we are able to generate more profit per customer. Across our 7043 customers, we generate much more profit using this best pipeline! Custom objectives like `CostBenefitMatrix` are just one example of how using EvalML can help find pipelines that can perform better on real-world problems, rather than on arbitrary standard statistical metrics.

```
[7]: cbm_pipeline_score = cbm_pipeline.score(X_holdout, y_holdout, [cost_benefit_matrix])
print(cbm_pipeline_score)
```

```
OrderedDict([('Cost Benefit Matrix', 62.091812588736396)])
```

```
[8]: # Calculate total profit across all customers using pipeline optimized for_
↳CostBenefitMatrix
total_profit_cbm = cbm_pipeline_score["Cost Benefit Matrix"] * len(X)
print(total_profit_cbm)
```

```
437312.63606247044
```

```
[9]: # Calculate difference in profit made using both pipelines
profit_diff = total_profit_cbm - total_profit_ll
print(profit_diff)
```

```
217656.3653573119
```

Finally, we can graph the confusion matrices for both pipelines to better understand why the pipeline trained using the cost-benefit matrix is able to correctly classify more samples than the pipeline trained with log loss: we were able to correctly predict more cases where the customer would have churned (true positive), allowing us to intervene and prevent those customers from leaving.

```
[10]: from evalml.model_understanding.metrics import graph_confusion_matrix

# pipeline trained with log loss
y_pred = ll_pipeline.predict(X_holdout)
graph_confusion_matrix(y_holdout, y_pred)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

```
[11]: # pipeline trained with cost-benefit matrix
y_pred = cbm_pipeline.predict(X_holdout)
graph_confusion_matrix(y_holdout, y_pred)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

3.4 Using Text Data with EvalML

In this demo, we will show you how to use EvalML to build models which use text data.

```
[1]: import evalml
from evalml import AutoMLSearch
```

3.4.1 Dataset

We will be utilizing a dataset of SMS text messages, some of which are categorized as spam, and others which are not (“ham”). This dataset is originally from [Kaggle](#), but modified to produce a slightly more even distribution of spam to ham.

```
[2]: from urllib.request import urlopen
import pandas as pd

input_data = urlopen(
    "https://featurelabs-static.s3.amazonaws.com/spam_text_messages_modified.csv"
)
data = pd.read_csv(input_data)[:750]

X = data.drop(["Category"], axis=1)
y = data["Category"]

display(X.head())
```

	Message
0	Free entry in 2 a wkly comp to win FA Cup fina...
1	FreeMsg Hey there darling it's been 3 week's n...
2	WINNER!! As a valued network customer you have...
3	Had your mobile 11 months or more? U R entitle...
4	SIX chances to win CASH! From 100 to 20,000 po...

The ham vs spam distribution of the data is 3:1, so any machine learning model must get above 75% accuracy in order to perform better than a trivial baseline model which simply classifies everything as ham.

```
[3]: y.value_counts(normalize=True)
```

```
[3]: Category
spam    0.593333
ham     0.406667
Name: proportion, dtype: float64
```

In order to properly utilize Woodwork's 'Natural Language' typing, we need to pass this argument in during initialization. Otherwise, this will be treated as an 'Unknown' type and dropped in the search.

```
[4]: X.ww.init(logical_types={"Message": "NaturalLanguage"})
```

3.4.2 Search for best pipeline

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

```
[5]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
      X, y, problem_type="binary", test_size=0.2, random_seed=0
    )
```

EvalML uses [Woodwork](#) to automatically detect which columns are text columns, so you can run search normally, as you would if there was no text data. We can print out the logical type of the Message column and assert that it is indeed inferred as a natural language column.

```
[6]: X_train.ww
```

```
[6]:      Physical Type      Logical Type Semantic Tag(s)
Column
Message      string NaturalLanguage      []
```

Because the spam/ham labels are binary, we will use `AutoMLSearch(X_train=X_train, y_train=y_train, problem_type='binary')`. When we call `.search()`, the search for the best pipeline will begin.

```
[7]: automl = AutoMLSearch(
      X_train=X_train,
      y_train=y_train,
      problem_type="binary",
      max_batches=1,
      optimize_thresholds=True,
      verbose=True,
    )

automl.search(interactive_plot=False)
```

AutoMLSearch will use mean CV score to rank pipelines.

```

```
[11]: best_pipeline.graph()
```

```
[11]:
```

Notice above that there is a `Natural Language Featurizer` as the first step in the pipeline. `AutoMLSearch` uses the `woodwork` accessor to recognize that `'Message'` is a text column, and converts this text into numerical values that can be handled by the estimator.

3.4.3 Evaluate on holdout

Now, we can score the pipeline on the holdout data using the ranking objectives for binary classification problems.

```
[12]: scores = best_pipeline.score(
        X_holdout, y_holdout, objectives=evalml.objectives.get_ranking_objectives("binary")
    )
print(f'Accuracy Binary: {scores["Accuracy Binary"]}')
Accuracy Binary: 0.9333333333333333
```

As you can see, this model performs relatively well on this dataset, even on unseen data.

3.4.4 What does the Natural Language Featurizer do?

Machine learning models cannot handle non-numeric data. Any text must be broken down into numeric features that provide useful information about that text. The `Natural Language Featurizer` first normalizes your text by removing any punctuation and other non-alphanumeric characters and converting any capital letters to lowercase. From there, it passes the text into `featuretools'` `nlp_primitives` dfs search, resulting in several informative features that replace the original column in your dataset: `Diversity Score`, `Mean Characters per Word`, `Polarity Score`, `LSA (Latent Semantic Analysis)`, `Number of Characters`, and `Number of Words`.

Diversity Score is the ratio of unique words to total words.

Mean Characters per Word is the average number of letters in each word.

Polarity Score is a prediction of how “polarized” the text is, on a scale from -1 (extremely negative) to 1 (extremely positive).

Latent Semantic Analysis is an abstract representation of how important each word is with respect to the entire text, reduced down into two values per text. While the other text features are each a single column, this feature adds two columns to your data, `LSA(column_name)[0]` and `LSA(column_name)[1]`.

Number of Characters is the number of characters in the text.

Number of Words is the number of words in the text.

Let’s see what this looks like with our spam/ham example.

```
[13]: best_pipeline.input_feature_names
[13]: {'Label Encoder': ['Message'],
      'Natural Language Featurizer': ['Message'],
      'Imputer': ['DIVERSITY_SCORE(Message)',
                  'MEAN_CHARACTERS_PER_WORD(Message)',
                  'NUM_CHARACTERS(Message)',
                  'NUM_WORDS(Message)',
                  'POLARITY_SCORE(Message)',
                  'LSA(Message)[0]',
                  'LSA(Message)[1]'],
      'RF Classifier Select From Model': ['DIVERSITY_SCORE(Message)',
                                          'MEAN_CHARACTERS_PER_WORD(Message)',
                                          'NUM_CHARACTERS(Message)',
                                          'NUM_WORDS(Message)',
                                          'POLARITY_SCORE(Message)',
                                          'LSA(Message)[0]',
                                          'LSA(Message)[1]'],
      'Random Forest Classifier': ['DIVERSITY_SCORE(Message)',
                                   'MEAN_CHARACTERS_PER_WORD(Message)',
                                   'NUM_CHARACTERS(Message)',
                                   'LSA(Message)[0]']}
```

Here, the Natural Language Featurizer takes in a single “Message” column, but then the next component in the pipeline, the Imputer, receives five columns of input. These five columns are the result of featurizing the text-type “Message” column. Most importantly, these featurized columns are what ends up passed in to the estimator.

If the dataset had any non-text columns, those would be left alone by this process. If the dataset had more than one text column, each would be broken into these five feature columns independently.

The features, more directly

Rather than just checking the new column names, let’s examine the output of this component directly. We can see this by running the component on its own.

```
[14]: natural_language_featurizer = evalml.pipelines.components.NaturalLanguageFeaturizer()
      X_featurized = natural_language_featurizer.fit_transform(X_train)
```

Now we can compare the input data to the output from the Natural Language Featurizer:

```
[15]: X_train.head()
[15]:
      Message
296  Sunshine Hols. To claim ur med holiday send a ...
652                                Yup ü not comin :-(
526  Hello hun how ru? Its here by the way. Im good...
571  I tagged MY friends that you seemed to count a...
472                                What happened to our yo date?
```

```
[16]: X_featurized.head()
[16]:
      DIVERSITY_SCORE(Message)  MEAN_CHARACTERS_PER_WORD(Message)  \
296                        1.0                        4.344828
652                        1.0                        3.000000
```

(continues on next page)

(continued from previous page)

526	1.0	3.363636
571	0.8	4.083333
472	1.0	3.833333

	NUM_CHARACTERS(Message)	NUM_WORDS(Message)	POLARITY_SCORE(Message)	\
296	154.0	29.0	0.003	
652	16.0	4.0	0.000	
526	143.0	33.0	0.162	
571	60.0	12.0	0.681	
472	28.0	6.0	0.000	

	LSA(Message) [0]	LSA(Message) [1]
296	0.150556	-0.072443
652	0.017340	-0.005411
526	0.169954	0.022670
571	0.144713	0.036799
472	0.109373	-0.042754

These numeric values now represent important information about the original text that the estimator at the end of the pipeline can successfully use to make predictions.

3.4.5 Why encode text this way?

To demonstrate the importance of text-specific modeling, let's train a model with the same dataset, without letting `AutoMLSearch` detect the text column. We can change this by explicitly setting the data type of the 'Message' column in Woodwork to Categorical using the utility method `infer_feature_types`.

```
[17]: from evalml.utils import infer_feature_types

X = infer_feature_types(X, {"Message": "Categorical"})
X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
    X, y, problem_type="binary", test_size=0.2, random_seed=0
)
```

```
[18]: automl_no_text = AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="binary",
    max_batches=1,
    optimize_thresholds=True,
    verbose=True,
)

automl_no_text.search(interactive_plot=False)

AutoMLSearch will use mean CV score to rank pipelines.

Without the Natural Language Featurizer, the 'Message' column was treated as a categorical column, and therefore the conversion of this text to numerical features happened in the One Hot Encoder. The best pipeline encoded the top 10 most frequent “categories” of these texts, meaning 10 text messages were one-hot encoded and all the others were dropped. Clearly, this removed almost all of the information from the dataset, as we can see the `best_pipeline_no_text` performs very similarly to randomly guessing “ham” in every case.

These guides include in-depth descriptions and explanations of EvalML's features.

4.1 Automated Machine Learning (AutoML) Search

4.1.1 Background

Machine Learning

Machine learning (ML) is the process of constructing a mathematical model of a system based on a sample dataset collected from that system.

One of the main goals of training an ML model is to teach the model to separate the signal present in the data from the noise inherent in system and in the data collection process. If this is done effectively, the model can then be used to make accurate predictions about the system when presented with new, similar data. Additionally, introspecting on an ML model can reveal key information about the system being modeled, such as which inputs and transformations of the inputs are most useful to the ML model for learning the signal in the data, and are therefore the most predictive.

There are a **variety** of ML problem types. Supervised learning describes the case where the collected data contains an output value to be modeled and a set of inputs with which to train the model. EvalML focuses on training supervised learning models.

EvalML supports three common supervised ML problem types. The first is regression, where the target value to model is a continuous numeric value. Next are binary and multiclass classification, where the target value to model consists of two or more discrete values or categories. The choice of which supervised ML problem type is most appropriate depends on domain expertise and on how the model will be evaluated and used.

EvalML is currently building support for supervised time series problems: time series regression, time series binary classification, and time series multiclass classification. While we've added some features to tackle these kinds of problems, our functionality is still being actively developed so please be mindful of that before using it.

AutoML and Search

AutoML is the process of automating the construction, training and evaluation of ML models. Given a data and some configuration, AutoML searches for the most effective and accurate ML model or models to fit the dataset. During the search, AutoML will explore different combinations of model type, model parameters and model architecture.

An effective AutoML solution offers several advantages over constructing and tuning ML models by hand. AutoML can assist with many of the difficult aspects of ML, such as avoiding overfitting and underfitting, imbalanced data, detecting data leakage and other potential issues with the problem setup, and automatically applying best-practice data cleaning, feature engineering, feature selection and various modeling techniques. AutoML can also leverage search algorithms to

optimally sweep the hyperparameter search space, resulting in model performance which would be difficult to achieve by manual training.

4.1.2 AutoML in EvalML

EvalML supports all of the above and more.

In its simplest usage, the AutoML search interface requires only the input data, the target data and a `problem_type` specifying what kind of supervised ML problem to model.

** Graphing methods, like verbose `AutoMLSearch`, on Jupyter Notebook and Jupyter Lab require `ipywidgets` to be installed.

** If graphing on Jupyter Lab, `jupyterlab-plotly` required. To download this, make sure you have `npm` installed.

```
[1]: import evalml
      from evalml.utils import infer_feature_types
```

```
X, y = evalml.demos.load_fraud(n_rows=650)
```

```

                Number of Features

Categorical             6
Numeric                5

Number of training examples: 650
Targets
False      86.31%
True       13.69%
Name: count, dtype: object
```

To provide data to EvalML, it is recommended that you initialize a `Woodwork accessor` on your data. This allows you to easily control how EvalML will treat each of your features before training a model.

EvalML also accepts pandas input, and will run type inference on top of the input pandas data. If you'd like to change the types inferred by EvalML, you can use the `infer_feature_types` utility method, which takes pandas or numpy input and converts it to a Woodwork data structure. The `feature_types` parameter can be used to specify what types specific columns should be.

Feature types such as `Natural Language` must be specified in this way, otherwise Woodwork will infer it as `Unknown` type and drop it during the `AutoMLSearch`.

In the example below, we reformat a couple features to make them easily consumable by the model, and then specify that the provider, which would have otherwise been inferred as a column with natural language, is a categorical column.

```
[2]: X.ww["expiration_date"] = X["expiration_date"].apply(
      lambda x: "20{}-01-{}".format(x.split("/")[1], x.split("/")[0])
    )
X = infer_feature_types(
    X,
    feature_types={
        "store_id": "categorical",
        "expiration_date": "datetime",
        "lat": "categorical",
        "lng": "categorical",
        "provider": "categorical",
```

(continues on next page)

(continued from previous page)

```
    },
)
```

In order to validate the results of the pipeline creation and optimization process, we will save some of our data as a holdout set.

```
[3]: X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
      X, y, problem_type="binary", test_size=0.2
    )
```

Data Checks

Before calling `AutoMLSearch.search`, we should run some sanity checks on our data to ensure that the input data being passed will not run into some common issues before running a potentially time-consuming search. EvalML has various data checks that makes this easy. Each data check will return a collection of warnings and errors if it detects potential issues with the input data. This allows users to inspect their data to avoid confusing errors that may arise during the search process. You can learn about each of the data checks available through our [data checks guide](#).

Here, we will run the `DefaultDataChecks` class, which contains a series of data checks that are generally useful.

```
[4]: from evalml.data_checks import DefaultDataChecks

data_checks = DefaultDataChecks("binary", "log loss binary")
data_checks.validate(X_train, y_train)
```

```
[4]: []
```

Since there were no warnings or errors returned, we can safely continue with the search process.

Holdout Set for Pipeline Ranking

If the `holdout_set_size` parameter is set and the input dataset has more than 500 rows, `AutoMLSearch` will create a holdout set from `holdout_set_size` of the training data. Alternatively, a holdout set can be manually specified by using the `X_holdout` and `y_holdout` parameters in `AutoMLSearch()`. In this example, the holdout set created previously will be used by AutoML search.

During the AutoML search process, the mean of the objective scores of all cross validation folds (shown the “`mean_cv_score`” column in the pipeline rankings), is calculated. This score is passed to the AutoML search tuner to further optimize the hyperparameters of the next batch of pipelines.

After, the pipeline will be fitted on the entire training dataset and scored on this new holdout set. This score is represented under the “`ranking_score`” column on the pipeline rankings board and is used to rank pipeline performance.

If a dataset has less than 500 rows or `holdout_set_size=0` (which is the default setting), the “`mean_cv_score`” will be used as the `ranking_score` instead.

```
[5]: automl = evalml.automl.AutoMLSearch(
      X_train=X_train,
      y_train=y_train,
      X_holdout=X_holdout,
      y_holdout=y_holdout,
      problem_type="binary",
      verbose=True,
```

(continues on next page)

(continued from previous page)

```

With the `verbose` argument set to `True`, the AutoML search will log its progress, reporting each pipeline and parameter set evaluated during the search. The search iteration plot shown during AutoML search tracks the current pipeline's validation score (tracked as the gray point) against the best pipeline validation score (tracked as the blue line).

There are a number of mechanisms to control the AutoML search time. One way is to set the `max_batches` parameter which controls the maximum number of rounds of AutoML to evaluate, where each round may train and score a variable number of pipelines. Another way is to set the `max_iterations` parameter which controls the maximum number of candidate models to be evaluated during AutoML. By default, AutoML will search for a single batch. The first pipeline to be evaluated will always be a baseline model representing a trivial solution.

The AutoML interface supports a variety of other parameters. For a comprehensive list, please [refer to the API reference](#).

We also provide [a standalone search method](#) which does all of the above in a single line, and returns the `AutoMLSearch` instance and data check results. If there were data check errors, AutoML will not be run and no `AutoMLSearch` instance will be returned.

Detecting Problem Type

EvalML includes a simple method, `detect_problem_type`, to help determine the problem type given the target data.

This function can return the predicted problem type as a `ProblemType` enum, choosing from `ProblemType.BINARY`, `ProblemType.MULTICLASS`, and `ProblemType.REGRESSION`. If the target data is invalid (for instance when there is only 1 unique label), the function will throw an error instead.

```

[6]: import pandas as pd
    from evalml.problem_types import detect_problem_type

    y_binary = pd.Series([0, 1, 1, 0, 1, 1])
    detect_problem_type(y_binary)

[6]: <ProblemTypes.BINARY: 'binary'>

```

Objective parameter

AutoMLSearch takes in an objective parameter to determine which objective to optimize for. By default, this parameter is set to auto, which allows AutoML to choose LogLossBinary for binary classification problems, LogLossMulticlass for multiclass classification problems, and R2 for regression problems.

It should be noted that the objective parameter is only used in ranking and helping choose the pipelines to iterate over, but is not used to optimize each individual pipeline during fit-time.

To get the default objective for each problem type, you can use the `get_default_primary_search_objective` function.

```
[7]: from evalml.automl import get_default_primary_search_objective

binary_objective = get_default_primary_search_objective("binary")
multiclass_objective = get_default_primary_search_objective("multiclass")
regression_objective = get_default_primary_search_objective("regression")

print(binary_objective.name)
print(multiclass_objective.name)
print(regression_objective.name)
```

```
Log Loss Binary
Log Loss Multiclass
R2
```

Using custom pipelines

EvalML's AutoML algorithm generates a set of pipelines to search with. To provide a custom set instead, set `allowed_component_graphs` to a dictionary of custom component graphs. AutoMLSearch will use these to generate Pipeline instances. Note: this will prevent AutoML from generating other pipelines to search over.

```
[8]: from evalml.pipelines import MulticlassClassificationPipeline

automl_custom = evalml.automl.AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    problem_type="multiclass",
    verbose=True,
    allowed_component_graphs={
        "My_pipeline": ["Simple Imputer", "Random Forest Classifier"],
        "My_other_pipeline": ["One Hot Encoder", "Random Forest Classifier"],
    },
)
```

```
AutoMLSearch will use mean CV score to rank pipelines.
Removing columns ['currency'] because they are of 'Unknown' type
Using default limit of max_batches=2.
```

Stopping the search early

To stop the search early, hit Ctrl-C. This will bring up a prompt asking for confirmation. Responding with y will immediately stop the search. Responding with n will continue the search.

Callback functions

AutoMLSearch supports several callback functions, which can be specified as parameters when initializing an AutoMLSearch object. They are:

- `start_iteration_callback`
- `add_result_callback`
- `error_callback`

Start Iteration Callback

Users can set `start_iteration_callback` to set what function is called before each pipeline training iteration. This callback function must take three positional parameters: the pipeline class, the pipeline parameters, and the AutoMLSearch object.

```
[9]: ## start_iteration_callback example function
def start_iteration_callback_example(pipeline_class, pipeline_params, automl_obj):
    print("Training pipeline with the following parameters:", pipeline_params)
```

Add Result Callback

Users can set `add_result_callback` to set what function is called after each pipeline training iteration. This callback function must take three positional parameters: a dictionary containing the training results for the new pipeline, an untrained_pipeline containing the parameters used during training, and the AutoMLSearch object.

```
[10]: ## add_result_callback example function
def add_result_callback_example(pipeline_results_dict, untrained_pipeline, automl_obj):
    print(
        "Results for trained pipeline with the following parameters:",
        pipeline_results_dict,
    )
```

Error Callback

Users can set the `error_callback` to set what function called when `search()` errors and raises an Exception. This callback function takes three positional parameters: the Exception raised, the traceback, and the AutoMLSearch object. This callback function must also accept `kwargs`, so AutoMLSearch is able to pass along other parameters used by default.

Evalml defines several error callback functions, which can be found under `evalml.automl.callbacks`. They are:

- `silent_error_callback`
- `raise_error_callback`

- `log_and_save_error_callback`
- `raise_and_save_error_callback`
- `log_error_callback` (default used when `error_callback` is `None`)

```
[11]: # error_callback example; this is implemented in the evalml library
def raise_error_callback(exception, traceback, automl, **kwargs):
    """Raises the exception thrown by the AutoMLSearch object. Also logs the exception
    as an error."""
    logger.error(f"AutoMLSearch raised a fatal exception: {str(exception)}")
    logger.error("\n".join(traceback))
    raise exception
```

4.1.3 View Rankings

A summary of all the pipelines built can be returned as a pandas DataFrame which is sorted by the validation score.

- For AutoML searches completed with a holdout set, the validation score is the holdout score of the pipeline fitted using the entire training dataset.
- For AutoML searches completed without a holdout set, the validation score is the average score across all cross-validation folds.

```

Recommendation Score

If you would like a more robust evaluation of the performance of your models, EvalML additionally provides a recommendation score alongside the selected objective. The recommendation score is a weighted average of a number of default objectives for your problem type, normalized and scaled so that the final score can be interpreted as a percentage from 0 to 100. This weighted score provides a more holistic understanding of model performance, and prioritizes model generalizability rather than one single objective which may not completely serve your use case.

```
[13]: automl.get_recommendation_scores(use_pipeline_names=True)
```

```
[13]: {'Baseline Classifier': 25.0,
      'Random Forest Classifier': 89.2028059447534,
      'LightGBM Classifier': 91.29441485901573,
      'Extra Trees Classifier': 76.48915094483688,
      'Elastic Net Classifier': 64.98618569828929,
      'XGBoost Classifier': 90.93050768077345,
      'Logistic Regression Classifier': 64.88094236798518}
```

```
[14]: automl.get_recommendation_scores(priority="F1", use_pipeline_names=True)
```

```
[14]: {'Baseline Classifier': 16.666666666666664,
      'Random Forest Classifier': 87.42552654381409,
      'LightGBM Classifier': 90.0296099060105,
      'Extra Trees Classifier': 68.38407164438401,
      'Elastic Net Classifier': 53.893229489916436,
      'XGBoost Classifier': 89.78700512051563,
      'Logistic Regression Classifier': 53.8230672697137}
```

To see what objectives are included in the recommendation score, you can use:

```
[15]: evalml.objectives.get_default_recommendation_objectives("binary")
```

```
[15]: {'AUC', 'Balanced Accuracy Binary', 'F1', 'Log Loss Binary'}
```

If you would like to automatically rank your pipelines by this recommendation score, you can set `use_recommendation=True` when initializing `AutoMLSearch`.

```
[16]: automl_recommendation = evalml.automl.AutoMLSearch(
    X_train=X_train,
    y_train=y_train,
    X_holdout=X_holdout,
    y_holdout=y_holdout,
    problem_type="binary",
    use_recommendation=True,
)
```

(continues on next page)

(continued from previous page)

```

automl_recommendation.search(interactive_plot=False)

0          91.294415         0.160955         0.299971
1          90.930508         0.166761         0.260214
2          89.202806         0.219145         0.254382
3          76.489151         0.348408         0.361341
4          64.986186         0.400375         0.374725
5          64.880942         0.401581         0.374364
6          25.000000         4.990660         4.921248

```

There is a helper function on the `AutoMLSearch` object to help you understand how the recommendation score was calculated. It displays the raw scores of the objectives included within the score calculation. Here, we take a look at pipeline with `id=9`, the Decision Tree pipeline:

```

[17]: automl_recommendation.get_recommendation_score_breakdown(3)

```

```

[17]: {'AUC': 0.845734126984127,
      'F1': 0.5217391304347826,
      'Balanced Accuracy Binary': 0.7619047619047619,
      'Log Loss Binary': 0.3484078428021002}

```

4.1.4 Describe Pipeline

Each pipeline is given an `id`. We can get more information about any particular pipeline using that `id`. Here, we will get more information about the pipeline with `id = 1`.

```

[18]: automl.describe_pipeline(1)

```

```

→ 0.163	0.036	-	-				

4.1.5 Get Pipeline

We can get the object of any pipeline via their id as well:

```
[19]: pipeline = automl.get_pipeline(1)
      print(pipeline.name)
      print(pipeline.parameters)

Random Forest Classifier w/ Label Encoder + Drop Columns Transformer + DateTime_
→ Featurizer + Imputer + One Hot Encoder + Oversampler + RF Classifier Select From Model
{'Label Encoder': {'positive_label': None}, 'Drop Columns Transformer': {'columns': [
→ 'currency']}, 'DateTime Featurizer': {'features_to_extract': ['year', 'month', 'day_of_
→ week', 'hour'], 'encode_as_categories': False, 'time_index': None}, 'Imputer': {
→ 'categorical_impute_strategy': 'most_frequent', 'numeric_impute_strategy': 'mean',
→ 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value': None, 'numeric_
→ fill_value': None, 'boolean_fill_value': None}, 'One Hot Encoder': {'top_n': 10,
→ 'features_to_encode': None, 'categories': None, 'drop': 'if_binary', 'handle_unknown':
→ 'ignore', 'handle_missing': 'error'}, 'Oversampler': {'sampling_ratio': 0.25, 'k_
→ neighbors_default': 5, 'n_jobs': -1, 'sampling_ratio_dict': None, 'categorical_features
→ ': [3, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29,
→ 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49], 'k_
→ neighbors': 5}, 'RF Classifier Select From Model': {'number_features': None, 'n_
→ estimators': 10, 'max_depth': None, 'percent_features': 0.5, 'threshold': 'median', 'n_
→ jobs': -1}, 'Random Forest Classifier': {'n_estimators': 100, 'max_depth': 6, 'n_jobs':
→ -1}}
```

Get best pipeline

If you specifically want to get the best pipeline, there is a convenient accessor for that. The pipeline returned is already fitted on the input X, y data that we passed to AutoMLSearch. To turn off this default behavior, set `train_best_pipeline=False` when initializing AutoMLSearch.

```
[20]: best_pipeline = automl.best_pipeline
print(best_pipeline.name)
print(best_pipeline.parameters)
best_pipeline.predict(X_train)
```

```

4.1.6 Training and Scoring Multiple Pipelines using AutoMLSearch

AutoMLSearch will automatically fit the best pipeline on the entire training data. It also provides an easy API for training and scoring other pipelines.

If you'd like to train one or more pipelines on the entire training data, you can use the `train_pipelines` method.

Similarly, if you'd like to score one or more pipelines on a particular dataset, you can use the `score_pipelines` method.

```
[21]: trained_pipelines = automl.train_pipelines([automl.get_pipeline(i) for i in [0, 1, 2]])
      trained_pipelines
```

```

```

4.1.7 Saving AutoMLSearch and pipelines from AutoMLSearch

There are two ways to save results from AutoMLSearch.

- You can save the AutoMLSearch object itself, calling `.save(<filepath>)` to do so. This will allow you to save the AutoMLSearch state and reload all pipelines from this.
- If you want to save a pipeline from AutoMLSearch for future use, pipeline classes themselves have a `.save(<filepath>)` method.

```
[23]: # saving the entire automl search
automl.save("automl.cloudpickle")
automl2 = evalml.automl.AutoMLSearch.load("automl.cloudpickle")
# saving the best pipeline using .save()
best_pipeline.save("pipeline.cloudpickle")
best_pipeline_copy = evalml.pipelines.PipelineBase.load("pipeline.cloudpickle")
```

4.1.8 Limiting the AutoML Search Space

The AutoML search algorithm first trains each component in the pipeline with their default values. After the first iteration, it then tweaks the parameters of these components using the pre-defined hyperparameter ranges that these components have. To limit the search over certain hyperparameter ranges, you can specify a `search_parameters` argument with your `AutoMLSearch` parameters. These parameters will limit the hyperparameter search space or pipeline parameter space.

Hyperparameter ranges can be found through the [API reference](#) for each component. Parameter arguments must be specified as dictionaries, but the associated values must be `skopt.space` Real, Integer, Categorical objects for setting hyperparameter ranges.

If however you'd like to specify certain values for the initial batch of the AutoML search algorithm, you can use the `search_parameters` argument with non `skopt.space` objects. This will set the initial batch's component parameters to the values passed by this argument.

```
[24]: from evalml import AutoMLSearch
      from evalml.demos import load_fraud
      from skopt.space import Categorical
      from evalml.model_family import ModelFamily
      import woodwork as ww

X, y = load_fraud(n_rows=1000)

# example of setting parameter to just one value
search_parameters = {"Imputer": {"numeric_impute_strategy": "mean"}}

# limit the numeric impute strategy to include only `median` and `most_frequent`
# `mean` is the default value for this argument, but it doesn't need to be included in_
# the specified hyperparameter range for this to work
search_parameters = {
    "Imputer": {"numeric_impute_strategy": Categorical(["median", "most_frequent"])}
}

# using this custom hyperparameter means that our Imputer components in these pipelines_
# will only search through
# 'median' and 'most_frequent' strategies for 'numeric_impute_strategy'
automl_constrained = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    search_parameters=search_parameters,
    verbose=True,
)
```

	Number of Features

True	14.10%

(continues on next page)

(continued from previous page)

```
Name: count, dtype: object
AutoMLSearch will use mean CV score to rank pipelines.
Using default limit of max_batches=2.
```

A `skopt.space` Integer, Real, or Categorical will set the hyperparameter space explored during search. All other values will set the pipeline parameters directly. Setting pipeline parameters directly defines the initialization parameters that a pipeline starts with during the first batch of AutoMLSearch. the hyperparameter range then defines the space of possible new parameter values, which the tuner chooses.

Let's walk through some examples to explain this. For instance,

```
search_parameters = {'Imputer': {
    'numeric_impute_strategy': 'mean'
}}
```

then in the initial search, the algorithm would use mean as the impute strategy in batch 1. However, since `Imputer.numeric_impute_strategy` has a valid hyperparameter range, if the algorithm suggests a different strategy, it can and will change this value. To limit this to using mean only for the duration of the search, it is necessary to use the `skopt.space`:

```
search_parameters = {'Imputer': {
    'numeric_impute_strategy': Categorical(['mean'])
}}
```

However, if a value has no hyperparameter range associated, then the algorithm will use this value as the only parameter. For instance,

```
search_parameters = {'Label Encoder': {
    'positive_label': True
}}
```

Since `Label Encoder.positive_label` has no associated hyperparameter range, the algorithm will use this parameter for the entire duration of the search.

4.1.9 Imbalanced Data

The AutoML search algorithm now has functionality to handle imbalanced data during classification! AutoMLSearch now provides two additional parameters, `sampler_method` and `sampler_balanced_ratio`, that allow you to let AutoMLSearch know whether to sample imbalanced data, and how to do so. `sampler_method` takes in either `Undersampler`, `Oversampler`, `auto`, or `None` as the sampler to use, and `sampler_balanced_ratio` specifies the minority/majority ratio that you want to sample to. Details on the Undersampler and Oversampler components can be found in the [documentation](#).

This can be used for imbalanced datasets, like the fraud dataset, which has a 'minority:majority' ratio of < 0.2.

```
[25]: automl_auto = AutoMLSearch(
    X_train=X, y_train=y, problem_type="binary", automl_algorithm="iterative"
)
automl_auto.allowed_pipelines[-1]
```

```
[25]: pipeline = BinaryClassificationPipeline(component_graph={'Label Encoder': ['Label Encoder
→ ', 'X', 'y'], 'DateTime Featurizer': ['DateTime Featurizer', 'X', 'Label Encoder.y'],
→ 'Imputer': ['Imputer', 'DateTime Featurizer.x', 'Label Encoder.y'], 'One Hot Encoder':
→ ['One Hot Encoder', 'Imputer.x', 'Label Encoder.y'], 'Oversampler': ['Oversampler',
→ 'One Hot Encoder.x', 'Label Encoder.y'], 'Extra Trees Classifier': ['Extra Trees
Classifier', 'Oversampler.x', 'Oversampler.y']}, parameters={'Label Encoder': {
→ 'positive_label': None}, 'DateTime Featurizer': {'features_to_extract': ['year', 'month
→ ', 'day_of_week', 'hour'], 'encode_as_categories': False, 'time_index': None}, 'Imputer
→ ': {'categorical_impute_strategy': 'most_frequent', 'numeric_impute_strategy': 'mean',
→ 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value': None, 'numeric
→ 
```

(continued from previous page)

The Oversampler is chosen as the default sampling component here, since the `sampler_balanced_ratio = 0.25`. If you specified a lower ratio, for instance `sampler_balanced_ratio = 0.1`, then there would be no sampling component added here. This is because if a ratio of 0.1 would be considered balanced, then a ratio of 0.2 would also be balanced.

The Oversampler uses SMOTE under the hood, and automatically selects whether to use SMOTE, SMOTEN, or SMO-TENC based on the data it receives.

```
[26]: automl_auto_ratio = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    sampler_balanced_ratio=0.1,
    automl_algorithm="iterative",
)
automl_auto_ratio.allowed_pipelines[-1]

[26]: pipeline = BinaryClassificationPipeline(component_graph={'Label Encoder': ['Label Encoder', 'X', 'y'], 'DateTime Featurizer': ['DateTime Featurizer', 'X', 'Label Encoder.y'], 'Imputer': ['Imputer', 'DateTime Featurizer.x', 'Label Encoder.y'], 'One Hot Encoder': ['One Hot Encoder', 'Imputer.x', 'Label Encoder.y'], 'Extra Trees Classifier': ['Extra Trees Classifier', 'One Hot Encoder.x', 'Label Encoder.y']}, parameters={'Label Encoder': {'positive_label': None}, 'DateTime Featurizer': {'features_to_extract': ['year', 'month', 'day_of_week', 'hour'], 'encode_as_categories': False, 'time_index': None}, 'Imputer': {'categorical_impute_strategy': 'most_frequent', 'numeric_impute_strategy': 'mean', 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value': None, 'numeric_fill_value': None, 'boolean_fill_value': None}, 'One Hot Encoder': {'top_n': 10, 'features_to_encode': None, 'categories': None, 'drop': 'if_binary', 'handle_unknown': 'ignore', 'handle_missing': 'error'}, 'Extra Trees Classifier': {'n_estimators': 100, 'max_features': 'sqrt', 'max_depth': 6, 'min_samples_split': 2, 'min_weight_fraction_leaf': 0.0, 'n_jobs': -1}}, random_seed=0)
```

Additionally, you can add more fine-grained sampling ratios by passing in a `sampling_ratio_dict` in pipeline parameters. For this dictionary, AutoMLSearch expects the keys to be int values from 0 to `n-1` for the classes, and the values would be the `sampler_balanced_ratio` associated with each target. This dictionary would override the AutoML argument `sampler_balanced_ratio`. Below, you can see the scenario for Oversampler component on this dataset. Note that the logic for Undersamplers is included in the commented section.

```
[27]: # In this case, the majority class is the negative class
# for the oversampler, we don't want to oversample this class, so class 0 (majority) will
# have a ratio of 1 to itself
# for the minority class 1, we want to oversample it to have a minority/majority ratio
# of 0.5, which means we want minority to have 1/2 the samples as the majority
sampler_ratio_dict = {0: 1, 1: 0.5}
search_parameters = {"Oversampler": {"sampler_balanced_ratio": sampler_ratio_dict}}
automl_auto_ratio_dict = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    search_parameters=search_parameters,
    automl_algorithm="iterative",
)
```

(continues on next page)

(continued from previous page)

```

automl_auto_ratio_dict.allowed_pipelines[-1]

# Undersampler case
# we don't want to undersample this class, so class 1 (minority) will have a ratio of 1
# to itself
# for the majority class 0, we want to undersample it to have a minority/majority ratio
# of 0.5, which means we want majority to have 2x the samples as the minority
# sampler_ratio_dict = {0: 0.5, 1: 1}
# search_parameters = {"Oversampler": {"sampler_balanced_ratio": sampler_ratio_dict}}
# automl_auto_ratio_dict = AutoMLSearch(X_train=X, y_train=y, problem_type='binary',
# search_parameters=search_parameters)

```

```

```

4.1.10 Adding ensemble methods to AutoML

Stacking

Stacking is an ensemble machine learning algorithm that involves training a model to best combine the predictions of several base learning algorithms. First, each base learning algorithms is trained using the given data. Then, the combining algorithm or meta-learner is trained on the predictions made by those base learning algorithms to make a final prediction.

AutoML enables stacking using the `ensembling` flag during initialization; this is set to `False` by default. How ensembling runs is defined by the AutoML algorithm you choose. In the `IterativeAlgorithm`, the stacking ensemble pipeline runs in its own batch after a whole cycle of training has occurred (each allowed pipeline trains for one batch). Note that this means **a large number of iterations may need to run before the stacking ensemble runs**. It is also important to note that **only the first CV fold is calculated for stacking ensembles** because the model internally uses CV folds. See below in the AutoML Algorithms section to see how ensembling is run for `DefaultAlgorithm`. Please do note that ensembling is currently unavailable for time series problems.

```

[28]: X, y = evalml.demos.load_breast_cancer()

automl_with_ensembling = AutoMLSearch(
    X_train=X,
    y_train=y,

4.1.11 AutoML Algorithms

EvalML currently has two algorithms available for users to choose from. Below, we will run through how each algorithm works and how to access them through `AutoMLSearch` as well as the top level search methods.

IterativeAlgorithm

`IterativeAlgorithm` is the first AutoML Algorithm created in EvalML and can be accessed with the `search_iterative` method or specifying `AutoMLSearch(automl_algorithm='iterative')`. The algorithm works as follows:

- Every batch (after the initial baseline model) contains pipelines of all available estimators for the specified problem type
- Pipelines contain preprocessing (imputing, encoding, etc.) needed for machine learning but no feature selection is applied
- Ensembling can be turned on by passing in the `ensembling=True` parameter and will be run after a whole cycle of training has occurred (each allowed pipeline trains for one batch)

```
[30]: import evalml
```

```
X, y = evalml.demos.load_fraud(n_rows=250)
```

```

                Number of Features
Boolean                1
Categorical             6
Numeric                5

Number of training examples: 250
Targets
False      88.40%
True       11.60%
Name: count, dtype: object
```

```
[31]: from evalml.automl import search_iterative
```

```

# top level search method will run `AutoMLSearch` with `IterativeAlgorithm` as well as
↳ apply our default data checks
auto_iterative, messages_iterative = search_iterative(X, y, problem_type="binary")
```

```
[32]: from evalml import AutoMLSearch
```

```

auto_iterative = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    automl_algorithm="iterative",
    verbose=True,
)
auto_iterative.search(interactive_plot=False)
```

AutoMLSearch will use mean CV score to rank pipelines.
 Removing columns ['currency', 'expiration_date'] because they are of 'Unknown' type

```

DefaultAlgorithm

DefaultAlgorithm was designed to do three main things:

1. Abstract out more parameters and decisions from the user.
2. Perform deeper tuning for high performing pipelines.
3. Create a platform to introduce feature selection as well as other potential techniques/heuristics for AutoML.

DefaultAlgorithm does this by creating the concept of two modes: `fast` and `long`, where `fast` is a subset of `long`. The algorithm runs as follows:

1. Run naive pipelines:
 - a. a random forest pipeline with the default preprocessing pipeline
2. Run the same pipelines, this time with feature selection. Subsequent pipelines will use the selected features with a `SelectedColumns` transformer.
3. Run all pipelines with preprocessing components:
 - a. scan rest of estimators (`IterativeAlgorithm` batch 1).
4. First ensembling run

Fast mode ends here. Begin long mode.

6. Run top 3 estimators:
 - a. Generate 50 random parameter sets. Run all 150 in one batch
7. Second ensembling run
8. Repeat 8a and 8b indefinitely until the specified time in `AutoMLSearch` is met:

- a. For each of the previous top 3 estimators, sample 10 parameters from the tuner. Run all 30 in one batch
- b. Run ensembling

To this end, it is recommended to use the top level `search()` method to run `DefaultAlgorithm`. This allows users to specify running search with just the mode parameter, where `fast` is recommended for users who want a fast scan at how EvalML pipelines will perform on their problem and where `long` is reserved for a deeper dive into high performing pipelines. If one needs finer control over AutoML parameters, one can also specify `automl_algorithm='default'` using `AutoMLSearch` and it will default to using `fast` mode. However, in this case ensembling will be defined by the `ensembling` flag (if `ensembling=False` the abovementioned ensembling batches will be skipped). Users are welcome to select `max_batches` according to the algorithm above (or other stopping criteria) but should be aware that results may not be optimal if the algorithm does not run for the full length of `fast` mode. Note that the `allowed_model_families` and `excluded_model_families` parameters are only applied to the non-naive batches in the default algorithms. If users want to apply these to all estimators, use the iterative algorithm by specifying `automl_algorithm='iterative'`.

```
[33]: from evalml.automl import search

# top level search method will run `AutoMLSearch` with `IterativeAlgorithm` as well as
↳ apply our default data checks
auto_default, messages_default = search(X, y, problem_type="binary", mode="fast")
```

```
[34]: from evalml import AutoMLSearch
```

```
auto_default = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    automl_algorithm="default",
    ensembling=True,
    verbose=True,
)
auto_default.search(interactive_plot=False)
```

AutoMLSearch will use mean CV score to rank pipelines.

```

4.1.12 Pipeline differences

Through the search output above, we can see how pipelines differ between `IterativeAlgorithm` and `DefaultAlgorithm`. This is because `DefaultAlgorithm` utilizes new components such as `RFRegressorSelectFromModel` and other column selectors for feature selection as well as a new pipeline structure to handle feature selection for categorical and non-categorical features.

```
[35]: auto_iterative.get_pipeline(4).graph()
```

```
[35]:
```

```
[36]: auto_default.get_pipeline(6).graph()

If there are errors, such as with the Iterative Algorithm example above, we can examine these closer by accessing the errors field. There is one dictionary entry per pipeline fold that failed, and each entry contains the pipeline parameters with the error that was thrown and its full traceback.

```
[38]: auto_iterative.errors
```

```
[38]: {}
```

4.1.14 Parallel AutoML

By default, all pipelines in an AutoML batch are evaluated in series. Pipelines can be evaluated in parallel to improve performance during AutoML search. This is accomplished by a futures style submission and evaluation of pipelines in a batch. As of this writing, the pipelines use a threaded model for concurrent evaluation. This is similar to the currently implemented `n_jobs` parameter in the estimators, which uses increased numbers of threads to train and evaluate estimators.

Quick Start

To quickly use some parallelism to enhance the pipeline searching, a string can be passed through to `AutoMLSearch` during initialization to setup the parallel engine and client within the `AutoMLSearch` object. The current options are “`cf_threaded`”, “`cf_process`”, “`dask_threaded`” and “`dask_process`” and indicate the futures backend to use and whether to use threaded- or process-level parallelism.

```

[39]: automl_cf_threaded = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    allowed_model_families=[ModelFamily.LINEAR_MODEL],

```

(continues on next page)

(continued from previous page)

```

    engine="cf_threaded",
)
automl_cf_threaded.search(interactive_plot=False)
automl_cf_threaded.close_engine()

```

Parallelism with Concurrent Futures

The `EngineBase` class is robust and extensible enough to support futures-like implementations from a variety of libraries. The `CfEngine` extends the `EngineBase` to use the native Python `concurrent.futures` library. The `CfEngine` supports both thread- and process-level parallelism. The type of parallelism can be chosen using either the `ThreadPoolExecutor` or the `ProcessPoolExecutor`. If either executor is passed a `max_workers` parameter, it will set the number of processes and threads spawned. If not, the default number of processes will be equal to the number of processors available and the number of threads set to five times the number of processors available.

Here, the `CfEngine` is invoked with default parameters, which is threaded parallelism using all available threads.

```

[40]: from concurrent.futures import ThreadPoolExecutor

from evalml.automl.engine.cf_engine import CFEngine, CFClient

cf_engine = CFEngine(CFClient(ThreadPoolExecutor(max_workers=4)))
automl_cf_threaded = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    allowed_model_families=[ModelFamily.LINEAR_MODEL],
    engine=cf_engine,
)
automl_cf_threaded.search(interactive_plot=False)
automl_cf_threaded.close_engine()

```

Note: the cell demonstrating process-level parallelism is a markdown due to incompatibility with our ReadTheDocs build. It can be run successfully locally.

```

from concurrent.futures import ProcessPoolExecutor

# Repeat the process but using process-level parallelism\
cf_engine = CFEngine(CFClient(ProcessPoolExecutor(max_workers=2)))
automl_cf_process = AutoMLSearch(X_train=X, y_train=y,
                                problem_type="binary",
                                engine="cf_process")
automl_cf_process.search(interactive_plot = False)
automl_cf_process.close_engine()

```

Parallelism with Dask

Thread or process level parallelism can be explicitly invoked for the DaskEngine (as well as the CFEngine). The processes can be set to True and the number of processes set using `n_workers`. If processes is set to False, then the resulting parallelism will be threaded and `n_workers` will represent the threads used. Examples of both follow.

```
[41]: from dask.distributed import LocalCluster

from evalml.automl.engine import DaskEngine

dask_engine_p2 = DaskEngine(cluster=LocalCluster(processes=True, n_workers=2))
automl_dask_p2 = AutoMLSearch(
    X_train=X,
    y_train=y,
    problem_type="binary",
    allowed_model_families=[ModelFamily.LINEAR_MODEL],
    engine=dask_engine_p2,
)
automl_dask_p2.search(interactive_plot=False)

# Explicitly shutdown the automl object's LocalCluster
automl_dask_p2.close_engine()
```

Inside a Dask worker with `daemon=True`, setting `n_jobs=1`.

Possible work-arounds:

- `dask.config.set({'distributed.worker.daemon': False})`

Dask (two processes) search duration: 20.654544591903687
Dask (four threads)search duration: 16.323939085006714

```

4.2 Pipelines

EvalML pipelines represent a sequence of operations to be applied to data, where each operation is either a data transformation or an ML modeling algorithm.

A pipeline holds a combination of one or more components, which will be applied to new input data in sequence.

Each component and pipeline supports a set of parameters which configure its behavior. The AutoML search process seeks to find the combination of pipeline structure and pipeline parameters which perform the best on the data.

4.2.1 Defining a Pipeline Instance

Pipeline instances can be instantiated using any of the following classes:

- RegressionPipeline
- BinaryClassificationPipeline
- MulticlassClassificationPipeline
- TimeSeriesRegressionPipeline
- TimeSeriesBinaryClassificationPipeline
- TimeSeriesMulticlassClassificationPipeline

The class you want to use will depend on your problem type. The only required parameter input for instantiating a pipeline instance is `component_graph`, which can be a `ComponentGraph` instance, a list, or a dictionary containing a sequence of components to be fit and evaluated.

A `component_graph` list is the default representation, which represents a linear order of transforming components with an estimator as the final component. A `component_graph` dictionary is used to represent a non-linear graph of components, where the key is a unique name for each component and the value is a list with the component's class as the first element and any parents of the component as the following element(s). For these two `component_graph` formats, each component can be provided as a reference to the component class for custom components, and as either a string name or as a reference to the component class for components defined in EvalML.

If you choose to provide a `ComponentGraph` instance and want to set custom parameters for your pipeline, set it through the pipeline initialization rather than `ComponentGraph.instantiate()`.

```

[1]: from evalml.pipelines import MulticlassClassificationPipeline, ComponentGraph

component_graph_as_list = ["Imputer", "Random Forest Classifier"]
MulticlassClassificationPipeline(component_graph=component_graph_as_list)

```

```
[1]: pipeline = MulticlassClassificationPipeline(component_graph={'Imputer': ['Imputer', 'X',
→ 'y'], 'Random Forest Classifier': ['Random Forest Classifier', 'Imputer.x', 'y']},
→ parameters={'Imputer':{'categorical_impute_strategy': 'most_frequent', 'numeric_impute_
→ strategy': 'mean', 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value
→ ': None, 'numeric_fill_value': None, 'boolean_fill_value': None}, 'Random Forest
→ Classifier':{'n_estimators': 100, 'max_depth': 6, 'n_jobs': -1}}, random_seed=0)
```

```
[2]: component_graph_as_dict = {
    "Imputer": ["Imputer", "X", "y"],
    "Encoder": ["One Hot Encoder", "Imputer.x", "y"],
    "Random Forest Clf": ["Random Forest Classifier", "Encoder.x", "y"],
    "Elastic Net Clf": ["Elastic Net Classifier", "Encoder.x", "y"],
    "Final Estimator": [
        "Logistic Regression Classifier",
        "Random Forest Clf.x",
        "Elastic Net Clf.x",
        "y",
    ],
}
```

```
MulticlassClassificationPipeline(component_graph=component_graph_as_dict)
```

```
[2]: pipeline = MulticlassClassificationPipeline(component_graph={'Imputer': ['Imputer', 'X',
→ 'y'], 'Encoder': ['One Hot Encoder', 'Imputer.x', 'y'], 'Random Forest Clf': ['Random
→ Forest Classifier', 'Encoder.x', 'y'], 'Elastic Net Clf': ['Elastic Net Classifier',

→ 'multi_class': 'auto', 'solver': 'saga'}, 'Final Estimator':{'penalty': 'l2', 'C': 1.0,
→ 'n_jobs': -1, 'multi_class': 'auto', 'solver': 'lbfgs'}}, random_seed=0)
```

```
[3]: cg = ComponentGraph(component_graph_as_dict)
```

```
# set parameters in the pipeline rather than through cg.instantiate()
```

```
MulticlassClassificationPipeline(component_graph=cg, parameters={})
```

```
[3]: pipeline = MulticlassClassificationPipeline(component_graph={'Imputer': ['Imputer', 'X',
→ 'y'], 'Encoder': ['One Hot Encoder', 'Imputer.x', 'y'], 'Random Forest Clf': ['Random
→ Forest Classifier', 'Encoder.x', 'y'], 'Elastic Net Clf': ['Elastic Net Classifier',
→ 'Encoder.x', 'y'], 'Final Estimator': ['Logistic Regression Classifier', 'Random
→ Forest Clf.x', 'Elastic Net Clf.x', 'y']}, parameters={'Imputer':{'categorical_impute_
→ strategy': 'most_frequent', 'numeric_impute_strategy': 'mean', 'boolean_impute_strategy
→ ': 'most_frequent', 'categorical_fill_value': None, 'numeric_fill_value': None,
→ 'boolean_fill_value': None}, 'Encoder':{'top_n': 10, 'features_to_encode': None,
→ 'categories': None, 'drop': 'if_binary', 'handle_unknown': 'ignore', 'handle_missing':
→ 'error'}, 'Random Forest Clf':{'n_estimators': 100, 'max_depth': 6, 'n_jobs': -1},
→ 'Elastic Net Clf':{'penalty': 'elasticnet', 'C': 1.0, 'l1_ratio': 0.15, 'n_jobs': -1,
→ 'multi_class': 'auto', 'solver': 'saga'}, 'Final Estimator':{'penalty': 'l2', 'C': 1.0,
→ 'n_jobs': -1, 'multi_class': 'auto', 'solver': 'lbfgs'}}, random_seed=0)
```

(continues on next page)

If you're using your own *custom components* you can refer to them like so:

```
[4]: from evalml.pipelines.components import Transformer

class NewTransformer(Transformer):
    name = "New Transformer"
    hyperparameter_ranges = {"parameter_1": ["a", "b", "c"]}

    def __init__(self, parameter_1=1, random_seed=0):
        parameters = {"parameter_1": parameter_1}
        super().__init__(parameters=parameters, random_seed=random_seed)

    def transform(self, X, y=None):
        # Your code here!
        return X

MulticlassClassificationPipeline([NewTransformer, "Random Forest Classifier"])

[4]: pipeline = MulticlassClassificationPipeline(component_graph={'New Transformer': ↵
↵ [NewTransformer, 'X', 'y'], 'Random Forest Classifier': ['Random Forest Classifier',
↵ 'New Transformer.x', 'y']}, parameters={'New Transformer':{'parameter_1': 1}, 'Random_
↵ Forest Classifier':{'n_estimators': 100, 'max_depth': 6, 'n_jobs': -1}}, random_seed=0)
```

4.2.2 Pipeline Usage

All pipelines define the following methods:

- `fit` fits each component on the provided training data, in order.
- `predict` computes the predictions of the component graph on the provided data.
- `score` computes the value of *an objective* on the provided data.

```
[5]: from evalml.demos import load_wine

X, y = load_wine()

pipeline = MulticlassClassificationPipeline(
    component_graph={
        "Label Encoder": ["Label Encoder", "X", "y"],
        "Imputer": ["Imputer", "X", "Label Encoder.y"],
        "Random Forest Classifier": [
            "Random Forest Classifier",
            "Imputer.x",
            "Label Encoder.y",
        ],
    },
)
pipeline.fit(X, y)
```

(continues on next page)

(continued from previous page)

```

print(pipeline.predict(X))
print(pipeline.score(X, y, objectives=["log loss multiclass"]))

```

4.2.3 Custom Name

By default, a pipeline's name is created using the component graph that makes up the pipeline. E.g. A pipeline with an imputer, one-hot encoder, and logistic regression classifier will have the name 'Logistic Regression Classifier w/ Imputer + One Hot Encoder'.

If you'd like to override the pipeline's name attribute, you can set the `custom_name` parameter when initializing a pipeline, like so:

```

[6]: component_graph = ["Imputer", "One Hot Encoder", "Logistic Regression Classifier"]
    pipeline = MulticlassClassificationPipeline(component_graph)
    print("Pipeline with default name:", pipeline.name)

    pipeline_with_name = MulticlassClassificationPipeline(
        component_graph, custom_name="My cool custom pipeline"
    )
    print("Pipeline with custom name:", pipeline_with_name.name)

    Pipeline with default name: Logistic Regression Classifier w/ Imputer + One Hot Encoder
    Pipeline with custom name: My cool custom pipeline

```

4.2.4 Pipeline Parameters

You can also pass in custom parameters by using the `parameters` parameter, which will then be used when instantiating each component in `component_graph`. The parameters dictionary needs to be in the format of a two-layered dictionary where the key-value pairs are the component name and corresponding component parameters dictionary. The component parameters dictionary consists of (parameter name, parameter values) key-value pairs.

An example will be shown below. The API reference for component parameters can also be found [here](#).

```
[7]: parameters = {
    "Imputer": {
        "categorical_impute_strategy": "most_frequent",
        "numeric_impute_strategy": "median",
    },
    "Logistic Regression Classifier": {
        "penalty": "l2",
        "C": 1.0,
    },
}
component_graph = [
    "Imputer",
    "One Hot Encoder",
    "Standard Scaler",
    "Logistic Regression Classifier",
]
MulticlassClassificationPipeline(component_graph=component_graph, parameters=parameters)

[7]: pipeline = MulticlassClassificationPipeline(component_graph={'Imputer': ['Imputer', 'X',
→ 'y'], 'One Hot Encoder': ['One Hot Encoder', 'Imputer.x', 'y'], 'Standard Scaler': [
→ 'Standard Scaler', 'One Hot Encoder.x', 'y'], 'Logistic Regression Classifier': [
→ 'Logistic Regression Classifier', 'Standard Scaler.x', 'y']}, parameters={'Imputer':{
→ 'categorical_impute_strategy': 'most_frequent', 'numeric_impute_strategy': 'median',
→ 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value': None, 'numeric_
→ fill_value': None, 'boolean_fill_value': None}, 'One Hot Encoder':{'top_n': 10,
→ 'features_to_encode': None, 'categories': None, 'drop': 'if_binary', 'handle_unknown':
→ 'ignore', 'handle_missing': 'error'}, 'Logistic Regression Classifier':{'penalty': 'l2
→ ', 'C': 1.0, 'n_jobs': -1, 'multi_class': 'auto', 'solver': 'lbfgs'}}}, random_seed=0)
```

4.2.5 Pipeline Description

You can call `.graph()` to see each component and its parameters. Each component takes in data and feeds it to the next.

```
[8]: component_graph = [
    "Imputer",
    "One Hot Encoder",
    "Standard Scaler",
    "Logistic Regression Classifier",
]
pipeline = MulticlassClassificationPipeline(
    component_graph=component_graph, parameters=parameters
)
pipeline.graph()
```

[8]:

```
[9]: component_graph_as_dict = {
    "Imputer": ["Imputer", "X", "y"],
    "Encoder": ["One Hot Encoder", "Imputer.x", "y"],
    "Random Forest Clf": ["Random Forest Classifier", "Encoder.x", "y"],
    "Elastic Net Clf": ["Elastic Net Classifier", "Encoder.x", "y"],
    "Final Estimator": [
        "Logistic Regression Classifier",
        "Random Forest Clf.x",
        "Elastic Net Clf.x",
        "y",
    ],
}

nonlinear_pipeline = MulticlassClassificationPipeline(
    component_graph=component_graph_as_dict
)
nonlinear_pipeline.graph()
```

[9]:

You can see a textual representation of the pipeline by calling `.describe()`:

[10]: `pipeline.describe()`

```
*****

```

4.2.6 Component Graph

You can use `pipeline.get_component(name)` and provide the component name to access any component (API reference [here](#)):

```
[12]: pipeline.get_component("Imputer")
[12]: Imputer(categorical_impute_strategy='most_frequent', numeric_impute_strategy='median',
↳ boolean_impute_strategy='most_frequent', categorical_fill_value=None, numeric_fill_
↳ value=None, boolean_fill_value=None)
```

```
[13]: nonlinear_pipeline.get_component("Elastic Net Clf")
[13]: ElasticNetClassifier(penalty='elasticnet', C=1.0, l1_ratio=0.15, n_jobs=-1, multi_class=
↳ 'auto', solver='saga')
```

Alternatively, you can index directly into the pipeline to get a component

```
[14]: first_component = pipeline[0]
print(first_component.name)
```

```
Imputer
```

```
[15]: nonlinear_pipeline["Final Estimator"]
[15]: LogisticRegressionClassifier(penalty='l2', C=1.0, n_jobs=-1, multi_class='auto', solver=
↳ 'lbfgs')
```

4.2.7 Pipeline Estimator

EvalML enforces that the last component of a linear pipeline is an estimator. You can access this estimator directly by using `pipeline.estimator`.

```
[16]: pipeline.estimator
[16]: LogisticRegressionClassifier(penalty='l2', C=1.0, n_jobs=-1, multi_class='auto', solver=
↳ 'lbfgs')
```

4.2.8 Input Feature Names

After a pipeline is fitted, you can access a pipeline's `input_feature_names` attribute to obtain a dictionary containing a list of feature names passed to each component of the pipeline. This could be especially useful for debugging where a feature might have been dropped or detecting unexpected behavior.

```
[17]: pipeline = MulticlassClassificationPipeline(["Imputer", "Random Forest Classifier"])
pipeline.fit(X, y)
pipeline.input_feature_names
[17]: {'Imputer': ['alcohol',
↳ 'malic_acid',
↳ 'ash',
↳ 'alcalinity_of_ash',
↳ 'magnesium',
```

(continues on next page)

(continued from previous page)

```

'total_phenols',
'flavanoids',
'nonflavanoid_phenols',
'proanthocyanins',
'color_intensity',
'hue',
'od280/od315_of_diluted_wines',
'proline'],
'Random Forest Classifier': ['alcohol',
'malic_acid',
'ash',
'alcalinity_of_ash',
'magnesium',
'total_phenols',
'flavanoids',
'nonflavanoid_phenols',
'proanthocyanins',
'color_intensity',
'hue',
'od280/od315_of_diluted_wines',
'proline']]

```

4.2.9 Binary Classification Pipeline Thresholds

For binary classification pipelines, you can choose to tune the decision boundary threshold, which allows the pipeline to distinguish predictions from positive to negative. The default boundary, if none is set, is 0.5, which means that predictions with a probability of ≥ 0.5 are classified as the positive class, while all others are negative.

You can use the binary classification pipeline's `optimize_thresholds` method to choose the best threshold for an objective, or it can be manually set. EvalML's [AutoMLSearch](#) uses `optimize_thresholds` by default for binary problems, and it uses F1 as the default objective to optimize on. This can be turned off by passing in `optimize_thresholds=False`, or you can change the objective used by changing the `objective` or `alternate_thresholding_objective` arguments.

```

[18]: from evalml.demos import load_breast_cancer
      from evalml.pipelines import BinaryClassificationPipeline

X, y = load_breast_cancer()
X_to_predict = X.tail(10)

bcp = BinaryClassificationPipeline(
    {
        "Imputer": ["Imputer", "X", "y"],
        "Label Encoder": ["Label Encoder", "Imputer.x", "y"],
        "RFC": ["Random Forest Classifier", "Imputer.x", "Label Encoder.y"],
    }
)
bcp.fit(X, y)

predict_proba = bcp.predict_proba(X_to_predict)
predict_proba

```

```

      Number of Features
Numeric              30

Number of training examples: 569
Targets
benign      62.74%
malignant   37.26%
Name: count, dtype: object

```

```

[18]:      benign  malignant
559  0.925711  0.074289
560  0.939512  0.060488
561  0.991177  0.008823
562  0.010155  0.989845
563  0.000155  0.999845
564  0.000100  0.999900
565  0.000155  0.999845
566  0.011528  0.988472
567  0.000155  0.999845
568  0.994452  0.005548

```

```

[19]: # view the current threshold
print("The threshold is {}".format(bcp.threshold))

# view the first few predictions
print(bcp.predict(X_to_predict))

```

```

The threshold is None
559      benign
560      benign
561      benign
562    malignant
563    malignant
564    malignant
565    malignant
566    malignant
567    malignant
568      benign
dtype: category
Categories (2, object): ['benign', 'malignant']

```

Note that the default threshold above is None, which means that the pipeline defaults to using 0.5 as the threshold.

You can manually set the threshold as well:

```

[20]: # you can manually set the threshold
bcp.threshold = 0.99
# view the threshold
print("The threshold is {}".format(bcp.threshold))

# view the first few predictions
print(bcp.predict(X_to_predict))

The threshold is 0.99
559      benign

```

(continues on next page)

(continued from previous page)

```

560      benign
561      benign
562      benign
563      malignant
564      malignant
565      malignant
566      benign
567      malignant
568      benign
Name: malignant, dtype: category
Categories (2, object): ['benign', 'malignant']

```

However, the best way to set the threshold is by using the pipeline's `optimize_threshold` method. This takes in the predicted values, as well as the true values and objective to optimize with, and it finds the best threshold to maximize this objective value.

This method is best used with validation data, since optimizing on training data could lead to overfitting and optimizing on test data would introduce large biases.

Below walks through threshold tuning using the F1 objective.

```

[21]: from evalml.objectives import F1

# get predictions for positive class only
predict_proba = predict_proba.iloc[:, -1]
bcp.optimize_threshold(X_to_predict, y.tail(10), predict_proba, F1())

print("The new threshold is {}".format(bcp.threshold))

# view the first few predictions
print(bcp.predict(X_to_predict))

The new threshold is 0.13521817340545206
559      benign
560      benign
561      benign
562      malignant
563      malignant
564      malignant
565      malignant
566      malignant
567      malignant
568      benign
Name: malignant, dtype: category
Categories (2, object): ['benign', 'malignant']

```

4.2.10 Grabbing rows near the decision boundary

For binary classification problems, you can also look at the rows closest to the decision boundary by using `rows_of_interest`. This method returns the indices of interest, which can then be used to obtain the subset of the data that falls closest to the decision boundary. This can help with further analysis of the model, and can give you better understanding of what rows the model could be having trouble with.

`rows_of_interest` takes in an `epsilon` parameter (defaulted to 0.1), which determines which rows to return. The rows that are returned are the rows where the probability of it being in the positive class fall between the `threshold +/- epsilon` range. Increase the `epsilon` value to get more rows, and decrease it to get fewer rows.

Below is a walkthrough of using `rows_of_interest`, building off the previous pipeline which is already thresholded.

```
[22]: from evalml.pipelines.utils import rows_of_interest
```

```
indices = rows_of_interest(bcp, X, y, types="all")
X.iloc[indices].head()
```

```

      413    0.149718
      Name: malignant, dtype: float64

```

4.2.11 Saving and Loading Pipelines

You can save and load trained or untrained pipeline instances using the Python `pickle` format, like so:

```

[24]: import pickle

pipeline_to_pickle = BinaryClassificationPipeline(
    ["Imputer", "Random Forest Classifier"]
)

with open("pipeline.pkl", "wb") as f:
    pickle.dump(pipeline_to_pickle, f)

pickled_pipeline = None
with open("pipeline.pkl", "rb") as f:
    pickled_pipeline = pickle.load(f)

assert pickled_pipeline == pipeline_to_pickle
pickled_pipeline.fit(X, y)

[24]: pipeline = BinaryClassificationPipeline(component_graph={'Imputer': ['Imputer', 'X', 'y',
↪ ], 'Random Forest Classifier': ['Random Forest Classifier', 'Imputer.x', 'y']},
↪ parameters={'Imputer': {'categorical_impute_strategy': 'most_frequent', 'numeric_impute_
↪ strategy': 'mean', 'boolean_impute_strategy': 'most_frequent', 'categorical_fill_value
↪ ': None, 'numeric_fill_value': None, 'boolean_fill_value': None}, 'Random Forest
↪ Classifier': {'n_estimators': 100, 'max_depth': 6, 'n_jobs': -1}}, random_seed=0)

```

4.2.12 Generate Code

Once you have instantiated a pipeline, you can generate string Python code to recreate this pipeline, which can then be saved and run elsewhere with EvalML. `generate_pipeline_code` requires a pipeline instance as the input. It can also handle custom components, but it won't return the code required to define the component. Note that any external libraries used in creating the pipeline instance will also need to be imported to execute the returned code.

Code generation is not yet supported for nonlinear pipelines.

```
[25]: from evalml.pipelines.utils import generate_pipeline_code
from evalml.pipelines import BinaryClassificationPipeline
import pandas as pd
from evalml.utils import infer_feature_types
from skopt.space import Integer

class MyDropNullColumns(Transformer):
    """Transformer to drop features whose percentage of NaN values exceeds a specified
    threshold"""

    name = "My Drop Null Columns Transformer"
    hyperparameter_ranges = {}

    def __init__(self, pct_null_threshold=1.0, random_seed=0, **kwargs):
        """Initializes an transformer to drop features whose percentage of NaN values
        exceeds a specified threshold.

        Args:
            pct_null_threshold(float): The percentage of NaN values in an input feature
            to drop.
                Must be a value between [0, 1] inclusive. If equal to 0.0, will drop
            columns with any null values.
                If equal to 1.0, will drop columns with all null values. Defaults to 0.
            95.
        """
        if pct_null_threshold < 0 or pct_null_threshold > 1:
            raise ValueError(
                "pct_null_threshold must be a float between 0 and 1, inclusive."
            )
        parameters = {"pct_null_threshold": pct_null_threshold}
        parameters.update(kwargs)

        self._cols_to_drop = None
        super().__init__(
            parameters=parameters, component_obj=None, random_seed=random_seed
        )

    def fit(self, X, y=None):
        pct_null_threshold = self.parameters["pct_null_threshold"]
        X = infer_feature_types(X)
        percent_null = X.isnull().mean()
        if pct_null_threshold == 0.0:
            null_cols = percent_null[percent_null > 0]
        else:
```

(continues on next page)

(continued from previous page)

```

        null_cols = percent_null[percent_null >= pct_null_threshold]
        self._cols_to_drop = list(null_cols.index)
        return self

    def transform(self, X, y=None):
        """Transforms data X by dropping columns that exceed the threshold of null
        values.
        Args:
            X (pd.DataFrame): Data to transform
            y (pd.Series, optional): Targets
        Returns:
            pd.DataFrame: Transformed X
        """

        X = infer_feature_types(X)
        return X.drop(columns=self._cols_to_drop)

pipeline_instance = BinaryClassificationPipeline(
    [
        "Imputer",

4.3 Component Graphs

EvalML component graphs represent and describe the flow of data in a collection of related components. A component graph is comprised of nodes representing components, and edges between pairs of nodes representing where the inputs and outputs of each component should go. It is the backbone of the features offered by the EvalML *pipeline*, but is also a powerful data structure on its own. EvalML currently supports component graphs as linear and *directed acyclic graphs* (DAG).

4.3.1 Defining a Component Graph

Component graphs can be defined by specifying the dictionary of components and edges that describe the graph.

In this dictionary, each key is a reference name for a component. Each corresponding value is a list, where the first element is the component itself, and the remaining elements are the input edges that should be connected to that component. The component as listed in the value can either be the component object itself or its string name.

This structure is very similar to that of *Dask computation graphs*.

For example, in the code example below, we have a simple component graph made up of two components: an Imputer and a Random Forest Classifier. The names used to reference these two components are given by the keys, “My Imputer” and “RF Classifier” respectively. Each value in the dictionary is a list where the first element is the component corresponding to the component name, and the remaining elements are the inputs, e.g. “My Imputer” represents an Imputer component which has inputs “X” (the original features matrix) and “y” (the original target).

Feature edges are specified as “X” or “{component_name}.x”. For example, {“My Component”: [MyComponent, “Imputer.x”, ...]} indicates that we should use the feature output of the Imputer as as part of the feature input for MyComponent. Similarly, target edges are specified as “y” or “{component_name}.y”. {“My Component”: [MyComponent, “Target Imputer.y”, ...]} indicates that we should use the target output of the Target Imputer as a target input for MyComponent.

Each component can have a number of feature inputs, but can only have one target input. All input edges must be explicitly defined.

Using a real example, we define a simple component graph consisting of three nodes: an Imputer (“My Imputer”), an One-Hot Encoder (“OHE”), and a Random Forest Classifier (“RF Classifier”).

- “My Imputer” takes the original X as a features input, and the original y as the target input
- “OHE” also takes the original X as a features input, and the original y as the target input
- “RF Classifier” takes the concatted feature outputs from “My Imputer” and “OHE” as a features input, and the original y as the target input.

```
[1]: from evalml.pipelines import ComponentGraph

component_dict = {
    "My Imputer": ["Imputer", "X", "y"],
    "OHE": ["One Hot Encoder", "X", "y"],
    "RF Classifier": [
        "Random Forest Classifier",
        "My Imputer.x",
        "OHE.x",
        "y",
    ], # takes in multiple feature inputs
}
cg_simple = ComponentGraph(component_dict)
```

All component graphs must end with one final or terminus node. This can either be a transformer or an estimator. Below, the component graph is invalid because has two terminus nodes: the “RF Classifier” and the “EN Classifier”.

```
[2]: # Can't instantiate a component graph with more than one terminus node (here: RF_
↳Classifier, EN Classifier)
component_dict = {
    "My Imputer": ["Imputer", "X", "y"],
    "RF Classifier": ["Random Forest Classifier", "My Imputer.x", "y"],
    "EN Classifier": ["Elastic Net Classifier", "My Imputer.x", "y"],
}
```

Once we have defined a component graph, we can instantiate the graph with specific parameter values for each component using `.instantiate(parameters)`. All components in a component graph must be instantiated before fitting, transforming, or predicting.

Below, we instantiate our graph and set the value of our Imputer’s `numeric_impute_strategy` to “most_frequent”.

```
[3]: cg_simple.instantiate({"My Imputer": {"numeric_impute_strategy": "most_frequent"}})

[3]: {'My Imputer': ['Imputer', 'X', 'y'], 'OHE': ['One Hot Encoder', 'X', 'y'], 'RF_
↳Classifier': ['Random Forest Classifier', 'My Imputer.x', 'OHE.x', 'y']}
```

4.3.2 Components in the Component Graph

You can use `.get_component(name)` and provide the unique component name to access any component in the component graph. Below, we can grab our Imputer component and confirm that `numeric_impute_strategy` has indeed been set to “most_frequent”.

```
[4]: cg_simple.get_component("My Imputer")

[4]: Imputer(categorical_impute_strategy='most_frequent', numeric_impute_strategy='most_
↳frequent', boolean_impute_strategy='most_frequent', categorical_fill_value=None,
↳numeric_fill_value=None, boolean_fill_value=None)
```

You can also `.get_inputs(name)` and provide the unique component name to retrieve all inputs for that component.

Below, we can grab our “RF Classifier” component and confirm that we use “My Imputer.x” as our features input and “y” as target input.

```
[5]: cg_simple.get_inputs("RF Classifier")
```

```
[5]: ['My Imputer.x', 'OHE.x', 'y']
```

4.3.3 Component Graph Computation Order

Upon initialization, each component graph will generate a topological order. We can access this generated order by calling the `.compute_order` attribute. This attribute is used to determine the order that components should be evaluated during calls to `fit` and `transform`.

```
[6]: cg_simple.compute_order
```

```
[6]: ['My Imputer', 'OHE', 'RF Classifier']
```

4.3.4 Visualizing Component Graphs

We can get more information about an instantiated component graph by calling `.describe()`. This method will pretty-print each of the components in the graph and its parameters.

```
[7]: # Using a more involved component graph with more complex edges
component_dict = {
    "Imputer": ["Imputer", "X", "y"],
    "Target Imputer": ["Target Imputer", "X", "y"],
    "OneHot_RandomForest": ["One Hot Encoder", "Imputer.x", "Target Imputer.y"],
    "OneHot_ElasticNet": ["One Hot Encoder", "Imputer.x", "y"],
    "Random Forest": ["Random Forest Classifier", "OneHot_RandomForest.x", "y"],
    "Elastic Net": [
        "Elastic Net Classifier",
        "OneHot_ElasticNet.x",
        "Target Imputer.y",
    ],
    "Logistic Regression": [
        "Logistic Regression Classifier",
        "Random Forest.x",
        "Elastic Net.x",
        "y",
    ],
}
cg_with_estimators = ComponentGraph(component_dict)
cg_with_estimators.instantiate({})
cg_with_estimators.describe()
```

```
1. Imputer
   * categorical_impute_strategy : most_frequent
   * numeric_impute_strategy : mean
   * boolean_impute_strategy : most_frequent
   * categorical_fill_value : None
   * numeric_fill_value : None
```

(continues on next page)

(continued from previous page)

```

        * boolean_fill_value : None
2. Target Imputer

7. Logistic Regression Classifier
    * penalty : l2
    * C : 1.0
    * n_jobs : -1
    * multi_class : auto
    * solver : lbfgs

```

We can also visualize a component graph by calling `.graph()`.

```
[8]: cg_with_estimators.graph()
```

```
[8]:
```

4.3.5 Component graph methods

Similar to the pipeline structure, we can call `fit`, `transform` or `predict`.

We can also call `fit_features` which will fit all but the final component and `compute_final_component_features` which will transform all but the final component. These two methods may be useful in cases where you want to understand what transformed features are being passed into the last component.

```
[9]: from evalml.demos import load_breast_cancer
```

(continues on next page)

(continued from previous page)

```

X, y = load_breast_cancer()
component_dict = {
    "My Imputer": ["Imputer", "X", "y"],
    "OHE": ["One Hot Encoder", "My Imputer.x", "y"],
}
cg_with_final_transformer = ComponentGraph(component_dict)
cg_with_final_transformer.instantiate({})
cg_with_final_transformer.fit(X, y)

# We can call `transform` for ComponentGraphs with a final transformer
cg_with_final_transformer.transform(X, y)

```

4.4 Components

Components are the lowest level of building blocks in EvalML. Each component represents a fundamental operation to be applied to data.

All components accept parameters as keyword arguments to their `__init__` methods. These parameters can be used to configure behavior.

Each component class definition must include a human-readable `name` for the component. Additionally, each component class may expose parameters for AutoML search by defining a `hyperparameter_ranges` attribute containing the parameters in question.

EvalML splits components into two categories: **transformers** and **estimators**.

4.4.1 Transformers

Transformers subclass the `Transformer` class, and define a `fit` method to learn information from training data and a `transform` method to apply a learned transformation to new data.

For example, an *imputer* is configured with the desired impute strategy to follow, for instance the mean value. The imputers `fit` method would learn the mean from the training data, and the `transform` method would fill the learned mean value in for any missing values in new data.

All transformers can execute `fit` and `transform` separately or in one step by calling `fit_transform`. Defining a custom `fit_transform` method can facilitate useful performance optimizations in some cases.

```
[1]: import numpy as np
      import pandas as pd
      from evalml.pipelines.components import SimpleImputer

      X = pd.DataFrame([[1, 2, 3], [1, np.nan, 3]])
      display(X)

      0      1      2
0  1  2.0  3
1  1  NaN  3
```

```
[2]: import woodwork as ww
```

```
imp = SimpleImputer(impute_strategy="mean")
```

```
X.ww.init()
```

```
X = imp.fit_transform(X)
```

```
display(X)
```

```

      0      1      2
0  1  2.0  3
1  1  2.0  3

```

Below is a list of all transformers included with EvalML:

```
[3]: from evalml.pipelines.components.utils import all_components, Estimator, Transformer
```

```
for component in all_components():
```

```
    if issubclass(component, Transformer):
```

```
        print(f"Transformer: {component.name}")
```

```

4.4.2 Estimators

Each estimator wraps an ML algorithm. Estimators subclass the `Estimator` class, and define a `fit` method to learn information from training data and a `predict` method for generating predictions from new data. Classification estimators should also define a `predict_proba` method for generating predicted probabilities.

Estimator classes each define a `model_family` attribute indicating what type of model is used.

Here's an example of using the `LogisticRegressionClassifier` estimator to fit and predict on a simple dataset:

```
[4]: from evalml.pipelines.components import LogisticRegressionClassifier

clf = LogisticRegressionClassifier()

X = X
y = [1, 0]

clf.fit(X, y)
clf.predict(X)

[4]: 0      0
     1      0
dtype: int64
```

Below is a list of all estimators included with EvalML:

```
[5]: from evalml.pipelines.components.utils import all_components, Estimator, Transformer

for component in all_components():
    if issubclass(component, Estimator):
        print(f"Estimator: {component.name}")

4.4.3 Defining Custom Components

EvalML allows you to easily create your own custom components by following the steps below.

Custom Transformers

Your transformer must inherit from the correct subclass. In this case *Transformer* for components that transform data. Next we will use EvalML's *DropNullColumns* as an example.

```

[6]: from evalml.pipelines.components import Transformer
     from evalml.utils import (
         infer_feature_types,
     )

class DropNullColumns(Transformer):
    """Transformer to drop features whose percentage of NaN values exceeds a specified
    ↪ threshold"""

    name = "Drop Null Columns Transformer"
    hyperparameter_ranges = {}

    def __init__(self, pct_null_threshold=1.0, random_seed=0, **kwargs):
        """Initializes an transformer to drop features whose percentage of NaN values
        ↪ exceeds a specified threshold.

        Args:
            pct_null_threshold(float): The percentage of NaN values in an input feature
            ↪ to drop.
                Must be a value between [0, 1] inclusive. If equal to 0.0, will drop
            ↪ columns with any null values.
                If equal to 1.0, will drop columns with all null values. Defaults to 0.
            ↪ 95.
        """

```

(continues on next page)

(continued from previous page)

```

    if pct_null_threshold < 0 or pct_null_threshold > 1:
        raise ValueError(
            "pct_null_threshold must be a float between 0 and 1, inclusive."
        )
    parameters = {"pct_null_threshold": pct_null_threshold}
    parameters.update(kwargs)

    self._cols_to_drop = None
    super().__init__(
        parameters=parameters, component_obj=None, random_seed=random_seed
    )

def fit(self, X, y=None):
    """Fits DropNullColumns component to data

    Args:
        X (pd.DataFrame): The input training data of shape [n_samples, n_features]
        y (pd.Series, optional): The target training data of length [n_samples]

    Returns:
        self
    """
    pct_null_threshold = self.parameters["pct_null_threshold"]
    X_t = infer_feature_types(X)
    percent_null = X_t.isnull().mean()
    if pct_null_threshold == 0.0:
        null_cols = percent_null[percent_null > 0]
    else:
        null_cols = percent_null[percent_null >= pct_null_threshold]
    self._cols_to_drop = list(null_cols.index)
    return self

def transform(self, X, y=None):
    """Transforms data X by dropping columns that exceed the threshold of null_
    ↪ values.

    Args:
        X (pd.DataFrame): Data to transform
        y (pd.Series, optional): Ignored.

    Returns:
        pd.DataFrame: Transformed X
    """
    X_t = infer_feature_types(X)
    return X_t.drop(self._cols_to_drop)

```

Required fields

- `name`: A human-readable name.
- `modifies_features`: A boolean that specifies whether this component modifies (subsets or transforms) the features variable during `transform`.
- `modifies_target`: A boolean that specifies whether this component modifies (subsets or transforms) the target variable during `transform`.

Required methods

Likewise, there are select methods you need to override as `Transformer` is an abstract base class:

- `__init__()`: The `__init__()` method of your transformer will need to call `super().__init__()` and pass three parameters in: a `parameters` dictionary holding the parameters to the component, the `component_obj`, and the `random_seed` value. You can see that `component_obj` is set to `None` above and we will discuss `component_obj` in depth later on.
- `fit()`: The `fit()` method is responsible for fitting your component on training data. It should return the component object.
- `transform()`: After fitting a component, the `transform()` method will take in new data and transform accordingly. It should return a pandas dataframe with woodwork initialized. Note: a component must call `fit()` before `transform()`.

You can also call or override `fit_transform()` that combines `fit()` and `transform()` into one method.

Custom Estimators

Your estimator must inherit from the correct subclass. In this case `Estimator` for components that predict new target values. Next we will use EvalML's `BaselineRegressor` as an example.

```
[7]: import numpy as np
import pandas as pd

from evalml.model_family import ModelFamily
from evalml.pipelines.components.estimators import Estimator
from evalml.problem_types import ProblemTypes

class BaselineRegressor(Estimator):
    """Regressor that predicts using the specified strategy.

    This is useful as a simple baseline regressor to compare with other regressors.
    """

    name = "Baseline Regressor"
    hyperparameter_ranges = {}
    model_family = ModelFamily.BASELINE
    supported_problem_types = [
        ProblemTypes.REGRESSION,
        ProblemTypes.TIME_SERIES_REGRESSION,
    ]
```

(continues on next page)

(continued from previous page)

```

def __init__(self, strategy="mean", random_seed=0, **kwargs):
    """Baseline regressor that uses a simple strategy to make predictions.

    Args:
        strategy (str): Method used to predict. Valid options are "mean", "median".
        Defaults to "mean".
        random_seed (int): Seed for the random number generator. Defaults to 0.

    """
    if strategy not in ["mean", "median"]:
        raise ValueError(
            "'strategy' parameter must equal either 'mean' or 'median'"
        )
    parameters = {"strategy": strategy}
    parameters.update(kwargs)

    self._prediction_value = None
    self._num_features = None
    super().__init__(
        parameters=parameters, component_obj=None, random_seed=random_seed
    )

def fit(self, X, y=None):
    if y is None:
        raise ValueError("Cannot fit Baseline regressor if y is None")
    X = infer_feature_types(X)
    y = infer_feature_types(y)

    if self.parameters["strategy"] == "mean":
        self._prediction_value = y.mean()
    elif self.parameters["strategy"] == "median":
        self._prediction_value = y.median()
    self._num_features = X.shape[1]
    return self

def predict(self, X):
    X = infer_feature_types(X)
    predictions = pd.Series([self._prediction_value] * len(X))
    return infer_feature_types(predictions)

@property
def feature_importance(self):
    """Returns importance associated with each feature. Since baseline regressors do
    not use input features to calculate predictions, returns an array of zeroes.

    Returns:
        np.ndarray (float): An array of zeroes

    """
    return np.zeros(self._num_features)

```

Required fields

- `name`: A human-readable name.
- `model_family` - EvalML *model_family* that this component belongs to
- `supported_problem_types` - list of EvalML *problem_types* that this component supports
- `modifies_features`: A boolean that specifies whether the return value from `predict` or `predict_proba` should be used as features.
- `modifies_target`: A boolean that specifies whether the return value from `predict` or `predict_proba` should be used as the target variable.

Model families and problem types include:

```
[8]: from evalml.model_family import ModelFamily
from evalml.problem_types import ProblemTypes

print("Model Families:\n", [m.value for m in ModelFamily])
print("Problem Types:\n", [p.value for p in ProblemTypes])

Model Families:
['k_neighbors', 'random_forest', 'svm', 'xgboost', 'lightgbm', 'linear_model', 'catboost',
→ 'extra_trees', 'ensemble', 'decision_tree', 'exponential_smoothing', 'arima',
→ 'varmax', 'baseline', 'prophet', 'vowpal_wabbit', 'none']
Problem Types:
['binary', 'multiclass', 'regression', 'time series regression', 'time series binary',
→ 'time series multiclass', 'multiseries time series regression']
```

Required methods

- `__init__()` - the `__init__()` method of your estimator will need to call `super().__init__()` and pass three parameters in: a `parameters` dictionary holding the parameters to the component, the `component_obj`, and the `random_seed` value.
- `fit()` - the `fit()` method is responsible for fitting your component on training data.
- `predict()` - after fitting a component, the `predict()` method will take in new data and predict new target values. Note: a component must call `fit()` before `predict()`.
- `feature_importance` - `feature_importance` is a [Python property](#) that returns a list of importances associated with each feature.

If your estimator handles classification problems it also requires an additional method:

- `predict_proba()` - this method predicts probability estimates for classification labels

Components Wrapping Third-Party Objects

The `component_obj` parameter is used for wrapping third-party objects and using them in component implementation. If you're using a `component_obj` you will need to define `__init__()` and pass in the relevant object that has also implemented the required methods mentioned above. However, if the `component_obj` does not follow EvalML component conventions, you may need to override methods as needed. Below is an example of EvalML's *LinearRegressor*.

```
[9]: from sklearn.linear_model import LinearRegression as SKLinearRegression

from evalml.model_family import ModelFamily
from evalml.pipelines.components.estimators import Estimator
from evalml.problem_types import ProblemTypes

class LinearRegressor(Estimator):
    """Linear Regressor."""

    name = "Linear Regressor"
    model_family = ModelFamily.LINEAR_MODEL
    supported_problem_types = [ProblemTypes.REGRESSION]

    def __init__(
        self, fit_intercept=True, normalize=False, n_jobs=-1, random_seed=0, **kwargs
    ):
        parameters = {
            "fit_intercept": fit_intercept,
            "normalize": normalize,
            "n_jobs": n_jobs,
        }
        parameters.update(kwargs)
        linear_regressor = SKLinearRegression(**parameters)
        super().__init__(
            parameters=parameters,
            component_obj=linear_regressor,
            random_seed=random_seed,
        )

    @property
    def feature_importance(self):
        return self._component_obj.coef_
```

Hyperparameter Ranges for AutoML

`hyperparameter_ranges` is a dictionary mapping the parameter name (str) to an allowed range (*SkOpt Space*) for that parameter. Both lists and `skopt.space.Categorical` values are accepted for categorical spaces.

AutoML will perform a search over the allowed ranges for each parameter to select models which produce optimal performance within those ranges. AutoML gets the allowed ranges for each component from the component's `hyperparameter_ranges` class attribute. Any component parameter you add an entry for in `hyperparameter_ranges` will be included in the AutoML search. If parameters are omitted, AutoML will use the default value in all pipelines.

4.4.4 Generate Component Code

Once you have a component defined in EvalML, you can generate string Python code to recreate this component, which can then be saved and run elsewhere with EvalML. `generate_component_code` requires a component instance as the input. This method works for custom components as well, although it won't return the code required to define the custom component.

```
[10]: from evalml.pipelines.components import LogisticRegressionClassifier
      from evalml.pipelines.components.utils import generate_component_code

      lr = LogisticRegressionClassifier(C=5)
      code = generate_component_code(lr)
      print(code)

      from evalml.pipelines.components.estimators.classifiers.logistic_regression_classifier_
      ↪ import LogisticRegressionClassifier

      logisticRegressionClassifier = LogisticRegressionClassifier(**{'penalty': 'l2', 'C': 5,
      ↪ 'n_jobs': -1, 'multi_class': 'auto', 'solver': 'lbfgs'})

[11]: # this string can then be copy and pasted into a separate window and executed as python_
      ↪ code
      exec(code)

[12]: # We can also do this for custom components
      from evalml.pipelines.components.utils import generate_component_code

      myDropNull = DropNullColumns()
      print(generate_component_code(myDropNull))

      dropNullColumnsTransformer = DropNullColumns(**{'pct_null_threshold': 1.0})
```

Expectations for Custom Classification Components

EvalML expects the following from custom classification component implementations:

- Classification targets will range from 0 to n-1 and are integers.
- For classification estimators, the order of `predict_proba`'s columns must match the order of the target, and the column names must be integers ranging from 0 to n-1

4.5 Objectives

4.5.1 Overview

One of the key choices to make when training an ML model is what metric to choose by which to measure the efficacy of the model at learning the signal. Such metrics are useful for comparing how well the trained models generalize to new similar data.

This choice of metric is a key component of AutoML because it defines the cost function the AutoML search will seek to optimize. In EvalML, these metrics are called **objectives**. AutoML will seek to minimize (or maximize) the objective score as it explores more pipelines and parameters and will use the feedback from scoring pipelines to tune the

available hyperparameters and continue the search. Therefore, it is critical to have an objective function that represents how the model will be applied in the intended domain of use.

EvalML supports a variety of objectives from traditional supervised ML including [mean squared error](#) for regression problems and [cross entropy](#) or [area under the ROC curve](#) for classification problems. EvalML also allows the user to define a custom objective using their domain expertise, so that AutoML can search for models which provide the most value for the user's problem.

Optimization vs Ranking Objectives

There are many common objectives used for evaluating model performance. However, not all of these objectives should be used to optimize AutoMLSearch. Consider the popular objective `recall`, which is the number of true positives divided by the number of true positives and false negatives. If the model has no false negatives, the `recall` ends up being a perfect score of 1. During automatic optimization, models can exploit this by predicting the positive label in every case, making a completely useless but seemingly highly performant model. However, this objective is still useful when trying to evaluate performance after a model has been trained.

Due to this potential issue, we define two types of objectives: optimization and ranking. Optimization objectives are those that can be used within AutoMLSearch to train performant models. Ranking objectives can be used after AutoMLSearch has been run, to rank or otherwise evaluate model performance. These include all of the optimization metrics, as well as all other important metrics such as recall that are excluded from optimization.

Note that we also define a third class of objectives, non-core objectives, which are domain-specific and require additional configuration before they can be used.

4.5.2 Optimization Objectives

Use the `get_optimization_objectives` method to get a list of which objectives can be used for optimization in AutoMLSearch for each problem type:

```
[1]: from evalml.objectives import get_optimization_objectives
from evalml.problem_types import ProblemTypes

for objective in get_optimization_objectives(ProblemTypes.BINARY):
    print(objective.name)
```

```
MCC Binary
Log Loss Binary
Gini
AUC
Precision
F1
Balanced Accuracy Binary
Accuracy Binary
```

4.5.3 Ranking Objectives

Use the `get_ranking_objectives` method to get a list of which objectives are included with EvalML for each problem type:

```
[2]: from evalml.objectives import get_ranking_objectives

for objective in get_ranking_objectives(ProblemTypes.BINARY):
    print(objective.name)
```

```
MCC Binary
Log Loss Binary
Gini
AUC
Recall
Precision
F1
Balanced Accuracy Binary
Accuracy Binary
```

EvalML defines a base objective class for each problem type: `RegressionObjective`, `BinaryClassificationObjective` and `MulticlassClassificationObjective`. All EvalML objectives are a subclass of one of these.

Binary Classification Objectives and Thresholds

All binary classification objectives have a `threshold` property. Some binary classification objectives like log loss and AUC are unaffected by the choice of binary classification threshold, because they score based on predicted probabilities or examine a range of threshold values. These metrics are defined with `score_needs_proba` set to `False`. For all other binary classification objectives, we can compute the optimal binary classification threshold from the predicted probabilities and the target.

```
[3]: from evalml.pipelines import BinaryClassificationPipeline
from evalml.demos import load_fraud
from evalml.objectives import F1

X, y = load_fraud(n_rows=100)
X.wm.init(
    logical_types={
        "provider": "Categorical",
        "region": "Categorical",
        "currency": "Categorical",
        "expiration_date": "Categorical",
    }
)
objective = F1()
pipeline = BinaryClassificationPipeline(
    component_graph=[
        "Imputer",
        "DateTime Featurizer",
        "One Hot Encoder",
        "Random Forest Classifier",
    ]
)
```

(continues on next page)

(continued from previous page)

```

)
pipeline.fit(X, y)
print(pipeline.threshold)
print(pipeline.score(X, y, objectives=[objective]))

y_pred_proba = pipeline.predict_proba(X)[True]
pipeline.threshold = objective.optimize_threshold(y_pred_proba, y)
print(pipeline.threshold)
print(pipeline.score(X, y, objectives=[objective]))

```

	Number of Features
Boolean	1
Categorical	6
Numeric	5

```

Number of training examples: 100
Targets
False    91.00%
True     9.00%
Name: count, dtype: object
None
OrderedDict([('F1', 1.0)])
0.37905689607742854
OrderedDict([('F1', 1.0)])

```

4.5.4 Custom Objectives

Often times, the objective function is very specific to the use-case or business problem. To get the right objective to optimize requires thinking through the decisions or actions that will be taken using the model and assigning a cost/benefit to doing that correctly or incorrectly based on known outcomes in the training data.

Once you have determined the objective for your business, you can provide that to EvalML to optimize by defining a custom objective function.

Defining a Custom Objective Function

To create a custom objective class, we must define several elements:

- **name:** The printable name of this objective.
- **objective_function:** This function takes the predictions, true labels, and an optional reference to the inputs, and returns a score of how well the model performed.
- **greater_is_better:** True if a higher `objective_function` value represents a better solution, and otherwise False.
- **score_needs_proba:** Only for classification objectives. True if the objective is intended to function with predicted probabilities as opposed to predicted values (example: cross entropy for classifiers).
- **decision_function:** Only for binary classification objectives. This function takes predicted probabilities that were output from the model and a binary classification threshold, and returns predicted values.
- **perfect_score:** The score achieved by a perfect model on this objective.

- `expected_range`: The expected range of values we want this objective to output, which doesn't necessarily have to be equal to the possible range of values. For example, our expected R2 range is from `[-1, 1]`, although the actual range is `(-inf, 1]`.

Example: Fraud Detection

To give a concrete example, let's look at how the *fraud detection* objective function is built.

```
[4]: from evalml.objectives.binary_classification_objective import (
    BinaryClassificationObjective,
)
import pandas as pd

class FraudCost(BinaryClassificationObjective):
    """Score the percentage of money lost of the total transaction amount process due to
    fraud"""

    name = "Fraud Cost"
    greater_is_better = False
    score_needs_proba = False
    perfect_score = 0.0

    def __init__(
        self,
        retry_percentage=0.5,
        interchange_fee=0.02,
        fraud_payout_percentage=1.0,
        amount_col="amount",
    ):
        """Create instance of FraudCost

        Args:
            retry_percentage (float): What percentage of customers that will retry a
            transaction if it
            is declined. Between 0 and 1. Defaults to .5

            interchange_fee (float): How much of each successful transaction you can
            collect.
            Between 0 and 1. Defaults to .02

            fraud_payout_percentage (float): Percentage of fraud you will not be able to
            collect.
            Between 0 and 1. Defaults to 1.0

            amount_col (str): Name of column in data that contains the amount. Defaults
            to "amount"
        """
        self.retry_percentage = retry_percentage
        self.interchange_fee = interchange_fee
        self.fraud_payout_percentage = fraud_payout_percentage
        self.amount_col = amount_col
```

(continues on next page)

(continued from previous page)

```

def decision_function(self, ypred_proba, threshold=0.0, X=None):
    """Determine if a transaction is fraud given predicted probabilities, threshold,
    and dataframe with transaction amount

    Args:
        ypred_proba (pd.Series): Predicted probabilities
        X (pd.DataFrame): Dataframe containing transaction amount
        threshold (float): Dollar threshold to determine if transaction is fraud

    Returns:
        pd.Series: Series of predicted fraud labels using X and threshold
    """
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)

    if not isinstance(ypred_proba, pd.Series):
        ypred_proba = pd.Series(ypred_proba)

    transformed_probs = ypred_proba.values * X[self.amount_col]
    return transformed_probs > threshold

def objective_function(self, y_true, y_predicted, X):
    """Calculate amount lost to fraud per transaction given predictions, true values,
    and dataframe with transaction amount

    Args:
        y_predicted (pd.Series): predicted fraud labels
        y_true (pd.Series): true fraud labels
        X (pd.DataFrame): dataframe with transaction amounts

    Returns:
        float: amount lost to fraud per transaction
    """
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)

    if not isinstance(y_predicted, pd.Series):
        y_predicted = pd.Series(y_predicted)

    if not isinstance(y_true, pd.Series):
        y_true = pd.Series(y_true)

    # extract transaction using the amount columns in users data
    try:
        transaction_amount = X[self.amount_col]
    except KeyError:
        raise ValueError("`{}` is not a valid column in X.".format(self.amount_col))

    # amount paid if transaction is fraud
    fraud_cost = transaction_amount * self.fraud_payout_percentage

    # money made from interchange fees on transaction

```

(continues on next page)

(continued from previous page)

```

interchange_cost = (
    transaction_amount * (1 - self.retry_percentage) * self.interchange_fee
)

# calculate cost of missing fraudulent transactions
false_negatives = (y_true & ~y_predicted) * fraud_cost

# calculate money lost from fees
false_positives = (~y_true & y_predicted) * interchange_cost

loss = false_negatives.sum() + false_positives.sum()

loss_per_total_processed = loss / transaction_amount.sum()

return loss_per_total_processed

```

4.6 Model Understanding

Simply examining a model's performance metrics is not enough to select a model and promote it for use in a production setting. While developing an ML algorithm, it is important to understand how the model behaves on the data, to examine the key factors influencing its predictions and to consider where it may be deficient. Determination of what "success" may mean for an ML project depends first and foremost on the user's domain expertise.

EvalML includes a variety of tools for understanding models, from graphing utilities to methods for explaining predictions.

** Graphing methods on Jupyter Notebook and Jupyter Lab require [ipywidgets](#) to be installed.

** If graphing on Jupyter Lab, [jupyterlab-plotly](#) required. To download this, make sure you have [npm](#) installed.

4.6.1 Explaining Feature Influence

The EvalML package offers a variety of methods for understanding which features in a dataset have an impact on the output of the model. We can investigate this either through feature importance or through permutation importance, and leverage either in generating more readable explanations.

First, let's train a pipeline on some data.

```

[1]: import evalml
from evalml.pipelines import BinaryClassificationPipeline

X, y = evalml.demos.load_breast_cancer()

X_train, X_holdout, y_train, y_holdout = evalml.preprocessing.split_data(
    X, y, problem_type="binary", test_size=0.2, random_seed=0
)

pipeline_binary = BinaryClassificationPipeline(
    component_graph={
        "Label Encoder": ["Label Encoder", "X", "y"],

```

(continues on next page)

(continued from previous page)

```

    "Imputer": ["Imputer", "X", "Label Encoder.y"],
    "Random Forest Classifier": [
        "Random Forest Classifier",
        "Imputer.x",
        "Label Encoder.y",
    ],
}
)
pipeline_binary.fit(X_train, y_train)
print(pipeline_binary.score(X_holdout, y_holdout, objectives=["log loss binary"]))

```

Number of Features
 Numeric 30

Number of training examples: 569
 Targets
 benign 62.74%
 malignant 37.26%
 Name: count, dtype: object
 OrderedDict([('Log Loss Binary', 0.1686746297113362)])

Feature Importance

We can get the importance associated with each feature of the resulting pipeline

```

[2]: pipeline_binary.feature_importance
[2]:

```

	feature	importance

We can also create a bar plot of the feature importances

```
[3]: pipeline_binary.graph_feature_importance()
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

If we have a linear model, we can also view feature importance by simply inspecting the coefficients of the model.

```
[4]: from evalml.model_understanding import get_linear_coefficients
```

```
pipeline_linear = BinaryClassificationPipeline(
    component_graph={
        "Label Encoder": ["Label Encoder", "X", "y"],
        "Imputer": ["Imputer", "X", "Label Encoder.y"],
        "Logistic Regression Classifier": [
            "Logistic Regression Classifier",
            "Imputer.x",
            "Label Encoder.y",
        ],
    },
)
pipeline_linear.fit(X_train, y_train)

get_linear_coefficients(pipeline_linear.estimator, features=X.columns)
```

```

Human Readable Importance

We can generate a more human-comprehensible understanding of either the feature or permutation importance by using `readable_explanation(pipeline)`. This picks out a subset of features that have the highest impact on the output of the model, sorting them into either “heavily” or “somewhat” influential on the model. These features are selected either by feature importance or permutation importance with a given objective. If there are any features that actively decrease the performance of the pipeline, this function highlights those and recommends removal.

Note that permutation importance runs on the original input features, while feature importance runs on the features as they were passed in to the final estimator, having gone through a number of preprocessing steps. The two methods will highlight different features as being important, and feature names may vary as well.

```

[7]: from evalml.model_understanding import readable_explanation

```

```

readable_explanation(
    pipeline_binary,
    X_holdout,
    y_holdout,
    objective="log loss binary",
    importance_method="permutation",
)

```

Random Forest Classifier: The output as measured by log loss binary is heavily_

- influenced by worst perimeter, and is somewhat influenced by worst area, worst radius,
- mean concave points, and worst concave points.

The features smoothness error, mean smoothness, fractal dimension error, worst_

- compactness, mean concavity, mean compactness, radius error, mean radius, worst_
- fractal dimension, symmetry error, perimeter error, concave points error, and worst_
- symmetry detracted from model performance. We suggest removing these features.

```

[8]: readable_explanation(
    pipeline_binary, importance_method="feature"
) # feature importance doesn't require X and y

```

Random Forest Classifier: The output is somewhat influenced by mean concave points,

- worst perimeter, worst concave points, worst radius, and mean concavity.

We can adjust the number of most important features visible with the `max_features` argument, or modify the minimum threshold for “importance” with `min_importance_threshold`. However, these values will not affect any detrimental features displayed, as this function always displays all of them.

4.6.2 Metrics for Model Understanding

Confusion Matrix

For binary or multiclass classification, we can view a [confusion matrix](#) of the classifier's predictions. In the DataFrame output of `confusion_matrix()`, the column header represents the predicted labels while row header represents the actual labels.

```
[9]: from evalml.model_understanding.metrics import confusion_matrix
```

```
y_pred = pipeline_binary.predict(X_holdout)
confusion_matrix(y_holdout, y_pred)
```

```
[9]:
```

	benign	malignant
benign	0.930556	0.069444
malignant	0.023810	0.976190

```
[10]: from evalml.model_understanding.metrics import graph_confusion_matrix
```

```
y_pred = pipeline_binary.predict(X_holdout)
graph_confusion_matrix(y_holdout, y_pred)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Precision-Recall Curve

For binary classification, we can view the precision-recall curve of the pipeline.

```
[11]: from evalml.model_understanding.metrics import graph_precision_recall_curve
```

```
# get the predicted probabilities associated with the "true" label
import woodwork as ww
```

```
y_encoded = y_holdout.ww.map({"benign": 0, "malignant": 1})
y_pred_proba = pipeline_binary.predict_proba(X_holdout)["malignant"]
graph_precision_recall_curve(y_encoded, y_pred_proba)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

ROC Curve

For binary and multiclass classification, we can view the [Receiver Operating Characteristic \(ROC\) curve](#) of the pipeline.

```
[12]: from evalml.model_understanding.metrics import graph_roc_curve
```

```
# get the predicted probabilities associated with the "malignant" label
y_pred_proba = pipeline_binary.predict_proba(X_holdout)["malignant"]
graph_roc_curve(y_encoded, y_pred_proba)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

The ROC curve can also be generated for multiclass classification problems. For multiclass problems, the graph will show a one-vs-many ROC curve for each class.

```
[13]: from evalml.pipelines import MulticlassClassificationPipeline
```

```
X_multi, y_multi = evalml.demos.load_wine()

pipeline_multi = MulticlassClassificationPipeline(
    ["Simple Imputer", "Random Forest Classifier"]
)
pipeline_multi.fit(X_multi, y_multi)

y_pred_proba = pipeline_multi.predict_proba(X_multi)
graph_roc_curve(y_multi, y_pred_proba)
```

```
      Number of Features
Numeric              13

Number of training examples: 178
Targets
class_1    39.89%
class_0    33.15%

Name: count, dtype: object
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.6.3 Visualizations

Binary Objective Score vs. Threshold Graph

Some *binary classification objectives* (objectives that have `score_needs_proba` set to `False`) are sensitive to a decision threshold. For those objectives, we can obtain and graph the scores for thresholds from zero to one, calculated at evenly-spaced intervals determined by `steps`.

```
[14]: from evalml.model_understanding.visualizations import binary_objective_vs_threshold
```

```
binary_objective_vs_threshold(pipeline_binary, X_holdout, y_holdout, "f1", steps=10)
```

```
[14]:   threshold    score
0         0.0  0.538462
1         0.1  0.811881
2         0.2  0.891304
3         0.3  0.901099
4         0.4  0.931818
5         0.5  0.931818
6         0.6  0.941176
```

(continues on next page)

(continued from previous page)

```

7      0.7  0.951220
8      0.8  0.936709
9      0.9  0.923077
10     1.0  0.000000

```

```

[15]: from evalml.model_understanding.visualizations import (
      graph_binary_objective_vs_threshold,
      )

      graph_binary_objective_vs_threshold(
          pipeline_binary, X_holdout, y_holdout, "f1", steps=100
      )

```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Predicted Vs Actual Values Graph for Regression Problems

We can also create a scatterplot comparing predicted vs actual values for regression problems. We can specify an `outlier_threshold` to color values differently if the absolute difference between the actual and predicted values are outside of a given threshold.

```

[16]: from evalml.model_understanding.visualizations import graph_prediction_vs_actual
      from evalml.pipelines import RegressionPipeline

      X_regress, y_regress = evalml.demos.load_diabetes()
      X_train_reg, X_test_reg, y_train_reg, y_test_reg = evalml.preprocessing.split_data(
          X_regress, y_regress, problem_type="regression"
      )

      pipeline_regress = RegressionPipeline(["One Hot Encoder", "Linear Regressor"])
      pipeline_regress.fit(X_train_reg, y_train_reg)

      y_pred = pipeline_regress.predict(X_test_reg)
      graph_prediction_vs_actual(y_test_reg, y_pred, outlier_threshold=50)

```

```

      Number of Features
Numeric          10

Number of training examples: 442
Targets
200    1.36%
72     1.36%
90     1.13%
178    1.13%
71     1.13%
...
73     0.23%
222    0.23%
86     0.23%
79     0.23%

```

(continues on next page)

(continued from previous page)

```
57      0.23%
Name: count, Length: 214, dtype: object
```

```
Data type cannot be displayed: application/vnd.plotly.v1+json, text/html
```

Tree Visualization

Now let's train a decision tree on some data. We can visualize the structure of the Decision Tree that was fit to that data, and save it if necessary.

```
[17]: pipeline_dt = BinaryClassificationPipeline(
      ["Simple Imputer", "Decision Tree Classifier"]
    )
    pipeline_dt.fit(X_train, y_train)

[17]: pipeline = BinaryClassificationPipeline(component_graph={'Simple Imputer': ['Simple_
→ Imputer', 'X', 'y'], 'Decision Tree Classifier': ['Decision Tree Classifier', 'Simple_
→ Imputer.x', 'y']}, parameters={'Simple Imputer':{'impute_strategy': 'most_frequent',
→ 'fill_value': None}, 'Decision Tree Classifier':{'criterion': 'gini', 'max_features':
→ 'sqrt', 'max_depth': 6, 'min_samples_split': 2, 'min_weight_fraction_leaf': 0.0}},
→ random_seed=0)

[18]: from evalml.model_understanding.visualizations import visualize_decision_tree

    visualize_decision_tree(
        pipeline_dt.estimator, max_depth=2, rotate=False, filled=True, filepath=None
    )

[18]:
```

Confusion Matrix and Thresholds for Binary Classification Pipelines

For binary classification pipelines, EvalML also provides the ability to compare the actual positive and actual negative histograms, as well as obtaining the confusion matrices and ideal thresholds per objective.

```
[19]: from evalml.model_understanding import find_confusion_matrix_per_thresholds

    df, objective_thresholds = find_confusion_matrix_per_thresholds(
        pipeline_binary, X, y, n_bins=10
    )
    df.head(10)
```

0.9	0	30	[39, 44, 91, 99, 100]	
1.0	0	212	[0, 1, 2, 3, 4]	

```
[20]: objective_thresholds
```

```
[20]: {'accuracy': {'objective score': 0.9894551845342706, 'threshold value': 0.4},
      'balanced_accuracy': {'objective score': 0.9906387083135141,
                             'threshold value': 0.4},
      'precision': {'objective score': 1.0, 'threshold value': 0.8},
      'f1': {'objective score': 0.9859813084112149, 'threshold value': 0.4}}
```

In the above results, the first dataframe contains the histograms for the actual positive and negative classes, indicated by `true_pos_count` and `true_neg_count`. The columns `true_positives`, `true_negatives`, `false_positives`, and `false_negatives` contain the confusion matrix information for the associated threshold, and the `data_in_bins` holds a random subset of row indices (both positive and negative) that belong in each bin. The index of the dataframe represents the associated threshold. For instance, at index `0.1`, there is 1 positive and 309 negative rows that fall between `[0.0, 0.1]`.

The returned `objective_thresholds` dictionary has the objective measure as the key, and the dictionary value associated contains both the best objective score and the threshold that results in the associated score.

Visualize high dimensional data in lower space

We can use T-SNE to visualize data with many features on a 2D plot, making it easier to see relationships in your data.

```
[21]: # Our data is highly dimensional, we can't plot this in a way we understand
      print(len(X.columns))
```

```
30
```

```
[22]: from evalml.model_understanding import graph_t_sne
```

```
fig = graph_t_sne(X)
fig
```

```
Data type cannot be displayed: application/vnd.plotly.v1+json, text/html
```

4.6.4 Partial Dependence Plots

We can calculate the one-way partial dependence plots for a feature.

```
[23]: from evalml.model_understanding import partial_dependence

partial_dependence(
    pipeline_binary, X_holdout, features="mean radius", grid_resolution=5
)
```

	feature_values	partial_dependence	class_label
0	9.69092	0.392453	malignant
1	12.40459	0.395962	malignant
2	15.11826	0.417396	malignant
3	17.83193	0.429542	malignant
4	20.54560	0.429717	malignant

```
[24]: from evalml.model_understanding import graph_partial_dependence

graph_partial_dependence(
    pipeline_binary, X_holdout, features="mean radius", grid_resolution=5
)
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

We can also compute the partial dependence for a categorical feature. We will demonstrate this on the fraud dataset.

```
[25]: X_fraud, y_fraud = evalml.demos.load_fraud(100, verbose=False)
X_fraud.ww.init(
    logical_types={
        "provider": "Categorical",
        "region": "Categorical",
        "currency": "Categorical",
        "expiration_date": "Categorical",
    }
)

fraud_pipeline = BinaryClassificationPipeline(
    ["DateTime Featurizer", "One Hot Encoder", "Random Forest Classifier"]
)
fraud_pipeline.fit(X_fraud, y_fraud)

graph_partial_dependence(fraud_pipeline, X_fraud, features="provider")
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

Two-way partial dependence plots are also possible and invoke the same API.

```
[26]: partial_dependence(
    pipeline_binary,
    X_holdout,
```

(continues on next page)

(continued from previous page)

```

features=("worst_perimeter", "worst_radius"),
grid_resolution=5,
)

```

[26]:

        grid_resolution=5,
    )

```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.6.5 Explaining Predictions

We can explain why the model made certain predictions with the [explain_predictions](#) function. This can use either the [Shapley Additive Explanations \(SHAP\)](#) algorithm or the [Local Interpretable Model-agnostic Explanations \(LIME\)](#) algorithm to identify the top features that explain the predicted value.

This function can explain both classification and regression models - all you need to do is provide the pipeline, the input features, and a list of rows corresponding to the indices of the input features you want to explain. The function will return a table that you can print summarizing the top 3 most positive and negative contributing features to the predicted value.

In the example below, we explain the prediction for the third data point in the data set. We see that the `worst_concave_points` feature increased the estimated probability that the tumor is malignant by 20% while the `worst_radius` feature decreased the probability the tumor is malignant by 5%.

```

[28]: from evalml.model_understanding.prediction_explanations import explain_predictions

table = explain_predictions(
    pipeline=pipeline_binary,
    input_features=X_holdout,
    y=None,
    indices_to_explain=[3],
    top_k_features=6,
)

```

(continues on next page)

(continued from previous page)

```

    include_explainer_values=True,
)
print(table)

```

Random Forest Classifier w/ Label Encoder + Imputer

```

{'Label Encoder': {'positive_label': None}, 'Imputer': {'categorical_impute_strategy':
↳ 'most_frequent', 'numeric_impute_strategy': 'mean', 'boolean_impute_strategy': 'most_
↳ frequent', 'categorical_fill_value': None, 'numeric_fill_value': None, 'boolean_fill_
↳ value': None}, 'Random Forest Classifier': {'n_estimators': 100, 'max_depth': 6, 'n_
↳ jobs': -1}}

```

1 of 1

	Feature Name	Feature Value	Contribution to Prediction	SHAP
↳ Value				
↳				
↳				
↳ 02	worst concavity	0.18	-	-0.
↳ 03	mean concavity	0.04	-	-0.
↳ 03	worst area	599.50	-	-0.
↳ 05	worst radius	14.04	-	-0.
↳ 05	mean concave points	0.03	-	-0.
↳ 06	worst perimeter	92.80	-	-0.

The interpretation of the table is the same for regression problems - but the SHAP value now corresponds to the change in the estimated value of the dependent variable rather than a change in probability. For multiclass classification problems, a table will be output for each possible class.

Below is an example of how you would explain three predictions with *explain_predictions*.

```
[29]: from evalml.model_understanding.prediction_explanations import explain_predictions
```

```

report = explain_predictions(
    pipeline=pipeline_binary,
    input_features=X_holdout,
    y=y_holdout,
    indices_to_explain=[0, 4, 9],
    include_explainer_values=True,
    output_format="text",
)
print(report)

```

Random Forest Classifier w/ Label Encoder + Imputer

(continues on next page)

(continued from previous page)

```
{'Label Encoder': {'positive_label': None}, 'Imputer': {'categorical_impute_strategy':
↪ 'most_frequent', 'numeric_impute_strategy': 'mean', 'boolean_impute_strategy': 'most_
↪ frequent', 'categorical_fill_value': None, 'numeric_fill_value': None, 'boolean_fill_
↪ value': None}, 'Random Forest Classifier': {'n_estimators': 100, 'max_depth': 6, 'n_
↪ jobs': -1}}
```

1 of 3

	Feature Name	Feature Value	Contribution to Prediction	SHAP
↪Value				
	=====			
	worst perimeter	101.20	-	-0.
↪04	worst concave points	0.06	-	-0.
↪05	mean concave points	0.01	-	-0.
↪05				

2 of 3

	Feature Name	Feature Value	Contribution to Prediction	SHAP
↪Value				
	=====			
	worst radius	11.94	-	-0.
↪05	worst perimeter	80.78	-	-0.
↪06	mean concave points	0.02	-	-0.
↪06				

3 of 3

	Feature Name	Feature Value	Contribution to Prediction	SHAP
↪Value				
	=====			
	worst concave points	0.10	-	-0.
↪05	worst perimeter	99.21	-	-0.
↪06	mean concave points	0.03	-	-0.
↪08				

The above examples used the SHAP algorithm, since that is what `explain_predictions` uses by default. If you would like to use LIME instead, you can change that with the `algorithm="lime"` argument.

```
[30]: from evalml.model_understanding.prediction_explanations import explain_predictions
```

```
table = explain_predictions(
    pipeline=pipeline_binary,
    input_features=X_holdout,
    y=None,
    indices_to_explain=[3],
    top_k_features=6,
    include_explainer_values=True,
    algorithm="lime",
)
print(table)
```

Random Forest Classifier w/ Label Encoder + Imputer

```
{'Label Encoder': {'positive_label': None}, 'Imputer': {'categorical_impute_strategy':

Explaining Best and Worst Predictions

When debugging machine learning models, it is often useful to analyze the best and worst predictions the model made. The `explain_predictions_best_worst` function can help us with this.

This function will display the output of `explain_predictions` for the best 2 and worst 2 predictions. By default, the best and worst predictions are determined by the absolute error for regression problems and `cross entropy` for classification problems.

We can specify our own ranking function by passing in a function to the `metric` parameter. This function will be called on `y_true` and `y_pred`. By convention, lower scores are better.

At the top of each table, we can see the predicted probabilities, target value, error, and row index for that prediction. For a regression problem, we would see the predicted value instead of predicted probabilities.

```
[32]: from evalml.model_understanding.prediction_explanations import (
    explain_predictions_best_worst,
)
```

```
shap_report = explain_predictions_best_worst(
    pipeline=pipeline_binary,
    input_features=X_holdout,
    y_true=y_holdout,
    include_explainer_values=True,
    top_k_features=6,
    num_to_explain=2,
)
```

```
print(shap_report)
```

We use a custom metric ([hinge loss](#)) for selecting the best and worst predictions. See this example:

```
[34]: import numpy as np
```

```
def hinge_loss(y_true, y_pred_proba):
    probabilities = np.clip(y_pred_proba.iloc[:, 1], 0.001, 0.999)
    y_true[y_true == 0] = -1

    return np.clip(
        1 - y_true * np.log(probabilities / (1 - probabilities)), a_min=0, a_max=None
    )
```

(continues on next page)

(continued from previous page)

Changing Output Formats

Instead of getting the prediction explanations as text, you can get the report as a python dictionary or pandas dataframe. All you have to do is pass `output_format="dict"` or `output_format="dataframe"` to either `explain_prediction`, `explain_predictions`, or `explain_predictions_best_worst`.

Single prediction as a dictionary

```
[35]: import json

single_prediction_report = explain_predictions(
    pipeline=pipeline_binary,
    input_features=X_holdout,
    indices_to_explain=[3],
    y=y_holdout,
    top_k_features=6,
    include_explainer_values=True,
    output_format="dict",
)
print(json.dumps(single_prediction_report, indent=2))
```

```
{
  "explanations": [

4.6.6 Force Plots

Force plots can be generated to predict single or multiple rows for binary, multiclass and regression problem types. These use the SHAP algorithm. Here's an example of predicting a single row on a binary classification dataset. The force plots show the predictive power of each of the features in making the negative ("Class: 0") prediction and the positive ("Class: 1") prediction.

```
[39]: import shap

from evalml.model_understanding.force_plots import graph_force_plot

rows_to_explain = [0] # Should be a list of integer indices of the rows to explain.

results = graph_force_plot(
    pipeline_binary,
    rows_to_explain=rows_to_explain,
    training_data=X_holdout,
    y=y_holdout,
)

for result in results:
    for cls in result:
        print("Class:", cls)
        display(result[cls]["plot"])
```

<IPython.core.display.HTML object>

Class: malignant

<shap.plots._force.AdditiveForceVisualizer at 0x7f422685bdc0>

Here's an example of a force plot explaining multiple predictions on a multiclass problem. These plots show the force plots for each row arranged as consecutive columns that can be ordered by the dropdown above. Clicking the column indicates which row explanation is underneath.

```
[40]: rows_to_explain = [
    0,
    1,
    2,
    3,
    4,
] # Should be a list of integer indices of the rows to explain.

results = graph_force_plot(
    pipeline_multi, rows_to_explain=rows_to_explain, training_data=X_multi, y=y_multi
)

for idx, result in enumerate(results):
    print("Row:", idx)
    for cls in result:
        print("Class:", cls)
        display(result[cls]["plot"])
```

4.7 Data Checks

EvalML provides data checks to help guide you in achieving the highest performing model. These utility functions help deal with problems such as overfitting, abnormal data, and missing data. These data checks can be found under `evalml/data_checks`. Below we will cover examples for each available data check in EvalML, as well as the `DefaultDataChecks` collection of data checks.

4.7.1 Missing Data

Missing data or rows with NaN values provide many challenges for machine learning pipelines. In the worst case, many algorithms simply will not run with missing data! EvalML pipelines contain imputation *components* to ensure that doesn't happen. Imputation works by approximating missing values with existing values. However, if a column contains a high number of missing values, a large percentage of the column would be approximated by a small percentage. This could potentially create a column without useful information for machine learning pipelines. By using `NullDataCheck`, EvalML will alert you to this potential problem by returning the columns that pass the missing values threshold.

```
[1]: import numpy as np
import pandas as pd

from evalml.data_checks import NullDataCheck

X = pd.DataFrame(
    [[1, 2, 3], [0, 4, np.nan], [1, 4, np.nan], [9, 4, np.nan], [8, 6, np.nan]]
)

null_check = NullDataCheck(pct_null_col_threshold=0.8, pct_null_row_threshold=0.8)
messages = null_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Warning: Column(s) '2' are 80.0% or more null
```

4.7.2 Abnormal Data

EvalML provides a few data checks to check for abnormal data:

- `NoVarianceDataCheck`
- `ClassImbalanceDataCheck`
- `TargetLeakageDataCheck`
- `InvalidTargetDataCheck`
- `IDColumnsDataCheck`
- `OutliersDataCheck`

- HighVarianceCVDataCheck
- MulticollinearityDataCheck
- UniquenessDataCheck
- TargetDistributionDataCheck
- DateTimeFormatDataCheck
- TimeSeriesParametersDataCheck
- TimeSeriesSplittingDataCheck

Zero Variance

Data with zero variance indicates that all values are identical. If a feature has zero variance, it is not likely to be a useful feature. Similarly, if the target has zero variance, there is likely something wrong. `NoVarianceDataCheck` checks if the target or any feature has only one unique value and alerts you to any such columns.

```
[2]: from evalml.data_checks import NoVarianceDataCheck

X = pd.DataFrame({"no var col": [0, 0, 0], "good col": [0, 4, 1]})
y = pd.Series([1, 0, 1])
no_variance_data_check = NoVarianceDataCheck()
messages = no_variance_data_check.validate(X, y)

warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

Warning: 'no var col' has 1 unique value.
```

Note that you can set NaN to count as an unique value, but `NoVarianceDataCheck` will still return a warning if there is only one unique non-NaN value in a given column.

```
[3]: from evalml.data_checks import NoVarianceDataCheck

X = pd.DataFrame(
    {
        "no var col": [0, 0, 0],
        "no var col with nan": [1, np.nan, 1],
        "good col": [0, 4, 1],
    }
)
y = pd.Series([1, 0, 1])

no_variance_data_check = NoVarianceDataCheck(count_nan_as_value=True)
messages = no_variance_data_check.validate(X, y)

warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])
```

```
Warning: 'no var col' has 1 unique value.
Warning: 'no var col with nan' has two unique values including nulls. Consider encoding
↳ the nulls for this column to be useful for machine learning.
```

Class Imbalance

For classification problems, the distribution of examples across each class can vary. For small variations, this is normal and expected. However, when the number of examples for each class label is disproportionately biased or skewed towards a particular class (or classes), it can be difficult for machine learning models to predict well. In addition, having a low number of examples for a given class could mean that one or more of the CV folds generated for the training data could only have few or no examples from that class. This may cause the model to only predict the majority class and ultimately resulting in a poor-performant model.

`ClassImbalanceDataCheck` checks if the target labels are imbalanced beyond a specified threshold for a certain number of CV folds. It returns `DataCheckError` messages for any classes that have less samples than double the number of CV folds specified (since that indicates the likelihood of having at little to no samples of that class in a given fold), and `DataCheckWarning` messages for any classes that fall below the set threshold percentage.

```
[4]: from evalml.data_checks import ClassImbalanceDataCheck

X = pd.DataFrame([[1, 2, 0, 1], [4, 1, 9, 0], [4, 4, 8, 3], [9, 2, 7, 1]])
y = pd.Series([0, 1, 1, 1, 1])

class_imbalance_check = ClassImbalanceDataCheck(threshold=0.25, num_cv_folds=4)
messages = class_imbalance_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])
```

```
Warning: The following labels fall below 25% of the target: [0]
Warning: The following labels in the target have severe class imbalance because they
↳ fall under 25% of the target and have less than 100 samples: [0]
Error: The number of instances of these targets is less than 2 * the number of cross
↳ folds = 8 instances: [0, 1]
```

Target Leakage

Target leakage, also known as data leakage, can occur when you train your model on a dataset that includes information that should not be available at the time of prediction. This causes the model to score suspiciously well, but perform poorly in production. `TargetLeakageDataCheck` checks for features that could potentially be “leaking” information by calculating the Pearson correlation coefficient between each feature and the target to warn users if there are features are highly correlated with the target. Currently, only numerical features are considered.

```
[5]: from evalml.data_checks import TargetLeakageDataCheck
```

```
X = pd.DataFrame(
```

(continues on next page)

(continued from previous page)

```

    {
        "leak": [10, 42, 31, 51, 61] * 5,
        "x": [42, 54, 12, 64, 12] * 5,
        "y": [12, 5, 13, 74, 24] * 5,
    }
)
y = pd.Series([10, 42, 31, 51, 40] * 5)

target_leakage_check = TargetLeakageDataCheck(pct_corr_threshold=0.8)
messages = target_leakage_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

```

Warning: Columns 'leak', 'x', 'y' are 80.0% or more correlated with the target

Invalid Target Data

The `InvalidTargetDataCheck` checks if the target data contains any missing or invalid values. Specifically:

- if any of the target values are missing, a `DataCheckError` message is returned
- if the specified problem type is a binary classification problem but there is more or less than two unique values in the target, a `DataCheckError` message is returned
- if binary classification target classes are numeric values not equal to {0, 1}, a `DataCheckError` message is returned because it can cause unpredictable behavior when passed to pipelines

[6]: `from evalml.data_checks import InvalidTargetDataCheck`

```

X = pd.DataFrame({})
y = pd.Series([0, 1, None, None])

invalid_target_check = InvalidTargetDataCheck("binary", "Log Loss Binary")
messages = invalid_target_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

```

Warning: Input target and features have different lengths
Warning: Input target and features have mismatched indices. Details will include the
↪ first 10 mismatched indices.

(continues on next page)

(continued from previous page)

```
Error: 2 row(s) (50.0%) of target values are null
```

ID Columns

ID columns in your dataset provide little to no benefit to a machine learning pipeline as the pipeline cannot extrapolate useful information from unique identifiers. Thus, `IDColumnsDataCheck` reminds you if these columns exist. In the given example, 'user_number' and 'revenue_id' columns are both identified as potentially being unique identifiers that should be removed.

```
[7]: from evalml.data_checks import IDColumnsDataCheck

X = pd.DataFrame(
    [[0, 53, 6325, 5], [1, 90, 6325, 10], [2, 90, 18, 20]],
    columns=["user_number", "cost", "revenue", "revenue_id"],
)

id_col_check = IDColumnsDataCheck(id_threshold=0.9)
messages = id_col_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Warning: Columns 'user_number', 'revenue_id' are 90.0% or more likely to be an ID column
```

Primary key columns however, can be useful. Primary key columns are typically the first column in the dataset, have all unique values, and are either named ID or a name that ends with `_id`. Though they are ignored from the modeling process, they can be used as an identifier to query on before or after the modeling process. `IDColumnsDataCheck` will also remind you if it finds that the first column of the `DataFrame` is a primary key. In the given example, `user_id` is identified as a primary key, while `revenue_id` was identified as a regular unique identifier.

```
[8]: from evalml.data_checks import IDColumnsDataCheck

X = pd.DataFrame(
    [[0, 53, 6325, 5], [1, 90, 6325, 10], [2, 90, 18, 20]],
    columns=["user_id", "cost", "revenue", "revenue_id"],
)

id_col_check = IDColumnsDataCheck(id_threshold=0.9)
messages = id_col_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])
```

(continues on next page)

(continued from previous page)

```
for error in errors:
    print("Error:", error["message"])
```

```
Warning: The first column 'user_id' is likely to be the primary key
Warning: Columns 'revenue_id' are 90.0% or more likely to be an ID column
```

Multicollinearity

The MulticollinearityDataCheck data check is used in to detect if are any set of features that are likely to be multicollinear. Multicollinear features affect the performance of a model, but more importantly, it may greatly impact model interpretation. EvalML uses mutual information to determine collinearity.

```
[9]: from evalml.data_checks import MulticollinearityDataCheck

y = pd.Series([1, 0, 2, 3, 4] * 5)
X = pd.DataFrame(
    {
        "col_1": y,
        "col_2": y * 3,
        "col_3": ~y,
        "col_4": y / 2,
        "col_5": y + 1,
        "not_collinear": [0, 1, 0, 0, 0] * 5,
    }
)

multi_check = MulticollinearityDataCheck(threshold=0.95)
messages = multi_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Warning: Columns are likely to be correlated: [('col_1', 'col_2'), ('col_1', 'col_3'), (
↳ 'col_1', 'col_4'), ('col_1', 'col_5'), ('col_2', 'col_3'), ('col_2', 'col_4'), ('col_2
↳ ', 'col_5'), ('col_3', 'col_4'), ('col_3', 'col_5'), ('col_4', 'col_5')]
```

Uniqueness

The `UniquenessDataCheck` is used to detect columns with either too unique or not unique enough values. For regression type problems, the data is checked for a lower limit of uniqueness. For multiclass type problems, the data is checked for an upper limit.

```
[10]: import pandas as pd
from evalml.data_checks import UniquenessDataCheck

X = pd.DataFrame(
    {
        "most_unique": [float(x) for x in range(10)], # [0,1,2,3,4,5,6,7,8,9]
        "more_unique": [x % 5 for x in range(10)], # [0,1,2,3,4,0,1,2,3,4]
        "unique": [x % 3 for x in range(10)], # [0,1,2,0,1,2,0,1,2,0]
        "less_unique": [x % 2 for x in range(10)], # [0,1,0,1,0,1,0,1,0,1]
        "not_unique": [float(1) for x in range(10)],
    }
) # [1,1,1,1,1,1,1,1,1,1]

uniqueness_check = UniquenessDataCheck(problem_type="regression", threshold=0.5)
messages = uniqueness_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Warning: Input columns 'not_unique' for regression problem type are not unique enough.
```

Sparsity

The `SparsityDataCheck` is used to identify features that contain a sparsity of values.

```
[11]: from evalml.data_checks import SparsityDataCheck

X = pd.DataFrame(
    {
        "most_sparse": [float(x) for x in range(10)], # [0,1,2,3,4,5,6,7,8,9]
        "more_sparse": [x % 5 for x in range(10)], # [0,1,2,3,4,0,1,2,3,4]
        "sparse": [x % 3 for x in range(10)], # [0,1,2,0,1,2,0,1,2,0]
        "less_sparse": [x % 2 for x in range(10)], # [0,1,0,1,0,1,0,1,0,1]
        "not_sparse": [float(1) for x in range(10)],
    }
) # [1,1,1,1,1,1,1,1,1,1]

sparsity_check = SparsityDataCheck(
    problem_type="multiclass", threshold=0.4, unique_count_threshold=3
)
```

(continues on next page)

(continued from previous page)

```

messages = sparsity_check.validate(X)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Warning: Input columns ('most_sparse', 'more_sparse', 'sparse') for multiclass problem.
↳ type are too sparse.

```

Outliers

Outliers are observations that differ significantly from other observations in the same sample. Many machine learning pipelines suffer in performance if outliers are not dropped from the training set as they are not representative of the data. `OutliersDataCheck()` uses IQR to notify you if a sample can be considered an outlier.

Below we generate a random dataset with some outliers.

```

[12]: data = np.tile(np.arange(10) * 0.01, (100, 10))
      X = pd.DataFrame(data=data)

      # generate some outliers in columns 3, 25, 55, and 72
      X.iloc[0, 3] = -10000
      X.iloc[3, 25] = 10000
      X.iloc[5, 55] = 10000
      X.iloc[10, 72] = -10000

```

We then utilize `OutliersDataCheck()` to rediscover these outliers.

```

[13]: from evalml.data_checks import OutliersDataCheck

      outliers_check = OutliersDataCheck()
      messages = outliers_check.validate(X)

      errors = [message for message in messages if message["level"] == "error"]
      warnings = [message for message in messages if message["level"] == "warning"]

      for warning in warnings:
          print("Warning:", warning["message"])

      for error in errors:
          print("Error:", error["message"])

Warning: Column(s) '3', '25', '55', '72' are likely to have outlier data.

```

Target Distribution

Target data can come in a variety of distributions, such as Gaussian or Lognormal. When we work with machine learning models, we feed data into an estimator that learns from the training data provided. Sometimes the data can be significantly spread out with a long tail or outliers, which could lead to a lognormal distribution. This can cause machine learning model performance to suffer.

To help the estimators better understand the underlying relationships in the data between the features and the target, we can use the `TargetDistributionDataCheck` to identify such a distribution.

```
[14]: from scipy.stats import lognorm
      from evalml.data_checks import TargetDistributionDataCheck

      data = np.tile(np.arange(10) * 0.01, (100, 10))
      X = pd.DataFrame(data=data)
      y = pd.Series(lognorm.rvs(s=0.4, loc=1, scale=1, size=100))

      target_dist_check = TargetDistributionDataCheck()
      messages = target_dist_check.validate(X, y)

      errors = [message for message in messages if message["level"] == "error"]
      warnings = [message for message in messages if message["level"] == "warning"]

      for warning in warnings:
          print("Warning:", warning["message"])

      for error in errors:
          print("Error:", error["message"])

      Warning: Target may have a lognormal distribution.
```

Datetime Format

Datetime information is a necessary component of time series problems, but sometimes the data we deal with may contain flaws that make it impossible for time series models to work with them. For example, in order to identify a frequency in the datetime information there has to be equal interval spacing between data points i.e. January 1, 2021, January 3, 2021, January 5, 2021, ...etc which are separated by two days. If instead there are random jumps in the datetime data i.e. January 1, 2021, January 3, 2021, January 12, 2021, then a frequency can't be inferred. Another common issue with time series models are that they can't handle datetime information that isn't properly sorted. Datetime values that aren't monotonically increasing (sorted in ascending order) will encounter this issue and their frequency cannot be inferred.

To make it easy to verify that the datetime column you're working with is properly spaced and sorted, we can leverage the `DatetimeFormatDataCheck`. When initializing the data check, pass in the name of the column that contains your datetime information (or pass in "index" if it's found in either your X or y indices).

```
[15]: from evalml.data_checks import DateTimeFormatDataCheck

      X = pd.DataFrame(
          pd.date_range("January 1, 2021", periods=8, freq="2D"), columns=["dates"]
      )
      y = pd.Series([1, 2, 4, 2, 1, 2, 3, 1])

      # Replaces the last entry with January 16th instead of January 15th
```

(continues on next page)

(continued from previous page)

```

# so that the data is no longer evenly spaced.
X.iloc[7] = "January 16, 2021"

datetime_format_check = DateTimeFormatDataCheck(datetime_column="dates")
messages = datetime_format_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

print("-----")

# Reverses the order of the index datetime values to be decreasing.
X = X[::-1]
messages = datetime_format_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Error: Column 'dates' has datetime values that do not align with the inferred frequency.
Error: A frequency was detected in column 'dates', but there are faulty datetime values.
↳ that need to be addressed.
-----
Error: Datetime values must be sorted in ascending order.
Error: No frequency could be detected in column 'dates', possibly due to uneven.
↳ intervals or too many duplicate/missing values.

```

Time Series Parameters

In order to support time series problem types in AutoML, certain conditions have to be met. - The parameters `gap`, `max_delay`, `forecast_horizon`, and `time_index` have to be passed in to `problem_configuration`. - The values of `gap`, `max_delay`, `forecast_horizon` have to be appropriate for the size of the data.

For point 2 above, this means that the window size (as defined by `gap + max_delay + forecast_horizon`) has to be less than the number of observations in the data divided by the number of splits + 1. For example, with 100 observations and 3 splits, the split size would be 25. This means that the window size has to be less than 25.

```
[16]: from evalml.data_checks import TimeSeriesParametersDataCheck
```

```

X = pd.DataFrame(pd.date_range("1/1/21", periods=100), columns=["dates"])
y = pd.Series([i % 2 for i in range(100)])

```

(continues on next page)

(continued from previous page)

```

problem_config = {
    "gap": 1,
    "max_delay": 23,
    "forecast_horizon": 1,
    "time_index": "dates",
}

# With 3 splits, the split size will be 25 (100/3+1)
# Since gap + max_delay + forecast_horizon is 25, this will
# throw an error for window size.
ts_params_data_check = TimeSeriesParametersDataCheck(
    problem_configuration=problem_config, n_splits=3
)
messages = ts_params_data_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

```

Time Series Splitting

Due to the nature of time series data, splitting cannot involve shuffling and has to be done in a sequential manner. This means splitting the data into `n_splits + 1` different sections and increasing the size of the training data by the split size every iteration while keeping the test size equal to the split size.

For every split in the data, the training and validation segments must contain target data that has an example of every class found in the entire target set for time series binary and time series multiclass problems. The reason for this is that many classification machine learning models run into issues if they're trained on data that doesn't contain an instance of a class but then the model is expected to be able to predict for it. For example, with 3 splits and a split size of 25, this means that every training/validation split: (0:25)/(25:50), (0:50)/(50:75), (0:75)/(75:100) must contain at least one instance of all unique target classes in the training and validation set. - At least one instance of both classes in a time series binary problem. - At least one instance of all classes in a time series multiclass problem.

```

[17]: from evalml.data_checks import TimeSeriesSplittingDataCheck

X = None
y = pd.Series([0 if i < 50 else i % 2 for i in range(100)])

ts_splitting_check = TimeSeriesSplittingDataCheck("time series binary", 3)
messages = ts_splitting_check.validate(X, y)

errors = [message for message in messages if message["level"] == "error"]
warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:

```

(continues on next page)

(continued from previous page)

```
print("Warning:", warning["message"])

for error in errors:
    print("Error:", error["message"])

Error: Time Series Binary and Time Series Multiclass problem types require every
↳ training and validation split to have at least one instance of all the target classes.
↳ The following splits are invalid: [1, 2]
```

4.7.3 Data Check Messages

Each data check's `validate` method returns a list of `DataCheckMessage` objects indicating warnings or errors found; warnings are stored as a `DataCheckWarning` *object* and errors are stored as a `DataCheckError` *object*. You can filter the messages returned by a data check by checking for the type of message returned. Below, `NoVarianceDataCheck` returns a list containing a `DataCheckWarning` and a `DataCheckError` message. We can determine which is which by checking the type of each message.

```
[18]: from evalml.data_checks import NoVarianceDataCheck, DataCheckWarning

X = pd.DataFrame(
    {
        "no var col": [0, 0, 0],
        "no var col with nan": [1, np.nan, 1],
        "good col": [0, 4, 1],
    }
)
y = pd.Series([1, 0, 1])

no_variance_data_check = NoVarianceDataCheck(count_nan_as_value=True)
messages = no_variance_data_check.validate(X, y)

warnings = [message for message in messages if message["level"] == "warning"]

for warning in warnings:
    print("Warning:", warning["message"])

Warning: 'no var col' has 1 unique value.
Warning: 'no var col with nan' has two unique values including nulls. Consider encoding
↳ the nulls for this column to be useful for machine learning.
```

4.7.4 Writing Your Own Data Check

If you would prefer to write your own data check, you can do so by extending the `DataCheck` class and implementing the `validate(self, X, y)` class method. Below, we've created a new `DataCheck`, `ZeroVarianceDataCheck`, which is similar to `NoVarianceDataCheck` defined in EvalML. The `validate(self, X, y)` method should return a dictionary with 'warnings' and 'errors' as keys mapping to list of warnings and errors, respectively.

```
[19]: from evalml.data_checks import DataCheck

class ZeroVarianceDataCheck(DataCheck):
```

(continues on next page)

(continued from previous page)

```

def validate(self, X, y):
    messages = []
    if not isinstance(X, pd.DataFrame):
        X = pd.DataFrame(X)
    warning_msg = "Column '{}' has zero variance"
    messages.extend(
        [
            DataCheckError(warning_msg.format(column), self.name)
            for column in X.columns
            if len(X[column].unique()) == 1
        ]
    )
    return messages

```

4.7.5 Defining Collections of Data Checks

For convenience, EvalML provides a `DataChecks` class to represent a collection of data checks. We will go over `DefaultDataChecks` ([API reference](#)), a collection defined to check for some of the most common data issues.

Default Data Checks

`DefaultDataChecks` is a collection of data checks defined to check for some of the most common data issues. They include:

- `NullDataCheck`
- `IDColumnsDataCheck`
- `TargetLeakageDataCheck`
- `InvalidTargetDataCheck`
- `TargetDistributionDataCheck` (for regression problem types)
- `ClassImbalanceDataCheck` (for classification problem types)
- `NoVarianceDataCheck`
- `DateTimeFormatDataCheck` (for time series problem types)
- `TimeSeriesParametersDataCheck` (for time series problem types)
- `TimeSeriesSplittingDataCheck` (for time series classification problem types)

4.7.6 Writing Your Own Collection of Data Checks

If you would prefer to create your own collection of data checks, you could either write your own data checks class by extending the `DataChecks` class and setting the `self.data_checks` attribute to the list of `DataCheck` classes or objects, or you could pass that list of data checks to the constructor of the `DataChecks` class. Below, we create two identical collections of data checks using the two different methods.

```

[20]: # Create a subclass of `DataChecks`
from evalml.data_checks import (
    DataChecks,

```

(continues on next page)

(continued from previous page)

```

    NullDataCheck,
    InvalidTargetDataCheck,
    NoVarianceDataCheck,
    ClassImbalanceDataCheck,
    TargetLeakageDataCheck,
)
from evalml.problem_types import ProblemTypes, handle_problem_types

class MyCustomDataChecks(DataChecks):
    data_checks = [
        NullDataCheck,
        InvalidTargetDataCheck,
        NoVarianceDataCheck,
        TargetLeakageDataCheck,
    ]

    def __init__(self, problem_type, objective):
        """
        A collection of basic data checks.
        Args:
            problem_type (str): The problem type that is being validated. Can be
            ↪ regression, binary, or multiclass.
        """
        if handle_problem_types(problem_type) == ProblemTypes.REGRESSION:
            super().__init__(
                self.data_checks,
                data_check_params={
                    "InvalidTargetDataCheck": {
                        "problem_type": problem_type,
                        "objective": objective,
                    },
                },
            )
        else:
            super().__init__(
                self.data_checks + [ClassImbalanceDataCheck],
                data_check_params={
                    "InvalidTargetDataCheck": {
                        "problem_type": problem_type,
                        "objective": objective,
                    },
                },
            )

custom_data_checks = MyCustomDataChecks(
    problem_type=ProblemTypes.REGRESSION, objective="R2"
)
for data_check in custom_data_checks.data_checks:
    print(data_check.name)

```

```
NullDataCheck
InvalidTargetDataCheck
NoVarianceDataCheck
TargetLeakageDataCheck
```

```
[21]: # Pass list of data checks to the `data_checks` parameter of DataChecks
same_custom_data_checks = DataChecks(
    data_checks=[
        NullDataCheck,
        InvalidTargetDataCheck,
        NoVarianceDataCheck,
        TargetLeakageDataCheck,
    ],
    data_check_params={
        "InvalidTargetDataCheck": {
            "problem_type": ProblemTypes.REGRESSION,
            "objective": "R2",
        }
    },
)
for data_check in custom_data_checks.data_checks:
    print(data_check.name)
```

```
NullDataCheck
InvalidTargetDataCheck
NoVarianceDataCheck
TargetLeakageDataCheck
```

4.8 Understanding Data Check Actions

EvalML streamlines the creation and implementation of machine learning models for tabular data. One of the many features it offers is [data checks](#), which help determine the health of our data before we train a model on it. These data checks have associated actions with them and will be shown in this notebook. In our default data checks, we have the following checks:

- `NullDataCheck`: Checks whether the rows or columns are null or highly null
- `IDColumnsDataCheck`: Checks for columns that could be ID columns
- `TargetLeakageDataCheck`: Checks if any of the input features have high association with the targets
- `InvalidTargetDataCheck`: Checks if there are null or other invalid values in the target
- `NoVarianceDataCheck`: Checks if either the target or any features have no variance

EvalML has additional data checks that can be seen [here](#), with usage examples [here](#). Below, we will walk through usage of EvalML's default data checks and actions.

First, we import the necessary requirements to demonstrate these checks.

```
[1]: import woodwork as ww
import pandas as pd
from evalml import AutoMLSearch
from evalml.demos import load_fraud
from evalml.preprocessing import split_data
```

Let's look at the input feature data. EvalML uses the [Woodwork](#) library to represent this data. The demo data that EvalML returns is a Woodwork DataTable and DataColumn.

```
[2]: X, y = load_fraud(n_rows=1500)
X.head()
```

```

                Number of Features
Boolean                      1
Categorical                   6
Numeric                       5

Number of training examples: 1500
Targets
False      86.60%
True       13.40%
Name: count, dtype: object
```

```

4.8.1 Adding noise and unclean data

This data is already clean and compatible with EvalML's AutoMLSearch. In order to demonstrate EvalML default data checks, we will add the following:

- A column of mostly null values (<0.5% non-null)
- A column with low/no variance
- A row of null values
- A missing target value

We will add the first two columns to the whole dataset and we will only add the last two to the training data. Note: these only represent some of the scenarios that EvalML default data checks can catch.

```
[3]: # add a column with no variance in the data
X["no_variance"] = [1 for _ in range(X.shape[0])]

# add a column with >99.5% null values
X["mostly_nulls"] = [None] * (X.shape[0] - 5) + [i for i in range(5)]

# since we changed the data, let's reinitialize the woodwork datatable
X.ww.init()
# let's split some training and validation data
X_train, X_valid, y_train, y_valid = split_data(X, y, problem_type="binary")
```

```
[4]: # make row 1 all nan values

[1200 rows x 14 columns]

If we call `AutoMLSearch.search()` on this data, the search will fail due to the columns and issues we've added above. Note: we use a `try/except` here to catch the resulting `ValueError` that `AutoMLSearch` raises.

```
[5]: automl = AutoMLSearch(X_train=X_train, y_train=y_train, problem_type="binary")
try:
    automl.search()
except ValueError as e:
    # to make the error message more distinct
    print("=" * 80, "\n")
    print("Search errored out! Message received is: {}".format(e))
    print("=" * 80, "\n")
```

```
=====
Search errored out! Message received is: Input y contains NaN.
=====
```

We can use the `search_iterative()` function provided in `EvalML` to determine what potential health issues our data has. We can see that this `search_iterative` function is a public method available through `evalml.automl` and is different from the `search` function of the `AutoMLSearch` class in `EvalML`. This `search_iterative()` function allows us to run the default data checks on the data, and, if there are no errors, automatically runs `AutoMLSearch.search()`.

```
[6]: from evalml.automl import search_iterative

automl, messages = search_iterative(X_train, y_train, problem_type="binary")
automl, messages
```

```
[6]: (None,
[{'message': '1 out of 1200 rows are 95.0% or more null',
  'data_check_name': 'NullDataCheck',
  'level': 'warning',
  'details': {'columns': None,
  'rows': [1477],
  'pct_null_cols': id
1477    1.0
dtype: float64},
  'code': 'HIGHLY_NULL_ROWS',
  'action_options': [{'code': 'DROP_ROWS',
  'data_check_name': 'NullDataCheck',
```

(continues on next page)

(continued from previous page)

```

    'metadata': {'columns': None, 'rows': [1477]},
    'parameters': {}]]],
{'message': "Column(s) 'mostly_nulls' are 95.0% or more null",
 'data_check_name': 'NullDataCheck',
 'level': 'warning',
 'details': {'columns': ['mostly_nulls'],
 'rows': None,
 'pct_null_rows': {'mostly_nulls': 0.9966666666666667}},
 'code': 'HIGHLY_NULL_COLS',
 'action_options': [{'code': 'DROP_COL',
 'data_check_name': 'NullDataCheck',
 'metadata': {'columns': ['mostly_nulls'], 'rows': None},
 'parameters': {}]]],
{'message': '1 row(s) (0.08333333333333334%) of target values are null',
 'data_check_name': 'InvalidTargetDataCheck',
 'level': 'error',
 'details': {'columns': None,
 'rows': [990],
 'num_null_rows': 1,
 'pct_null_rows': 0.08333333333333334},
 'code': 'TARGET_HAS_NULL',
 'action_options': [{'code': 'DROP_ROWS',
 'data_check_name': 'InvalidTargetDataCheck',
 'metadata': {'columns': None, 'rows': [990], 'is_target': True},
 'parameters': {}]]],
{'message': "'no_variance' has 1 unique value.",
 'data_check_name': 'NoVarianceDataCheck',
 'level': 'warning',
 'details': {'columns': ['no_variance'], 'rows': None},
 'code': 'NO_VARIANCE',
 'action_options': [{'code': 'DROP_COL',
 'data_check_name': 'NoVarianceDataCheck',
 'metadata': {'columns': ['no_variance'], 'rows': None},
 'parameters': {}]]]]])

```

The return value of the `search_iterative` function above is a tuple. The first element is the `AutoMLSearch` object if it runs (and `None` otherwise), and the second element is a dictionary of potential warnings and errors that the default data checks find on the passed-in `X` and `y` data. In this dictionary, warnings are suggestions that the data checks give that can be useful to address to make the search better but will not break `AutoMLSearch`. On the flip side, errors indicate issues that will break `AutoMLSearch` and need to be addressed by the user.

Above, we can see that there were errors so search did not automatically run.

4.8.2 Addressing warnings and errors

We can automatically address the warnings and errors returned by `search_iterative` by using `make_pipeline_from_data_check_output`, a utility method that creates a pipeline that will automatically clean up our data. We just need to pass this method the messages from running `DataCheck.validate()` and our problem type.

```
[7]: from evalml.pipelines.utils import make_pipeline_from_data_check_output

actions_pipeline = make_pipeline_from_data_check_output("binary", messages)
actions_pipeline.fit(X_train, y_train)
X_train_cleaned, y_train_cleaned = actions_pipeline.transform(X_train, y_train)
print(
    "The new length of X_train is {} and y_train is {}".format(
        len(X_train_cleaned), len(y_train_cleaned)
    )
)

The new length of X_train is 1198 and y_train is 1198
```

Now, we can run `search_iterative` to completion.

```
[8]: results_cleaned = search_iterative(
    X_train_cleaned, y_train_cleaned, problem_type="binary"
)
```

Note that this time, we get an `AutoMLSearch` object returned to us as the first element of the tuple. We can use and inspect the `AutoMLSearch` object as needed.

```
[9]: automl_object = results_cleaned[0]
automl_object.rankings
```

```
[9]:   id  pipeline_name  search_order  \
0   1  Random Forest Classifier w/ Label Encoder + Da...      1
1   0   Mode Baseline Binary Classification Pipeline      0

   ranking_score  mean_cv_score  standard_deviation_cv_score  \
0         0.238873         0.238873             0.016718
1         4.843912         4.843912             0.049015

   percent_better_than_baseline  high_variance_cv  \
0                95.06859             False
1                 0.00000             False

           parameters
0  {'Label Encoder': {'positive_label': None}, 'D...
1  {'Label Encoder': {'positive_label': None}, 'B...
```

If we check the second element in the tuple, we can see that there are no longer any warnings or errors detected!

```
[10]: data_check_results = results_cleaned[1]
data_check_results

[10]: []
```

4.8.3 Only addressing DataCheck errors

Previously, we used `make_pipeline_from_actions` to address all of the warnings and errors returned by `search_iterative`. We will now show how we can also manually address errors to allow `AutoMLSearch` to run, and how ignoring warnings will come at the expense of performance.

We can print out the errors first to make it easier to read, and then we'll create new features and targets from the original training data.

```
[11]: errors = [message for message in messages if message["level"] == "error"]
      errors
```

```
[11]: [{'message': '1 row(s) (0.08333333333333334%) of target values are null',
      'data_check_name': 'InvalidTargetDataCheck',
      'level': 'error',
      'details': {'columns': None,
                  'rows': [990],
                  'num_null_rows': 1,
                  'pct_null_rows': 0.08333333333333334},
      'code': 'TARGET_HAS_NULL',
      'action_options': [{'code': 'DROP_ROWS',
                          'data_check_name': 'InvalidTargetDataCheck',
                          'metadata': {'columns': None, 'rows': [990], 'is_target': True},
                          'parameters': {}}]]]
```

```
[12]: # copy the DataTables to new variables
      X_train_no_errors = X_train.copy()
      y_train_no_errors = y_train.copy()

      # We address the errors by looking at the resulting dictionary errors listed

      # let's address the `TARGET_HAS_NULL` error
      y_train_no_errors.fillna(False, inplace=True)

      # let's reinitialize the Woodwork DataTable
      X_train_no_errors.ww.init()
      X_train_no_errors.head()
```

```
[12]:
```

```

4.9 Utilities

4.9.1 Configuring Logging

EvalML uses [the standard Python logging package](#). Default logging behavior prints WARNING level logs and above (ERROR and CRITICAL) to stdout. To configure different behavior, please refer to the Python logging documentation.

To see up-to-date feedback as `AutoMLSearch` runs, use the argument `verbose=True` when instantiating the object. This will temporarily set up a logging object to print INFO level logs and above to stdout, as well as display a graph of the best score over pipeline iterations.

4.9.2 System Information

EvalML provides a command-line interface (CLI) tool prints the version of EvalML and core dependencies installed, as well as some basic system information. To use this tool, just run `evalml info` in your shell or terminal. This could be useful for debugging purposes or tracking down any version-related issues.

```
[1]: !evalml info
/usr/bin/sh: 1: evalml: not found
```

4.10 AutoMLSearch for time series problems

In this guide, we'll show how you can use EvalML to perform an automated search of machine learning pipelines for time series problems. Time series support is still being actively developed in EvalML so expect this page to improve over time.

4.10.1 But first, what is a time series?

A time series is a series of measurements taken at different moments in time ([Wikipedia](#)). The main difference between a time series dataset and a normal dataset is that the rows of a time series dataset are ordered chronologically, where the relative time between rows is significant. This relationship between the rows does not exist in non-time series datasets. In a non-time-series dataset, you can shuffle the rows and the dataset still has the same meaning. If you shuffle the rows of a time series dataset, the relationship between the rows is completely different!

4.10.2 What does AutoMLSearch for time series do?

In a machine learning setting, we are usually interested in using past values of the time series to predict future values. That is what EvalML's time series functionality is built to do.

4.10.3 Loading the data

In this guide, we work with daily minimum temperature recordings from Melbourne, Australia from the beginning of 1981 to end of 1990.

We start by loading the temperature data into two splits. The first split will be a training split consisting of data from 1981 to end of 1989. This is the data we'll use to find the best pipeline with AutoML. The second split will be a testing split consisting of data from 1990. This is the split we'll use to evaluate how well our pipeline generalizes on unseen data.

```
[2]: import pandas as pd
      from evalml.demos import load_weather
```

```
X, y = load_weather()
```

```

                Number of Features

```

```
[3]: train_dates, test_dates = X.Date < "1990-01-01", X.Date >= "1990-01-01"
      X_train, y_train = X.ww.loc[train_dates], y.ww.loc[train_dates]
      X_test, y_test = X.ww.loc[test_dates], y.ww.loc[test_dates]
```

Visualizing the training set

```
[4]: import plotly.graph_objects as go
```

```
[5]: data = [
      go.Scatter(
          x=X_train["Date"],
          y=y_train,
          mode="lines+markers",
          name="Temperature (C)",
          line=dict(color="#1f77b4"),
      )
      ]
      # Let plotly pick the best date format.
      layout = go.Layout(
```

(continues on next page)

(continued from previous page)

```

    title={"text": "Min Daily Temperature, Melbourne 1980-1989"},
    xaxis={"title": "Time"},
    yaxis={"title": "Temperature (C)"},
)

go.Figure(data=data, layout=layout)

```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.10.4 Fixing the data

Sometimes, the datasets we work with do not have perfectly consistent DateTime columns. We can use the `TimeSeriesRegularizer` and `TimeSeriesImputer` to correct any discrepancies in our data in a time-series specific way.

To show an example of this, let's create some discrepancies in our training data. We'll also add a couple of extra columns in the X DataFrame to highlight more of the options with these tools.

```

[6]: X["Categorical"] = [str(i % 4) for i in range(len(X))]
     X["Categorical"] = X["Categorical"].astype("category")
     X["Numeric"] = [i for i in range(len(X))]

     # Re-split the data since we modified X
     X_train, y_train = X.loc[train_dates], y.ww.loc[train_dates]
     X_test, y_test = X.loc[test_dates], y.ww.loc[test_dates]

```

```

[7]: X_train["Date"][500] = None
     X_train["Date"][1042] = None
     X_train["Date"][1043] = None
     X_train["Date"][231] = pd.Timestamp("1981-08-19")

     X_train.drop(1209, inplace=True)
     X_train.drop(398, inplace=True)
     y_train.drop(1209, inplace=True)
     y_train.drop(398, inplace=True)

```

With these changes, there are now NaN values in the training data that our models won't be able to recognize, and there is no longer a clear frequency between the dates.

```

[8]: print(f"Inferred frequency: {pd.infer_freq(X_train['Date'])}")
     print(f"NaNs in date column: {X_train['Date'].isna().any()}")
     print(
         f"NaNs in other training data columns: {X_train['Categorical'].isna().any() or X_
         ↪train['Numeric'].isna().any()}"
     )
     print(f"NaNs in target data: {y_train.isna().any()}")

```

```

Inferred frequency: None
NaNs in date column: True

```

(continues on next page)

(continued from previous page)

```
NaNs in other training data columns: False
NaNs in target data: False
```

Time Series Regularizer

We can use the `TimeSeriesRegularizer` component to restore the missing and NaN Date/Time values we've created in our data. This component is designed to infer the proper frequency using Woodwork's `"infer_frequency"` function and generate a new DataFrame that follows it. In order to maintain as much original information from the input data as possible, all rows with completely correct times are ported over into this new DataFrame. If there are any rows that have the same timestamp as another, these will be dropped. The first occurrence of a date or time maintains priority. If there are any values that don't quite line up with the inferred frequency they will be shifted to any closely missing datetimes, or dropped if there are none nearby.

```
[9]: from evalml.pipelines.components import TimeSeriesRegularizer
```

```
regularizer = TimeSeriesRegularizer(time_index="Date")
X_train, y_train = regularizer.fit_transform(X_train, y_train)
```

Now we can see that pandas has successfully inferred the frequency of the training data, and there are no more null values within `X_train`. However, by adding values that were dropped before, we have created NaN values within the target data, as well as the other columns in our training data.

```
[10]: print(f"Inferred frequency: {pd.infer_freq(X_train['Date'])}")
      print(f"NaNs in training data: {X_train['Date'].isna().any()}")
      print(
          f"NaNs in other training data columns: {X_train['Categorical'].isna().any() or X_
          ↪train['Numeric'].isna().any()}"
      )
      print(f"NaNs in target data: {y_train.isna().any()}")
```

```
Inferred frequency: D
NaNs in training data: False
NaNs in other training data columns: True
NaNs in target data: True
```

Time Series Imputer

We could easily use the `Imputer` and `TargetImputer` components to fill in the missing gaps in our `X` and `y` data. However, these tools are not built for time series problems. Their supported imputation strategies of "mean", "most_frequent", or similar are all static. They don't account for the passing of time, and how neighboring data points may have more predictive power than simply taking the average. The `TimeSeriesImputer` solves this problem by offering three different imputation strategies: - "forwards_fill": fills in any NaN values with the same value as found in the previous non-NaN cell. - "backwards_fill": fills in any NaN values with the same value as found in the next non-NaN cell. - "interpolate": (numeric columns only) fills in any NaN values by linearly interpolating the values of the previous and next non-NaN cells.

```
[11]: from evalml.pipelines.components import TimeSeriesImputer
```

```
ts_imputer = TimeSeriesImputer(
    categorical_impute_strategy="forwards_fill",
    numeric_impute_strategy="backwards_fill",
```

(continues on next page)

(continued from previous page)

```

    target_impute_strategy="interpolate",
)
X_train, y_train = ts_imputer.fit_transform(X_train, y_train)

```

Now, finally, we have a DataFrame that's back in order without flaws, which we can use for running AutoMLSearch and running models without issue.

```

[12]: print(f"Inferred frequency: {pd.infer_freq(X_train['Date'])}")
      print(f"NaNs in training data: {X_train['Date'].isna().any()}")
      print(
          f"NaNs in other training data columns: {X_train['Categorical'].isna().any() or X_
          ↪train['Numeric'].isna().any()}"
      )
      print(f"NaNs in target data: {y_train.isna().any()}")

```

```

Inferred frequency: D
NaNs in training data: False
NaNs in other training data columns: False
NaNs in target data: False

```

4.10.5 Trending and Seasonality Decomposition

Decomposing a target signal into a trend and/or a cyclical signal is a common pre-processing step for time series modeling. Having an understanding of the presence or absence of these component signals can provide additional insight and decomposing the signal into these constituent components can enable non-time-series aware estimators to perform better while attempting to model this data. We have two unique decomposers, the `PolynomialDecompser` and the `STLDecomposer`.

Let's first take a look at a year's worth of the weather dataset.

```

[13]: import matplotlib.pyplot as plt

length = 365
X_train_time = X_train.set_index("Date").asfreq(pd.infer_freq(X_train["Date"]))
y_train_time = y_train.set_axis(X_train["Date"]).asfreq(pd.infer_freq(X_train["Date"]))
plt.plot(y_train_time[0:length], "bo")
plt.show()

```

With the knowledge that this is a weather dataset and the data itself is daily weather data, we can assume that the seasonal data will have a period of approximately 365 data points. Let's build and fit decomposers to detrend and deseasonalize this data.

Polynomial Decomposer

```
[14]: from evalml.pipelines.components.transformers.preprocessing.polynomial_decomposer import PolynomialDecomposer

      pdc = PolynomialDecomposer(degree=1, period=365)
      X_t, y_t = pdc.fit_transform(X_train_time, y_train_time)

      plt.plot(y_train_time, "bo", label="Signal")
      plt.plot(y_t, "rx", label="Detrended/Deseasonalized Signal")
      plt.legend()
      plt.show()
```

The result is the residual signal, with the trend and seasonality removed. If we want to look at what the component identified as the trend and seasonality, we can call the `plot_decomposition()` function.

```
[15]: res = pdc.plot_decomposition(X_train_time, y_train_time)
```

It is desirable to enhance the decomposer component with a guess at the period of the seasonal aspect of the signal before decomposing it. To do that, we can use the `determine_periodicity(X, y)` function of the `Decomposer` class.

```
[16]: period = pdc.determine_periodicity(X_train_time, y_train_time)
      print(period)
```

```
351
```

The `PolynomialDecomposer` class, if not explicitly set in the constructor, will set its `period` parameter based on a `statsmodels` function `freq_to_period` that considers the frequency of the datetime data. This will give a reasonable guess as to what the frequency could be. For example, if the `PolynomialDecomposer` object is fit with `period` not explicitly set, it will take on a default value of 7, which is good for daily data signals that have a known seasonal component period that is weekly.

In this case where the seasonal period is not known beforehand, the `set_period()` convenience function will look at the target data, determine a better guess for the period and set the `Decomposer` object appropriately.

```
[17]: pdc = PolynomialDecomposer()
      pdc.fit(X_train_time, y_train_time)
      assert pdc.period == 7
      pdc.set_period(X_train_time, y_train_time)
      assert 350 < pdc.period < 370
```

STLDecomposer

The `STLDecomposer` runs on `statsmodels`' implementation of `STL` decomposition. Let's take a look at how `STL` decomposes the weather dataset.

```
[18]: from evalml.pipelines.components import STLDecomposer

stl = STLDecomposer()
X_t, y_t = stl.fit_transform(X_train_time, y_train_time)

res = stl.plot_decomposition(X_train_time, y_train_time)
```

This doesn't look nearly as good as the `PolynomialDecomposer` did. This is because `STL` decomposition performs best when the data has a small seasonal period, generally less than 14 time units. The weather dataset's seasonal period of ~365 days does not work as well since `STL` extracted a shorter term seasonality for decomposition.

We can generate some synthetic data that better highlights where `STL` performs well. For this example, we'll generate monthly data with an annual seasonal period.

```
[19]: import random
import numpy as np
from datetime import datetime
from sklearn.preprocessing import minmax_scale
```

(continues on next page)

(continued from previous page)

```

def generate_synthetic_data(
    period=12,
    num_periods=25,
    scale=10,
    seasonal_scale=2,
    trend_degree=1,
    freq_str="M",
):
    freq = 2 * np.pi / period
    x = np.arange(0, period * num_periods, 1)
    dts = pd.date_range(datetime.today(), periods=len(x), freq=freq_str)
    X = pd.DataFrame({"x": x})
    X = X.set_index(dts)

    if trend_degree == 1:
        y_trend = pd.Series(scale * minmax_scale(x + 2))
    elif trend_degree == 2:
        y_trend = pd.Series(scale * minmax_scale(x**2))
    elif trend_degree == 3:
        y_trend = pd.Series(scale * minmax_scale((x - 5) ** 3 + x**2))
    y_seasonal = pd.Series(seasonal_scale * np.sin(freq * x))
    y_random = pd.Series(np.random.normal(0, 1, len(X)))
    y = y_trend + y_seasonal + y_random
    return X, y

X_stl, y_stl = generate_synthetic_data()

```

Let's see how the STLDecomposer does at decomposing this data.

```

[20]: stl = STLDecomposer()
      X_t_stl, y_t_stl = stl.fit_transform(X_stl, y_stl)

      res = stl.plot_decomposition(X_stl, y_stl)

```

On top of decomposing this type of data well, the statsmodels implementation of STL automatically determines the seasonal period of the data, which is saved during fit time for this component.

```
[21]: stl = STLDecomposer()
      assert stl.period == None
      stl.fit(X_stl, y_stl)
      print(stl.period)
```

```
None
```

4.10.6 Running AutoMLSearch

AutoMLSearch for time series problems works very similarly to the other problem types with the exception that users need to pass in a new parameter called `problem_configuration`.

The `problem_configuration` is a dictionary specifying the following values:

- **forecast_horizon**: The number of time periods we are trying to forecast. In this example, we’re interested in predicting weather for the next 7 days, so the value is 7.
- **gap**: The number of time periods between the end of the training set and the start of the test set. For example, in our case we are interested in predicting the weather for the next 7 days with the data as it is “today”, so the gap

is 0. However, if we had to predict the weather for next Monday-Sunday with the data as it was on the previous Friday, the gap would be 2 (Saturday and Sunday separate Monday from Friday). It is important to select a value that matches the realistic delay between the forecast date and the most recently available data that can be used to make that forecast.

- **max_delay:** The maximum number of rows to look in the past from the current row in order to compute features. In our example, we'll say we can use the previous week's weather to predict the current week's.
- **time_index:** The column of the training dataset that contains the date corresponding to each observation. While only some of the models we run during time series searches require the `time_index`, we require it to be passed in to top level search so that the parameter can reach the models that need it.

Note that the values of these parameters must be in the same units as the training/testing data.

Visualization of forecast horizon and gap

Forecast Horizon: 2

Gap: 1

```
[22]: from evalml automl import AutoMLSearch

problem_config = {"gap": 0, "max_delay": 7, "forecast_horizon": 7, "time_index": "Date"}

automl = AutoMLSearch(
    X_train,
    y_train,
    problem_type="time series regression",
    max_batches=1,
    problem_configuration=problem_config,
    automl_algorithm="iterative",
    allowed_model_families=[
        "xgboost",
        "random_forest",
        "linear_model",
        "extra_trees",
    ],
)
```

```
[23]: automl.search()
```

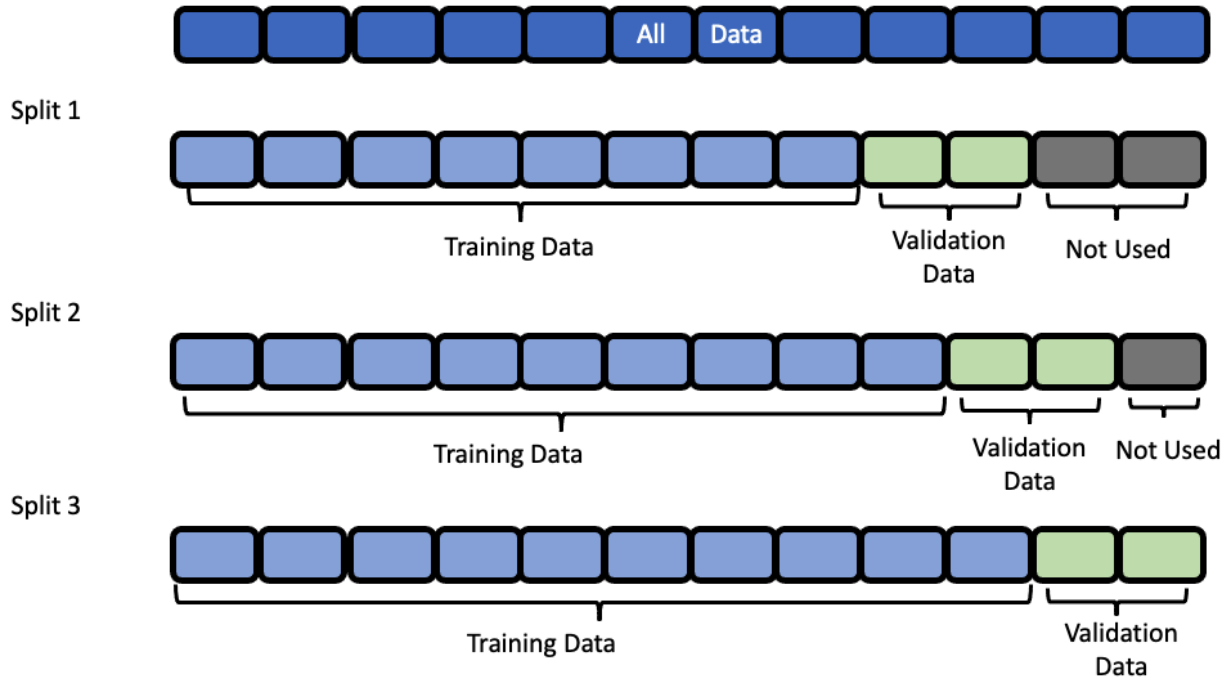

```
[23]: {1: {'Elastic Net Regressor w/ Imputer + Time Series Featurizer + STL Decomposer +  
↳ DateTime Featurizer + One Hot Encoder + Drop NaN Rows Transformer + Standard Scaler':

    'Total time of batch': 82.43312287330627}}
```

4.10.7 Understanding what happened under the hood

This is great, AutoMLSearch is able to find a pipeline that scores an R2 value of 0.44 compared to a baseline pipeline that is only able to score 0.07. But how did it do that?

Data Splitting

EvalML uses [rolling origin cross validation](#) for time series problems. Basically, we take successive cuts of the training data while keeping the validation set size fixed at `forecast_horizon` number of time units. Note that the splits are not separated by gap number of units. This is because we need access to all the data to generate features for every row of the validation set. However, the feature engineering done by our pipelines respects the gap value. This is explained more in the [feature engineering section](#).

Baseline Pipeline

The most naive thing we can do in a time series problem is use the most recently available observation to predict the next observation. In our example, this means we'll use the measurement from 7 days ago as the prediction for the current date.

```
[24]: import pandas as pd

baseline = automl.get_pipeline(0)
baseline.fit(X_train, y_train)
naive_baseline_preds = baseline.predict_in_sample(
    X_test, y_test, objective=None, X_train=X_train, y_train=y_train
)
expected_preds = pd.Series(
    pd.concat([y_train.iloc[-7:], y_test]).shift(7).iloc[7:], name="target"
)
pd.testing.assert_series_equal(expected_preds, naive_baseline_preds)
```

Feature Engineering

EvalML uses the values of `gap`, `forecast_horizon`, and `max_delay` to calculate a “window” of allowed dates that can be used for engineering the features of each row in the validation/test set. The formula for computing the bounds of the window is:

$$[t - (\text{max_delay} + \text{forecast_horizon} + \text{gap}), t - (\text{forecast_horizon} + \text{gap})]$$

As an example, this is what the features for the first five days of August would look like in our current problem:

Forecast Horizon: 7

Gap: 0

Max Delay: 7

	Prediction Date	Latest date for lagging	Earliest date for lagging
■	08-01	07-25	07-18
■	08-02	07-26	07-19
■	08-03	07-27	07-20
■	08-04	07-28	07-21
■	08-05	07-29	07-22

■ Prediction point
■ Data before the forecast point

The estimator then takes these features to generate predictions:

How the estimator generates predictions

Feature engineering components for time series

For an example of a time-series feature engineering component see [TimeSeriesFeaturizer](#)

4.10.8 Evaluate best pipeline on test data

Now that we have covered the mechanics of how EvalML runs AutoMLSearch for time series pipelines, we can compare the performance on the test set of the best pipeline found during search and the baseline pipeline.

```
[25]: pl = automl.best_pipeline
      pl.fit(X_train, y_train)
      best_pipeline_score = pl.score(X_test, y_test, ["MedianAE"], X_train, y_train)[
          "MedianAE"
      ]
```

```
[26]: best_pipeline_score
```

```
[26]: 1.8867196350647752
```

```
[27]: baseline = automl.get_pipeline(0)
baseline.fit(X_train, y_train)
naive_baseline_score = baseline.score(X_test, y_test, ["MedianAE"], X_train, y_train)[
    "MedianAE"
]
```

```
[28]: naive_baseline_score
```

```
[28]: 2.3
```

The pipeline found by AutoMLSearch has a 31% improvement over the naive forecast!

```
[29]: automl.objective.calculate_percent_difference(best_pipeline_score, naive_baseline_score)
```

```
[29]: 17.96871151892281
```

4.10.9 Visualize the predictions over time

```
[30]: from evalml.model_understanding import graph_prediction_vs_actual_over_time

fig = graph_prediction_vs_actual_over_time(
    pl, X_test, y_test, X_train, y_train, dates=X_test["Date"]
)
fig
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.10.10 Predicting on unseen data

You'll notice that in the code snippets here, we use the `predict_in_sample` pipeline method as opposed to the usual `predict` method. What's the difference?

- `predict_in_sample` is used when the target value is known on the dates we are predicting on. This is true in cross validation. This method has an expected `y` parameter so that we can compute features using previous target values for all of the observations on the holdout set.
- `predict` is used when the target value is not known, e.g. the test dataset. The `y` parameter is not expected as only the target is observed in the training set. The test dataset must be separated by `gap` units from the training dataset. For the moment, the test set size must be less than or equal to `forecast_horizon`.

Here is an example of these two methods in action:

predict_in_sample

```
[31]: pl.predict_in_sample(X_test, y_test, objective=None, X_train=X_train, y_train=y_train)
```

```
[31]: 3287    13.124784
      3288    13.468004
      3289    13.472009
      3290    12.724985
      3291    11.868053
      ...
      3647    14.159499
      3648    13.257666
      3649    13.365598
      3650    13.731870
      3651    12.263210
      Name: target, Length: 365, dtype: float64
```

predict

```
[32]: pl.predict(X_test, objective=None, X_train=X_train, y_train=y_train)
```

```
[32]: 3287    13.124784
      3288    13.468004
      3289    13.472009
      3290    12.724985
      3291    11.868053
      ...
      3647    18.339399
      3648    18.393293
      3649    18.464086
      3650    18.354281
      3651    18.330683
      Name: target, Length: 365, dtype: float64
```

4.10.11 Validating the holdout data

Before we predict on our holdout data, it is important to validate that it meets the requirements we summarized in the second point above in **Predicting on unseen data**. We can call on `validate_holdout_datasets` in order to verify the two requirements:

1. The holdout data is separated by gap units from the training dataset. This is determined by the `time_index` column, not the index e.g. if your datetime frequency for the column “Date” is 2 days with a gap of 3, then the holdout data must start 2 days x 3 = 6 days after the training data.
2. The length of the holdout data must be less than or equal to the `forecast_horizon`.

```
[33]: from evalml.utils.gen_utils import validate_holdout_datasets

      # Holdout dataset has 365 observations
      validation_results = validate_holdout_datasets(X_test, X_train, problem_config)
      assert not validation_results.is_valid
      # Holdout dataset has 7 observations
```

(continues on next page)

(continued from previous page)

```
validation_results = validate_holdout_datasets(
    X_test.iloc[: pl.forecast_horizon], X_train, problem_config
)
assert validation_results.is_valid
```

predict – Test set size matches forecast horizon

```
[34]: pl.predict(
    X_test.iloc[: pl.forecast_horizon], objective=None, X_train=X_train, y_train=y_train
)

[34]: 3287    13.124784
      3288    13.468004
      3289    13.472009
      3290    12.724985
      3291    11.868053
      3292    13.315326
      3293    12.943245
      Name: target, dtype: float64
```

predict – Test set size is less than forecast horizon

```
[35]: pl.predict(
    X_test.iloc[: pl.forecast_horizon - 2],
    objective=None,
    X_train=X_train,
    y_train=y_train,
)

[35]: 3287    13.124784
      3288    13.468004
      3289    13.472009
      3290    12.724985
      3291    11.868053
      Name: target, dtype: float64
```

predict – Test set size index starts at 0

```
[36]: pl.predict(
    X_test.iloc[: pl.forecast_horizon].reset_index(drop=True),
    objective=None,
    X_train=X_train,
    y_train=y_train,
)

[36]: 3287    13.124784
      3288    13.468004
      3289    13.472009
      3290    12.724985
```

(continues on next page)

(continued from previous page)

```

3291    11.868053
3292    13.315326
3293    12.943245
Name: target, dtype: float64

```

4.10.12 Prediction Intervals

Getting Prediction Intervals

While predictions that are generated by EvalML pipelines aim to be accurate as possible, it is very rarely the case that future results are the exact same values as predicted. Prediction intervals can help to contextualize a prediction by showing the range a future prediction is expected to fall within a certain likelihood.

Given the preprocessed (transformed, ready for prediction) features, the corresponding predictions, and a **fitted** EvalML estimator, the prediction intervals for this set of predictions is generated by calling `get_prediction_intervals()` on the pipeline's estimator. Here, we use the fitted estimator in our trained EvalML pipeline to generate the prediction intervals:

```

[37]: X_trans = pl.transform_all_but_final(X_test, y_test)
      y_pred = pl.predict(X_test, objective=None, X_train=X_train, y_train=y_train)
      pl.estimator.get_prediction_intervals(X=X_trans, y=y_pred)

```

```

[37]: {'0.95_lower': 3299    13.053448
      3300    13.059237
      3301    13.561511
      3302    13.934604
      3303    14.108101
      ...
      3647    12.722115
      3648    12.465191
      3649    12.651836
      3650    13.000082
      3651    10.880485
      Length: 353, dtype: float64,
      '0.95_upper': 3299    14.960487
      3300    14.966275
      3301    15.468550
      3302    15.841642
      3303    16.015140
      ...
      3647    15.596882
      3648    14.050141
      3649    14.079360
      3650    14.463658
      3651    13.645936
      Length: 353, dtype: float64}

```

By default, prediction intervals are calculated for the 95% upper and lower bound. In the above example, 95% of the time, a prediction sometime in the future will fall in this range.

To generate prediction intervals for a custom value, use the `coverage` parameter. In the example below, the 80% interval range is calculated below:

```
[38]: pl.estimated.get_prediction_intervals(X=X_trans, y=y_pred, coverage=[0.8])
```

```
[38]: {'0.8_lower': 3299      13.383495
      3300      13.389283
      3301      13.891558
      3302      14.264650
      3303      14.438148
      ...
      3647      13.219644

4.10.13 Forecasting Future Data

Unlike standard pipelines, time series pipelines are able to generate predictions out to the future. The number of predictions out in the future is dependent on the `forecast_horizon` parameter set in the problem configuration of an AutoML search.

To show that it is possible to generate brand new predictions in the future, the entire weather dataset (including the holdout set) will be used. The code block below refit the pipeline on the entire dataset and generates a forecast.

```
[39]: X.ww.init()
      y.ww.init()

      pl.fit(X, y)
      X_forecast_dates = pl.get_forecast_period(X=X).to_frame()
      y_forecast = pl.get_forecast_predictions(X=X, y=y)
      display("Forecast Dates:", X_forecast_dates)
      display("Forecast Predictions:", y_forecast)
```

```
'Forecast Dates:'
```

```
      Date
3652 1991-01-01
3653 1991-01-02
3654 1991-01-03
3655 1991-01-04
3656 1991-01-05
```

(continues on next page)

(continued from previous page)

```
3657 1991-01-06
3658 1991-01-07
```

'Forecast Predictions:'

```
3652    13.131977
3653    12.556440
3654    13.066180
3655    13.394714
3656    12.375170
3657    13.541838
3658    13.348718
Name: Temp, dtype: float64
```

Using these forecasted values, it is possible to generate the prediction intervals for each forecasted point.

```
[40]: res = pl.get_prediction_intervals(
        X=pd.DataFrame(X_forecast_dates), y=y_forecast, X_train=X, y_train=y
    )
    display(res)

{'0.95_lower': 3652    7.140981
 3653    4.083893
 3654    2.689471
 3655    1.412723
 3656   -1.021104
 3657   -1.133045
 3658   -2.501967
  Name: 0.95_lower, dtype: float64,
 '0.95_upper': 3652    19.122973
 3653    21.028988
 3654    23.442889
 3655    25.376706
 3656    25.771444
 3657    28.216721
 3658    29.199403
  Name: 0.95_upper, dtype: float64}
```

```
[41]: y_lower = res["0.95_lower"]
      y_upper = res["0.95_upper"]
```

Using the forecasted predictions and corresponding prediction intervals, we can plot this data. For this plot, only the last 31 days of data will be used so that the forecasted data is visible.

```
[42]: X_before = X[-31:]
      y_before = y[-31:]
```

```
[43]: fig = go.Figure(
    [
        # Plot last 31 days of training data
        go.Scatter(x=X_before["Date"], y=y_before, name="Training Data", mode="lines"),
        # Plot forecast data
        go.Scatter(
```

(continues on next page)

(continued from previous page)

```

        x=X_forecast_dates["Date"], y=y_forecast, name="Forecast Data", mode="lines"
    ),
    # Plot prediction intervals
    go.Scatter(
        x=pd.concat([X_forecast_dates["Date"], X_forecast_dates["Date"][:-1]]),
        y=pd.concat([y_upper, y_lower[:-1]]),
        fill="toself",
        fillcolor="rgba(255,0,0,0.2)",
        line=dict(color="rgba(255,0,0,0.2)",
        name="Forecast Prediction Intervals",
        showlegend=True,
    ),
],
layout={
    "title": "Plot of Last Two Weeks of Data + Forecast Data With Prediction_
↪Intervals",
    "xaxis": dict(title="Date"),
    "yaxis": dict(title="Temperature (C)",
},
)
fig.show()

```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.10.14 Forecasting into the future

Our previous examples have shown using a pipeline to predict on data we had at training time. However, we can also use EvalML time series pipelines to forecast dates into the future as long we provide data that meets the requirements of **Predicting on unseen data** as well.

To help figure out the dates we need in `X_train` to forecast dates into the future - we've provided `dates_needed_for_prediction` and `dates_needed_for_prediction_range`.

```

[44]: forecast_date = pd.Timestamp("1991-01-07")
      beginning_date, end_date = pl.dates_needed_for_prediction(forecast_date)

      print("Dates needed:")
      print(f"{beginning_date.strftime('%Y-%m-%d %X')} to {end_date.strftime('%Y-%m-%d %X')}")

Dates needed:
1990-12-23 00:00:00 to 1991-01-06 00:00:00

```

We can see how the dates are valid by generating some future dates and features with the above date range.

```

[45]: import random

      dates = pd.date_range(
          beginning_date,
          end_date,
          freq=pl.frequency.split("-")[0],

```

(continues on next page)

(continued from previous page)

```

)

X_train_forecast = pd.DataFrame(index=[i + 1 for i in range(len(dates))])
categorical_feature = pd.Series(
    [random.randint(0, 3) for i in range(len(dates))], index=X_train_forecast.index
)
numeric_feature = pd.Series(
    [i + 1 for i in range(len(dates))], index=X_train_forecast.index
)

X_train_forecast["Date"] = pd.Series(dates.values, index=X_train_forecast.index)
X_train_forecast["Categorical"] = pd.Series(
    categorical_feature.values, index=X_train_forecast.index
)
X_train_forecast["Numeric"] = pd.Series(
    numeric_feature.values, index=X_train_forecast.index
)
X_train_forecast.ww.init(
    logical_types={"Categorical": "categorical", "Numeric": "integer"}
)

y_train_forecast = pd.Series(
    X_train_forecast["Numeric"].values, index=X_train_forecast.index
)

```

```

[46]: X_test_forecast = pd.DataFrame(
    {"Date": [forecast_date], "Categorical": [3], "Numeric": [53862]}
)

```

... and we succesfully have our prediction!

```

[47]: pl.predict(X_test_forecast, X_train=X_train_forecast, y_train=y_train_forecast)

```

```

[47]: 16      9.059353
      Name: Temp, dtype: float64

```

```

[48]: forecast_start = pd.Timestamp("1991-01-07")
      forecast_end = pd.Timestamp("1991-01-14")

      dates = pl.dates_needed_for_prediction_range(forecast_start, forecast_end)
      print("Dates needed:")
      print(f"{dates[0].strftime('%Y-%m-%d %X')} to {dates[1].strftime('%Y-%m-%d %X')}")

      Dates needed:
      1990-12-23 00:00:00 to 1991-01-13 00:00:00

```

4.10.15 Known-in-advance features

In time series problems, the goal is to predict an unknown value of a data series corresponding to a future moment in time. Since the state of the world is not known in the future, we create features from data in the past since those values are known when we go make our prediction.

However, there are some features corresponding to dates in the future that can be known with certainty, either because they can be derived from the forecast date or because the feature can be controlled by the modeler. This includes features such as if the date is a US Holiday, or the location of a store in a sales dataset. With these sorts of features, we don't need to include them in our time-series specific preprocessing steps (such as Time Series Featurization).

To handle these features, EvalML will split them into a separate path through the component graph, bypassing the unnecessary preprocessing steps. Let's take a look at what that looks like, using some synthetic data.

```
[50]: X = pd.DataFrame(
    {"features": range(101, 601), "date": pd.date_range("2010-10-01", periods=500)}
)
y = pd.Series(range(500))

X.ww.init()
X.ww["bool_feature"] = (
    pd.Series([True, False]).sample(n=X.shape[0], replace=True).reset_index(drop=True)
)
X.ww["cat_feature"] = (
    pd.Series(["a", "b", "c"]).sample(n=X.shape[0], replace=True).reset_index(drop=True)
)

automl = AutoMLSearch(
    X,
    y,
    problem_type="time series regression",
    problem_configuration={
        "max_delay": 5,
        "gap": 3,
        "forecast_horizon": 2,
        "time_index": "date",
        "known_in_advance": ["bool_feature", "cat_feature"],
    },
)
automl.search()
```

4.10.16 Multiseries time series problems

The above documentation has focused on single series time series data. Now, we take a look at multiseries time series forecasting.

What is multiseries?

Multiseries time series refers to data where we have multiple time series that we're trying to forecast simultaneously. For example, if we are a retailer who sells multiple products at our stores, we may have a single dataset that contains sales data for those multiple products. In this case, we would like to forecast sales for all products without splitting them off into separate datasets.

There are two forms of multiseries forecasting - independent and dependent. Independent forecasting assumes that the separate series we're modeling are independent from each other, that is, the value of one series at a given point in time is unrelated to the value of a different series at any point in time. In our sales example, product A sales and product B sales would not impact each other at all. Dependent forecasting is the opposite, where it is assumed that all series have an impact on the others in the dataset.

At the moment, EvalML only supports independent multiseries time series forecasting.

Preparing the data

For this example, we will generate a fake example dataset with just two example series. It is common that many real-world scenarios will have more.

```
[52]: import numpy as np

time_index = list(pd.date_range(start="1/1/2018", periods=50)) * 2
series_id = pd.Series([1] * 50 + [2] * 50, dtype="str")

series_1_target = pd.Series(10 * np.sin(np.arange(50)) + np.random.rand(50))
series_2_target = pd.Series(range(50) + np.random.rand(50))
target = pd.Series(
    pd.concat([series_1_target, series_2_target]), name="target"
).reset_index(drop=True)

data = (
    pd.DataFrame(
        {
            "date": time_index,
            "series_id": series_id,
            "target": target,
        },
    )
    .sort_values("date")
    .reset_index(drop=True)
)
X = data.drop(["target"], axis=1)
y = data["target"]
```

This data has two unique series with their own target patterns, combined into a single dataset. Notice that both targets are combined into a single column, with each series' targets being delineated by the `series_id`. These values could be in essentially any order, as long as the date, series id, and target values are in equivalent rows. Note that the series id column can be categorical, it does not need to be numeric as it is in this example. Also note that while this example does not contain any other non-target features, the `VARMAXRegressor` can handle them.

```
[53]: data.head(6)
```

```
[53]:
```

	date	series_id	target
0	2018-01-01	1	0.779005
1	2018-01-01	2	0.757211
2	2018-01-02	1	8.553715
3	2018-01-02	2	1.718959
4	2018-01-03	1	9.804033
5	2018-01-03	2	2.350875

In EvalML, we refer to this general data format as being “stacked” data, where all the target values for the separate series are stacked into a single column. If we removed the series id column and broke them into separate columns with one for each series, that would be referred to as “unstacked” data. EvalML provides utility functions to go between these formats, `unstack_multiseries`, `stack_data`, and `stack_X`. The stacking functions are differentiated by their return type, where `stack_data` will stack the input into a single column while `stack_X` will stack multiple series into their respective columns within a `DataFrame`.

```
[54]: from evalml.pipelines.utils import unstack_multiseries
```

```
X_unstacked, y_unstacked = unstack_multiseries(
    X, y, series_id="series_id", time_index="date", target_name="target"
)
y_unstacked.head(10)
```

```
[54]:
```

	target 1	target 2
0	0.779005	0.757211
1	8.553715	1.718959
2	9.804033	2.350875
3	1.791330	3.608529
4	-7.543976	4.438055
5	-8.821156	5.573601
6	-2.455962	6.224085
7	7.039058	7.308838
8	10.353171	8.415636
9	4.193871	9.702678

We provide a separate utility function to split your data into training and holdout sets for multiseries data.

```
[55]: from evalml.preprocessing import split_multiseries_data
```

```
X_train, X_holdout, y_train, y_holdout = split_multiseries_data(
    X, y, series_id="series_id", time_index="date"
)
```

Running AutoMLSearch

Running AutoMLSearch for multiseriess time series forecasting is similar to any other single series time series problem. The data should be in its “stacked” format, and the problem configuration requires an additional parameter of `series_id`.

Right now, the only estimator that supports multiseriess time series regression forecasting outside of the baseline model is the VARMAXRegressor (more information can be found [here](#)). The VARMAX regressor is trained during the first batch twice - once on its own and once running STL decomposition beforehand, as with single series instances.

```
[56]: problem_configuration = {
      "time_index": "date",
      "forecast_horizon": 5,
      "max_delay": 10,
      "gap": 0,
      "series_id": "series_id",
    }

    automl = AutoMLSearch(
        X_train,
        y_train,
        problem_type="multiseriess time series regression",
        problem_configuration=problem_configuration,
    )
    automl.search()

Visualizing the data and results

As with any other time series problem, EvalML provides utility functions to visualize the data.

Decomposition

Plotting the decomposition of our multiseried data displays each series' decomposition in order. The decomposition object, unlike AutoMLSearch, requires unstacked data.

```
[58]: decomposer = STLDecomposer(time_index="date", series_id="series_id")
      decomposer.fit(X_unstacked, y_unstacked)

      decomposer.plot_decomposition(X_unstacked, y_unstacked)

[58]: {'target|1': (<Figure size 1850x1450 with 4 Axes>,
      array([<Axes: title={'center': 'signal'}>,
             <Axes: title={'center': 'trend'}>,
             <Axes: title={'center': 'seasonality'}>,
             <Axes: title={'center': 'residual'}>], dtype=object)),
      'target|2': (<Figure size 1850x1450 with 4 Axes>,
      array([<Axes: title={'center': 'signal'}>,
             <Axes: title={'center': 'trend'}>,
             <Axes: title={'center': 'seasonality'}>,
             <Axes: title={'center': 'residual'}>], dtype=object)))
```

Prediction vs actual

Similarly, we can visualize the performance of our models by examining the prediction compared to the actual values over time. If we'd like to see the results of a single series, rather than all of them, we can use the argument `single_series`.

```
[59]: pipeline = automl.best_pipeline
fig = graph_prediction_vs_actual_over_time(
    pipeline, X_holdout, y_holdout, X_train, y_train, dates=X_holdout["date"]
)
fig
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

```
[60]: fig = graph_prediction_vs_actual_over_time(  
    pipeline,  
    X_holdout,  
    y_holdout,  
    X_train,  
    y_train,  
    dates=X_holdout["date"],  
    single_series="2",  
)  
fig
```

Data type cannot be displayed: application/vnd.plotly.v1+json, text/html

4.11 FAQ

4.11.1 Q: What is the difference between EvalML and other AutoML libraries?

EvalML optimizes machine learning pipelines on *custom practical objectives* instead of vague machine learning loss functions so that it will find the best pipelines for your specific needs. Furthermore, EvalML *pipelines* are able to take in all kinds of data (missing values, categorical, etc.) as long as the data are in a single table. EvalML also allows you to build your own pipelines with existing or custom components so you can have more control over the AutoML process. Moreover, EvalML also provides you with support in the form of *data checks* to ensure that you are aware of potential issues your data may cause with machine learning algorithms.

4.11.2 Q: How does EvalML handle missing values?

EvalML contains imputation components in its pipelines so that missing values are taken care of. EvalML optimizes over different types of imputation to search for the best possible pipeline. You can find more information about components [here](#) and in the API reference [here](#).

4.11.3 Q: How does EvalML handle categorical encoding?

EvalML provides a *one-hot-encoding component* in its pipelines for categorical variables. EvalML plans to support other encoders in the future.

4.11.4 Q: How does EvalML handle feature selection?

EvalML currently utilizes scikit-learn's [SelectFromModel](#) with a Random Forest classifier/regressor to handle feature selection. EvalML plans on supporting more feature selectors in the future. You can find more information in the API reference [here](#).

4.11.5 Q: How is feature importance calculated?

Feature importance depends on the estimator used. Variable coefficients are used for regression-based estimators (Logistic Regression and Linear Regression) and Gini importance is used for tree-based estimators (Random Forest and XGBoost).

4.11.6 Q: How does hyperparameter tuning work?

EvalML tunes hyperparameters for its pipelines through Bayesian optimization. In the future we plan to support more optimization techniques such as random search.

4.11.7 Q: Can I create my own objective metric?

Yes you can! You can *create your own custom objective* so that EvalML optimizes the best model for your needs.

4.11.8 Q: How does EvalML avoid overfitting?

EvalML provides *data checks* to combat overfitting. Such data checks include detecting label leakage, unstable pipelines, hold-out datasets and cross validation. EvalML defaults to using Stratified K-Fold cross-validation for classification problems and K-Fold cross-validation for regression problems but allows you to utilize your own cross-validation methods as well.

4.11.9 Q: Can I create my own pipeline for EvalML?

Yes! EvalML allows you to create *custom pipelines* using modular components. This allows you to customize EvalML pipelines for your own needs or for AutoML.

4.11.10 Q: Does EvalML work with X algorithm?

EvalML is constantly improving and adding new components and will allow your own algorithms to be used as components in our pipelines.

API REFERENCE**5.1 Demo Datasets**

<i>load_breast_cancer</i>	Load breast cancer dataset. Binary classification problem.
<i>load_churn</i>	Load churn dataset, which can be used for binary classification problems.
<i>load_diabetes</i>	Load diabetes dataset. Used for regression problems.
<i>load_fraud</i>	Load credit card fraud dataset.
<i>load_weather</i>	Load the Australian daily-min-temperatures weather dataset.
<i>load_wine</i>	Load wine dataset. Multiclass problem.

5.2 Preprocessing**5.2.1 Preprocessing Utils**

Utilities to preprocess data before using evalml.

<i>load_data</i>	Load features and target from file.
<i>number_of_features</i>	Get the number of features of each specific dtype in a DataFrame.
<i>split_data</i>	Split data into train and test sets.
<i>target_distribution</i>	Get the target distributions.

5.2.2 Data Splitters

<i>NoSplit</i>	Does not split the training data into training and validation sets.
<i>KFold</i>	Wrapper class for sklearn's KFold splitter.
<i>StratifiedKFold</i>	Wrapper class for sklearn's Stratified KFold splitter.
<i>TrainingValidationSplit</i>	Split the training data into training and validation sets.
<i>TimeSeriesSplit</i>	Rolling Origin Cross Validation for time series problems.

5.3 Exceptions

<i>AutoMLSearchException</i>	Exception raised when all pipelines in an automl batch return a score of NaN for the primary objective.
<i>ComponentNotYetFittedError</i>	An exception to be raised when predict/predict_proba/transform is called on a component without fitting first.
<i>DataCheckInitError</i>	Exception raised when a data check can't initialize with the parameters given.
<i>MethodPropertyNotFoundError</i>	Exception to raise when a class is does not have an expected method or property.
<i>MissingComponentError</i>	An exception raised when a component is not found in all_components().
<i>NoPositiveLabelException</i>	Exception when a particular classification label for the 'positive' class cannot be found in the column index or unique values.
<i>ObjectiveCreationError</i>	Exception when get_objective tries to instantiate an objective and required args are not provided.
<i>ObjectiveNotFoundError</i>	Exception to raise when specified objective does not exist.
<i>PartialDependenceError</i>	Exception raised for all errors that partial dependence can raise.
<i>PipelineError</i>	Exception raised for errors that can be raised when applying a pipeline.
<i>PipelineNotFoundError</i>	An exception raised when a particular pipeline is not found in automl search results.
<i>PipelineNotYetFittedError</i>	An exception to be raised when predict/predict_proba/transform is called on a pipeline without fitting first.
<i>PipelineScoreError</i>	An exception raised when a pipeline errors while scoring any objective in a list of objectives.

5.3.1 Warnings

<i>NullsInColumnWarning</i>	Warning thrown when there are null values in the column of interest.
<i>ParameterNotUsedWarning</i>	Warning thrown when a pipeline parameter isn't used in a defined pipeline's component graph during initialization.

5.3.2 Error Codes

<i>PartialDependenceErrorCode</i>	Enum identifying the type of error encountered in partial dependence.
<i>PipelineErrorCodeEnum</i>	Enum identifying the type of error encountered while applying a pipeline.
<i>ValidationErrorCode</i>	Enum identifying the type of error encountered in hold-out validation.

5.4 AutoML

5.4.1 AutoML Search Interface

<i>AutoMLSearch</i>	Automated Pipeline search.
---------------------	----------------------------

5.4.2 AutoML Utils

<i>get_default_primary_search_objective</i>	Get the default primary search objective for a problem type.
<i>get_threshold_tuning_info</i>	Determine for a given automl config and pipeline what the threshold tuning objective should be and whether or not training data should be further split to achieve proper threshold tuning.
<i>make_data_splitter</i>	Given the training data and ML problem parameters, compute a data splitting method to use during AutoML search.
<i>resplit_training_data</i>	Further split the training data for a given pipeline. This is needed for binary pipelines in order to properly tune the threshold.
<i>search</i>	Given data and configuration, run an automl search.
<i>search_iterative</i>	Given data and configuration, run an automl search.
<i>tune_binary_threshold</i>	Tunes the threshold of a binary pipeline to the X and y thresholding data.

5.4.3 AutoML Algorithm Classes

<i>AutoMLAlgorithm</i>	Base class for the AutoML algorithms which power EvalML.
<i>DefaultAlgorithm</i>	An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.
<i>IterativeAlgorithm</i>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

5.4.4 AutoML Callbacks

<i>log_error_callback</i>	Logs the exception thrown as an error.
<i>raise_error_callback</i>	Raises the exception thrown by the AutoMLSearch object.
<i>silent_error_callback</i>	No-op.

5.4.5 AutoML Engines

<i>CFEngine</i>	The concurrent.futures (CF) engine.
<i>DaskEngine</i>	The dask engine.
<i>EngineBase</i>	Base class for EvalML engines.
<i>SequentialEngine</i>	The default engine for the AutoML search.

5.5 Pipelines

5.5.1 Pipeline Base Classes

<i>BinaryClassificationPipeline</i>	Pipeline subclass for all binary classification pipelines.
<i>ClassificationPipeline</i>	Pipeline subclass for all classification pipelines.
<i>MulticlassClassificationPipeline</i>	Pipeline subclass for all multiclass classification pipelines.
<i>PipelineBase</i>	Machine learning pipeline.
<i>RegressionPipeline</i>	Pipeline subclass for all regression pipelines.
<i>TimeSeriesBinaryClassificationPipeline</i>	Pipeline base class for time series binary classification problems.
<i>TimeSeriesClassificationPipeline</i>	Pipeline base class for time series classification problems.
<i>TimeSeriesMulticlassClassificationPipeline</i>	Pipeline base class for time series multiclass classification problems.
<i>TimeSeriesRegressionPipeline</i>	Pipeline base class for time series regression problems.

5.5.2 Pipeline Utils

<code>get_actions_from_option_defaults</code>	Returns a list of actions based on the defaults parameters of each option in the input <code>DataCheckActionOption</code> list.
<code>generate_pipeline_code</code>	Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.
<code>generate_pipeline_example</code>	Creates and returns a string that contains the Python imports and code required for running the EvalML pipeline.
<code>make_pipeline</code>	Given input data, target data, an estimator class and the problem type, generates a pipeline class with a preprocessing chain which was recommended based on the inputs. The pipeline will be a subclass of the appropriate pipeline base class for the specified <code>problem_type</code> .
<code>make_pipeline_from_actions</code>	Creates a pipeline of components to address the input <code>DataCheckAction</code> list.
<code>make_pipeline_from_data_check_output</code>	Creates a pipeline of components to address warnings and errors output from running data checks. Uses all default suggestions.
<code>rows_of_interest</code>	Get the row indices of the data that are closest to the threshold. Works only for binary classification problems and pipelines.

5.6 Component Graphs

<code>ComponentGraph</code>	Component graph for a pipeline as a directed acyclic graph (DAG).
-----------------------------	---

5.7 Components

5.7.1 Component Base Classes

Components represent a step in a pipeline.

<code>ComponentBase</code>	Base class for all components.
<code>Transformer</code>	A component that may or may not need fitting that transforms data. These components are used before an estimator.
<code>Estimator</code>	A component that fits and predicts given data.

5.7.2 Component Utils

<i>allowed_model_families</i>	List the model types allowed for a particular problem type.
<i>estimator_unable_to_handle_nans</i>	If True, provided estimator class is unable to handle NaN values as an input.
<i>generate_component_code</i>	Creates and returns a string that contains the Python imports and code required for running the EvalML component.
<i>get_estimators</i>	Returns the estimators allowed for a particular problem type.
<i>handle_component_class</i>	Standardizes input from a string name to a Component-Base subclass if necessary.
<i>make_balancing_dictionary</i>	Makes dictionary for oversampler components. Find ratio of each class to the majority. If the ratio is smaller than the <code>sampling_ratio</code> , we want to oversample, otherwise, we don't want to sample at all, and we leave the data as is.

5.7.3 Transformers

Transformers are components that take in data as input and output transformed data.

<i>DateTimeFeaturizer</i>	Transformer that can automatically extract features from datetime columns.
<i>DFSTransformer</i>	Featuretools DFS component that generates features for the input features.
<i>DropColumns</i>	Drops specified columns in input data.
<i>DropNaNRowsTransformer</i>	Transformer to drop rows with NaN values.
<i>DropNullColumns</i>	Transformer to drop features whose percentage of NaN values exceeds a specified threshold.
<i>DropRowsTransformer</i>	Transformer to drop rows specified by row indices.
<i>EmailFeaturizer</i>	Transformer that can automatically extract features from emails.
<i>Imputer</i>	Imputes missing data according to a specified imputation strategy.
<i>LabelEncoder</i>	A transformer that encodes target labels using values between 0 and <code>num_classes - 1</code> .
<i>LinearDiscriminantAnalysis</i>	Reduces the number of features by using Linear Discriminant Analysis.
<i>LogTransformer</i>	Applies a log transformation to the target data.
<i>LSA</i>	Transformer to calculate the Latent Semantic Analysis Values of text input.
<i>NaturalLanguageFeaturizer</i>	Transformer that can automatically featurize text columns using featuretools' <code>nlp_primitives</code> .
<i>OneHotEncoder</i>	A transformer that encodes categorical features in a one-hot numeric array.
<i>OrdinalEncoder</i>	A transformer that encodes ordinal features as an array of ordinal integers representing the relative order of categories.

continues on next page

Table 1 – continued from previous page

<i>Oversampler</i>	SMOTE Oversampler component. Will automatically select whether to use SMOTE, SMOTEN, or SMOTENC based on inputs to the component.
<i>PCA</i>	Reduces the number of features by using Principal Component Analysis (PCA).
<i>PerColumnImputer</i>	Imputes missing data according to a specified imputation strategy per column.
<i>PolynomialDecomposer</i>	Removes trends and seasonality from time series by fitting a polynomial and moving average to the data.
<i>ReplaceNullableTypes</i>	Transformer to replace features with the new nullable dtypes with a dtype that is compatible in EvalML.
<i>RFClassifierRFSelector</i>	Selects relevant features using recursive feature elimination with a Random Forest Classifier.
<i>RFClassifierSelectFromModel</i>	Selects top features based on importance weights using a Random Forest classifier.
<i>RFRegressorRFSelector</i>	Selects relevant features using recursive feature elimination with a Random Forest Regressor.
<i>RFRegressorSelectFromModel</i>	Selects top features based on importance weights using a Random Forest regressor.
<i>SelectByType</i>	Selects columns by specified Woodwork logical type or semantic tag in input data.
<i>SelectColumns</i>	Selects specified columns in input data.
<i>SimpleImputer</i>	Imputes missing data according to a specified imputation strategy. Natural language columns are ignored.
<i>StandardScaler</i>	A transformer that standardizes input features by removing the mean and scaling to unit variance.
<i>STLDecomposer</i>	Removes trends and seasonality from time series using the STL algorithm.
<i>TargetEncoder</i>	A transformer that encodes categorical features into target encodings.
<i>TargetImputer</i>	Imputes missing target data according to a specified imputation strategy.
<i>TimeSeriesFeaturizer</i>	Transformer that delays input features and target variable for time series problems.
<i>TimeSeriesImputer</i>	Imputes missing data according to a specified timeseries-specific imputation strategy.
<i>TimeSeriesRegularizer</i>	Transformer that regularizes an inconsistently spaced datetime column.
<i>Undersampler</i>	Initializes an undersampling transformer to downsample the majority classes in the dataset.
<i>URLFeaturizer</i>	Transformer that can automatically extract features from URL.

5.7.4 Estimators

Classifiers

Classifiers are components that output a predicted class label.

<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.
<i>CatBoostClassifier</i>	CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>DecisionTreeClassifier</i>	Decision Tree Classifier.
<i>ElasticNetClassifier</i>	Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.
<i>ExtraTreesClassifier</i>	Extra Trees Classifier.
<i>KNeighborsClassifier</i>	K-Nearest Neighbors Classifier.
<i>LightGBMClassifier</i>	LightGBM Classifier.
<i>LogisticRegressionClassifier</i>	Logistic Regression Classifier.
<i>RandomForestClassifier</i>	Random Forest Classifier.
<i>StackedEnsembleClassifier</i>	Stacked Ensemble Classifier.
<i>SVMClassifier</i>	Support Vector Machine Classifier.
<i>VowpalWabbitBinaryClassifier</i>	Vowpal Wabbit Binary Classifier.
<i>VowpalWabbitMulticlassClassifier</i>	Vowpal Wabbit Multiclass Classifier.
<i>XGBoostClassifier</i>	XGBoost Classifier.

Regressors

Regressors are components that output a predicted target value.

<i>ARIMAREgressor</i>	Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html .
<i>BaselineRegressor</i>	Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.
<i>CatBoostRegressor</i>	CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>DecisionTreeRegressor</i>	Decision Tree Regressor.
<i>ElasticNetRegressor</i>	Elastic Net Regressor.
<i>ExponentialSmoothingRegressor</i>	Holt-Winters Exponential Smoothing Forecaster.
<i>ExtraTreesRegressor</i>	Extra Trees Regressor.
<i>LightGBMRegressor</i>	LightGBM Regressor.
<i>LinearRegressor</i>	Linear Regressor.
<i>ProphetRegressor</i>	Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.
<i>RandomForestRegressor</i>	Random Forest Regressor.
<i>StackedEnsembleRegressor</i>	Stacked Ensemble Regressor.
<i>SVMRegressor</i>	Support Vector Machine Regressor.
<i>TimeSeriesBaselineEstimator</i>	Time series estimator that predicts using the naive forecasting approach.
<i>VowpalWabbitRegressor</i>	Vowpal Wabbit Regressor.
<i>XGBoostRegressor</i>	XGBoost Regressor.

5.8 Model Understanding

5.8.1 Metrics

<i>binary_objective_vs_threshold</i>	Computes objective score as a function of potential binary classification decision thresholds for a fitted binary classification pipeline.
<i>calculate_permutation_importance</i>	Calculates permutation importance for features.
<i>calculate_permutation_importance_one_column</i>	Calculates permutation importance for one column in the original dataframe.
<i>confusion_matrix</i>	Confusion matrix for binary and multiclass classification.
<i>find_confusion_matrix_per_thresholds</i>	Gets the confusion matrix and histogram bins for each threshold as well as the best threshold per objective. Only works with Binary Classification Pipelines.
<i>get_linear_coefficients</i>	Returns a dataframe showing the features with the greatest predictive power for a linear model.
<i>get_prediction_vs_actual_data</i>	Combines <code>y_true</code> and <code>y_pred</code> into a single dataframe and adds a column for outliers. Used in <code>graph_prediction_vs_actual()</code> .
<i>get_prediction_vs_actual_over_time_data</i>	Get the data needed for the <code>prediction_vs_actual_over_time</code> plot.
<i>normalize_confusion_matrix</i>	Normalizes a confusion matrix.
<i>partial_dependence</i>	Calculates one or two-way partial dependence.
<i>precision_recall_curve</i>	Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.
<i>roc_curve</i>	Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve. Works with binary or multiclass problems.
<i>t_sne</i>	Get the transformed output after fitting X to the embedded space using t-SNE.
<i>get_influential_features</i>	Finds the most influential features as well as any detrimental features from a dataframe of feature importances.
<i>readable_explanation</i>	Outputs a human-readable explanation of trained pipeline behavior.

5.8.2 Visualization Methods

<code>graph_binary_objective_vs_threshold</code>	Generates a plot graphing objective score vs. decision thresholds for a fitted binary classification pipeline.
<code>graph_confusion_matrix</code>	Generate and display a confusion matrix plot.
<code>graph_partial_dependence</code>	Create an one-way or two-way partial dependence plot.
<code>graph_permutation_importance</code>	Generate a bar graph of the pipeline's permutation importance.
<code>graph_precision_recall_curve</code>	Generate and display a precision-recall plot.
<code>graph_prediction_vs_actual</code>	Generate a scatter plot comparing the true and predicted values. Used for regression plotting.
<code>graph_prediction_vs_actual_over_time</code>	Plot the target values and predictions against time on the x-axis.
<code>graph_roc_curve</code>	Generate and display a Receiver Operating Characteristic (ROC) plot for binary and multiclass classification problems.
<code>graph_t_sne</code>	Plot high dimensional data into lower dimensional space using t-SNE.

5.8.3 Prediction Explanations

<code>explain_predictions</code>	Creates a report summarizing the top contributing features for each data point in the input features.
<code>explain_predictions_best_worst</code>	Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

5.9 Objectives

5.9.1 Objective Base Classes

<code>ObjectiveBase</code>	Base class for all objectives.
<code>BinaryClassificationObjective</code>	Base class for all binary classification objectives.
<code>MulticlassClassificationObjective</code>	Base class for all multiclass classification objectives.
<code>RegressionObjective</code>	Base class for all regression objectives.

5.9.2 Domain-Specific Objectives

<i>CostBenefitMatrix</i>	Score using a cost-benefit matrix. Scores quantify the benefits of a given value, so greater numeric scores represents a better score. Costs and scores can be negative, indicating that a value is not beneficial. For example, in the case of monetary profit, a negative cost and/or score represents loss of cash flow.
<i>FraudCost</i>	Score the percentage of money lost of the total transaction amount process due to fraud.
<i>LeadScoring</i>	Lead scoring.
<i>SensitivityLowAlert</i>	Sensitivity at Low Alert Rates.

5.9.3 Classification Objectives

<i>AccuracyBinary</i>	Accuracy score for binary classification.
<i>AccuracyMulticlass</i>	Accuracy score for multiclass classification.
<i>AUC</i>	AUC score for binary classification.
<i>AUCMacro</i>	AUC score for multiclass classification using macro averaging.
<i>AUCMicro</i>	AUC score for multiclass classification using micro averaging.
<i>AUCWeighted</i>	AUC Score for multiclass classification using weighted averaging.
<i>Gini</i>	Gini coefficient for binary classification.
<i>BalancedAccuracyBinary</i>	Balanced accuracy score for binary classification.
<i>BalancedAccuracyMulticlass</i>	Balanced accuracy score for multiclass classification.
<i>F1</i>	F1 score for binary classification.
<i>F1Micro</i>	F1 score for multiclass classification using micro averaging.
<i>F1Macro</i>	F1 score for multiclass classification using macro averaging.
<i>F1Weighted</i>	F1 score for multiclass classification using weighted averaging.
<i>LogLossBinary</i>	Log Loss for binary classification.
<i>LogLossMulticlass</i>	Log Loss for multiclass classification.
<i>MCCBinary</i>	Matthews correlation coefficient for binary classification.
<i>MCCMulticlass</i>	Matthews correlation coefficient for multiclass classification.
<i>Precision</i>	Precision score for binary classification.
<i>PrecisionMicro</i>	Precision score for multiclass classification using micro averaging.
<i>PrecisionMacro</i>	Precision score for multiclass classification using macro-averaging.
<i>PrecisionWeighted</i>	Precision score for multiclass classification using weighted averaging.
<i>Recall</i>	Recall score for binary classification.
<i>RecallMicro</i>	Recall score for multiclass classification using micro averaging.
<i>RecallMacro</i>	Recall score for multiclass classification using macro averaging.
<i>RecallWeighted</i>	Recall score for multiclass classification using weighted averaging.

5.9.4 Regression Objectives

<i>ExpVariance</i>	Explained variance score for regression.
<i>MAE</i>	Mean absolute error for regression.
<i>MASE</i>	Mean absolute scaled error for time series regression.
<i>MAPE</i>	Mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.
<i>SMAPE</i>	Symmetric mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.
<i>MSE</i>	Mean squared error for regression.
<i>MeanSquaredLogError</i>	Mean squared log error for regression.
<i>MedianAE</i>	Median absolute error for regression.
<i>MaxError</i>	Maximum residual error for regression.
<i>R2</i>	Coefficient of determination for regression.
<i>RootMeanSquaredError</i>	Root mean squared error for regression.
<i>RootMeanSquaredLogError</i>	Root mean squared log error for regression.

5.9.5 Objective Utils

<i>get_all_objective_names</i>	Get a list of the names of all objectives.
<i>get_core_objectives</i>	Returns all core objective instances associated with the given problem type.
<i>get_core_objective_names</i>	Get a list of all valid core objectives.
<i>get_default_recommendation_objectives</i>	Get the default recommendation score metrics for the given problem type.
<i>get_non_core_objectives</i>	Get non-core objective classes.
<i>get_objective</i>	Returns the Objective class corresponding to a given objective name.
<i>get_optimization_objectives</i>	Get objectives for optimization.
<i>get_ranking_objectives</i>	Get objectives for pipeline rankings.
<i>normalize_objectives</i>	Converts objectives from a $[0, \infty)$ scale to $[0, 1]$ given a max and min for each objective.
<i>organize_objectives</i>	Generate objectives to consider, with optional modifications to the defaults.
<i>ranking_only_objectives</i>	Get ranking-only objective classes.
<i>recommendation_score</i>	Computes a recommendation score for a model given scores for a group of objectives.

5.10 Problem Types

<i>detect_problem_type</i>	Determine the type of problem is being solved based on the targets (binary vs multiclass classification, regression). Ignores missing and null data.
<i>handle_problem_types</i>	Handles problem_type by either returning the ProblemTypes or converting from a str.
<i>is_binary</i>	Determines if the provided problem_type is a binary classification problem type.
<i>is_classification</i>	Determines if the provided problem_type is a classification problem type.
<i>is_multiclass</i>	Determines if the provided problem_type is a multiclass classification problem type.
<i>is_regression</i>	Determines if the provided problem_type is a regression problem type.
<i>is_time_series</i>	Determines if the provided problem_type is a time series problem type.
<i>ProblemTypes</i>	Enum defining the supported types of machine learning problems.

5.11 Model Family

<i>handle_model_family</i>	Handles model_family by either returning the ModelFamily or converting from a string.
<i>ModelFamily</i>	Enum for family of machine learning models.

5.12 Tuners

<i>Tuner</i>	Base Tuner class.
<i>SKOptTuner</i>	Bayesian Optimizer.
<i>GridSearchTuner</i>	Grid Search Optimizer, which generates all of the possible points to search for using a grid.
<i>RandomSearchTuner</i>	Random Search Optimizer.

5.13 Data Checks

5.13.1 Data Check Classes

<i>ClassImbalanceDataCheck</i>	Check if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds. Use for classification problems.
<i>DateTimeFormatDataCheck</i>	Check if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.
<i>IDColumnsDataCheck</i>	Check if any of the features are likely to be ID columns.
<i>InvalidTargetDataCheck</i>	Check if the target data is considered invalid.
<i>MulticollinearityDataCheck</i>	Check if any set features are likely to be multicollinear.
<i>NoVarianceDataCheck</i>	Check if the target or any of the features have no variance.
<i>NullDataCheck</i>	Check if there are any highly-null numerical, boolean, categorical, natural language, and unknown columns and rows in the input.
<i>OutliersDataCheck</i>	Checks if there are any outliers in input data by using IQR to determine score anomalies.
<i>SparsityDataCheck</i>	Check if there are any columns with sparsely populated values in the input.
<i>TargetDistributionDataCheck</i>	Check if the target data contains certain distributions that may need to be transformed prior training to improve model performance. Uses the Shapiro-Wilks test when the dataset is ≤ 5000 samples, otherwise uses Jarque-Bera.
<i>TargetLeakageDataCheck</i>	Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and other correlation metrics.
<i>TimeSeriesParametersDataCheck</i>	Checks whether the time series parameters are compatible with data splitting.
<i>TimeSeriesSplittingDataCheck</i>	Checks whether the time series target data is compatible with splitting.
<i>UniquenessDataCheck</i>	Check if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.
<i>DataCheck</i>	Base class for all data checks.
<i>DataChecks</i>	A collection of data checks.
<i>DefaultDataChecks</i>	A collection of basic data checks that is used by AutoML by default.

5.13.2 Data Check Messages

<i>DataCheckMessage</i>	Base class for a message returned by a DataCheck, tagged by name.
<i>DataCheckError</i>	DataCheckMessage subclass for errors returned by data checks.
<i>DataCheckWarning</i>	DataCheckMessage subclass for warnings returned by data checks.

5.13.3 Data Check Message Types

<i>DataCheckMessageType</i>	Enum for type of data check message: WARNING or ERROR.
-----------------------------	--

5.13.4 Data Check Message Codes

<i>DataCheckMessageCode</i>	Enum for data check message code.
-----------------------------	-----------------------------------

5.13.5 Data Check Actions

<i>DataCheckAction</i>	A recommended action returned by a DataCheck.
<i>DataCheckActionCode</i>	Enum for data check action code.
<i>DataCheckActionOption</i>	A recommended action option returned by a DataCheck.

5.14 Utils

5.14.1 General Utils

<code>convert_to_seconds</code>	Converts a string describing a length of time to its length in seconds.
<code>downcast_nullable_types</code>	Downcasts IntegerNullable, BooleanNullable types to Double, Boolean in order to support certain estimators like ARIMA, CatBoost, and LightGBM.
<code>drop_rows_with_nans</code>	Drop rows that have any NaNs in all dataframes or series.
<code>get_importable_subclasses</code>	Get importable subclasses of a base class. Used to list all of our estimators, transformers, components and pipelines dynamically.
<code>get_logger</code>	Get the logger with the associated name.
<code>get_time_index</code>	Determines the column in the given data that should be used as the time index.
<code>import_or_raise</code>	Attempts to import the requested library by name. If the import fails, raises an ImportError or warning.
<code>infer_feature_types</code>	Create a Woodwork structure from the given list, pandas, or numpy input, with specified types for columns. If a column's type is not specified, it will be inferred by Woodwork.
<code>is_all_numeric</code>	Checks if the given DataFrame contains only numeric values.
<code>get_random_state</code>	Generates a numpy.random.RandomState instance using seed.
<code>get_random_seed</code>	Given a numpy.random.RandomState object, generate an int representing a seed value for another random number generator. Or, if given an int, return that int.
<code>pad_with_nans</code>	Pad the beginning num_to_pad rows with nans.
<code>safe_repr</code>	Convert the given value into a string that can safely be used for repr.
<code>save_plot</code>	Saves fig to filepath if specified, or to a default location if not.

Evalml

EvalML.

Subpackages

Automl

AutoMLSearch and related modules.

Subpackages

automl_algorithm

AutoML algorithms that power EvalML.

Submodules

automl_algorithm

Base class for the AutoML algorithms which power EvalML.

lowed_component_graphs=None,
search_parameters=None,
tuner_class=None,
text_in_ensembling=False,
random_seed=0,
n_jobs=-1)

```

Base class for the AutoML algorithms which power EvalML.

This class represents an automated machine learning (AutoML) algorithm. It encapsulates the decision-making logic behind an automl search, by both deciding which pipelines to evaluate next and by deciding what set of parameters to configure the pipeline with.

To use this interface, you must define a `next_batch` method which returns the next group of pipelines to evaluate on the training data. That method may access state and results recorded from the previous batches, although that information is not tracked in a general way in this base class. Overriding `add_result` is a convenient way to record pipeline evaluation info if necessary.

Parameters

- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **search_parameters** (*dict*) – Search parameter ranges specified for pipelines to iterate over.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **text_in_ensembling** (*boolean*) – If True and ensembling is True, then n_jobs will be set to 1 to avoid downstream sklearn stacking issues related to nlTK. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Methods

<code>add_result</code>	Register results from evaluating a pipeline.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self*, *score_to_minimize*, *pipeline*, *trained_pipeline_results*)

Register results from evaluating a pipeline.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.

Raises **PipelineNotFoundError** – If pipeline is not allowed in search.

property **batch_number**(*self*)

Returns the number of batches which have been recommended so far.

property **default_max_batches**(*self*)

Returns the number of max batches AutoMLSearch should run by default.

abstract **next_batch**(*self*)

Get the next batch of pipelines to evaluate.

Returns A list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list[PipelineBase]

abstract **num_pipelines_per_batch**(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters **batch_number** (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property pipeline_number(*self*)

Returns the number of pipelines which have been recommended so far.

exception evalml.automl.automl_algorithm.automl_algorithm.AutoMLAlgorithmException

Exception raised when an error is encountered during the computation of the automl algorithm.

default_algorithm

An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.

Module Contents

Classes Summary

<i>DefaultAlgorithm</i>	An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.

                                                                    sampler_name, al-
                                                                    lowed_model_families=None,
                                                                    ex-
                                                                    cluded_model_families=None,
                                                                    tuner_class=None,
                                                                    random_seed=0,
                                                                    search_parameters=None,
                                                                    n_jobs=1,
                                                                    text_in_ensembling=False,
                                                                    top_n=3,
                                                                    ensembling=False,
                                                                    num_long_explore_pipelines=50,
                                                                    num_long_pipelines_per_batch=10,
                                                                    al-
                                                                    low_long_running_models=False,
                                                                    features=None,
                                                                    run_feature_selection=True,
                                                                    verbose=False, ex-
                                                                    clude_featurizers=None)
```

An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.

1. Naive pipelines:

- run baseline with default preprocessing pipeline
- run naive linear model with default preprocessing pipeline
- run basic RF pipeline with default preprocessing pipeline

2. Naive pipelines with feature selection

- a. subsequent pipelines will use the selected features with a SelectedColumns transformer

At this point we have a single pipeline candidate for preprocessing and feature selection

3. **Pipelines with preprocessing components:**

- a. scan rest of estimators (our current batch 1).

4. First ensembling run

Fast mode ends here. Begin long mode.

6. **Run top 3 estimators:**

- a. Generate 50 random parameter sets. Run all 150 in one batch

7. Second ensembling run

8. **Repeat these indefinitely until stopping criterion is met:**

- a. For each of the previous top 3 estimators, sample 10 parameters from the tuner. Run all 30 in one batch
- b. Run ensembling

Parameters

- **X** (*pd.DataFrame*) – Training data.
- **y** (*pd.Series*) – Target data.
- **problem_type** (*ProblemType*) – Problem type associated with training data.
- **sampler_name** (*BaseSampler*) – Sampler to use for preprocessing.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **search_parameters** (*dict or None*) – Pipeline-level parameters and custom hyperparameter ranges specified for pipelines to iterate over. Hyperparameter ranges must be passed in as *skopt.space* objects. Defaults to None.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **text_in_ensembling** (*boolean*) – If True and ensembling is True, then *n_jobs* will be set to 1 to avoid downstream sklearn stacking issues related to *nlTK*. Defaults to False.
- **top_n** (*int*) – top n number of pipelines to use for long mode.
- **num_long_explore_pipelines** (*int*) – number of pipelines to explore for each top n pipeline at the start of long mode.
- **num_long_pipelines_per_batch** (*int*) – number of pipelines per batch for each top n pipeline through long mode.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If False and no pipelines, component graphs, or model families are provided, AutoMLSearch will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to False.

- **features** (*list*) – List of features to run DFS on in AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature has not been computed yet.
- **run_feature_selection** (*bool*) – If True, will run a separate feature selection pipeline and only use selected features in subsequent batches. If False, will use all of the features for every pipeline. Only used for default algorithm.
- **verbose** (*boolean*) – Whether or not to display logging information regarding pipeline building. Defaults to False.
- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by DefaultAlgorithm. Valid options are “DatetimeFeaturizer”, “EmailFeaturizer”, “URLFeaturizer”, “NaturalLanguageFeaturizer”, “TimeSeriesFeaturizer”
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run `evalml.pipelines.components.utils.allowed_model_families(“binary”)` to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. For default algorithm, this only applies to estimators in the non-naive batches.
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines. For default algorithm, this only excludes estimators in the non-naive batches.

Methods

<code>add_result</code>	Register results from evaluating a pipeline. In batch number 2, the selected column names from the feature selector are taken to be used in a column selector. Information regarding the best pipeline is updated here as well.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self, score_to_minimize, pipeline, trained_pipeline_results, cached_data=None*)

Register results from evaluating a pipeline. In batch number 2, the selected column names from the feature selector are taken to be used in a column selector. Information regarding the best pipeline is updated here as well.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.

- **cached_data** (*dict*) – A dictionary of cached data, where the keys are the model family. Expected to be of format {model_family: {hash1: trained_component_graph, hash2: trained_component_graph...}...}. Defaults to None.

property batch_number(*self*)

Returns the number of batches which have been recommended so far.

property default_max_batches(*self*)

Returns the number of max batches AutoMLSearch should run by default.

next_batch(*self*)

Get the next batch of pipelines to evaluate.

Returns a list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list(PipelineBase)

num_pipelines_per_batch(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters **batch_number** (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property pipeline_number(*self*)

Returns the number of pipelines which have been recommended so far.

iterative_algorithm

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Module Contents

Classes Summary

IterativeAlgorithm

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Contents

```

class evalml.automl.automl_algorithm.iterative_algorithm.IterativeAlgorithm(X, y,
                                                                    problem_type,
                                                                    sampler_name=None,
                                                                    allowed_model_families=None,
                                                                    excluded_model_families=None,
                                                                    allowed_component_graphs=None,
                                                                    max_batches=None,
                                                                    max_iterations=None,
                                                                    tuner_class=None,
                                                                    random_seed=0,
                                                                    pipelines_per_batch=5,
                                                                    n_jobs=-1, number_features=None,
                                                                    ensembling=False,
                                                                    text_in_ensembling=False,
                                                                    search_parameters=None,
                                                                    estimator_family_order=None,
                                                                    allow_long_running_models=False,
                                                                    features=None,
                                                                    verbose=False,
                                                                    exclude_featurizers=None)

```

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Parameters

- **X** (*pd.DataFrame*) – Training data.
- **y** (*pd.Series*) – Target data.
- **problem_type** (*ProblemType*) – Problem type associated with training data.
- **sampler_name** (*BaseSampler*) – Sampler to use for preprocessing. Defaults to None.
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run `evalml.pipelines.components.utils.allowed_model_families("binary")` to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if `allowed_pipelines` is provided, this parameter will be ignored.
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines.
- **allowed_component_graphs** (*dict*) – A dictionary of lists or *ComponentGraphs* indicating the component graphs allowed in the search. The format should follow { "Name_0": [list_of_components], "Name_1": [ComponentGraph(...)] }

The default of None indicates all pipeline component graphs for this problem type are allowed. Setting this field will cause `allowed_model_families` to be ignored.

e.g. `allowed_component_graphs = { "My_Graph": ["Imputer", "One Hot Encoder", "Random Forest Classifier"] }`

- **max_batches** (*int*) – The maximum number of batches to be evaluated. Used to determine ensembling. Defaults to None.
- **max_iterations** (*int*) – The maximum number of iterations to be evaluated. Used to determine ensembling. Defaults to None.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **pipelines_per_batch** (*int*) – The number of pipelines to be evaluated in each batch, after the first batch. Defaults to 5.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to None.
- **number_features** (*int*) – The number of columns in the input features. Defaults to None.
- **ensembling** (*boolean*) – If True, runs ensembling in a separate batch after every allowed pipeline class has been iterated over. Defaults to False.
- **text_in_ensembling** (*boolean*) – If True and ensembling is True, then `n_jobs` will be set to 1 to avoid downstream sklearn stacking issues related to nltk. Defaults to False.
- **search_parameters** (*dict or None*) – Pipeline-level parameters and custom hyperparameter ranges specified for pipelines to iterate over. Hyperparameter ranges must be passed in as `skopt.space` objects. Defaults to None.
- **_estimator_family_order** (*list(ModelFamily) or None*) – specify the sort order for the first batch. Defaults to None, which uses `_ESTIMATOR_FAMILY_ORDER`.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If False and no pipelines, component graphs, or model families are provided, AutoMLSearch will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to False.
- **features** (*list*) – List of features to run DFS on in AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input.
- **verbose** (*boolean*) – Whether or not to display logging information regarding pipeline building. Defaults to False.
- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by IterativeAlgorithm. Valid options are "DatetimeFeaturizer", "EmailFeaturizer", "URLFeaturizer", "NaturalLanguageFeaturizer", "TimeSeriesFeaturizer"

Methods

<code>add_result</code>	Register results from evaluating a pipeline.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self*, *score_to_minimize*, *pipeline*, *trained_pipeline_results*, *cached_data=None*)

Register results from evaluating a pipeline.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.
- **cached_data** (*dict*) – A dictionary of cached data, where the keys are the model family. Expected to be of format {model_family: {hash1: trained_component_graph, hash2: trained_component_graph... }... }. Defaults to None.

Raises ValueError – If default parameters are not in the acceptable hyperparameter ranges.

property batch_number(*self*)

Returns the number of batches which have been recommended so far.

property default_max_batches(*self*)

Returns the number of max batches AutoMLSearch should run by default.

next_batch(*self*)

Get the next batch of pipelines to evaluate.

Returns A list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list[PipelineBase]

Raises AutoMLAlgorithmException – If no results were reported from the first batch.

num_pipelines_per_batch(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters batch_number (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property pipeline_number(*self*)

Returns the number of pipelines which have been recommended so far.

Package Contents

Classes Summary

<i>AutoMLAlgorithm</i>	Base class for the AutoML algorithms which power EvalML.
<i>DefaultAlgorithm</i>	An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.
<i>IterativeAlgorithm</i>	An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Exceptions Summary

Contents

```
class evalml.automl.automl_algorithm.AutoMLAlgorithm(allowed_pipelines=None,
                                                       allowed_model_families=None,
                                                       excluded_model_families=None,
                                                       allowed_component_graphs=None,
                                                       search_parameters=None, tuner_class=None,
                                                       text_in_ensembling=False, random_seed=0,
                                                       n_jobs=- 1)
```

Base class for the AutoML algorithms which power EvalML.

This class represents an automated machine learning (AutoML) algorithm. It encapsulates the decision-making logic behind an automl search, by both deciding which pipelines to evaluate next and by deciding what set of parameters to configure the pipeline with.

To use this interface, you must define a `next_batch` method which returns the next group of pipelines to evaluate on the training data. That method may access state and results recorded from the previous batches, although that information is not tracked in a general way in this base class. Overriding `add_result` is a convenient way to record pipeline evaluation info if necessary.

Parameters

- **allowed_pipelines** (*list(class)*) – A list of PipelineBase subclasses indicating the pipelines allowed in the search. The default of None indicates all pipelines for this problem type are allowed.
- **search_parameters** (*dict*) – Search parameter ranges specified for pipelines to iterate over.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **text_in_ensembling** (*boolean*) – If True and ensembling is True, then `n_jobs` will be set to 1 to avoid downstream sklearn stacking issues related to nlTK. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Methods

<code>add_result</code>	Register results from evaluating a pipeline.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self*, *score_to_minimize*, *pipeline*, *trained_pipeline_results*)

Register results from evaluating a pipeline.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.

Raises **PipelineNotFoundError** – If pipeline is not allowed in search.

property **batch_number**(*self*)

Returns the number of batches which have been recommended so far.

property **default_max_batches**(*self*)

Returns the number of max batches AutoMLSearch should run by default.

abstract **next_batch**(*self*)

Get the next batch of pipelines to evaluate.

Returns A list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list[PipelineBase]

abstract **num_pipelines_per_batch**(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters **batch_number** (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property **pipeline_number**(*self*)

Returns the number of pipelines which have been recommended so far.

exception evalml.automl.automl_algorithm.AutoMLAlgorithmException

Exception raised when an error is encountered during the computation of the automl algorithm.

```
class evalml.automl.automl_algorithm.DefaultAlgorithm(X, y, problem_type, sampler_name,
                                                    allowed_model_families=None,
                                                    excluded_model_families=None,
                                                    tuner_class=None, random_seed=0,
                                                    search_parameters=None, n_jobs=1,
                                                    text_in_ensembling=False, top_n=3,
                                                    ensembling=False,
                                                    num_long_explore_pipelines=50,
                                                    num_long_pipelines_per_batch=10,
                                                    allow_long_running_models=False,
                                                    features=None, run_feature_selection=True,
                                                    verbose=False, exclude_featurizers=None)
```

An automl algorithm that consists of two modes: fast and long, where fast is a subset of long.

1. Naive pipelines:

- a. run baseline with default preprocessing pipeline
- b. run naive linear model with default preprocessing pipeline
- c. run basic RF pipeline with default preprocessing pipeline

2. Naive pipelines with feature selection

- a. subsequent pipelines will use the selected features with a SelectedColumns transformer

At this point we have a single pipeline candidate for preprocessing and feature selection

3. Pipelines with preprocessing components:

- a. scan rest of estimators (our current batch 1).

4. First ensembling run

Fast mode ends here. Begin long mode.

6. Run top 3 estimators:

- a. Generate 50 random parameter sets. Run all 150 in one batch

7. Second ensembling run

8. Repeat these indefinitely until stopping criterion is met:

- a. For each of the previous top 3 estimators, sample 10 parameters from the tuner. Run all 30 in one batch
- b. Run ensembling

Parameters

- **X** (*pd.DataFrame*) – Training data.
- **y** (*pd.Series*) – Target data.
- **problem_type** (*ProblemType*) – Problem type associated with training data.
- **sampler_name** (*BaseSampler*) – Sampler to use for preprocessing.
- **tuner_class** (*class*) – A subclass of Tuner, to be used to find parameters for each pipeline. The default of None indicates the SKOptTuner will be used.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

- **search_parameters** (*dict or None*) – Pipeline-level parameters and custom hyperparameter ranges specified for pipelines to iterate over. Hyperparameter ranges must be passed in as `skopt.space` objects. Defaults to `None`.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to `-1`.
- **text_in_ensembling** (*boolean*) – If `True` and `ensembling` is `True`, then `n_jobs` will be set to `1` to avoid downstream `sklearn` stacking issues related to `nlTK`. Defaults to `False`.
- **top_n** (*int*) – top `n` number of pipelines to use for long mode.
- **num_long_explore_pipelines** (*int*) – number of pipelines to explore for each top `n` pipeline at the start of long mode.
- **num_long_pipelines_per_batch** (*int*) – number of pipelines per batch for each top `n` pipeline through long mode.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If `False` and no pipelines, component graphs, or model families are provided, `AutoMLSearch` will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to `False`.
- **features** (*list*) – List of features to run DFS on in AutoML pipelines. Defaults to `None`. Features will only be computed if the columns used by the feature exist in the input and if the feature has not been computed yet.
- **run_feature_selection** (*bool*) – If `True`, will run a separate feature selection pipeline and only use selected features in subsequent batches. If `False`, will use all of the features for every pipeline. Only used for default algorithm.
- **verbose** (*boolean*) – Whether or not to display logging information regarding pipeline building. Defaults to `False`.
- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by `DefaultAlgorithm`. Valid options are “`DatetimeFeaturizer`”, “`EmailFeaturizer`”, “`URLFeaturizer`”, “`NaturalLanguageFeaturizer`”, “`TimeSeriesFeaturizer`”
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of `None` searches over all model families. Run `evalml.pipelines.components.utils.allowed_model_families(“binary”)` to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. For default algorithm, this only applies to estimators in the non-naive batches.
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines. For default algorithm, this only excludes estimators in the non-naive batches.

Methods

<code>add_result</code>	Register results from evaluating a pipeline. In batch number 2, the selected column names from the feature selector are taken to be used in a column selector. Information regarding the best pipeline is updated here as well.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self*, *score_to_minimize*, *pipeline*, *trained_pipeline_results*, *cached_data=None*)

Register results from evaluating a pipeline. In batch number 2, the selected column names from the feature selector are taken to be used in a column selector. Information regarding the best pipeline is updated here as well.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.
- **cached_data** (*dict*) – A dictionary of cached data, where the keys are the model family. Expected to be of format {model_family: {hash1: trained_component_graph, hash2: trained_component_graph... }... }. Defaults to None.

property batch_number(*self*)

Returns the number of batches which have been recommended so far.

property default_max_batches(*self*)

Returns the number of max batches AutoMLSearch should run by default.

next_batch(*self*)

Get the next batch of pipelines to evaluate.

Returns a list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list(PipelineBase)

num_pipelines_per_batch(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters **batch_number** (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property pipeline_number(*self*)

Returns the number of pipelines which have been recommended so far.

```
class evalml.automl.automl_algorithm.IterativeAlgorithm(X, y, problem_type, sampler_name=None,
                                                         allowed_model_families=None,
                                                         excluded_model_families=None,
                                                         allowed_component_graphs=None,
                                                         max_batches=None, max_iterations=None,
                                                         tuner_class=None, random_seed=0,
                                                         pipelines_per_batch=5, n_jobs=-1,
                                                         number_features=None,
                                                         ensembling=False,
                                                         text_in_ensembling=False,
                                                         search_parameters=None,
                                                         _estimator_family_order=None,
                                                         allow_long_running_models=False,
                                                         features=None, verbose=False,
                                                         exclude_featurizers=None)
```

An automl algorithm which first fits a base round of pipelines with default parameters, then does a round of parameter tuning on each pipeline in order of performance.

Parameters

- **X** (*pd.DataFrame*) – Training data.
- **y** (*pd.Series*) – Target data.
- **problem_type** (*ProblemType*) – Problem type associated with training data.
- **sampler_name** (*BaseSampler*) – Sampler to use for preprocessing. Defaults to None.
- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run `evalml.pipelines.components.utils.allowed_model_families("binary")` to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if `allowed_pipelines` is provided, this parameter will be ignored.
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines.
- **allowed_component_graphs** (*dict*) – A dictionary of lists or *ComponentGraphs* indicating the component graphs allowed in the search. The format should follow { "Name_0": [list_of_components], "Name_1": [ComponentGraph(...)] }

The default of None indicates all pipeline component graphs for this problem type are allowed. Setting this field will cause `allowed_model_families` to be ignored.

e.g. `allowed_component_graphs = { "My_Graph": ["Imputer", "One Hot Encoder", "Random Forest Classifier"] }`
- **max_batches** (*int*) – The maximum number of batches to be evaluated. Used to determine ensembling. Defaults to None.
- **max_iterations** (*int*) – The maximum number of iterations to be evaluated. Used to determine ensembling. Defaults to None.
- **tuner_class** (*class*) – A subclass of *Tuner*, to be used to find parameters for each pipeline. The default of None indicates the *SKOptTuner* will be used.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **pipelines_per_batch** (*int*) – The number of pipelines to be evaluated in each batch, after the first batch. Defaults to 5.

- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to None.
- **number_features** (*int*) – The number of columns in the input features. Defaults to None.
- **ensembling** (*boolean*) – If True, runs ensembling in a separate batch after every allowed pipeline class has been iterated over. Defaults to False.
- **text_in_ensembling** (*boolean*) – If True and ensembling is True, then n_jobs will be set to 1 to avoid downstream sklearn stacking issues related to nltk. Defaults to False.
- **search_parameters** (*dict or None*) – Pipeline-level parameters and custom hyperparameter ranges specified for pipelines to iterate over. Hyperparameter ranges must be passed in as `skopt.space` objects. Defaults to None.
- **_estimator_family_order** (*list(ModelFamily) or None*) – specify the sort order for the first batch. Defaults to None, which uses `_ESTIMATOR_FAMILY_ORDER`.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If False and no pipelines, component graphs, or model families are provided, AutoMLSearch will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to False.
- **features** (*list*) – List of features to run DFS on in AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the input and if the feature itself is not in input.
- **verbose** (*boolean*) – Whether or not to display logging information regarding pipeline building. Defaults to False.
- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by IterativeAlgorithm. Valid options are “DatetimeFeaturizer”, “EmailFeaturizer”, “URLFeaturizer”, “NaturalLanguageFeaturizer”, “TimeSeriesFeaturizer”

Methods

<code>add_result</code>	Register results from evaluating a pipeline.
<code>batch_number</code>	Returns the number of batches which have been recommended so far.
<code>default_max_batches</code>	Returns the number of max batches AutoMLSearch should run by default.
<code>next_batch</code>	Get the next batch of pipelines to evaluate.
<code>num_pipelines_per_batch</code>	Return the number of pipelines in the nth batch.
<code>pipeline_number</code>	Returns the number of pipelines which have been recommended so far.

add_result(*self, score_to_minimize, pipeline, trained_pipeline_results, cached_data=None*)

Register results from evaluating a pipeline.

Parameters

- **score_to_minimize** (*float*) – The score obtained by this pipeline on the primary objective, converted so that lower values indicate better pipelines.
- **pipeline** (*PipelineBase*) – The trained pipeline object which was used to compute the score.
- **trained_pipeline_results** (*dict*) – Results from training a pipeline.

- **cached_data** (*dict*) – A dictionary of cached data, where the keys are the model family. Expected to be of format {model_family: {hash1: trained_component_graph, hash2: trained_component_graph...}...}. Defaults to None.

Raises ValueError – If default parameters are not in the acceptable hyperparameter ranges.

property batch_number(*self*)

Returns the number of batches which have been recommended so far.

property default_max_batches(*self*)

Returns the number of max batches AutoMLSearch should run by default.

next_batch(*self*)

Get the next batch of pipelines to evaluate.

Returns A list of instances of PipelineBase subclasses, ready to be trained and evaluated.

Return type list[PipelineBase]

Raises AutoMLAlgorithmException – If no results were reported from the first batch.

num_pipelines_per_batch(*self*, *batch_number*)

Return the number of pipelines in the nth batch.

Parameters batch_number (*int*) – which batch to calculate the number of pipelines for.

Returns number of pipelines in the given batch.

Return type int

property pipeline_number(*self*)

Returns the number of pipelines which have been recommended so far.

engine

EvalML Engine classes used to evaluate pipelines in AutoMLSearch.

Submodules

cf_engine

Custom CFClient API to match Dask's CFClient and allow context management.

Module Contents

Classes Summary

<i>CFClient</i>	Custom CFClient API to match Dask's CFClient and allow context management.
<i>CFComputation</i>	A Future-like wrapper around jobs created by the CFEngine.
<i>CFEngine</i>	The concurrent.futures (CF) engine.

Contents

class evalml.automl.engine.cf_engine.CFClient(*pool*)

Custom CFClient API to match Dask's CFClient and allow context management.

Parameters *pool* (*cf.ThreadPoolExecutor* or *cf.ProcessPoolExecutor*) – The resource pool to execute the futures work on.

Methods

<i>close</i>	Closes the underlying Executor.
<i>is_closed</i>	Property that determines whether the Engine's Client's resources are closed.
<i>submit</i>	Pass through to imitate Dask's Client API.

close(*self*)

Closes the underlying Executor.

property *is_closed*(*self*)

Property that determines whether the Engine's Client's resources are closed.

submit(*self*, **args*, ***kwargs*)

Pass through to imitate Dask's Client API.

class evalml.automl.engine.cf_engine.CFComputation(*future*)

A Future-like wrapper around jobs created by the CFEngine.

Parameters *future* (*cf.Future*) – The concurrent.futures.Future that is desired to be executed.

Methods

<i>cancel</i>	Cancel the current computation.
<i>done</i>	Returns whether the computation is done.
<i>get_result</i>	Gets the computation result. Will block until the computation is finished.
<i>is_cancelled</i>	Returns whether computation was cancelled.

cancel(*self*)

Cancel the current computation.

Returns

False if the call is currently being executed or finished running and cannot be cancelled.
True if the call can be canceled.

Return type bool

done(*self*)

Returns whether the computation is done.

get_result(*self*)

Gets the computation result. Will block until the computation is finished.

Raises

- **Exception** – If computation fails. Returns traceback.
- **cf.TimeoutError** – If computation takes longer than default timeout time.

- **cf.CancelledError** – If computation was canceled before completing.

Returns The result of the requested job.

property is_cancelled(self)

Returns whether computation was cancelled.

class evalml.engine.cf_engine.**CFEngine**(client=None)

The concurrent.futures (CF) engine.

Parameters **client** (None or **CFClient**) – If None, creates a threaded pool for processing. Defaults to None.

Methods

<i>close</i>	Function to properly shutdown the Engine's Client's resources.
<i>is_closed</i>	Property that determines whether the Engine's Client's resources are shutdown.
<i>setup_job_log</i>	Set up logger for job.
<i>submit_evaluation_job</i>	Send evaluation job to cluster.
<i>submit_scoring_job</i>	Send scoring job to cluster.
<i>submit_training_job</i>	Send training job to cluster.

close(self)

Function to properly shutdown the Engine's Client's resources.

property is_closed(self)

Property that determines whether the Engine's Client's resources are shutdown.

static setup_job_log()

Set up logger for job.

submit_evaluation_job(self, automl_config, pipeline, X, y, X_holdout=None, y_holdout=None)

Send evaluation job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool

Return type *CFComputation*

submit_scoring_job(self, automl_config, pipeline, X, y, objectives, X_train=None, y_train=None)

Send scoring job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – Objectives to score on.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool.

Return type *CFComputation*

submit_training_job(*self, automl_config, pipeline, X, y*)

Send training job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool

Return type *CFComputation*

dask_engine

A Future-like wrapper around jobs created by the DaskEngine.

Module Contents

Classes Summary

<i>DaskComputation</i>	A Future-like wrapper around jobs created by the DaskEngine.
<i>DaskEngine</i>	The dask engine.

Contents

class evalml.automl.engine.dask_engine.**DaskComputation**(*dask_future*)

A Future-like wrapper around jobs created by the DaskEngine.

Parameters **dask_future** (*callable*) – Computation to do.

Methods

<i>cancel</i>	Cancel the current computation.
<i>done</i>	Returns whether the computation is done.
<i>get_result</i>	Gets the computation result. Will block until the computation is finished.
<i>is_cancelled</i>	Returns whether computation was cancelled.

cancel(*self*)

Cancel the current computation.

done(*self*)

Returns whether the computation is done.

get_result(*self*)

Gets the computation result. Will block until the computation is finished.

Raises Exception – If computation fails. Returns traceback.

Returns Computation results.

property is_cancelled(*self*)

Returns whether computation was cancelled.

class evalml.automl.engine.dask_engine.**DaskEngine**(*cluster=None*)

The dask engine.

Parameters **cluster** (*None or dd.Client*) – If None, creates a local, threaded Dask client for processing. Defaults to None.

Methods

<i>close</i>	Closes the underlying cluster.
<i>is_closed</i>	Property that determines whether the Engine's Client's resources are shutdown.
<i>send_data_to_cluster</i>	Send data to the cluster.
<i>setup_job_log</i>	Set up logger for job.
<i>submit_evaluation_job</i>	Send evaluation job to cluster.
<i>submit_scoring_job</i>	Send scoring job to cluster.
<i>submit_training_job</i>	Send training job to cluster.

close(*self*)

Closes the underlying cluster.

property is_closed(*self*)

Property that determines whether the Engine's Client's resources are shutdown.

send_data_to_cluster(*self*, *X*, *y*)

Send data to the cluster.

The implementation uses caching so the data is only sent once. This follows dask best practices.

Parameters

- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns The modeling data.

Return type *dask.Future*

static setup_job_log()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Send evaluation job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns

An object wrapping a reference to a future-like computation occurring in the dask cluster.

Return type *DaskComputation*

submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*, *y_train=None*)

Send scoring job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.

Returns

An object wrapping a reference to a future-like computation occurring in the dask cluster.

Return type *DaskComputation*

submit_training_job(*self*, *automl_config*, *pipeline*, *X*, *y*)

Send training job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns

An object wrapping a reference to a future-like computation occurring in the dask cluster.

Return type *DaskComputation*

engine_base

Base class for EvalML engines.

Module Contents

Classes Summary

<i>EngineBase</i>	Base class for EvalML engines.
<i>EngineComputation</i>	Wrapper around the result of a (possibly asynchronous) engine computation.
<i>JobLogger</i>	Mimic the behavior of a python logging.Logger but stores all messages rather than actually logging them.

Functions

<i>evaluate_pipeline</i>	Function submitted to the submit_evaluation_job engine method.
<i>score_pipeline</i>	Wrap around pipeline.score method to make it easy to score pipelines with dask.
<i>train_and_score_pipeline</i>	Given a pipeline, config and data, train and score the pipeline and return the CV or TV scores.
<i>train_pipeline</i>	Train a pipeline and tune the threshold if necessary.

Contents

class evalml.engine.engine_base.**EngineBase**

Base class for EvalML engines.

Methods

<i>setup_job_log</i>	Set up logger for job.
<i>submit_evaluation_job</i>	Submit job for pipeline evaluation during AutoMLSearch.
<i>submit_scoring_job</i>	Submit job for pipeline scoring.
<i>submit_training_job</i>	Submit job for pipeline training.

static **setup_job_log()**

Set up logger for job.

abstract **submit_evaluation_job**(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*,
y_holdout=None)

Submit job for pipeline evaluation during AutoMLSearch.

abstract **submit_scoring_job**(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*,
y_train=None)

Submit job for pipeline scoring.

abstract **submit_training_job**(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Submit job for pipeline training.

class evalml.engine.engine_base.**EngineComputation**

Wrapper around the result of a (possibly asynchronous) engine computation.

Methods

<i>cancel</i>	Cancel the computation.
<i>done</i>	Whether the computation is done.
<i>get_result</i>	Gets the computation result. Will block until the computation is finished.

abstract **cancel**(*self*)

Cancel the computation.

abstract **done**(*self*)

Whether the computation is done.

abstract **get_result**(*self*)

Gets the computation result. Will block until the computation is finished.

Raises Exception: If computation fails. Returns traceback.

evalml.engine.engine_base.**evaluate_pipeline**(*pipeline*, *automl_config*, *X*, *y*, *logger*,
X_holdout=None, *y_holdout=None*)

Function submitted to the submit_evaluation_job engine method.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to score.

- **automl_config** (*AutoMLConfig*) – The AutoMLSearch object, used to access config and the error callback.
- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Training target.
- **logger** – Logger object to write to.
- **X_holdout** (*pd.DataFrame*) – Holdout set features.
- **y_holdout** (*pd.DataFrame*) – Holdout set target.

Returns

First - A dict containing **cv_score_mean**, **cv_scores**, **training_time** and a **cv_data** structure with details.
 Second - The pipeline class we trained and scored. Third - the job logger instance with all the recorded messages.

Return type tuple of three items

class evalml.automl.engine.engine_base.JobLogger

Mimic the behavior of a python logging.Logger but stores all messages rather than actually logging them.

This is used during engine jobs so that log messages are recorded after the job completes. This is desired so that all of the messages for a single job are grouped together in the log.

Methods

<i>debug</i>	Store message at the debug level.
<i>error</i>	Store message at the error level.
<i>info</i>	Store message at the info level.
<i>warning</i>	Store message at the warning level.
<i>write_to_logger</i>	Write all the messages to the logger, first in, first out (FIFO) order.

debug(*self, msg*)

Store message at the debug level.

error(*self, msg*)

Store message at the error level.

info(*self, msg*)

Store message at the info level.

warning(*self, msg*)

Store message at the warning level.

write_to_logger(*self, logger*)

Write all the messages to the logger, first in, first out (FIFO) order.

evalml.automl.engine.engine_base.**score_pipeline**(*pipeline, X, y, objectives, X_train=None, y_train=None, X_schema=None, y_schema=None*)

Wrap around pipeline.score method to make it easy to score pipelines with dask.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to score.
- **X** (*pd.DataFrame*) – Features to score on.
- **y** (*pd.Series*) – Target used to calculate scores.

- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **X_schema** (*ww.TableSchema*) – Schema for features. Defaults to None.
- **y_schema** (*ww.ColumnSchema*) – Schema for columns. Defaults to None.

Returns Dictionary object containing pipeline scores.

Return type dict

```
evalml.automl.engine.engine_base.train_and_score_pipeline(pipeline, automl_config, full_X_train,
                                                         full_y_train, logger, X_holdout=None,
                                                         y_holdout=None)
```

Given a pipeline, config and data, train and score the pipeline and return the CV or TV scores.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to score.
- **automl_config** (*AutoMLSearch*) – The AutoMLSearch object, used to access config and the error callback.
- **full_X_train** (*pd.DataFrame*) – Training features.
- **full_y_train** (*pd.Series*) – Training target.
- **logger** – Logger object to write to.
- **X_holdout** (*pd.DataFrame*) – Holdout set features.
- **y_holdout** (*pd.DataFrame*) – Holdout set target.

Raises Exception – If there are missing target values in the training set after data split.

Returns

First - A dict containing cv_score_mean, cv_scores, training_time and a cv_data structure with details.

Second - The pipeline class we trained and scored. Third - the job logger instance with all the recorded messages.

Return type tuple of three items

```
evalml.automl.engine.engine_base.train_pipeline(pipeline, X, y, automl_config, schema=True,
                                                get_hashes=False)
```

Train a pipeline and tune the threshold if necessary.

Parameters

- **pipeline** (*PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Features to train on.
- **y** (*pd.Series*) – Target to train on.
- **automl_config** (*AutoMLSearch*) – The AutoMLSearch object, used to access config and the error callback.
- **schema** (*bool*) – Whether to use the schemas for X and y. Defaults to True.
- **get_hashes** (*bool*) – Whether to return the hashes of the data used to train (and potentially threshold). Defaults to False

Returns A trained pipeline instance. hash (optional): The hash of the input data indices, only returned when get_hashes is True.

Return type pipeline (PipelineBase)

sequential_engine

A Future-like api for jobs created by the SequentialEngine, an Engine that sequentially computes the submitted jobs.

Module Contents

Classes Summary

<i>SequentialComputation</i>	A Future-like api for jobs created by the SequentialEngine, an Engine that sequentially computes the submitted jobs.
<i>SequentialEngine</i>	The default engine for the AutoML search.

Contents

class evalml automl engine sequential_engine **SequentialComputation**(work, **kwargs)

A Future-like api for jobs created by the SequentialEngine, an Engine that sequentially computes the submitted jobs.

In order to separate the engine from the AutoMLSearch loop, we need the sequential computations to behave the same way as concurrent computations from AutoMLSearch’s point-of-view. One way to do this is by delaying the computation in the sequential engine until get_result is called. Since AutoMLSearch will call get_result only when the computation is “done”, by always returning True in done() we make sure that get_result is called in the order that the jobs are submitted. So the computations happen sequentially!

Parameters work (callable) – Computation that should be done by the engine.

Methods

<i>cancel</i>	Cancel the current computation.
<i>done</i>	Whether the computation is done.
<i>get_result</i>	Gets the computation result. Will block until the computation is finished.

cancel(self)

Cancel the current computation.

done(self)

Whether the computation is done.

Returns Always returns True.

Return type bool

get_result(self)

Gets the computation result. Will block until the computation is finished.

Raises **Exception** – If computation fails. Returns traceback.

Returns Computation results.

class evalml.automl.engine.sequential_engine.**SequentialEngine**

The default engine for the AutoML search.

Trains and scores pipelines locally and sequentially.

Methods

<code>close</code>	No-op.
<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Submit a job to evaluate a pipeline.
<code>submit_scoring_job</code>	Submit a job to score a pipeline.
<code>submit_training_job</code>	Submit a job to train a pipeline.

close(*self*)

No-op.

static setup_job_log()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Submit a job to evaluate a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns Computation result.

Return type *SequentialComputation*

submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*, *y_train=None*)

Submit a job to score a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.

Returns Computation result.

Return type *SequentialComputation*

submit_training_job(*self*, *automl_config*, *pipeline*, *X*, *y*)

Submit a job to train a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns Computation result.

Return type *SequentialComputation*

Package Contents

Classes Summary

<i>CFEngine</i>	The concurrent.futures (CF) engine.
<i>DaskEngine</i>	The dask engine.
<i>EngineBase</i>	Base class for EvalML engines.
<i>EngineComputation</i>	Wrapper around the result of a (possibly asynchronous) engine computation.
<i>SequentialEngine</i>	The default engine for the AutoML search.

Functions

<i>evaluate_pipeline</i>	Function submitted to the submit_evaluation_job engine method.
<i>train_and_score_pipeline</i>	Given a pipeline, config and data, train and score the pipeline and return the CV or TV scores.
<i>train_pipeline</i>	Train a pipeline and tune the threshold if necessary.

Contents

class evalml.automl.engine.**CFEngine**(*client=None*)

The concurrent.futures (CF) engine.

Parameters **client** (*None* or *CFClient*) – If *None*, creates a threaded pool for processing. Defaults to *None*.

Methods

<code>close</code>	Function to properly shutdown the Engine's Client's resources.
<code>is_closed</code>	Property that determines whether the Engine's Client's resources are shutdown.
<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Send evaluation job to cluster.
<code>submit_scoring_job</code>	Send scoring job to cluster.
<code>submit_training_job</code>	Send training job to cluster.

close(*self*)

Function to properly shutdown the Engine's Client's resources.

property is_closed(*self*)

Property that determines whether the Engine's Client's resources are shutdown.

static setup_job_log()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout*=None, *y_holdout*=None)

Send evaluation job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool

Return type CFComputation**submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train*=None, *y_train*=None)**

Send scoring job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – Objectives to score on.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool.

Return type CFComputation

submit_training_job(*self*, *automl_config*, *pipeline*, *X*, *y*)

Send training job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns

An object wrapping a reference to a future-like computation occurring in the resource pool

Return type CFComputation

class evalml.automl.engine.DaskEngine(*cluster=None*)

The dask engine.

Parameters **cluster** (*None* or *dd.Client*) – If *None*, creates a local, threaded Dask client for processing. Defaults to *None*.

Methods

<i>close</i>	Closes the underlying cluster.
<i>is_closed</i>	Property that determines whether the Engine's Client's resources are shutdown.
<i>send_data_to_cluster</i>	Send data to the cluster.
<i>setup_job_log</i>	Set up logger for job.
<i>submit_evaluation_job</i>	Send evaluation job to cluster.
<i>submit_scoring_job</i>	Send scoring job to cluster.
<i>submit_training_job</i>	Send training job to cluster.

close(*self*)

Closes the underlying cluster.

property is_closed(*self*)

Property that determines whether the Engine's Client's resources are shutdown.

send_data_to_cluster(*self*, *X*, *y*)

Send data to the cluster.

The implementation uses caching so the data is only sent once. This follows dask best practices.

Parameters

- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns The modeling data.

Return type *dask.Future*

static setup_job_log()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Send evaluation job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns

An object wrapping a reference to a future-like computation occurring in the dask cluster.

Return type DaskComputation

submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*, *y_train=None*)

Send scoring job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.

Returns

An object wrapping a reference to a future-like computation occurring in the dask cluster.

Return type DaskComputation

submit_training_job(*self*, *automl_config*, *pipeline*, *X*, *y*)

Send training job to cluster.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns

An object wrapping a reference to a future-like computation occurring in the `dask` cluster.

Return type `DaskComputation`

class `evalml.automl.engine.EngineBase`

Base class for EvalML engines.

Methods

<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Submit job for pipeline evaluation during AutoMLSearch.
<code>submit_scoring_job</code>	Submit job for pipeline scoring.
<code>submit_training_job</code>	Submit job for pipeline training.

static `setup_job_log()`

Set up logger for job.

abstract `submit_evaluation_job(self, automl_config, pipeline, X, y, X_holdout=None, y_holdout=None)`

Submit job for pipeline evaluation during AutoMLSearch.

abstract `submit_scoring_job(self, automl_config, pipeline, X, y, objectives, X_train=None, y_train=None)`

Submit job for pipeline scoring.

abstract `submit_training_job(self, automl_config, pipeline, X, y, X_holdout=None, y_holdout=None)`

Submit job for pipeline training.

class `evalml.automl.engine.EngineComputation`

Wrapper around the result of a (possibly asynchronous) engine computation.

Methods

<code>cancel</code>	Cancel the computation.
<code>done</code>	Whether the computation is done.
<code>get_result</code>	Gets the computation result. Will block until the computation is finished.

abstract `cancel(self)`

Cancel the computation.

abstract `done(self)`

Whether the computation is done.

abstract `get_result(self)`

Gets the computation result. Will block until the computation is finished.

Raises Exception: If computation fails. Returns traceback.

`evalml.automl.engine.evaluate_pipeline(pipeline, automl_config, X, y, logger, X_holdout=None, y_holdout=None)`

Function submitted to the `submit_evaluation_job` engine method.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to score.
- **automl_config** (*AutoMLConfig*) – The AutoMLSearch object, used to access config and the error callback.
- **X** (*pd.DataFrame*) – Training features.
- **y** (*pd.Series*) – Training target.
- **logger** – Logger object to write to.
- **X_holdout** (*pd.DataFrame*) – Holdout set features.
- **y_holdout** (*pd.DataFrame*) – Holdout set target.

Returns

First - A dict containing **cv_score_mean**, **cv_scores**, **training_time** and a **cv_data** structure with details.
Second - The pipeline class we trained and scored. Third - the job logger instance with all the recorded messages.

Return type tuple of three items

class evalml.automl.engine.**SequentialEngine**

The default engine for the AutoML search.

Trains and scores pipelines locally and sequentially.

Methods

<code>close</code>	No-op.
<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Submit a job to evaluate a pipeline.
<code>submit_scoring_job</code>	Submit a job to score a pipeline.
<code>submit_training_job</code>	Submit a job to train a pipeline.

close(*self*)

No-op.

static setup_job_log()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Submit a job to evaluate a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns Computation result.

Return type SequentialComputation

submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*, *y_train=None*)

Submit a job to score a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.

Returns Computation result.

Return type SequentialComputation

submit_training_job(*self*, *automl_config*, *pipeline*, *X*, *y*)

Submit a job to train a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns Computation result.

Return type SequentialComputation

evalml.automl.engine.train_and_score_pipeline(*pipeline*, *automl_config*, *full_X_train*, *full_y_train*, *logger*, *X_holdout=None*, *y_holdout=None*)

Given a pipeline, config and data, train and score the pipeline and return the CV or TV scores.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to score.
- **automl_config** (*AutoMLSearch*) – The AutoMLSearch object, used to access config and the error callback.
- **full_X_train** (*pd.DataFrame*) – Training features.
- **full_y_train** (*pd.Series*) – Training target.
- **logger** – Logger object to write to.
- **X_holdout** (*pd.DataFrame*) – Holdout set features.
- **y_holdout** (*pd.DataFrame*) – Holdout set target.

Raises Exception – If there are missing target values in the training set after data split.

Returns

First - A dict containing **cv_score_mean**, **cv_scores**, **training_time** and a **cv_data** structure with details.
Second - The pipeline class we trained and scored. **Third** - the job logger instance with all the recorded messages.

Return type tuple of three items

`evalml.automl.engine.train_pipeline(pipeline, X, y, automl_config, schema=True, get_hashes=False)`

Train a pipeline and tune the threshold if necessary.

Parameters

- **pipeline** (*PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Features to train on.
- **y** (*pd.Series*) – Target to train on.
- **automl_config** (*AutoMLSearch*) – The AutoMLSearch object, used to access config and the error callback.
- **schema** (*bool*) – Whether to use the schemas for X and y. Defaults to True.
- **get_hashes** (*bool*) – Whether to return the hashes of the data used to train (and potentially threshold). Defaults to False

Returns A trained pipeline instance. hash (optional): The hash of the input data indices, only returned when get_hashes is True.

Return type pipeline (*PipelineBase*)

Submodules

automl_search

EvalML's core AutoML object.

Module Contents

Classes Summary

<i>AutoMLSearch</i>	Automated Pipeline search.
-------------------------------------	----------------------------

Functions

<i>build_engine_from_str</i>	Function that converts a convenience string for an parallel engine type and returns an instance of that engine.
<i>search</i>	Given data and configuration, run an automl search.
<i>search_iterative</i>	Given data and configuration, run an automl search.

Contents

```

                                              sampler_method='auto',
                                              sampler_balanced_ratio=0.25,
                                              allow_long_running_models=False,
                                              _pipelines_per_batch=5, automl_algorithm='default',
                                              engine='sequential', verbose=False, timing=False,
                                              exclude_featurizers=None, holdout_set_size=0,
                                              use_recommendation=False,
                                              include_recommendation=None,
                                              exclude_recommendation=None)
```

Automated Pipeline search.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.
- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.
- **X_holdout** (*pd.DataFrame*) – The input holdout data of shape [n_samples, n_features].
- **y_holdout** (*pd.Series*) – The target holdout data of length [n_samples].
- **problem_type** (*str or ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str, ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - LogLossBinary for binary classification problems, - LogLossMulticlass for multiclass classification problems, and - R2 for regression problems.
- **max_iterations** (*int*) – Maximum number of iterations to search. If max_iterations and max_time is not set, then max_iterations will default to max_iterations of 5.
- **max_time** (*int, str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.

- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **allowed_component_graphs** (*dict*) – A dictionary of lists or ComponentGraphs indicating the component graphs allowed in the search. The format should follow { “Name_0”: [list_of_components], “Name_1”: ComponentGraph(...) }

The default of None indicates all pipeline component graphs for this problem type are allowed. Setting this field will cause allowed_model_families to be ignored.

e.g. allowed_component_graphs = { “My_Graph”: [“Imputer”, “One Hot Encoder”, “Random Forest Classifier”] }

- **allowed_model_families** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run evalml.pipelines.components.utils.allowed_model_families(“binary”) to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if allowed_pipelines is provided, this parameter will be ignored. For default algorithm, this only applies to estimators in the non-naive batches.
- **features** (*list*) – List of features to run DFS on AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the search input and if the feature itself is not in search input. If features is an empty list, the DFS Transformer will not be included in pipelines.
- **run_feature_selection** (*bool*) – If True, will run a separate feature selection pipeline and only use selected features in subsequent batches. If False, will use all of the features for every pipeline. Only used for default algorithm, setting is no-op for iterative algorithm.
- **data_splitter** (*sklearn.model_selection.BaseCrossValidator*) – Data splitting method to use. Defaults to StratifiedKfold.
- **tuner_class** – The tuner class to use. Defaults to SKOptTuner.
- **optimize_thresholds** (*bool*) – Whether or not to optimize the binary pipeline threshold. Defaults to True.
- **start_iteration_callback** (*callable*) – Function called before each pipeline training iteration. Callback function takes three positional parameters: The pipeline instance and the AutoMLSearch object.
- **add_result_callback** (*callable*) – Function called after each pipeline training iteration. Callback function takes three positional parameters: A dictionary containing the training results for the new pipeline, an untrained_pipeline containing the parameters used during training, and the AutoMLSearch object.
- **error_callback** (*callable*) – Function called when *search()* errors and raises an Exception. Callback function takes three positional parameters: the Exception raised, the traceback, and the AutoMLSearch object. Must also accepts kwargs, so AutoMLSearch is able to pass along other appropriate parameters by default. Defaults to None, which will call *log_error_callback*.
- **additional_objectives** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **alternate_thresholding_objective** (*str*) – The objective to use for thresholding binary classification pipelines if the main objective provided isn’t tuneable. Defaults to F1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs below -1, (n_cpus + 1 + n_jobs) are used.
- **ensembling** (*boolean*) – If True, runs ensembling in a separate batch after every allowed pipeline class has been iterated over. If the number of unique pipelines to search over per batch is one, ensembling will not run. Defaults to False.
- **max_batches** (*int*) – The maximum number of batches of pipelines to search. Parameters max_time, and max_iterations have precedence over stopping the search.
- **problem_configuration** (*dict, None*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the time_index, gap, forecast_horizon, and max_delay variables. For multiseries time series problems, the values passed in should also include the name of a series_id column.
- **train_best_pipeline** (*boolean*) – Whether or not to train the best pipeline before returning it. Defaults to True.
- **search_parameters** (*dict*) – A dict of the hyperparameter ranges or pipeline parameters used to iterate over during search. Keys should consist of the component names and values should specify a singular value/list for pipeline parameters, or skopt.Space for hyperparameter ranges. In the example below, the Imputer parameters would be passed to the hyperparameter ranges, and the Label Encoder parameters would be used as the component parameter.
 e.g. `search_parameters = { 'Imputer' : [{ 'numeric_impute_strategy': Categorical(['most_frequent', 'median']) },], 'Label Encoder': { 'positive_label': True } }`
- **sampler_method** (*str*) – The data sampling component to use in the pipelines if the problem type is classification and the target balance is smaller than the sampler_balanced_ratio. Either 'auto', which will use our preferred sampler for the data, 'Undersampler', 'Oversampler', or None. Defaults to 'auto'.
- **sampler_balanced_ratio** (*float*) – The minority:majority class ratio that we consider balanced, so a 1:4 ratio would be equal to 0.25. If the class balance is larger than this provided value, then we will not add a sampler since the data is then considered balanced. Overrides the *sampler_ratio* of the samplers. Defaults to 0.25.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If False and no pipelines, component graphs, or model families are provided, AutoMLSearch will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to False.
- **_ensembling_split_size** (*float*) – The amount of the training data we'll set aside for training ensemble metalearners. Only used when ensembling is True. Must be between 0 and 1, exclusive. Defaults to 0.2
- **_pipelines_per_batch** (*int*) – The number of pipelines to train for every batch after the first one. The first batch will train a baseline pipeline + one of each pipeline family allowed in the search.
- **automl_algorithm** (*str*) – The automl algorithm to use. Currently the two choices are 'iterative' and 'default'. Defaults to *default*.
- **engine** (*EngineBase or str*) – The engine instance used to evaluate pipelines. Dask or concurrent.futures engines can also be chosen by providing a string from the list ["sequential", "cf_threaded", "cf_process", "dask_threaded", "dask_process"]. If a parallel engine is

selected this way, the maximum amount of parallelism, as determined by the engine, will be used. Defaults to “sequential”.

- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to stdout while search is running. Defaults to False.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to False.
- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by search. Valid options are “DatetimeFeaturizer”, “EmailFeaturizer”, “URLFeaturizer”, “NaturalLanguageFeaturizer”, “TimeSeriesFeaturizer”
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines. For default algorithm, this only excludes estimators in the non-naive batches.
- **holdout_set_size** (*float*) – The size of the holdout set that AutoML search will take for datasets larger than 500 rows. If set to 0, holdout set will not be taken regardless of number of rows. Must be between 0 and 1, exclusive. Defaults to 0.1.
- **use_recommendation** (*bool*) – Whether or not to use a recommendation score to rank pipelines instead of optimization objective. Defaults to False.
- **include_recommendation** (*list[str]*) – A list of objectives to include beyond the defaults in the recommendation score. Defaults to None.
- **exclude_recommendation** (*list[str]*) – A list of objectives to exclude from the defaults in the recommendation score. Defaults to None.

Methods

<code>add_to_rankings</code>	Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run.
<code>best_pipeline</code>	Returns a trained instance of the best pipeline and parameters found during automl search. If <code>train_best_pipeline</code> is set to False, returns an untrained pipeline instance.
<code>close_engine</code>	Function to explicitly close the engine, client, parallel resources.
<code>describe_pipeline</code>	Describe a pipeline.
<code>full_rankings</code>	Returns a pandas.DataFrame with scoring results from all pipelines searched.
<code>get_ensemble_input_pipelines</code>	Returns a list of input pipeline IDs given an ensemble pipeline ID.
<code>get_pipeline</code>	Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.
<code>get_recommendation_score_breakdown</code>	Reports the scores for the objectives used in the given pipeline's recommendation score calculation.
<code>get_recommendation_scores</code>	Calculates recommendation scores for all pipelines in the search results.
<code>load</code>	Loads AutoML object at file path.
<code>plot</code>	Return an instance of the plot with the latest scores.
<code>rankings</code>	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.
<code>results</code>	Class that allows access to a copy of the results from <code>automl_search</code> .
<code>save</code>	Saves AutoML object at file path.
<code>score_pipelines</code>	Score a list of pipelines on the given holdout data.
<code>search</code>	Find the best pipeline for the data set.
<code>train_pipelines</code>	Train a list of pipelines on the training data.

add_to_rankings(*self*, *pipeline*)

Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run.

Parameters `pipeline` (*PipelineBase*) – pipeline to train and evaluate.

property best_pipeline(*self*)

Returns a trained instance of the best pipeline and parameters found during automl search. If `train_best_pipeline` is set to False, returns an untrained pipeline instance.

Returns A trained instance of the best pipeline and parameters found during automl search. If `train_best_pipeline` is set to False, returns an untrained pipeline instance.

Return type *PipelineBase*

Raises **PipelineNotFoundError** – If this is called before `.search()` is called.

close_engine(*self*)

Function to explicitly close the engine, client, parallel resources.

describe_pipeline(*self*, *pipeline_id*, *return_dict=False*)

Describe a pipeline.

Parameters

- **pipeline_id** (*int*) – pipeline to describe
- **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

Raises **PipelineNotFoundError** – If *pipeline_id* is not a valid ID.

property full_rankings(*self*)

Returns a pandas.DataFrame with scoring results from all pipelines searched.

get_ensembler_input_pipelines(*self*, *ensemble_pipeline_id*)

Returns a list of input pipeline IDs given an ensembler pipeline ID.

Parameters **ensemble_pipeline_id** (*id*) – Ensemble pipeline ID to get input pipeline IDs from.

Returns A list of ensemble input pipeline IDs.

Return type list[int]

Raises **ValueError** – If *ensemble_pipeline_id* does not correspond to a valid ensemble pipeline ID.

get_pipeline(*self*, *pipeline_id*)

Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.

Parameters **pipeline_id** (*int*) – Pipeline to retrieve.

Returns Untrained pipeline instance associated with the provided ID.

Return type PipelineBase

Raises **PipelineNotFoundError** – if *pipeline_id* is not a valid ID.

get_recommendation_score_breakdown(*self*, *pipeline_id*)

Reports the scores for the objectives used in the given pipeline's recommendation score calculation.

Note that these scores are reported in their raw form, not scaled to be between 0 and 1.

Parameters **pipeline_id** (*int*) – The id of the pipeline to get the recommendation score breakdown for.

Returns A dictionary of the scores for each objective used in the recommendation score calculation.

Return type dict

get_recommendation_scores(*self*, *priority=None*, *custom_weights=None*, *use_pipeline_names=False*)

Calculates recommendation scores for all pipelines in the search results.

Parameters

- **priority** (*str*) – An optional name of a priority objective that should be given heavier weight (of 0.5) than the other objectives contributing to the score. Defaults to None, where all objectives are weighted equally.

- **custom_weights** (*dict[str, float]*) – A dictionary mapping objective names to corresponding weights between 0 and 1. Should not be used at the same time as `prioritized_objective`. Defaults to `None`.
- **use_pipeline_names** (*bool*) – Whether or not to return the pipeline names instead of ids as the keys to the recommendation score dictionary. Defaults to `False`.

Returns A dictionary mapping pipeline IDs to recommendation scores

static load(*file_path*, *pickle_type*='cloudpickle')

Loads AutoML object at file path.

Parameters

- **file_path** (*str*) – Location to find file to load
- **pickle_type** (*{ "pickle", "cloudpickle" }*) – The pickling library to use. Currently not used since the standard pickle library can handle cloudpickles.

Returns AutoSearchBase object

property plot(*self*)

Return an instance of the plot with the latest scores.

property rankings(*self*)

Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

property results(*self*)

Class that allows access to a copy of the results from *automl_search*.

Returns

Dictionary containing *pipeline_results*, a dict with results from each pipeline, and *search_order*, a list describing the order the pipelines were searched.

Return type dict

save(*self*, *file_path*, *pickle_type*='cloudpickle', *pickle_protocol*=cloudpickle.DEFAULT_PROTOCOL)

Saves AutoML object at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_type** (*{ "pickle", "cloudpickle" }*) – The pickling library to use.
- **pickle_protocol** (*int*) – The pickle data stream format.

Raises ValueError – If *pickle_type* is not “pickle” or “cloudpickle”.

score_pipelines(*self*, *pipelines*, *X_holdout*, *y_holdout*, *objectives*)

Score a list of pipelines on the given holdout data.

Parameters

- **pipelines** (*list[PipelineBase]*) – List of pipelines to train.
- **X_holdout** (*pd.DataFrame*) – Holdout features.
- **y_holdout** (*pd.Series*) – Holdout targets for scoring.
- **objectives** (*list[str], list[ObjectiveBase]*) – Objectives used for scoring.

Returns Dictionary keyed by pipeline name that maps to a dictionary of scores. Note that the any pipelines that error out during scoring will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

Return type dict[str, Dict[str, float]]

search(*self*, *interactive_plot=True*)

Find the best pipeline for the data set.

Parameters **interactive_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.

Raises **AutoMLSearchException** – If all pipelines in the current AutoML batch produced a score of np.nan on the primary objective.

Returns Dictionary keyed by batch number that maps to the timings for pipelines run in that batch, as well as the total time for each batch. Pipelines within a batch are labeled by pipeline name.

Return type Dict[int, Dict[str, Timestamp]]

train_pipelines(*self*, *pipelines*)

Train a list of pipelines on the training data.

This can be helpful for training pipelines once the search is complete.

Parameters **pipelines** (*list[PipelineBase]*) – List of pipelines to train.

Returns Dictionary keyed by pipeline name that maps to the fitted pipeline. Note that the any pipelines that error out during training will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

Return type Dict[str, PipelineBase]

`evalml.automl.automl_search.build_engine_from_str(engine_str)`

Function that converts a convenience string for an parallel engine type and returns an instance of that engine.

Parameters **engine_str** (*str*) – String representing the requested engine.

Returns Instance of the requested engine.

Return type (EngineBase)

Raises **ValueError** – If engine_str is not a valid engine.

`evalml.automl.automl_search.search(X_train=None, y_train=None, problem_type=None, objective='auto', mode='fast', max_time=None, patience=None, tolerance=None, problem_configuration=None, n_splits=3, verbose=False, timing=False)`

Given data and configuration, run an automl search.

This method will run EvalML's default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you'd like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and AutoMLSearch, instead of using this method.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.

- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.
- **problem_type** (*str or ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str, ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **mode** (*str*) – mode for `DefaultAlgorithm`. There are two modes: fast and long, where fast is a subset of long. Please look at `DefaultAlgorithm` for more details.
- **max_time** (*int, str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **problem_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n_splits** (*int*) – Number of splits to use with the default data splitter.
- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to stdout while search is running. Defaults to False.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to False.

Returns The automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

Return type (*AutoMLSearch*, dict)

Raises **ValueError** – If search configuration is not valid.

```
evalml.automl.automl_search.search_iterative(X_train=None, y_train=None, problem_type=None,
                                             objective='auto', problem_configuration=None,
                                             n_splits=3, timing=False, **kwargs)
```

Given data and configuration, run an automl search.

This method will run EvalML's default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you'd like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and `AutoMLSearch`, instead of using this method.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.
- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.

- **problem_type** (*str* or *ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **problem_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n_splits** (*int*) – Number of splits to use with the default data splitter.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to `False`.
- ****kwargs** – Other keyword arguments which are provided will be passed to `AutoMLSearch`.

Returns the automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

Return type (*AutoMLSearch*, *dict*)

Raises **ValueError** – If the search configuration is invalid.

callbacks

Callbacks available to pass to AutoML.

Module Contents

Functions

<code>log_error_callback</code>	Logs the exception thrown as an error.
<code>raise_error_callback</code>	Raises the exception thrown by the <code>AutoMLSearch</code> object.
<code>silent_error_callback</code>	No-op.

Attributes Summary

<code>logger</code>

Contents

`evalml automl callbacks.log_error_callback(exception, traceback, automl, **kwargs)`

Logs the exception thrown as an error.

Will not throw. This is the default behavior for AutoMLSearch.

Parameters

- **exception** – Exception to log.
- **traceback** – Exception traceback to log.
- **automl** – AutoMLSearch object.
- ****kwargs** – Other relevant keyword arguments to log.

`evalml automl callbacks.logger`

`evalml automl callbacks.raise_error_callback(exception, traceback, automl, **kwargs)`

Raises the exception thrown by the AutoMLSearch object.

Also logs the exception as an error.

Parameters

- **exception** – Exception to log and raise.
- **traceback** – Exception traceback to log.
- **automl** – AutoMLSearch object.
- ****kwargs** – Other relevant keyword arguments to log.

Raises exception – Raises the input exception.

`evalml automl callbacks.silent_error_callback(exception, traceback, automl, **kwargs)`

No-op.

pipeline_search_plots

Plots displayed during pipeline search.

Module Contents

Classes Summary

<i>PipelineSearchPlots</i>	Plots for the AutoMLSearch class during search.
<i>SearchIterationPlot</i>	Search iteration plot.

Contents

class evalml.automl.pipeline_search_plots.**PipelineSearchPlots**(*results*, *objective*)

Plots for the AutoMLSearch class during search.

Parameters

- **results** (*dict*) – Dictionary of current results.
- **objective** (*ObjectiveBase*) – Objective that AutoML is optimizing for.

Methods

<i>search_iteration_plot</i>	Shows a plot of the best score at each iteration using data gathered during training.
------------------------------	---

search_iteration_plot(*self*, *interactive_plot=False*)

Shows a plot of the best score at each iteration using data gathered during training.

Parameters **interactive_plot** (*bool*) – Whether or not to show an interactive plot. Defaults to False.

Returns plot

Raises **ValueError** – If engine_str is not a valid engine.

class evalml.automl.pipeline_search_plots.**SearchIterationPlot**(*results*, *objective*)

Search iteration plot.

Parameters

- **results** (*dict*) – Dictionary of current results.
- **objective** (*ObjectiveBase*) – Objective that AutoML is optimizing for.

Methods

<i>update</i>	Update the search plot.
---------------	-------------------------

update(*self*, *results*, *objective*)

Update the search plot.

progress

Progress abstraction holding stopping criteria and progress information.

Module Contents

Classes Summary

<i>Progress</i>	Progress object holding stopping criteria and progress information.

Contents

class evalml.automl.progress.**Progress**(*max_time=None, max_batches=None, max_iterations=None, patience=None, tolerance=None, automl_algorithm=None, objective=None, verbose=False*)

Progress object holding stopping criteria and progress information.

Parameters

- **max_time** (*int*) – Maximum time to search for pipelines.
- **max_iterations** (*int*) – Maximum number of iterations to search.
- **max_batches** (*int*) – The maximum number of batches of pipelines to search. Parameters *max_time*, and *max_iterations* have precedence over stopping the search.
- **patience** (*int*) – Number of iterations without improvement to stop search early.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping.
- **automl_algorithm** (*str*) – The automl algorithm to use. Used to calculate iterations if *max_batches* is selected as stopping criteria.
- **objective** (*str, ObjectiveBase*) – The objective used in search.
- **verbose** (*boolean*) – Whether or not to log out stopping information.

Methods

<i>elapsed</i>	Return time elapsed using the start time and current time.
<i>return_progress</i>	Return information about current and end state of each stopping criteria in order of priority.
<i>should_continue</i>	Given AutoML Results, return whether or not the search should continue.
<i>start_timing</i>	Sets start time to current time.

elapsed(*self*)

Return time elapsed using the start time and current time.

return_progress(*self*)

Return information about current and end state of each stopping criteria in order of priority.

Returns list of dictionaries containing information of each stopping criteria.

Return type List[Dict[str, unit]]

should_continue(*self, results, interrupted=False, mid_batch=False*)

Given AutoML Results, return whether or not the search should continue.

Parameters

- **results** (*dict*) – AutoMLSearch results.
- **interrupted** (*bool*) – whether AutoMLSearch was given an keyboard interrupt. Defaults to False.
- **mid_batch** (*bool*) – whether this method was called while in the middle of a batch or not. Defaults to False.

Returns True if search should continue, False otherwise.

Return type bool

start_timing(*self*)

Sets start time to current time.

utils

Utilities useful in AutoML.

Module Contents

Functions

<i>check_all_pipeline_names_unique</i>	Checks whether all the pipeline names are unique.
<i>get_best_sampler_for_data</i>	Returns the name of the sampler component to use for AutoMLSearch.
<i>get_default_primary_search_objective</i>	Get the default primary search objective for a problem type.
<i>get_pipelines_from_component_graphs</i>	Returns created pipelines from passed component graphs based on the specified problem type.
<i>get_threshold_tuning_info</i>	Determine for a given automl config and pipeline what the threshold tuning objective should be and whether or not training data should be further split to achieve proper threshold tuning.
<i>make_data_splitter</i>	Given the training data and ML problem parameters, compute a data splitting method to use during AutoML search.
<i>resplit_training_data</i>	Further split the training data for a given pipeline. This is needed for binary pipelines in order to properly tune the threshold.
<i>tune_binary_threshold</i>	Tunes the threshold of a binary pipeline to the X and y thresholding data.

Attributes Summary

AutoMLConfig

Contents

`evalml automl utils.AutoMLConfig`

`evalml automl utils.check_all_pipeline_names_unique(pipelines)`

Checks whether all the pipeline names are unique.

Parameters `pipelines` (*list*[*PipelineBase*]) – List of pipelines to check if all names are unique.

Raises `ValueError` – If any pipeline names are duplicated.

`evalml automl utils.get_best_sampler_for_data(X, y, sampler_method, sampler_balanced_ratio)`

Returns the name of the sampler component to use for AutoMLSearch.

Parameters

- `X` (*pd.DataFrame*) – The input feature data
- `y` (*pd.Series*) – The input target data
- `sampler_method` (*str*) – The `sampler_type` argument passed to AutoMLSearch
- `sampler_balanced_ratio` (*float*) – The ratio of min:majority targets that we would consider balanced, or should balance the classes to.

Returns The string name of the sampling component to use, or None if no sampler is necessary

Return type `str`, `None`

`evalml automl utils.get_default_primary_search_objective(problem_type)`

Get the default primary search objective for a problem type.

Parameters `problem_type` (*str* or *ProblemType*) – Problem type of interest.

Returns primary objective instance for the problem type.

Return type `ObjectiveBase`

`evalml automl utils.get_pipelines_from_component_graphs(component_graphs_dict, problem_type, parameters=None, random_seed=0)`

Returns created pipelines from passed component graphs based on the specified problem type.

Parameters

- `component_graphs_dict` (*dict*) – The dict of component graphs.
- `problem_type` (*str* or *ProblemType*) – The problem type for which pipelines will be created.
- `parameters` (*dict*) – Pipeline-level parameters that should be passed to the proposed pipelines. Defaults to None.
- `random_seed` (*int*) – Random seed. Defaults to 0.

Returns List of pipelines made from the passed component graphs.

Return type `list`

`evalml automl utils.get_threshold_tuning_info(automl_config, pipeline)`

Determine for a given automl config and pipeline what the threshold tuning objective should be and whether or not training data should be further split to achieve proper threshold tuning.

Can also be used after automl search has been performed to determine whether the full training data was used to train the pipeline.

Parameters

- **automl_config** ([AutoMLConfig](#)) – The AutoMLSearch’s config object. Used to determine threshold tuning objective and whether data needs resplitting.
- **pipeline** ([Pipeline](#)) – The pipeline instance to Threshold.

Returns threshold_tuning_objective, data_needs_resplitting (str, bool)

`evalml.automl.utils.make_data_splitter(X, y, problem_type, problem_configuration=None, n_splits=3, shuffle=True, random_seed=0)`

Given the training data and ML problem parameters, compute a data splitting method to use during AutoML search.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].
- **problem_type** (*ProblemType*) – The type of machine learning problem.
- **problem_configuration** (*dict, None*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, and `max_delay` variables. Defaults to `None`.
- **n_splits** (*int, None*) – The number of CV splits, if applicable. Defaults to 3.
- **shuffle** (*bool*) – Whether or not to shuffle the data before splitting, if applicable. Defaults to `True`.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Data splitting method.

Return type `sklearn.model_selection.BaseCrossValidator`

Raises **ValueError** – If `problem_configuration` is not given for a time-series problem.

`evalml.automl.utils.resplit_training_data(pipeline, X_train, y_train)`

Further split the training data for a given pipeline. This is needed for binary pipelines in order to properly tune the threshold.

Can be used after automl search has been performed to recreate the data that was used to train a pipeline.

Parameters

- **pipeline** (*PipelineBase*) – the pipeline whose training data we are splitting
- **X_train** (*pd.DataFrame or np.ndarray*) – training data of shape [n_samples, n_features]
- **y_train** (*pd.Series, or np.ndarray*) – training target data of length [n_samples]

Returns Feature and target data each split into train and threshold tuning sets.

Return type `pd.DataFrame, pd.DataFrame, pd.Series, pd.Series`

`evalml.automl.utils.tune_binary_threshold(pipeline, objective, problem_type, X_threshold_tuning, y_threshold_tuning, X=None, y=None)`

Tunes the threshold of a binary pipeline to the X and y thresholding data.

Parameters

- **pipeline** (*Pipeline*) – Pipeline instance to threshold.

- **objective** (*ObjectiveBase*) – The objective we want to tune with. If not tuneable and `best_pipeline` is `True`, will use F1.
- **problem_type** (*ProblemType*) – The problem type of the pipeline.
- **X_threshold_tuning** (*pd.DataFrame*) – Features to which the pipeline will be tuned.
- **y_threshold_tuning** (*pd.Series*) – Target data to which the pipeline will be tuned.
- **X** (*pd.DataFrame*) – Features to which the pipeline will be trained (used for time series binary). Defaults to `None`.
- **y** (*pd.Series*) – Target to which the pipeline will be trained (used for time series binary). Defaults to `None`.

Package Contents

Classes Summary

<i>AutoMLSearch</i>	Automated Pipeline search.
<i>EngineBase</i>	Base class for EvalML engines.
<i>Progress</i>	Progress object holding stopping criteria and progress information.
<i>SequentialEngine</i>	The default engine for the AutoML search.

Functions

<i>get_default_primary_search_objective</i>	Get the default primary search objective for a problem type.
<i>get_threshold_tuning_info</i>	Determine for a given automl config and pipeline what the threshold tuning objective should be and whether or not training data should be further split to achieve proper threshold tuning.
<i>make_data_splitter</i>	Given the training data and ML problem parameters, compute a data splitting method to use during AutoML search.
<i>resplit_training_data</i>	Further split the training data for a given pipeline. This is needed for binary pipelines in order to properly tune the threshold.
<i>search</i>	Given data and configuration, run an automl search.
<i>search_iterative</i>	Given data and configuration, run an automl search.
<i>tune_binary_threshold</i>	Tunes the threshold of a binary pipeline to the X and y thresholding data.

```

Automated Pipeline search.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.
- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.
- **X_holdout** (*pd.DataFrame*) – The input holdout data of shape [n_samples, n_features].
- **y_holdout** (*pd.Series*) – The target holdout data of length [n_samples].
- **problem_type** (*str* or *ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to ‘auto’, chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **max_iterations** (*int*) – Maximum number of iterations to search. If `max_iterations` and `max_time` is not set, then `max_iterations` will default to `max_iterations` of 5.
- **max_time** (*int*, *str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If `None`, early stopping is disabled. Defaults to `None`.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if `patience` is not `None`. Defaults to `None`.
- **allowed_component_graphs** (*dict*) – A dictionary of lists or `ComponentGraphs` indicating the component graphs allowed in the search. The format should follow { “Name_0”: [list_of_components], “Name_1”: `ComponentGraph(...)` }

The default of None indicates all pipeline component graphs for this problem type are allowed. Setting this field will cause `allowed_model_families` to be ignored.

e.g. `allowed_component_graphs = { "My_Graph": ["Imputer", "One Hot Encoder", "Random Forest Classifier"] }`

- **`allowed_model_families`** (*list(str, ModelFamily)*) – The model families to search. The default of None searches over all model families. Run `evalml.pipelines.components.utils.allowed_model_families("binary")` to see options. Change *binary* to *multiclass* or *regression* depending on the problem type. Note that if `allowed_pipelines` is provided, this parameter will be ignored. For default algorithm, this only applies to estimators in the non-naive batches.
- **`features`** (*list*) – List of features to run DFS on AutoML pipelines. Defaults to None. Features will only be computed if the columns used by the feature exist in the search input and if the feature itself is not in search input. If features is an empty list, the DFS Transformer will not be included in pipelines.
- **`run_feature_selection`** (*bool*) – If True, will run a separate feature selection pipeline and only use selected features in subsequent batches. If False, will use all of the features for every pipeline. Only used for default algorithm, setting is no-op for iterative algorithm.
- **`data_splitter`** (*sklearn.model_selection.BaseCrossValidator*) – Data splitting method to use. Defaults to StratifiedKFold.
- **`tuner_class`** – The tuner class to use. Defaults to SKOptTuner.
- **`optimize_thresholds`** (*bool*) – Whether or not to optimize the binary pipeline threshold. Defaults to True.
- **`start_iteration_callback`** (*callable*) – Function called before each pipeline training iteration. Callback function takes three positional parameters: The pipeline instance and the AutoMLSearch object.
- **`add_result_callback`** (*callable*) – Function called after each pipeline training iteration. Callback function takes three positional parameters: A dictionary containing the training results for the new pipeline, an untrained_pipeline containing the parameters used during training, and the AutoMLSearch object.
- **`error_callback`** (*callable*) – Function called when `search()` errors and raises an Exception. Callback function takes three positional parameters: the Exception raised, the traceback, and the AutoMLSearch object. Must also accepts kwargs, so AutoMLSearch is able to pass along other appropriate parameters by default. Defaults to None, which will call `log_error_callback`.
- **`additional_objectives`** (*list*) – Custom set of objectives to score on. Will override default objectives for problem type if not empty.
- **`alternate_thresholding_objective`** (*str*) – The objective to use for thresholding binary classification pipelines if the main objective provided isn't tuneable. Defaults to F1.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.
- **`n_jobs`** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` below -1, `(n_cpus + 1 + n_jobs)` are used.
- **`ensembling`** (*boolean*) – If True, runs ensembling in a separate batch after every allowed pipeline class has been iterated over. If the number of unique pipelines to search over per batch is one, ensembling will not run. Defaults to False.

- **max_batches** (*int*) – The maximum number of batches of pipelines to search. Parameters `max_time`, and `max_iterations` have precedence over stopping the search.
- **problem_configuration** (*dict*, *None*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables. For multiseries time series problems, the values passed in should also include the name of a `series_id` column.
- **train_best_pipeline** (*boolean*) – Whether or not to train the best pipeline before returning it. Defaults to `True`.
- **search_parameters** (*dict*) – A dict of the hyperparameter ranges or pipeline parameters used to iterate over during search. Keys should consist of the component names and values should specify a singular value/list for pipeline parameters, or `skopt.Space` for hyperparameter ranges. In the example below, the Imputer parameters would be passed to the hyperparameter ranges, and the Label Encoder parameters would be used as the component parameter.

e.g. `search_parameters = { 'Imputer' : [{ 'numeric_impute_strategy': Categorical(['most_frequent', 'median']) },], 'Label Encoder': { 'positive_label': True } }`
- **sampler_method** (*str*) – The data sampling component to use in the pipelines if the problem type is classification and the target balance is smaller than the `sampler_balanced_ratio`. Either `'auto'`, which will use our preferred sampler for the data, `'Undersampler'`, `'Oversampler'`, or `None`. Defaults to `'auto'`.
- **sampler_balanced_ratio** (*float*) – The minority:majority class ratio that we consider balanced, so a 1:4 ratio would be equal to 0.25. If the class balance is larger than this provided value, then we will not add a sampler since the data is then considered balanced. Overrides the `sampler_ratio` of the samplers. Defaults to 0.25.
- **allow_long_running_models** (*bool*) – Whether or not to allow longer-running models for large multiclass problems. If `False` and no pipelines, component graphs, or model families are provided, `AutoMLSearch` will not use Elastic Net or XGBoost when there are more than 75 multiclass targets and will not use CatBoost when there are more than 150 multiclass targets. Defaults to `False`.
- **_ensembling_split_size** (*float*) – The amount of the training data we'll set aside for training ensemble metalearners. Only used when `ensembling` is `True`. Must be between 0 and 1, exclusive. Defaults to 0.2
- **_pipelines_per_batch** (*int*) – The number of pipelines to train for every batch after the first one. The first batch will train a baseline pipeline + one of each pipeline family allowed in the search.
- **automl_algorithm** (*str*) – The automl algorithm to use. Currently the two choices are `'iterative'` and `'default'`. Defaults to `default`.
- **engine** (`EngineBase` or *str*) – The engine instance used to evaluate pipelines. Dask or `concurrent.futures` engines can also be chosen by providing a string from the list [`"sequential"`, `"cf_threaded"`, `"cf_process"`, `"dask_threaded"`, `"dask_process"`]. If a parallel engine is selected this way, the maximum amount of parallelism, as determined by the engine, will be used. Defaults to `"sequential"`.
- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to `stdout` while search is running. Defaults to `False`.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to `False`.

- **exclude_featurizers** (*list[str]*) – A list of featurizer components to exclude from the pipelines built by search. Valid options are “DatetimeFeaturizer”, “EmailFeaturizer”, “URLFeaturizer”, “NaturalLanguageFeaturizer”, “TimeSeriesFeaturizer”
- **excluded_model_families** (*list(str, ModelFamily)*) – A list of model families to exclude from the estimators used when building pipelines. For default algorithm, this only excludes estimators in the non-naive batches.
- **holdout_set_size** (*float*) – The size of the holdout set that AutoML search will take for datasets larger than 500 rows. If set to 0, holdout set will not be taken regardless of number of rows. Must be between 0 and 1, exclusive. Defaults to 0.1.
- **use_recommendation** (*bool*) – Whether or not to use a recommendation score to rank pipelines instead of optimization objective. Defaults to False.
- **include_recommendation** (*list[str]*) – A list of objectives to include beyond the defaults in the recommendation score. Defaults to None.
- **exclude_recommendation** (*list[str]*) – A list of objectives to exclude from the defaults in the recommendation score. Defaults to None.

Methods

<i>add_to_rankings</i>	Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run.
<i>best_pipeline</i>	Returns a trained instance of the best pipeline and parameters found during automl search. If <i>train_best_pipeline</i> is set to False, returns an untrained pipeline instance.
<i>close_engine</i>	Function to explicitly close the engine, client, parallel resources.
<i>describe_pipeline</i>	Describe a pipeline.
<i>full_rankings</i>	Returns a pandas.DataFrame with scoring results from all pipelines searched.
<i>get_ensembler_input_pipelines</i>	Returns a list of input pipeline IDs given an ensembler pipeline ID.
<i>get_pipeline</i>	Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.
<i>get_recommendation_score_breakdown</i>	Reports the scores for the objectives used in the given pipeline's recommendation score calculation.
<i>get_recommendation_scores</i>	Calculates recommendation scores for all pipelines in the search results.
<i>load</i>	Loads AutoML object at file path.
<i>plot</i>	Return an instance of the plot with the latest scores.
<i>rankings</i>	Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.
<i>results</i>	Class that allows access to a copy of the results from <i>automl_search</i> .
<i>save</i>	Saves AutoML object at file path.
<i>score_pipelines</i>	Score a list of pipelines on the given holdout data.
<i>search</i>	Find the best pipeline for the data set.
<i>train_pipelines</i>	Train a list of pipelines on the training data.

add_to_rankings(*self*, *pipeline*)

Fits and evaluates a given pipeline then adds the results to the automl rankings with the requirement that automl search has been run.

Parameters *pipeline* (*PipelineBase*) – pipeline to train and evaluate.

property best_pipeline(*self*)

Returns a trained instance of the best pipeline and parameters found during automl search. If *train_best_pipeline* is set to False, returns an untrained pipeline instance.

Returns A trained instance of the best pipeline and parameters found during automl search. If *train_best_pipeline* is set to False, returns an untrained pipeline instance.

Return type *PipelineBase*

Raises **PipelineNotFoundError** – If this is called before *.search()* is called.

close_engine(*self*)

Function to explicitly close the engine, client, parallel resources.

describe_pipeline(*self*, *pipeline_id*, *return_dict=False*)

Describe a pipeline.

Parameters

- **pipeline_id** (*int*) – pipeline to describe
- **return_dict** (*bool*) – If True, return dictionary of information about pipeline. Defaults to False.

Returns Description of specified pipeline. Includes information such as type of pipeline components, problem, training time, cross validation, etc.

Raises **PipelineNotFoundError** – If *pipeline_id* is not a valid ID.

property full_rankings(*self*)

Returns a pandas.DataFrame with scoring results from all pipelines searched.

get_ensembler_input_pipelines(*self*, *ensemble_pipeline_id*)

Returns a list of input pipeline IDs given an ensembler pipeline ID.

Parameters *ensemble_pipeline_id* (*id*) – Ensemble pipeline ID to get input pipeline IDs from.

Returns A list of ensemble input pipeline IDs.

Return type list[int]

Raises **ValueError** – If *ensemble_pipeline_id* does not correspond to a valid ensemble pipeline ID.

get_pipeline(*self*, *pipeline_id*)

Given the ID of a pipeline training result, returns an untrained instance of the specified pipeline initialized with the parameters used to train that pipeline during automl search.

Parameters *pipeline_id* (*int*) – Pipeline to retrieve.

Returns Untrained pipeline instance associated with the provided ID.

Return type *PipelineBase*

Raises **PipelineNotFoundError** – if *pipeline_id* is not a valid ID.

get_recommendation_score_breakdown(*self*, *pipeline_id*)

Reports the scores for the objectives used in the given pipeline's recommendation score calculation.

Note that these scores are reported in their raw form, not scaled to be between 0 and 1.

Parameters *pipeline_id* (*int*) – The id of the pipeline to get the recommendation score breakdown for.

Returns A dictionary of the scores for each objective used in the recommendation score calculation.

Return type dict

get_recommendation_scores(*self*, *priority=None*, *custom_weights=None*, *use_pipeline_names=False*)

Calculates recommendation scores for all pipelines in the search results.

Parameters

- **priority** (*str*) – An optional name of a priority objective that should be given heavier weight (of 0.5) than the other objectives contributing to the score. Defaults to None, where all objectives are weighted equally.
- **custom_weights** (*dict[str, float]*) – A dictionary mapping objective names to corresponding weights between 0 and 1. Should not be used at the same time as *prioritized_objective*. Defaults to None.
- **use_pipeline_names** (*bool*) – Whether or not to return the pipeline names instead of ids as the keys to the recommendation score dictionary. Defaults to False.

Returns A dictionary mapping pipeline IDs to recommendation scores

static load(*file_path*, *pickle_type='cloudpickle'*)

Loads AutoML object at file path.

Parameters

- **file_path** (*str*) – Location to find file to load
- **pickle_type** (*{ "pickle", "cloudpickle" }*) – The pickling library to use. Currently not used since the standard pickle library can handle cloudpickles.

Returns AutoSearchBase object

property plot(*self*)

Return an instance of the plot with the latest scores.

property rankings(*self*)

Returns a pandas.DataFrame with scoring results from the highest-scoring set of parameters used with each pipeline.

property results(*self*)

Class that allows access to a copy of the results from *automl_search*.

Returns

Dictionary containing *pipeline_results*, a dict with results from each pipeline, and *search_order*, a list describing the order the pipelines were searched.

Return type dict

save(*self*, *file_path*, *pickle_type='cloudpickle'*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves AutoML object at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_type** (*{"pickle", "cloudpickle"}*) – The pickling library to use.
- **pickle_protocol** (*int*) – The pickle data stream format.

Raises **ValueError** – If `pickle_type` is not “pickle” or “cloudpickle”.

score_pipelines(*self, pipelines, X_holdout, y_holdout, objectives*)

Score a list of pipelines on the given holdout data.

Parameters

- **pipelines** (*list[PipelineBase]*) – List of pipelines to train.
- **X_holdout** (*pd.DataFrame*) – Holdout features.
- **y_holdout** (*pd.Series*) – Holdout targets for scoring.
- **objectives** (*list[str], list[ObjectiveBase]*) – Objectives used for scoring.

Returns Dictionary keyed by pipeline name that maps to a dictionary of scores. Note that the any pipelines that error out during scoring will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

Return type `dict[str, Dict[str, float]]`

search(*self, interactive_plot=True*)

Find the best pipeline for the data set.

Parameters **interactive_plot** (*boolean, True*) – Shows an iteration vs. score plot in Jupyter notebook. Disabled by default in non-Jupyter environments.

Raises **AutoMLSearchException** – If all pipelines in the current AutoML batch produced a score of `np.nan` on the primary objective.

Returns Dictionary keyed by batch number that maps to the timings for pipelines run in that batch, as well as the total time for each batch. Pipelines within a batch are labeled by pipeline name.

Return type `Dict[int, Dict[str, Timestamp]]`

train_pipelines(*self, pipelines*)

Train a list of pipelines on the training data.

This can be helpful for training pipelines once the search is complete.

Parameters **pipelines** (*list[PipelineBase]*) – List of pipelines to train.

Returns Dictionary keyed by pipeline name that maps to the fitted pipeline. Note that the any pipelines that error out during training will not be included in the dictionary but the exception and stacktrace will be displayed in the log.

Return type `Dict[str, PipelineBase]`

class `evalml.automl.EngineBase`

Base class for EvalML engines.

Methods

<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Submit job for pipeline evaluation during AutoMLSearch.
<code>submit_scoring_job</code>	Submit job for pipeline scoring.
<code>submit_training_job</code>	Submit job for pipeline training.

static `setup_job_log()`

Set up logger for job.

abstract `submit_evaluation_job(self, automl_config, pipeline, X, y, X_holdout=None, y_holdout=None)`

Submit job for pipeline evaluation during AutoMLSearch.

abstract `submit_scoring_job(self, automl_config, pipeline, X, y, objectives, X_train=None, y_train=None)`

Submit job for pipeline scoring.

abstract `submit_training_job(self, automl_config, pipeline, X, y, X_holdout=None, y_holdout=None)`

Submit job for pipeline training.

`evalml.automl.get_default_primary_search_objective(problem_type)`

Get the default primary search objective for a problem type.

Parameters `problem_type` (*str* or *ProblemType*) – Problem type of interest.

Returns primary objective instance for the problem type.

Return type *ObjectiveBase*

`evalml.automl.get_threshold_tuning_info(automl_config, pipeline)`

Determine for a given automl config and pipeline what the threshold tuning objective should be and whether or not training data should be further split to achieve proper threshold tuning.

Can also be used after automl search has been performed to determine whether the full training data was used to train the pipeline.

Parameters

- **automl_config** (*AutoMLConfig*) – The AutoMLSearch’s config object. Used to determine threshold tuning objective and whether data needs resplitting.
- **pipeline** (*Pipeline*) – The pipeline instance to Threshold.

Returns `threshold_tuning_objective, data_needs_resplitting` (*str, bool*)

`evalml.automl.make_data_splitter(X, y, problem_type, problem_configuration=None, n_splits=3, shuffle=True, random_seed=0)`

Given the training data and ML problem parameters, compute a data splitting method to use during AutoML search.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.
- **problem_type** (*ProblemType*) – The type of machine learning problem.
- **problem_configuration** (*dict, None*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, and `max_delay` variables. Defaults to `None`.

- **n_splits** (*int*, *None*) – The number of CV splits, if applicable. Defaults to 3.
- **shuffle** (*bool*) – Whether or not to shuffle the data before splitting, if applicable. Defaults to True.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Data splitting method.

Return type `sklearn.model_selection.BaseCrossValidator`

Raises **ValueError** – If `problem_configuration` is not given for a time-series problem.

class `evalml automl.Progress`(*max_time=None*, *max_batches=None*, *max_iterations=None*, *patience=None*, *tolerance=None*, *automl_algorithm=None*, *objective=None*, *verbose=False*)

Progress object holding stopping criteria and progress information.

Parameters

- **max_time** (*int*) – Maximum time to search for pipelines.
- **max_iterations** (*int*) – Maximum number of iterations to search.
- **max_batches** (*int*) – The maximum number of batches of pipelines to search. Parameters `max_time`, and `max_iterations` have precedence over stopping the search.
- **patience** (*int*) – Number of iterations without improvement to stop search early.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping.
- **automl_algorithm** (*str*) – The automl algorithm to use. Used to calculate iterations if `max_batches` is selected as stopping criteria.
- **objective** (*str*, *ObjectiveBase*) – The objective used in search.
- **verbose** (*boolean*) – Whether or not to log out stopping information.

Methods

<code>elapsed</code>	Return time elapsed using the start time and current time.
<code>return_progress</code>	Return information about current and end state of each stopping criteria in order of priority.
<code>should_continue</code>	Given AutoML Results, return whether or not the search should continue.
<code>start_timing</code>	Sets start time to current time.

elapsed(*self*)

Return time elapsed using the start time and current time.

return_progress(*self*)

Return information about current and end state of each stopping criteria in order of priority.

Returns list of dictionaries containing information of each stopping criteria.

Return type `List[Dict[str, unit]]`

should_continue(*self*, *results*, *interrupted=False*, *mid_batch=False*)

Given AutoML Results, return whether or not the search should continue.

Parameters

- **results** (*dict*) – AutoMLSearch results.
- **interrupted** (*bool*) – whether AutoMLSearch was given an keyboard interrupt. Defaults to False.
- **mid_batch** (*bool*) – whether this method was called while in the middle of a batch or not. Defaults to False.

Returns True if search should continue, False otherwise.

Return type bool

start_timing(*self*)

Sets start time to current time.

`evalml.automl.resplit_training_data(pipeline, X_train, y_train)`

Further split the training data for a given pipeline. This is needed for binary pipelines in order to properly tune the threshold.

Can be used after automl search has been performed to recreate the data that was used to train a pipeline.

Parameters

- **pipeline** (*PipelineBase*) – the pipeline whose training data we are splitting
- **X_train** (*pd.DataFrame* or *np.ndarray*) – training data of shape [n_samples, n_features]
- **y_train** (*pd.Series*, or *np.ndarray*) – training target data of length [n_samples]

Returns Feature and target data each split into train and threshold tuning sets.

Return type *pd.DataFrame*, *pd.DataFrame*, *pd.Series*, *pd.Series*

`evalml.automl.search(X_train=None, y_train=None, problem_type=None, objective='auto', mode='fast', max_time=None, patience=None, tolerance=None, problem_configuration=None, n_splits=3, verbose=False, timing=False)`

Given data and configuration, run an automl search.

This method will run EvalML's default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you'd like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and AutoMLSearch, instead of using this method.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.
- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.
- **problem_type** (*str* or *ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - LogLossBinary for binary classification problems, - LogLossMulticlass for multiclass classification problems, and - R2 for regression problems.
- **mode** (*str*) – mode for DefaultAlgorithm. There are two modes: fast and long, where fast is a subset of long. Please look at DefaultAlgorithm for more details.

- **max_time** (*int*, *str*) – Maximum time to search for pipelines. This will not start a new pipeline search after the duration has elapsed. If it is an integer, then the time will be in seconds. For strings, time can be specified as seconds, minutes, or hours.
- **patience** (*int*) – Number of iterations without improvement to stop search early. Must be positive. If None, early stopping is disabled. Defaults to None.
- **tolerance** (*float*) – Minimum percentage difference to qualify as score improvement for early stopping. Only applicable if patience is not None. Defaults to None.
- **problem_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n_splits** (*int*) – Number of splits to use with the default data splitter.
- **verbose** (*boolean*) – Whether or not to display semi-real-time updates to stdout while search is running. Defaults to False.
- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to False.

Returns The automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

Return type (*AutoMLSearch*, dict)

Raises **ValueError** – If search configuration is not valid.

```
evalml.automl.search_iterative(X_train=None, y_train=None, problem_type=None, objective='auto',
                               problem_configuration=None, n_splits=3, timing=False, **kwargs)
```

Given data and configuration, run an automl search.

This method will run EvalML's default suite of data checks. If the data checks produce errors, the data check results will be returned before running the automl search. In that case we recommend you alter your data to address these errors and try again. This method is provided for convenience. If you'd like more control over when each of these steps is run, consider making calls directly to the various pieces like the data checks and AutoMLSearch, instead of using this method.

Parameters

- **X_train** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Required.
- **y_train** (*pd.Series*) – The target training data of length [n_samples]. Required for supervised learning tasks.
- **problem_type** (*str* or *ProblemTypes*) – Type of supervised learning problem. See `evalml.problem_types.ProblemType.all_problem_types` for a full list.
- **objective** (*str*, *ObjectiveBase*) – The objective to optimize for. Used to propose and rank pipelines, but not for optimizing each pipeline during fit-time. When set to 'auto', chooses: - `LogLossBinary` for binary classification problems, - `LogLossMulticlass` for multiclass classification problems, and - `R2` for regression problems.
- **problem_configuration** (*dict*) – Additional parameters needed to configure the search. For example, in time series problems, values should be passed in for the `time_index`, `gap`, `forecast_horizon`, and `max_delay` variables.
- **n_splits** (*int*) – Number of splits to use with the default data splitter.

- **timing** (*boolean*) – Whether or not to write pipeline search times to the logger. Defaults to False.
- ****kwargs** – Other keyword arguments which are provided will be passed to AutoMLSearch.

Returns the automl search object containing pipelines and rankings, and the results from running the data checks. If the data check results contain errors, automl search will not be run and an automl search object will not be returned.

Return type (*AutoMLSearch*, dict)

Raises **ValueError** – If the search configuration is invalid.

class evalml.automl.**SequentialEngine**

The default engine for the AutoML search.

Trains and scores pipelines locally and sequentially.

Methods

<code>close</code>	No-op.
<code>setup_job_log</code>	Set up logger for job.
<code>submit_evaluation_job</code>	Submit a job to evaluate a pipeline.
<code>submit_scoring_job</code>	Submit a job to score a pipeline.
<code>submit_training_job</code>	Submit a job to train a pipeline.

close(*self*)

No-op.

static **setup_job_log**()

Set up logger for job.

submit_evaluation_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *X_holdout=None*, *y_holdout=None*)

Submit a job to evaluate a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.
- **X_holdout** (*pd.Series*) – Holdout input data for holdout scoring.
- **y_holdout** (*pd.Series*) – Holdout target data for holdout scoring.

Returns Computation result.

Return type *SequentialComputation*

submit_scoring_job(*self*, *automl_config*, *pipeline*, *X*, *y*, *objectives*, *X_train=None*, *y_train=None*)

Submit a job to score a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to train.
- **X** (*pd.DataFrame*) – Input data for modeling.

- **y** (*pd.Series*) – Target data for modeling.
- **X_train** (*pd.DataFrame*) – Training features. Used for feature engineering in time series.
- **y_train** (*pd.Series*) – Training target. Used for feature engineering in time series.
- **objectives** (*list[ObjectiveBase]*) – List of objectives to score on.

Returns Computation result.

Return type SequentialComputation

submit_training_job(*self, automl_config, pipeline, X, y*)

Submit a job to train a pipeline.

Parameters

- **automl_config** – Structure containing data passed from AutoMLSearch instance.
- **pipeline** (*pipeline.PipelineBase*) – Pipeline to evaluate.
- **X** (*pd.DataFrame*) – Input data for modeling.
- **y** (*pd.Series*) – Target data for modeling.

Returns Computation result.

Return type SequentialComputation

evalml.automl.tune_binary_threshold(*pipeline, objective, problem_type, X_threshold_tuning, y_threshold_tuning, X=None, y=None*)

Tunes the threshold of a binary pipeline to the X and y thresholding data.

Parameters

- **pipeline** (*Pipeline*) – Pipeline instance to threshold.
- **objective** (*ObjectiveBase*) – The objective we want to tune with. If not tuneable and `best_pipeline` is True, will use F1.
- **problem_type** (*ProblemType*) – The problem type of the pipeline.
- **X_threshold_tuning** (*pd.DataFrame*) – Features to which the pipeline will be tuned.
- **y_threshold_tuning** (*pd.Series*) – Target data to which the pipeline will be tuned.
- **X** (*pd.DataFrame*) – Features to which the pipeline will be trained (used for time series binary). Defaults to None.
- **y** (*pd.Series*) – Target to which the pipeline will be trained (used for time series binary). Defaults to None.

Data Checks

Data checks.

Submodules

class_imbalance_data_check

Data check that checks if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds.

Use for classification problems.

Module Contents

Classes Summary

<i>ClassImbalanceDataCheck</i>	Check if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds. Use for classification problems.
--------------------------------	---

Contents

```
class evalml.data_checks.class_imbalance_data_check.ClassImbalanceDataCheck(threshold=0.1,  
                                                                           min_samples=100,  
                                                                           num_cv_folds=3,  
                                                                           test_size=None)
```

Check if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds. Use for classification problems.

Parameters

- **threshold** (*float*) – The minimum threshold allowed for class imbalance before a warning is raised. This threshold is calculated by comparing the number of samples in each class to the sum of samples in that class and the majority class. For example, a multiclass case with [900, 900, 100] samples per classes 0, 1, and 2, respectively, would have a 0.10 threshold for class 2 ($100 / (900 + 100)$). Defaults to 0.10.
- **min_samples** (*int*) – The minimum number of samples per accepted class. If the minority class is both below the threshold and min_samples, then we consider this severely imbalanced. Must be greater than 0. Defaults to 100.
- **num_cv_folds** (*int*) – The number of cross-validation folds. Must be positive. Choose 0 to ignore this warning. Defaults to 3.
- **test_size** (*None, float, int*) – Percentage of test set size. Used to calculate class imbalance prior to splitting the data into training and validation/test sets.

Raises

- **ValueError** – If threshold is not within 0 and 0.5
- **ValueError** – If min_samples is not greater than 0
- **ValueError** – If number of cv folds is negative
- **ValueError** – If test_size is not between 0 and 1

Methods

<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if any target labels are imbalanced beyond a threshold for binary and multiclass problems.

`name(cls)`

Return a name describing the data check.

`validate(self, X, y)`

Check if any target labels are imbalanced beyond a threshold for binary and multiclass problems.

Ignores NaN values in target labels if they appear.

Parameters

- `X` (`pd.DataFrame`, `np.ndarray`) – Features. Ignored.
- `y` (`pd.Series`, `np.ndarray`) – Target labels to check for imbalanced data.

Returns

Dictionary with `DataCheckWarnings` if imbalance in classes is less than the threshold, and `DataCheckErrors` if the number of values for each target is below `2 * num_cv_folds`.

Return type `dict`

Examples

```
>>> import pandas as pd
...
>>> X = pd.DataFrame()
>>> y = pd.Series([0, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1])
```

In this binary example, the target class 0 is present in fewer than 10% (threshold=0.10) of instances, and fewer than `2 * the number of cross folds` (`2 * 3 = 6`). Therefore, both a warning and an error are returned as part of the Class Imbalance Data Check. In addition, if a target is present with fewer than `min_samples` occurrences (default is 100) and is under the threshold, a severe class imbalance warning will be raised.

```
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.10)
>>> assert class_imb_dc.validate(X, y) == [
...     {
...         "message": "The number of instances of these targets is less than 2_
↳ * the number of cross folds = 6 instances: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "error",
...         "code": "CLASS_IMBALANCE_BELOW_FOLDS",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     },
...     {
...         "message": "The following labels fall below 10% of the target: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "warning",
...         "code": "CLASS_IMBALANCE_BELOW_THRESHOLD",
```

(continues on next page)

(continued from previous page)

```

...     "details": {"target_values": [0], "rows": None, "columns": None},
...     "action_options": []
... },
... {
...     "message": "The following labels in the target have severe class_
↪ imbalance because they fall under 10% of the target and have less than 100_
↪ samples: [0]",
...     "data_check_name": "ClassImbalanceDataCheck",
...     "level": "warning",
...     "code": "CLASS_IMBALANCE_SEVERE",
...     "details": {"target_values": [0], "rows": None, "columns": None},
...     "action_options": []
... }
... ]

```

In this multiclass example, the target class 0 is present in fewer than 30% of observations, however with 1 cv fold, the minimum number of instances required is $2 * 1 = 2$. Therefore a warning, but not an error, is raised.

```

>>> y = pd.Series([0, 0, 1, 1, 1, 1, 2, 2, 2, 2, 2])
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.30, min_samples=5, num_
↪ cv_folds=1)
>>> assert class_imb_dc.validate(X, y) == [
...     {
...         "message": "The following labels fall below 30% of the target: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "warning",
...         "code": "CLASS_IMBALANCE_BELOW_THRESHOLD",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     },
...     {
...         "message": "The following labels in the target have severe class_
↪ imbalance because they fall under 30% of the target and have less than 5_
↪ samples: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "warning",
...         "code": "CLASS_IMBALANCE_SEVERE",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     }
... ]
>>> y = pd.Series([0, 0, 1, 1, 1, 1, 2, 2, 2, 2])
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.30, num_cv_folds=1)
>>> assert class_imb_dc.validate(X, y) == []

```

data_check

Base class for all data checks.

Module Contents

Classes Summary

<i>DataCheck</i>	Base class for all data checks.
------------------	---------------------------------

Contents

class evalml.data_checks.data_check.DataCheck

Base class for all data checks.

Data checks are a set of heuristics used to determine if there are problems with input data.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Inspect and validate the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

name(cls)

Return a name describing the data check.

abstract validate(self, X, y=None)

Inspect and validate the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – The input data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – The target data of length [n_samples]

Returns Dictionary of DataCheckError and DataCheckWarning messages

Return type dict (DataCheckMessage)

data_check_action

Recommended action returned by a DataCheck.

Module Contents

Classes Summary

<i>DataCheckAction</i>	A recommended action returned by a DataCheck.
--	---

Contents

class evalml.data_checks.data_check_action.**DataCheckAction**(*action_code*, *data_check_name*, *metadata=None*)

A recommended action returned by a DataCheck.

Parameters

- **action_code** (*str*, *DataCheckActionCode*) – Action code associated with the action.
- **data_check_name** (*str*) – Name of data check.
- **metadata** (*dict*, *optional*) – Additional useful information associated with the action. Defaults to None.

Methods

<i>convert_dict_to_action</i>	Convert a dictionary into a DataCheckAction.
<i>to_dict</i>	Return a dictionary form of the data check action.

static **convert_dict_to_action**(*action_dict*)

Convert a dictionary into a DataCheckAction.

Parameters **action_dict** – Dictionary to convert into action. Should have keys “code”, “data_check_name”, and “metadata”.

Raises **ValueError** – If input dictionary does not have keys *code* and *metadata* and if the *metadata* dictionary does not have keys *columns* and *rows*.

Returns DataCheckAction object from the input dictionary.

to_dict(*self*)

Return a dictionary form of the data check action.

data_check_action_code

Enum for data check action code.

Module Contents

Classes Summary

<i>DataCheckActionCode</i>	Enum for data check action code.
--	----------------------------------

Contents

class evalml.data_checks.data_check_action_code.**DataCheckActionCode**

Enum for data check action code.

Attributes

DROP_COL	Action code for dropping a column.
DROP_ROWS	Action code for dropping rows.
IM- PUTE_COL	Action code for imputing a column.
REGULAR- IZE_AND_IMPUTE_DATASET	Action code for regularizing and imputing all features and target time series data.
SET_FIRST_COLUMN_ID	Action code for setting the first column as an id column.
TRANS- FORM_TARGET	Action code for transforming the target data.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

data_check_action_option

Recommended action returned by a DataCheck.

Module Contents

Classes Summary

<i>DataCheckActionOption</i>	A recommended action option returned by a DataCheck.
<i>DCAOParameterAllowedValuesType</i>	Enum for data check action option parameter allowed values type.
<i>DCAOParameterType</i>	Enum for data check action option parameter type.

Contents

```
class evalml.data_checks.data_check_action_option.DataCheckActionOption(action_code,
                                                                    data_check_name,
                                                                    parameters=None,
                                                                    metadata=None)
```

A recommended action option returned by a DataCheck.

It contains an action code that indicates what the action should be, a data check name that indicates what data check was used to generate the action, and parameters and metadata which can be used to further refine the action.

Parameters

- **action_code** (*DataCheckActionCode*) – Action code associated with the action option.
- **data_check_name** (*str*) – Name of the data check that produced this option.
- **parameters** (*dict*) – Parameters associated with the action option. Defaults to None.
- **metadata** (*dict, optional*) – Additional useful information associated with the action option. Defaults to None.

Examples

```
>>> parameters = {
...     "global_parameter_name": {
...         "parameter_type": "global",
...         "type": "float",
...         "default_value": 0.0,
...     },
...     "column_parameter_name": {
...         "parameter_type": "column",
...         "columns": {
...             "a": {
...                 "impute_strategy": {
...                     "categories": ["mean", "most_frequent"],
...                     "type": "category",
...                     "default_value": "mean",
...                 },
...                 "constant_fill_value": {"type": "float", "default_value": 0},
...             },
...         },
...     },
... }
>>> data_check_action = DataCheckActionOption(DataCheckActionCode.DROP_COL, None,
↪ metadata={}, parameters=parameters)
```

Methods

<code>convert_dict_to_option</code>	Convert a dictionary into a DataCheckActionOption.
<code>get_action_from_defaults</code>	Returns an action based on the defaults parameters.
<code>to_dict</code>	Return a dictionary form of the data check action option.

static `convert_dict_to_option(action_dict)`

Convert a dictionary into a `DataCheckActionOption`.

Parameters `action_dict` – Dictionary to convert into an action option. Should have keys “code”, “data_check_name”, and “metadata”.

Raises **ValueError** – If input dictionary does not have keys `code` and `metadata` and if the `meta-data` dictionary does not have keys `columns` and `rows`.

Returns `DataCheckActionOption` object from the input dictionary.

get_action_from_defaults(self)

Returns an action based on the defaults parameters.

Returns An based on the defaults parameters the option.

Return type `DataCheckAction`

to_dict(self)

Return a dictionary form of the data check action option.

class `evalml.data_checks.data_check_action_option.DCA0ParameterAllowedValuesType`

Enum for data check action option parameter allowed values type.

Attributes

CATEGORICAL	Categorical allowed values type. Parameters that have a set of allowed values.
NUMERICAL	Numerical allowed values type. Parameters that have a range of allowed values.

Methods

<code>name</code>	The name of the Enum member.
<code>value</code>	The value of the Enum member.

name(self)

The name of the Enum member.

value(self)

The value of the Enum member.

class `evalml.data_checks.data_check_action_option.DCA0ParameterType`

Enum for data check action option parameter type.

Attributes

COLUMN	Column parameter type. Parameters that apply to a specific column in the data set.
GLOBAL	Global parameter type. Parameters that apply to the entire data set.

Methods

<i>all_parameter_types</i>	Get a list of all defined parameter types.
<i>handle_dcao_parameter_type</i>	Handles the data check action option parameter type by either returning the DCAOParameType enum or converting from a str.
<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

all_parameter_types(*cls*)

Get a list of all defined parameter types.

Returns List of all defined parameter types.

Return type list(*DCAOParameType*)

static handle_dcao_parameter_type(*dcao_parameter_type*)

Handles the data check action option parameter type by either returning the DCAOParameType enum or converting from a str.

Parameters *dcao_parameter_type* (*str* or *DCAOParameType*) – Data check action option parameter type that needs to be handled.

Returns DCAOParameType enum

Raises

- **KeyError** – If input is not a valid DCAOParameType enum value.
- **ValueError** – If input is not a string or DCAOParameType object.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

data_check_message

Messages returned by a DataCheck, tagged by name.

Module Contents**Classes Summary**

<i>DataCheckError</i>	DataCheckMessage subclass for errors returned by data checks.
<i>DataCheckMessage</i>	Base class for a message returned by a DataCheck, tagged by name.
<i>DataCheckWarning</i>	DataCheckMessage subclass for warnings returned by data checks.

Contents

```
class evalml.data_checks.data_check_message.DataCheckError(message, data_check_name,
                                                            message_code=None, details=None,
                                                            action_options=None)
```

DataCheckMessage subclass for errors returned by data checks.

Attributes

mes- sage_type	DataCheckMessageType.ERROR
-------------------	----------------------------

Methods

<code>to_dict</code>	Return a dictionary form of the data check message.
--------------------------------------	---

`to_dict(self)`

Return a dictionary form of the data check message.

```
class evalml.data_checks.data_check_message.DataCheckMessage(message, data_check_name,
                                                              message_code=None, details=None,
                                                              action_options=None)
```

Base class for a message returned by a DataCheck, tagged by name.

Parameters

- **message** (*str*) – Message string.
- **data_check_name** (*str*) – Name of the associated data check.
- **message_code** (*DataCheckMessageCode*, *optional*) – Message code associated with the message. Defaults to None.
- **details** (*dict*, *optional*) – Additional useful information associated with the message. Defaults to None.
- **action_options** (*list*, *optional*) – A list of `DataCheckActionOption``s associated with the message. Defaults to None.

Attributes

mes- sage_type	None
-------------------	------

Methods

<code>to_dict</code>	Return a dictionary form of the data check message.
--------------------------------------	---

`to_dict(self)`

Return a dictionary form of the data check message.

```
class evalml.data_checks.data_check_message.DataCheckWarning(message, data_check_name,
                                                              message_code=None, details=None,
                                                              action_options=None)
```

DataCheckMessage subclass for warnings returned by data checks.

Attributes

message_type	DataCheckMessageType.WARNING
---------------------	------------------------------

Methods

<i>to_dict</i>	Return a dictionary form of the data check message.
--------------------------------	---

to_dict(*self*)

Return a dictionary form of the data check message.

data_check_message_code

Enum for data check message code.

Module Contents

Classes Summary

<i>DataCheckMessageCode</i>	Enum for data check message code.
---	-----------------------------------

Contents

class evalml.data_checks.data_check_message_code.**DataCheckMessageCode**

Enum for data check message code.

Attributes

CLASS_IMBALANCE_BELOW_FOLDS	Message code for when number of values for each target is below 2 * number of CV folds.
CLASS_IMBALANCE_BELOW_THRESHOLD	Message code for when number of classes is less than the threshold.
CLASS_IMBALANCE_SEVERE	Message code for when balance in classes is less than the threshold and minimum class is less than minimum number of accepted samples.
COLS_WITH_NULL	Message code for columns with null values.
DATE-TIME_HAS_MISALIGNED_VALUES	Message code for when datetime information has values that are not aligned with the inferred frequency.
DATE-TIME_HAS_NAN	Message code for when input datetime columns contain NaN values.
DATE-TIME_HAS_REDUNDANT_ROW	Message code for when datetime information has more than one row per datetime.
DATE-TIME_HAS_UNEVEN_INTERVALS	Message code for when the datetime values have uneven intervals.
DATE-TIME_INFORMATION_NOT_FOUND	Message code for when datetime information can not be found or is in an unaccepted format.

continues on next page

Table 2 – continued from previous page

DATE-TIME_IS_MISSING_VALUES	Message code for when datetime feature has values missing between the start and end dates.
DATE-TIME_IS_NOT_MONOTONIC	Message code for when the datetime values are not monotonically increasing.
DATE-TIME_NO_FREQUENCY_INFERRED	Message code for when no frequency can be inferred in the datetime values through Wood-ward.
HAS_ID_COLUMNS	Message code for data that has ID columns.
HAS_ID_FIRST_COLUMN	Message code for data that has an ID column as the first column.
HAS_OUTLIERS	Message code for when outliers are detected.
HIGH_VARIANCE	Message code for when high variance is detected for cross-validation.
HIGHLY_NULL_COLS	Message code for highly null columns.
HIGHLY_NULL_ROWS	Message code for highly null rows.
IN-VALID_SERIES_ID_COL	Message code for when given series_id is invalid
IS_MULTICOLLINEAR	Message code for when data is potentially multicollinear.
MIS-MATCHED_INDICES	Message code for when input target and features have mismatched indices.
MIS-MATCHED_INDICES_ORDER	Message code for when input target and features have mismatched indices order. The two indices have the same index values, but shuffled.
MIS-MATCHED_LENGTHS	Message code for when input target and features have different lengths.
MIS-MATCHED_SERIES_LENGTHS	Message code for when one or more unique series in a multiserie dataset is of a different length than the others
NATURAL_LANGUAGE_HAS_NAN	Message code for when input natural language columns contain NaN values.
NO_VARIANCE	Message code for when data has no variance (1 unique value).
NO_VARIANCE_WITH_NULL	Message code for when data has one unique value and NaN values.
NO_VARIANCE_ZERO_UNIQUE	Message code for when data has no variance (0 unique value)
NOT_ENOUGH_UNIQUE_VALUES	Message code for when data does not possess enough unique values.
TARGET_BINARY_NOT_TWO_UNIQUE_VALUES	Message code for target data for a binary classification problem that does not have two unique values.
TARGET_HAS_NULL	Message code for target data that has null values.
TARGET_INCOMPATIBLE_OBJECTIVE	Message code for target data that has incompatible values for the specified objective
TARGET_IS_EMPTY_OR_FULLY_NULL	Message code for target data that is empty or has all null values.
TARGET_IS_NONE	Message code for when target is None.
TARGET_LEAKAGE	Message code for when target leakage is detected.
TARGET_LOGNORMAL_DISTRIBUTION	Message code for target data with a lognormal distribution.
TARGET_MULTICLASS_HIGH_UNIQUE_CLASSES	Message code for target data for a multi classification problem that has an abnormally large number of target values.
TARGET_MULTICLASS_NOT_ENOUGH_CLASSES	Message code for target data for a multi classification problem that does not have more than the specified number of classes.
TARGET_MULTICLASS_NOT_TWO_EXAMPLES_PER_CLASS	Message code for target data for a multi classification problem that does not have two examples per class.
TARGET_UNSUPPORTED_PROBLEM_TYPE	Message code for target data that is being checked against an unsupported problem type.

continues on next page

Table 2 – continued from previous page

TAR- GET_UNSUPPORTED_TYPE	Message code for target data that is of an unsupported type.
TAR- GET_UNSUPPORTED_TYPE_REGRESSION	Message code for target data that is incompatible with regression
TIME- SERIES_PARAMETERS_NOT_COMPATIBLE_WITH_SPLIT	Message code when the time series parameters are too large for the smallest data split.
TIME- SERIES_TARGET_NOT_COMPATIBLE_WITH_SPLIT	Message code when any training and validation split of the time series target doesn't contain
TOO_SPARSE	Message code for when multiclass data has values that are too sparsely populated.
TOO_UNIQUE	Message code for when data possesses too many unique values.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

data_check_message_type

Enum for type of data check message.

Module Contents**Classes Summary**

<i>DataCheckMessageType</i>	Enum for type of data check message: WARNING or ERROR.
-----------------------------	--

Contents**class** evalml.data_checks.data_check_message_type.**DataCheckMessageType**

Enum for type of data check message: WARNING or ERROR.

Attributes

ERROR	Error message returned by a data check.
WARNING	Warning message returned by a data check.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

data_checks

A collection of data checks.

Module Contents

Classes Summary

<i>DataChecks</i>	A collection of data checks.
-------------------	------------------------------

Contents

class evalml.data_checks.data_checks.**DataChecks**(*data_checks=None, data_check_params=None*)

A collection of data checks.

Parameters

- **data_checks** (*list* (*DataCheck*)) – List of DataCheck objects.
- **data_check_params** (*dict*) – Parameters for passed DataCheck objects.

Methods

<i>validate</i>	Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.
-----------------	--

validate(*self, X, y=None*)

Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame, np.ndarray*) – The input data of shape [n_samples, n_features]
- **y** (*pd.Series, np.ndarray*) – The target data of length [n_samples]

Returns Dictionary containing DataCheckMessage objects

Return type dict

datetime_format_data_check

Data check that checks if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.

Module Contents

Classes Summary

<i>DateTimeFormatDataCheck</i>	Check if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.
--	---

Contents

```
class evalml.data_checks.datetime_format_data_check.DateTimeFormatDataCheck(datetime_column='index',  
                                                                           nan_duplicate_threshold=0.75,  
                                                                           series_id=None)
```

Check if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.

If used for multiserries problem, works specifically on stacked datasets.

Parameters

- **datetime_column** (*str*, *int*) – The name of the datetime column. If the datetime values are in the index, then pass “index”.
- **nan_duplicate_threshold** (*float*) – The percentage of values in the *datetime_column* that must not be duplicate or nan before *DATETIME_NO_FREQUENCY_INFERRED* is returned instead of *DATETIME_HAS_UNEVEN_INTERVALS*. For example, if this is set to 0.80, then only 20% of the values in *datetime_column* can be duplicate or nan. Defaults to 0.75.
- **series_id** (*str*) – The name of the series_id column for multiserries. Defaults to None

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Checks if the target data has equal intervals and is monotonically increasing.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Checks if the target data has equal intervals and is monotonically increasing.

Will return *DataCheckError*(s) if the data is not a datetime type, is not increasing, has redundant or missing row(s), contains invalid (NaN or None) values, or has values that don’t align with the assumed frequency.

If used for multiserries problem, works specifically on stacked datasets.

Parameters

- `X` (`pd.DataFrame`, `np.ndarray`) – Features.
- `y` (`pd.Series`, `np.ndarray`) – Target data.

Returns List with `DataCheckErrors` if unequal intervals are found in the datetime column.

Return type dict (`DataCheckError`)

Examples

```
>>> import pandas as pd
```

The column ‘dates’ has a set of two dates with daily frequency, two dates with hourly frequency, and two dates with monthly frequency.

```
>>> X = pd.DataFrame(pd.date_range("2015-01-01", periods=2).append(pd.date_
↳range("2015-01-08", periods=2, freq="H").append(pd.date_range("2016-03-02",
↳periods=2, freq="M"))), columns=["dates"])
>>> y = pd.Series([0, 1, 0, 1, 1, 0])
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="dates")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "No frequency could be detected in column 'dates',
↳possibly due to uneven intervals or too many duplicate/missing values.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "code": "DATETIME_NO_FREQUENCY_INFERRED",
...         "details": {"columns": None, "rows": None},
...         "action_options": []
...     }
... ]
```

The column “dates” has a gap in the values, which implies there are many dates missing.

```
>>> X = pd.DataFrame(pd.date_range("2021-01-01", periods=9).append(pd.date_
↳range("2021-01-31", periods=50)), columns=["dates"])
>>> y = pd.Series([0, 1, 0, 1, 1, 0, 0, 0, 1, 0])
>>> ww_payload = infer_frequency(X["dates"], debug=True, window_length=5,
↳threshold=0.8)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="dates")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Column 'dates' has datetime values missing between
↳start and end date.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "code": "DATETIME_IS_MISSING_VALUES",
...         "details": {"columns": None, "rows": None},
...         "action_options": []
...     },
...     {
...         "message": "A frequency was detected in column 'dates', but there
↳are faulty datetime values that need to be addressed.",
...         "data_check_name": "DateTimeFormatDataCheck",
...     }
... ]
```

(continues on next page)

(continued from previous page)

```

...     "level": "error",
...     "code": "DATETIME_HAS_UNEVEN_INTERVALS",
...     "details": {'columns': None, 'rows': None},
...     "action_options": [
...         {
...             'code': 'REGULARIZE_AND_IMPUTE_DATASET',
...             'data_check_name': 'DateTimeFormatDataCheck',
...             'metadata': {
...                 'columns': None,
...                 'is_target': True,
...                 'rows': None
...             },
...             'parameters': {
...                 'time_index': {
...                     'default_value': 'dates',
...                     'parameter_type': 'global',
...                     'type': 'str'
...                 },
...                 'frequency_payload': {
...                     'default_value': ww_payload,
...                     'parameter_type': 'global',
...                     'type': 'tuple'
...                 }
...             }
...         }
...     ]
... }
... ]

```

The column “dates” has a repeat of the date 2021-01-09 appended to the end, which is considered redundant and will raise an error.

```

>>> X = pd.DataFrame(pd.date_range("2021-01-01", periods=9).append(pd.date_
↳range("2021-01-09", periods=1)), columns=["dates"])
>>> y = pd.Series([0, 1, 0, 1, 1, 0, 0, 0, 1, 0])
>>> ww_payload = infer_frequency(X["dates"], debug=True, window_length=5,
↳threshold=0.8)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="dates")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Column 'dates' has more than one row with the same_
↳datetime value.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "code": "DATETIME_HAS_REDUNDANT_ROW",
...         "details": {"columns": None, "rows": None},
...         "action_options": []
...     },
...     {
...         "message": "A frequency was detected in column 'dates', but there_
↳are faulty datetime values that need to be addressed.",
...         "data_check_name": "DateTimeFormatDataCheck",

```

(continues on next page)

(continued from previous page)

```

...     "level": "error",
...     "code": "DATETIME_HAS_UNEVEN_INTERVALS",
...     "details": {'columns': None, 'rows': None},
...     "action_options": [
...         {
...             'code': 'REGULARIZE_AND_IMPUTE_DATASET',
...             'data_check_name': 'DateTimeFormatDataCheck',
...             'metadata': {
...                 'columns': None,
...                 'is_target': True,
...                 'rows': None
...             },
...             'parameters': {
...                 'time_index': {
...                     'default_value': 'dates',
...                     'parameter_type': 'global',
...                     'type': 'str'
...                 },
...                 'frequency_payload': {
...                     'default_value': ww_payload,
...                     'parameter_type': 'global',
...                     'type': 'tuple'
...                 }
...             }
...         }
...     ]
... }
... ]

```

The column “Weeks” has a date that does not follow the weekly pattern, which is considered misaligned.

```

>>> X = pd.DataFrame(pd.date_range("2021-01-01", freq="W", periods=12).
↳ append(pd.date_range("2021-03-22", periods=1)), columns=["Weeks"])
>>> ww_payload = infer_frequency(X["Weeks"], debug=True, window_length=5,
↳ threshold=0.8)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Column 'Weeks' has datetime values that do not align_
↳ with the inferred frequency.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_HAS_MISALIGNED_VALUES",
...         "action_options": []
...     },
...     {
...         "message": "A frequency was detected in column 'Weeks', but there_
↳ are faulty datetime values that need to be addressed.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "code": "DATETIME_HAS_UNEVEN_INTERVALS",

```

(continues on next page)

(continued from previous page)

```

...     "details": {'columns': None, 'rows': None},
...     "action_options": [
...         {
...             'code': 'REGULARIZE_AND_IMPUTE_DATASET',
...             'data_check_name': 'DateTimeFormatDataCheck',
...             'metadata': {
...                 'columns': None,
...                 'is_target': True,
...                 'rows': None
...             },
...             'parameters': {
...                 'time_index': {
...                     'default_value': 'Weeks',
...                     'parameter_type': 'global',
...                     'type': 'str'
...                 },
...                 'frequency_payload': {
...                     'default_value': ww_payload,
...                     'parameter_type': 'global',
...                     'type': 'tuple'
...                 }
...             }
...         }
...     ]
... }
... ]

```

The column “Weeks” passed integers instead of datetime data, which will raise an error.

```

>>> X = pd.DataFrame([1, 2, 3, 4], columns=["Weeks"])
>>> y = pd.Series([0] * 4)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Datetime information could not be found in the data, or
↳ was not in a supported datetime format.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_INFORMATION_NOT_FOUND",
...         "action_options": []
...     }
... ]

```

Converting that same integer data to datetime, however, is valid.

```

>>> X = pd.DataFrame(pd.to_datetime([1, 2, 3, 4]), columns=["Weeks"])
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == []

```

```

>>> X = pd.DataFrame(pd.date_range("2021-01-01", freq="W", periods=10),
↳ columns=["Weeks"])

```

(continues on next page)

(continued from previous page)

```
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == []
```

While the data passed in is of datetime type, time series requires the datetime information in `datetime_column` to be monotonically increasing (ascending).

```
>>> X = X.iloc[::-1]
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Datetime values must be sorted in ascending order.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_IS_NOT_MONOTONIC",
...         "action_options": []
...     }
... ]
```

The first value in the column “index” is replaced with NaT, which will raise an error in this data check.

```
>>> dates = [
...     ["2-1-21", "3-1-21"],
...     ["2-2-21", "3-2-21"],
...     ["2-3-21", "3-3-21"],
...     ["2-4-21", "3-4-21"],
...     ["2-5-21", "3-5-21"],

...                 }
...             }
...         }
...     ]
... }
... ]

```

For multiserries, the datacheck will go through each series and perform checks on them similar to the single series case. To denote that the datacheck is checking a multiserries, pass in the name of the `series_id` column to the datacheck.

```

>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range("2021-01-01", periods=15).repeat(2),
...         "series_id": pd.Series(list(range(2)) * 15, dtype="str")
...     }
... )
>>> X = X.drop([15])
>>> dc = DateTimeFormatDataCheck(datetime_column="date", series_id="series_id")
>>> ww_payload_expected_series1 = infer_frequency((X[X["series_id"] == "1"]
... ↪ "date"].reset_index(drop=True)), debug=True, window_length=4, threshold=0.4)
>>> xd = dc.validate(X,y)
>>> assert dc.validate(X, y) == [
...     {
...         "message": "Column 'date' for series '1' has datetime values_
... ↪ missing between start and end date.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_IS_MISSING_VALUES",

```

```

default_data_checks

A default set of data checks that can be used for a variety of datasets.

Module Contents

Classes Summary

DefaultDataChecks

A collection of basic data checks that is used by AutoML by default.

Contents

class evalml.data_checks.default_data_checks.**DefaultDataChecks**(*problem_type*, *objective*, *n_splits*=3, *problem_configuration*=None)

A collection of basic data checks that is used by AutoML by default.

Includes:

- *NullDataCheck*
- *HighlyNullRowsDataCheck*
- *IDColumnsDataCheck*
- *TargetLeakageDataCheck*
- *InvalidTargetDataCheck*
- *NoVarianceDataCheck*
- *ClassImbalanceDataCheck* (for classification problem types)
- *TargetDistributionDataCheck* (for regression problem types)
- *DateTimeFormatDataCheck* (for time series problem types)
- *TimeSeriesParametersDataCheck* (for time series problem types)
- *TimeSeriesSplittingDataCheck* (for time series classification problem types)

Parameters

- **problem_type** (*str*) – The problem type that is being validated. Can be regression, binary, or multiclass.
- **objective** (*str* or *ObjectiveBase*) – Name or instance of the objective class.
- **n_splits** (*int*) – The number of splits as determined by the data splitter being used. Defaults to 3.
- **problem_configuration** (*dict*) – Required for time series problem types. Values should be passed in for *time_index*,
- **gap** –
- **forecast_horizon** –
- **max_delay.** (*and*) –

Methods

<i>validate</i>	Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.
-----------------	--

validate(*self*, *X*, *y*=None)

Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input data of shape [n_samples, n_features]
- **y** (*pd.Series*, *np.ndarray*) – The target data of length [n_samples]

Returns Dictionary containing DataCheckMessage objects

Return type dict

id_columns_data_check

Data check that checks if any of the features are likely to be ID columns.

Module Contents

Classes Summary

<i>IDColumnsDataCheck</i>	Check if any of the features are likely to be ID columns.
---------------------------	---

Contents

class evalml.data_checks.id_columns_data_check.IDColumnsDataCheck(*id_threshold=1.0*,
exclude_time_index=True)

Check if any of the features are likely to be ID columns.

Parameters

- **id_threshold** (*float*) – The probability threshold to be considered an ID column. Defaults to 1.0.
- **exclude_time_index** (*bool*) – If True, the column set as the time index will not be included in the data check. Default is True.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any of the features are likely to be ID columns. Currently performs a number of simple checks.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if any of the features are likely to be ID columns. Currently performs a number of simple checks.

Checks performed are:

- column name is “id”
- column name ends in “_id”
- column contains all unique values (and is categorical / integer type)

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input features to check.
- **y** (*pd.Series*) – The target. Defaults to None. Ignored.

Returns A dictionary of features with column name or index and their probability of being ID columns

Return type dict

Examples

```
>>> import pandas as pd
```

Columns that end in “_id” and are completely unique are likely to be ID columns.

```
>>> df = pd.DataFrame({
...     "profits": [25, 15, 15, 31, 19],
...     "customer_id": [123, 124, 125, 126, 127],
...     "Sales": [10, 42, 31, 51, 61]
... })
...
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'customer_id' are 100.0% or more likely to be an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["customer_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["customer_id"], "rows": None}
...             }
...         ]
...     }
... ]
```

Columns named “ID” with all unique values will also be identified as ID columns.

```
>>> df = df.rename(columns={"customer_id": "ID"})
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'ID' are 100.0% or more likely to be an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["ID"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...             }
...         ]
...     }
... ]
```

(continues on next page)

(continued from previous page)

```

...         "parameters": {},
...         "metadata": {"columns": ["ID"], "rows": None}
...     }
... ]

```

Despite being all unique, “Country_Rank” will not be identified as an ID column as `id_threshold` is set to 1.0 by default and its name doesn’t indicate that it’s an ID.

```

>>> df = pd.DataFrame({
...     "humidity": ["high", "very high", "low", "low", "high"],
...     "Country_Rank": [1, 2, 3, 4, 5],
...     "Sales": ["very high", "high", "high", "medium", "very low"]
... })
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == []

```

However lowering the threshold will cause this column to be identified as an ID.

```

>>> id_col_check = IDColumnsDataCheck()
>>> id_col_check = IDColumnsDataCheck(id_threshold=0.95)
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'Country_Rank' are 95.0% or more likely to be_
↳ an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Country_Rank"], "rows": None},
...         "code": "HAS_ID_COLUMN",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["Country_Rank"], "rows": None}
...             }
...         ]
...     }
... ]

```

If the first column of the dataframe has all unique values and is named either ‘ID’ or a name that ends with ‘_id’, it is probably the primary key. The other ID columns should be dropped.

```

>>> df = pd.DataFrame({
...     "sales_id": [0, 1, 2, 3, 4],
...     "customer_id": [123, 124, 125, 126, 127],
...     "Sales": [10, 42, 31, 51, 61]
... })
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [

```

(continues on next page)

(continued from previous page)

```

...     {
...         "message": "The first column 'sales_id' is likely to be the primary_
↪key",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_FIRST_COLUMN",
...         "details": {"columns": ["sales_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "SET_FIRST_COL_ID",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["sales_id"], "rows": None}
...             }
...         ]
...     },
...     {
...         "message": "Columns 'customer_id' are 100.0% or more likely to be an_
↪ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["customer_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["customer_id"], "rows": None}
...             }
...         ]
...     }
... ]

```

invalid_target_data_check

Data check that checks if the target data contains missing or invalid values.

Module Contents

Classes Summary

<i>InvalidTargetDataCheck</i>	Check if the target data is considered invalid.
-------------------------------	---

Contents

```
class evalml.data_checks.invalid_target_data_check.InvalidTargetDataCheck(problem_type,
                                                                            objective,
                                                                            n_unique=100,
                                                                            null_strategy='drop')
```

Check if the target data is considered invalid.

Target data is considered invalid if:

- Target is None.
- Target has NaN or None values.
- Target is of an unsupported Woodwork logical type.
- Target and features have different lengths or indices.
- Target does not have enough instances of a class in a classification problem.
- Target does not contain numeric data for regression problems.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. e.g. ‘binary’, ‘multiclass’, ‘regression’, ‘time series regression’
- **objective** (*str* or *ObjectiveBase*) – Name or instance of the objective class.
- **n_unique** (*int*) – Number of unique target values to store when problem type is binary and target incorrectly has more than 2 unique values. Non-negative integer. If None, stores all unique values. Defaults to 100.
- **null_strategy** (*str*) – The type of action option that should be returned if the target is partially null. The options are *impute* and *drop* (default). *impute* - Will return a *DataCheckActionOption* for imputing the target column. *drop* - Will return a *DataCheckActionOption* for dropping the null rows in the target column.

Attributes

multi-class_continuous_threshold	0.05
---	------

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the target data is considered invalid. If the input features argument is not None, it will be used to check that the target and features have the same dimensions and indices.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if the target data is considered invalid. If the input features argument is not None, it will be used to check that the target and features have the same dimensions and indices.

Target data is considered invalid if:

- Target is None.
- Target has NaN or None values.
- Target is of an unsupported Woodwork logical type.
- Target and features have different lengths or indices.
- Target does not have enough instances of a class in a classification problem.
- Target does not contain numeric data for regression problems.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features. If not None, will be used to check that the target and features have the same dimensions and indices.
- **y** (*pd.Series*, *np.ndarray*) – Target data to check for invalid values.

Returns List with DataCheckErrors if any invalid values are found in the target data.

Return type dict (DataCheckError)

Examples

```
>>> import pandas as pd
```

Target values must be integers, doubles, or booleans.

```
>>> X = pd.DataFrame({"col": [1, 2, 3, 1]})
>>> y = pd.Series(["cat_1", "cat_2", "cat_1", "cat_2"])
>>> target_check = InvalidTargetDataCheck("regression", "R2", null_strategy=
↳ "impute")
>>> assert target_check.validate(X, y) == [
...     {
...         "message": "Target is unsupported Unknown type. Valid Woodwork_
↳ logical types include: integer, double, boolean, age, age_fractional, integer_
↳ nullable, boolean_nullable, age_nullable",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None, "unsupported_type":
↳ "unknown"},
...         "code": "TARGET_UNSUPPORTED_TYPE",
...         "action_options": []
...     },
...     {
...         "message": "Target data type should be numeric for regression type_
↳ problems.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "TARGET_UNSUPPORTED_TYPE_REGRESSION",
...         "action_options": []
...     }
... ]
```

The target cannot have null values.

```
>>> y = pd.Series([None, pd.NA, pd.NaT, None])
>>> assert target_check.validate(X, y) == [
...     {
...         "message": "Target is either empty or fully null.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "TARGET_IS_EMPTY_OR_FULLY_NULL",
...         "action_options": []
...     }
... ]
...
>>> y = pd.Series([1, None, 3, None])
>>> assert target_check.validate(None, y) == [
...     {
...         "message": "2 row(s) (50.0%) of target values are null",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {
...             "columns": None,
...             "rows": [1, 3],
...             "num_null_rows": 2,
...             "pct_null_rows": 50.0
...         },
...         "code": "TARGET_HAS_NULL",
...         "action_options": [
...             {
...                 "code": "IMPUTE_COL",
...                 "data_check_name": "InvalidTargetDataCheck",
...                 "parameters": {
...                     "impute_strategy": {
...                         "parameter_type": "global",
...                         "type": "category",
...                         "categories": ["mean", "most_frequent"],
...                         "default_value": "mean"
...                     }
...                 },
...                 "metadata": {"columns": None, "rows": None, "is_target":
True},
...             }
...         ],
...     }
... ]
```

If the target values don't match the problem type passed, an error will be raised. In this instance, only two values exist in the target column, but multiclass has been passed as the problem type.

```
>>> X = pd.DataFrame([i for i in range(50)])
>>> y = pd.Series([i%2 for i in range(50)])
>>> target_check = InvalidTargetDataCheck("multiclass", "Log Loss Multiclass")
>>> assert target_check.validate(X, y) == [
```

(continues on next page)

(continued from previous page)

```

...     {
...         "message": "Target has two or less classes, which is too few for
↳ multiclass problems. Consider changing to binary.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",

```

mismatched_series_length_data_check

Data check that checks if one or more unique series in a multiseries data is a different length than the others.

Module Contents

Classes Summary

<i>MismatchedSeriesLengthDataCheck</i>	Check if one or more unique series in a multiseries dataset is of a different length than the others.
--	---

Contents

class evalml.data_checks.mismatched_series_length_data_check.**MismatchedSeriesLengthDataCheck**(*series_id*)

Check if one or more unique series in a multiseries dataset is of a different length than the others.

Currently works specifically on stacked data

Parameters **series_id** (*str*) – The name of the series_id column for the dataset.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if one or more unique series in a multiseries dataset is of a different length than the other.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if one or more unique series in a multiseries dataset is of a different length than the other.

Currently works specifically on stacked data

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input features to check. Must have a series_id column.
- **y** (*pd.Series*) – The target. Defaults to None. Ignored.

Returns

List with DataCheckWarning if there are mismatch series length in the datasets or list with DataCheckError if the given series_id is not in the dataset

Return type dict (DataCheckWarning, DataCheckError)

Examples

```
>>> import pandas as pd
```

For multiseries time series datasets, each seriesID should ideally have the same number of datetime entries as each other. If they don't, then a warning will be raised denoting which seriesID have mismatched lengths.

```
>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range(start="1/1/2018", periods=20).repeat(5),
...         "series_id": pd.Series(list(range(5)) * 20, dtype="str"),
...         "feature_a": range(100),
...         "feature_b": reversed(range(100)),
...     },
... )
>>> X = X.drop(labels=0, axis=0)
>>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("series_id"
↪)
>>> assert mismatched_series_length_check.validate(X) == [
...     {
...         "message": "Series ID ['0'] do not match the majority length of the
↪other series, which is 20",
...         "data_check_name": "MismatchedSeriesLengthDataCheck",
...         "level": "warning",
...         "details": {
...             "columns": None,
...             "rows": None,
...             "series_id": ['0'],
...             "majority_length": 20
...         },
...         "code": "MISMATCHED_SERIES_LENGTH",
...         "action_options": [],
...     }
... ]
```

If `MismatchedSeriesLengthDataCheck` is passed in an invalid `series_id` column name, then an error will be raised.

```
>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range(start="1/1/2018", periods=20).repeat(5),
...         "series_id": pd.Series(list(range(5)) * 20, dtype="str"),
...         "feature_a": range(100),
...         "feature_b": reversed(range(100)),
...     },
... )
>>> X = X.drop(labels=0, axis=0)
>>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("not_
↪series_id")
>>> assert mismatched_series_length_check.validate(X) == [
...     {
...         "message": "series_id 'not_series_id' is not in the dataset.",
...         "data_check_name": "MismatchedSeriesLengthDataCheck",
...     }
... ]
```

(continues on next page)

(continued from previous page)

```

...     "level": "error",
...     "details": {
...         "columns": None,
...         "rows": None,
...         "series_id": "not_series_id",
...     },
...     "code": "INVALID_SERIES_ID_COL",
...     "action_options": [],
... }
... ]

```

If there are multiple lengths that have the same number of series (e.g. two series have length 20 and two series have length 19), this datacheck will consider the higher length to be the majority length (e.g. from the previous example length 20 would be the majority length) >>> X = pd.DataFrame(... { ... "date": pd.date_range(start="1/1/2018", periods=20).repeat(4), ... "series_id": pd.Series(list(range(4)) * 20, dtype="str"), ... "feature_a": range(80), ... "feature_b": reversed(range(80)), ... }, ...) >>> X = X.drop(labels=[0, 1], axis=0) >>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("series_id") >>> assert mismatched_series_length_check.validate(X) == [... { ... "message": "Series ID ['0', '1'] do not match the majority length of the other series, which is 20", ... "data_check_name": "MismatchedSeriesLengthDataCheck", ... "level": "warning", ... "details": { ... "columns": None, ... "rows": None, ... "series_id": ['0', '1'], ... "majority_length": 20 ... }, ... "code": "MISMATCHED_SERIES_LENGTH", ... "action_options": [], ... } ...]

multicollinearity_data_check

Data check to check if any set features are likely to be multicollinear.

Module Contents

Classes Summary

MulticollinearityDataCheck

Check if any set features are likely to be multicollinear.

Contents

class evalml.data_checks.multicollinearity_data_check.**MulticollinearityDataCheck**(threshold=0.9)

Check if any set features are likely to be multicollinear.

Parameters **threshold** (*float*) – The threshold to be considered. Defaults to 0.9.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any set of features are likely to be multicollinear.

name(cls)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if any set of features are likely to be multicollinear.

Parameters

- **X** (*pd.DataFrame*) – The input features to check.
- **y** (*pd.Series*) – The target. Ignored.

Returns dict with a DataCheckWarning if there are any potentially multicollinear columns.

Return type dict

Example

```
>>> import pandas as pd
```

Columns in X that are highly correlated with each other will be identified using mutual information.

```
>>> col = pd.Series([1, 0, 2, 3, 4] * 15)
>>> X = pd.DataFrame({"col_1": col, "col_2": col * 3})
>>> y = pd.Series([1, 0, 0, 1, 0] * 15)
...
>>> multicollinearity_check = MulticollinearityDataCheck(threshold=1.0)
>>> assert multicollinearity_check.validate(X, y) == [
...     {
...         "message": "Columns are likely to be correlated: [('col_1', 'col_2'
↪ ')]",
...         "data_check_name": "MulticollinearityDataCheck",
...         "level": "warning",
...         "code": "IS_MULTICOLLINEAR",
...         "details": {"columns": [("col_1", "col_2")], "rows": None},
...         "action_options": []
...     }
... ]
```

no_variance_data_check

Data check that checks if the target or any of the features have no variance.

Module Contents

Classes Summary

<i>NoVarianceDataCheck</i>	Check if the target or any of the features have no variance.
----------------------------	--

Contents

class evalml.data_checks.no_variance_data_check.NoVarianceDataCheck(*count_nan_as_value=False*)

Check if the target or any of the features have no variance.

Parameters *count_nan_as_value* (*bool*) – If True, missing values will be counted as their own unique value. Additionally, if true, will return a DataCheckWarning instead of an error if the feature has mostly missing data and only one unique value. Defaults to False.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the target or any of the features have no variance (1 unique value).

name(*cls*)

Return a name describing the data check.

validate(*self, X, y=None*)

Check if the target or any of the features have no variance (1 unique value).

Parameters

- *X* (*pd.DataFrame, np.ndarray*) – The input features.
- *y* (*pd.Series, np.ndarray*) – Optional, the target data.

Returns A dict of warnings/errors corresponding to features or target with no variance.

Return type dict

Examples

```
>>> import pandas as pd
```

Columns or target data that have only one unique value will raise an error.

```
>>> X = pd.DataFrame([2, 2, 2, 2, 2, 2, 2, 2], columns=["First_Column"])
>>> y = pd.Series([1, 1, 1, 1, 1, 1, 1, 1])
...
>>> novar_dc = NoVarianceDataCheck()
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["First_Column"], "rows": None}
...             }
...         ]
...     },
... ]
```

(continues on next page)

(continued from previous page)

```

...     ]
...     },
...     {
...         "message": "Y has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": []
...     }
... ]

```

By default, NaNs will not be counted as distinct values. In the first example, there are still two distinct values besides None. In the second, there are no distinct values as the target is entirely null.

```

>>> X["First_Column"] = [2, 2, 2, 3, 3, 3, None, None]
>>> y = pd.Series([1, 1, 1, 2, 2, 2, None, None])
>>> assert novar_dc.validate(X, y) == []
...
>>> y = pd.Series([None] * 7)
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "Y has 0 unique values.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE_ZERO_UNIQUE",
...         "action_options": []
...     }
... ]

```

As None is not considered a distinct value by default, there is only one unique value in X and y.

```

>>> X["First_Column"] = [2, 2, 2, 2, None, None, None, None]
>>> y = pd.Series([1, 1, 1, 1, None, None, None, None])
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["First_Column"], "rows": None}
...             }
...         ]
...     }
... ]

```

(continues on next page)

(continued from previous page)

```

...     {
...         "message": "Y has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": []
...     }
... ]

```

If `count_nan_as_value` is set to `True`, then NaNs are counted as unique values. In the event that there is an adequate number of unique values only because `count_nan_as_value` is set to `True`, a warning will be raised so the user can encode these values.

```

>>> novar_dc = NoVarianceDataCheck(count_nan_as_value=True)
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has two unique values including nulls.
↳ Consider encoding the nulls for this column to be useful for machine learning.
↳ ",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE_WITH_NULL",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["First_Column"], "rows": None}
...             },
...         ],
...     },
...     {
...         "message": "Y has two unique values including nulls. Consider
↳ encoding the nulls for this column to be useful for machine learning.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE_WITH_NULL",
...         "action_options": []
...     }
... ]

```

null_data_check

Data check that checks if there are any highly-null columns and rows in the input.

Module Contents

Classes Summary

<i>NullDataCheck</i>	Check if there are any highly-null numerical, boolean, categorical, natural language, and unknown columns and rows in the input.
----------------------	--

Contents

```
class evalml.data_checks.null_data_check.NullDataCheck(pct_null_col_threshold=0.95,
                                                         pct_moderately_null_col_threshold=0.2,
                                                         pct_null_row_threshold=0.95)
```

Check if there are any highly-null numerical, boolean, categorical, natural language, and unknown columns and rows in the input.

Parameters

- **pct_null_col_threshold** (*float*) – If the percentage of NaN values in an input feature exceeds this amount, that column will be considered highly-null. Defaults to 0.95.
- **pct_moderately_null_col_threshold** (*float*) – If the percentage of NaN values in an input feature exceeds this amount but is less than the percentage specified in `pct_null_col_threshold`, that column will be considered moderately-null. Defaults to 0.20.
- **pct_null_row_threshold** (*float*) – If the percentage of NaN values in an input row exceeds this amount, that row will be considered highly-null. Defaults to 0.95.

Methods

<i>get_null_column_information</i>	Finds columns that are considered highly null (percentage null is greater than threshold) and returns dictionary mapping column name to percentage null and dictionary mapping column name to null indices.
<i>get_null_row_information</i>	Finds rows that are considered highly null (percentage null is greater than threshold).
<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if there are any highly-null columns or rows in the input.

```
static get_null_column_information(X, pct_null_col_threshold=0.0)
```

Finds columns that are considered highly null (percentage null is greater than threshold) and returns dictionary mapping column name to percentage null and dictionary mapping column name to null indices.

Parameters

- **X** (*pd.DataFrame*) – DataFrame to check for highly null columns.

- **pct_null_col_threshold** (*float*) – Percentage threshold for a column to be considered null. Defaults to 0.0.

Returns Tuple containing: dictionary mapping column name to its null percentage and dictionary mapping column name to null indices in that column.

Return type tuple

static get_null_row_information(*X*, *pct_null_row_threshold=0.0*)

Finds rows that are considered highly null (percentage null is greater than threshold).

Parameters

- **X** (*pd.DataFrame*) – DataFrame to check for highly null rows.
- **pct_null_row_threshold** (*float*) – Percentage threshold for a row to be considered null. Defaults to 0.0.

Returns Series containing the percentage null for each row.

Return type *pd.Series*

name (*cls*)

Return a name describing the data check.

validate (*self*, *X*, *y=None*)

Check if there are any highly-null columns or rows in the input.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns dict with a DataCheckWarning if there are any highly-null columns or rows.

Return type dict

Examples

```
>>> import pandas as pd
...
>>> class SeriesWrap():
...     def __init__(self, series):
...         self.series = series
...
...     def __eq__(self, series_2):
...         return all(self.series.eq(series_2.series))
```

With `pct_null_col_threshold` set to 0.50, any column that has 50% or more of its observations set to null will be included in the warning, as well as the percentage of null values identified (“all_null”: 1.0, “lots_of_null”: 0.8).

```
>>> df = pd.DataFrame({
...     "all_null": [None, pd.NA, None, None, None],
...     "lots_of_null": [None, None, None, None, 5],
...     "few_null": [1, 2, None, 2, 3],
...     "no_null": [1, 2, 3, 4, 5]
... })
```

(continues on next page)

(continued from previous page)

```

...
>>> highly_null_dc = NullDataCheck(pct_null_col_threshold=0.50)
>>> assert highly_null_dc.validate(df) == [
...     {
...         "message": "Column(s) 'all_null', 'lots_of_null' are 50.0% or more_
↪null",
...         "data_check_name": "NullDataCheck",
...         "level": "warning",
...         "details": {
...             "columns": ["all_null", "lots_of_null"],
...             "rows": None,
...             "pct_null_rows": {"all_null": 1.0, "lots_of_null": 0.8}
...         },
...         "code": "HIGHLY_NULL_COLS",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NullDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["all_null", "lots_of_null"], "rows
↪": None}
...             }
...         ]
...     },
...     {
...         "message": "Column(s) 'few_null' have between 20.0% and 50.0% null_
↪values",

...                             }
...                         }
...                     }
...                 }
...             }
...         ]
...     }
... ]

```

With `pct_null_row_threshold` set to 0.50, any row with 50% or more of its respective column values set to null will be included in the warning, as well as the offending rows (`"rows": [0, 1, 2, 3]`). Since the default value for `pct_null_col_threshold` is 0.95, `"all_null"` is also included in the warnings since the percentage of null values in that row is over 95%. Since the default value for `pct_moderately_null_col_threshold` is 0.20, `"few_null"` is included as a "moderately null" column as it has a null column percentage of 20%.

```
>>> highly_null_dc = NullDataCheck(pct_null_row_threshold=0.50)
>>> validation_messages = highly_null_dc.validate(df)
>>> validation_messages[0]["details"]["pct_null_cols"] = SeriesWrap(validation_
↳ messages[0]["details"]["pct_null_cols"])
>>> highly_null_rows = SeriesWrap(pd.Series([0.5, 0.5, 0.75, 0.5]))
>>> assert validation_messages == [

outliers_data_check

Data check that checks if there are any outliers in input data by using IQR to determine score anomalies.

Module Contents

Classes Summary

OutliersDataCheck

Checks if there are any outliers in input data by using IQR to determine score anomalies.

Contents

class evalml.data_checks.outliers_data_check.OutliersDataCheck

Checks if there are any outliers in input data by using IQR to determine score anomalies.

Columns with score anomalies are considered to contain outliers.

Methods

<code>get_boxplot_data</code>	Returns box plot information for the given data.
<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if there are any outliers in a dataframe by using IQR to determine column anomalies. Column with anomalies are considered to contain outliers.

static `get_boxplot_data(data_)`

Returns box plot information for the given data.

Parameters `data` (`pd.Series`, `np.ndarray`) – Input data.

Returns A payload of box plot statistics.

Return type dict

Examples

```
>>> import pandas as pd
...
>>> df = pd.DataFrame({
...     "x": [1, 2, 3, 4, 5],
...     "y": [6, 7, 8, 9, 10],
...     "z": [-1, -2, -3, -1201, -4]
... })
>>> box_plot_data = OutliersDataCheck.get_boxplot_data(df["z"])
>>> box_plot_data["score"] = round(box_plot_data["score"], 2)
>>> assert box_plot_data == {
...     "score": 0.89,
...     "pct_outliers": 0.2,
...     "values": {"q1": -4.0,
...                 "median": -3.0,
...                 "q3": -2.0,
...                 "low_bound": -7.0,
...                 "high_bound": -1.0,
...                 "low_values": [-1201],
...                 "high_values": [],
...                 "low_indices": [3],
...                 "high_indices": []}
... }
```

name(`cls`)

Return a name describing the data check.

validate(`self`, `X`, `y=None`)

Check if there are any outliers in a dataframe by using IQR to determine column anomalies. Column with anomalies are considered to contain outliers.

Parameters

- `X` (`pd.DataFrame`, `np.ndarray`) – Input features.
- `y` (`pd.Series`, `np.ndarray`) – Ignored. Defaults to None.

Returns A dictionary with warnings if any columns have outliers.

Return type dict

Examples

```
>>> import pandas as pd
```

The column “z” has an outlier so a warning is added to alert the user of its location.

```
>>> df = pd.DataFrame({
...     "x": [1, 2, 3, 4, 5],
...     "y": [6, 7, 8, 9, 10],
...     "z": [-1, -2, -3, -1201, -4]
... })
...
>>> outliers_check = OutliersDataCheck()
>>> assert outliers_check.validate(df) == [
...     {
...         "message": "Column(s) 'z' are likely to have outlier data.",
...         "data_check_name": "OutliersDataCheck",
...         "level": "warning",
...         "code": "HAS_OUTLIERS",
...         "details": {"columns": ["z"], "rows": [3], "column_indices": {"z": 3,
... ↪ [3]}},
...         "action_options": [
...             {
...                 "code": "DROP_ROWS",
...                 "data_check_name": "OutliersDataCheck",
...                 "parameters": {},
...                 "metadata": {"rows": [3], "columns": None}
...             }
...         ]
...     }
... ]
```

sparsity_data_check

Data check that checks if there are any columns with sparsely populated values in the input.

Module Contents

Classes Summary

SparsityDataCheck

Check if there are any columns with sparsely populated values in the input.

Attributes Summary

warning_too_unique

Contents

class evalml.data_checks.sparsity_data_check.**SparsityDataCheck**(*problem_type, threshold, unique_count_threshold=10*)

Check if there are any columns with sparsely populated values in the input.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. ‘multiclass’ or ‘time series multiclass’ is the only accepted problem type.
- **threshold** (*float*) – The threshold value, or percentage of each column’s unique values, below which, a column exhibits sparsity. Should be between 0 and 1.
- **unique_count_threshold** (*int*) – The minimum number of times a unique value has to be present in a column to not be considered “sparse.” Defaults to 10.

Methods

<i>name</i>	Return a name describing the data check.
<i>sparsity_score</i>	Calculate a sparsity score for the given value counts by calculating the percentage of unique values that exceed the count_threshold.
<i>validate</i>	Calculate what percentage of each column’s unique values exceed the count threshold and compare that percentage to the sparsity threshold stored in the class instance.

name(*cls*)

Return a name describing the data check.

static sparsity_score(*col, count_threshold=10*)

Calculate a sparsity score for the given value counts by calculating the percentage of unique values that exceed the count_threshold.

Parameters

- **col** (*pd.Series*) – Feature values.
- **count_threshold** (*int*) – The number of instances below which a value is considered sparse. Default is 10.

Returns Sparsity score, or the percentage of the unique values that exceed count_threshold.

Return type (float)

validate(*self, X, y=None*)

Calculate what percentage of each column’s unique values exceed the count threshold and compare that percentage to the sparsity threshold stored in the class instance.

Parameters

- `X` (`pd.DataFrame`, `np.ndarray`) – Features.
- `y` (`pd.Series`, `np.ndarray`) – Ignored.

Returns dict with a `DataCheckWarning` if there are any sparse columns.

Return type dict

Examples

```
>>> import pandas as pd
```

For multiclass problems, if a column doesn't have enough representation from unique values, it will be considered sparse.

```
>>> df = pd.DataFrame({
...     "sparse": [float(x) for x in range(100)],
...     "not_sparse": [float(1) for x in range(100)]
... })
...
>>> sparsity_check = SparsityDataCheck(problem_type="multiclass", threshold=0.5,
↳ unique_count_threshold=10)
>>> assert sparsity_check.validate(df) == [
...     {
...         "message": "Input columns ('sparse') for multiclass problem type_
↳ are too sparse.",
...         "data_check_name": "SparsityDataCheck",
...         "level": "warning",
...         "code": "TOO_SPARSE",
...         "details": {
...             "columns": ["sparse"],
...             "sparsity_score": {"sparse": 0.0},
...             "rows": None
...         },
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "SparsityDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["sparse"], "rows": None}
...             }
...         ]
...     }
... ]
```

```
... >>> df["sparse"] = [float(x % 10) for x in range(100)] >>> sparsity_check = Sparsi-
tyDataCheck(problem_type="multiclass", threshold=1, unique_count_threshold=5) >>> assert spar-
sity_check.validate(df) == [] ... >>> sparse_array = pd.Series([1, 1, 1, 2, 2, 3] * 3) >>> assert Sparsi-
tyDataCheck.sparsity_score(sparse_array, count_threshold=5) == 0.6666666666666666
```

`evalml.data_checks.sparsity_data_check.warning_too_unique = Input columns ({} for {}
problem type are too sparse.`

target_distribution_data_check

Data check that checks if the target data contains certain distributions that may need to be transformed prior training to improve model performance.

Module Contents

Classes Summary

<i>TargetDistributionDataCheck</i>	Check if the target data contains certain distributions that may need to be transformed prior training to improve model performance. Uses the Shapiro-Wilks test when the dataset is ≤ 5000 samples, otherwise uses Jarque-Bera.
------------------------------------	---

Contents

class evalml.data_checks.target_distribution_data_check.TargetDistributionDataCheck

Check if the target data contains certain distributions that may need to be transformed prior training to improve model performance. Uses the Shapiro-Wilks test when the dataset is ≤ 5000 samples, otherwise uses Jarque-Bera.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the target data has a certain distribution.

name(cls)

Return a name describing the data check.

validate(self, X, y)

Check if the target data has a certain distribution.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features. Ignored.
- **y** (*pd.Series*, *np.ndarray*) – Target data to check for underlying distributions.

Returns List with DataCheckErrors if certain distributions are found in the target data.

Return type dict (DataCheckError)

Examples

```
>>> import pandas as pd
```

Targets that exhibit a lognormal distribution will raise a warning for the user to transform the target.

```
>>> y = [0.946, 0.972, 1.154, 0.954, 0.969, 1.222, 1.038, 0.999, 0.973, 0.897]
>>> target_check = TargetDistributionDataCheck()
>>> assert target_check.validate(None, y) == [
...     {
...         "message": "Target may have a lognormal distribution.",
...         "data_check_name": "TargetDistributionDataCheck",
...         "level": "warning",
...         "code": "TARGET_LOGNORMAL_DISTRIBUTION",
...         "details": {"normalization_method": "shapiro", "statistic": 0.8, "p-
↪value": 0.045, "columns": None, "rows": None},

...     }
... ]
```

target_leakage_data_check

Data check that checks if any of the features are highly correlated with the target by using mutual information or Pearson correlation.

Module Contents

Classes Summary

<i>TargetLeakageDataCheck</i>	Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and other correlation metrics.
-------------------------------	---

Contents

class evalml.data_checks.target_leakage_data_check.**TargetLeakageDataCheck**(*pct_corr_threshold=0.95*, *method='all'*)

Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and other correlation metrics.

If *method='mutual_info'*, this data check uses mutual information and supports all target and feature types. Other correlation metrics only support binary with numeric and boolean dtypes. This method will return a value in [-1, 1] if other correlation metrics are selected and will return a value in [0, 1] if mutual information is selected. Correlation metrics available can be found in Woodwork's [dependence_dict method](#).

Parameters

- **pct_corr_threshold** (*float*) – The correlation threshold to be considered leakage. Defaults to 0.95.
- **method** (*string*) – The method to determine correlation. Use 'all' or 'max' for the maximum correlation, or for specific correlation metrics, use their name (ie 'mutual_info' for mutual information, 'pearson' for Pearson correlation, etc). possible methods can be found in Woodwork's [config](#), under *correlation_metrics*. Defaults to 'all'.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and/or Spearman correlation.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and/or Spearman correlation.

If *method='mutual_info'* or *method='max'*, supports all target and feature types. Other correlation metrics only support binary with numeric and boolean dtypes. This method will return a value in [-1, 1] if other correlation metrics are selected and will return a value in [0, 1] if mutual information is selected.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input features to check.
- **y** (*pd.Series*, *np.ndarray*) – The target data.

Returns dict with a DataCheckWarning if target leakage is detected.

Return type dict (DataCheckWarning)

Examples

```
>>> import pandas as pd
```

Any columns that are strongly correlated with the target will raise a warning. This could be indicative of data leakage.

```
>>> X = pd.DataFrame({
...     "leak": [10, 42, 31, 51, 61] * 15,
...     "x": [42, 54, 12, 64, 12] * 15,
...     "y": [13, 5, 13, 74, 24] * 15,
... })
>>> y = pd.Series([10, 42, 31, 51, 40] * 15)
...
>>> target_leakage_check = TargetLeakageDataCheck(pct_corr_threshold=0.95)
>>> assert target_leakage_check.validate(X, y) == [
...     {
...         "message": "Column 'leak' is 95.0% or more correlated with the_
↳target",
...         "data_check_name": "TargetLeakageDataCheck",
...         "level": "warning",
...         "code": "TARGET_LEAKAGE",
...         "details": {"columns": ["leak"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "TargetLeakageDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["leak"], "rows": None}
...             }
...         ]
...     }
... ]
```

The default method can be changed to pearson from mutual_info.

```
>>> X["x"] = y / 2
>>> target_leakage_check = TargetLeakageDataCheck(pct_corr_threshold=0.8,
↳method="pearson")
>>> assert target_leakage_check.validate(X, y) == [
...     {
...         "message": "Columns 'leak', 'x' are 80.0% or more correlated with_
↳the target",
...         "data_check_name": "TargetLeakageDataCheck",
...         "level": "warning",
```

(continues on next page)

(continued from previous page)

```

...     "code": "TARGET_LEAKAGE",
...     "action_options": [
...         {
...             "code": "DROP_COL",
...             "data_check_name": "TargetLeakageDataCheck",
...             "parameters": {},
...             "metadata": {"columns": ["leak", "x"], "rows": None}
...         }
...     ]
... }
... ]

```

ts_parameters_data_check

Data check that checks whether the time series parameters are compatible with the data size.

Module Contents

Classes Summary

<i>TimeSeriesParametersDataCheck</i>	Checks whether the time series parameters are compatible with data splitting.
--------------------------------------	---

Contents

class evalml.data_checks.ts_parameters_data_check.**TimeSeriesParametersDataCheck**(*problem_configuration*, *n_splits*)

Checks whether the time series parameters are compatible with data splitting.

If $\text{gap} + \text{max_delay} + \text{forecast_horizon} > X.\text{shape}[0] // (\text{n_splits} + 1)$

then the feature engineering window is larger than the smallest split. This will cause the pipeline to create features from data that does not exist, which will cause errors.

Parameters

- **problem_configuration** (*dict*) – Dict containing problem_configuration parameters.
- **n_splits** (*int*) – Number of time series splits.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the time series parameters are compatible with data splitting.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if the time series parameters are compatible with data splitting.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns dict with a `DataCheckError` if parameters are too big for the split sizes.

Return type dict

Examples

```
>>> import pandas as pd
```

The time series parameters have to be compatible with the data passed. If the window size (`gap + max_delay + forecast_horizon`) is greater than or equal to the split size, then an error will be raised.

```
>>> X = pd.DataFrame({
...     "dates": pd.date_range("1/1/21", periods=100),
...     "first": [i for i in range(100)],
... })
>>> y = pd.Series([i for i in range(100)])
...
>>> problem_config = {"gap": 7, "max_delay": 2, "forecast_horizon": 12, "time_
↳index": "dates"}
>>> ts_parameters_check = TimeSeriesParametersDataCheck(problem_
↳configuration=problem_config, n_splits=7)
>>> assert ts_parameters_check.validate(X, y) == [
...     {
...         "message": "Since the data has 100 observations, n_splits=7, and a
↳forecast horizon of 12, the smallest "
...         "split would have 16 observations. Since 21 (gap + max_
↳delay + forecast_horizon)"
...         ">= 16, then at least one of the splits would be empty
↳by the time it reaches "
...         "the pipeline. Please use a smaller number of splits,
↳reduce one or more these "
...         "parameters, or collect more data.",
...         "data_check_name": "TimeSeriesParametersDataCheck",
...         "level": "error",
...         "code": "TIMESERIES_PARAMETERS_NOT_COMPATIBLE_WITH_SPLIT",
...         "details": {
...             "columns": None,
...             "rows": None,
...             "max_window_size": 21,

...             "n_obs": 100,
...             "n_splits": 7
...         },
...         "action_options": []
...     }
... ]
```

ts_splitting_data_check

Data check that checks whether the time series training and validation splits have adequate class representation.

Module Contents

Classes Summary

<i>TimeSeriesSplittingDataCheck</i>	Checks whether the time series target data is compatible with splitting.
-------------------------------------	--

Contents

class evalml.data_checks.ts_splitting_data_check.**TimeSeriesSplittingDataCheck**(*problem_type*, *n_splits*)

Checks whether the time series target data is compatible with splitting.

If the target data in the training and validation of every split doesn't have representation from all classes (for time series classification problems) this will prevent the estimators from training on all potential outcomes which will cause errors during prediction.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – Problem type.
- **n_splits** (*int*) – Number of time series splits.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the training and validation targets are compatible with time series data splitting.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if the training and validation targets are compatible with time series data splitting.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Ignored. Features.
- **y** (*pd.Series*, *np.ndarray*) – Target data.

Returns dict with a DataCheckError if splitting would result in inadequate class representation.

Return type dict

Example

```
>>> import pandas as pd
```

Passing `n_splits` as 3 means that the data will be segmented into 4 parts to be iterated over for training and validation splits. The first split results in training indices of [0:25] and validation indices of [25:50]. The training indices of the first split result in only one unique value (0). The third split results in training indices of [0:75] and validation indices of [75:100]. The validation indices of the third split result in only one unique value (1).

```
>>> X = None
>>> y = pd.Series([0 if i < 45 else i % 2 if i < 55 else 1 for i in range(100)])
>>> ts_splitting_check = TimeSeriesSplittingDataCheck("time series binary", 3)
>>> assert ts_splitting_check.validate(X, y) == [
...     {
...         "message": "Time Series Binary and Time Series Multiclass problem "
...                     "types require every training and validation split to "
...                     "have at least one instance of all the target classes. "
...                     "The following splits are invalid: [1, 3]",
...         "data_check_name": "TimeSeriesSplittingDataCheck",
...         "level": "error",
...         "details": {
...             "columns": None, "rows": None,
...             "invalid_splits": {
...                 1: {"Training": [0, 25]},
...                 3: {"Validation": [75, 100]}
...             }
...         },
...         "code": "TIMESERIES_TARGET_NOT_COMPATIBLE_WITH_SPLIT",
...         "action_options": []
...     }
... ]
```

uniqueness_data_check

Data check that checks if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.

Module Contents

Classes Summary

UniquenessDataCheck

Check if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.

Attributes Summary

warning_not_unique_enough

warning_too_unique

Contents

class `evalml.data_checks.uniqueness_data_check.UniquenessDataCheck`(*problem_type*,
threshold=0.5)

Check if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. e.g. ‘binary’, ‘multiclass’, ‘regression’, ‘time series regression’
- **threshold** (*float*) – The threshold to set as an upper bound on uniqueness for classification type problems or lower bound on for regression type problems. Defaults to 0.50.

Methods

<i>name</i>	Return a name describing the data check.
<i>uniqueness_score</i>	Calculate a uniqueness score for the provided field. NaN values are not considered as unique values in the calculation.
<i>validate</i>	Check if there are any columns in the input that are too unique in the case of classification problems or not unique enough in the case of regression problems.

name(*cls*)

Return a name describing the data check.

static uniqueness_score(*col*, *drop_na=True*)

Calculate a uniqueness score for the provided field. NaN values are not considered as unique values in the calculation.

Based on the Herfindahl-Hirschman Index.

Parameters

- **col** (*pd.Series*) – Feature values.
- **drop_na** (*bool*) – Whether to drop null values when computing the uniqueness score. Defaults to True.

Returns Uniqueness score.

Return type (float)

validate(*self*, *X*, *y=None*)

Check if there are any columns in the input that are too unique in the case of classification problems or not unique enough in the case of regression problems.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns

dict with a DataCheckWarning if there are any too unique or not unique enough columns.

Return type dict

Examples

```
>>> import pandas as pd
```

Because the problem type is regression, the column “regression_not_unique_enough” raises a warning for having just one value.

```
>>> df = pd.DataFrame({
...     "regression_unique_enough": [float(x) for x in range(100)],
...     "regression_not_unique_enough": [float(1) for x in range(100)]
... })
...
>>> uniqueness_check = UniquenessDataCheck(problem_type="regression",
↳ threshold=0.8)
>>> assert uniqueness_check.validate(df) == [
...     {
...         "message": "Input columns 'regression_not_unique_enough' for
↳ regression problem type are not unique enough.",
...         "data_check_name": "UniquenessDataCheck",
...         "level": "warning",
...         "code": "NOT_UNIQUE_ENOUGH",
...         "details": {"columns": ["regression_not_unique_enough"],
↳ "uniqueness_score": {"regression_not_unique_enough": 0.0}, "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "parameters": {},
...                 "data_check_name": "UniquenessDataCheck",
...                 "metadata": {"columns": ["regression_not_unique_enough"],
↳ "rows": None}
...             }
...         ]
...     }
... ]
```

For multiclass, the column “regression_unique_enough” has too many unique values and will raise an appropriate warning. `>>> y = pd.Series([1, 1, 1, 2, 2, 3, 3, 3])` `>>> uniqueness_check = UniquenessDataCheck(problem_type="multiclass", threshold=0.8)` `>>> assert uniqueness_check.validate(df) == [... { ... “message”: “Input columns ‘regression_unique_enough’ for multiclass problem type are too unique.”, ... “data_check_name”: “UniquenessDataCheck”, ... “level”: “warning”, ... “details”: { ... “columns”: [“regression_unique_enough”], ... “rows”: None, ... “uniqueness_score”: {“regression_unique_enough”: 0.99} ... }, ... “code”: “TOO_UNIQUE”, ... “action_options”: [... { ... “code”: “DROP_COL”, ... “data_check_name”: “UniquenessDataCheck”, ... “parameters”: {}, ...`

```
“metadata”: {“columns”: [“regression_unique_enough”], “rows”: None} ... } ... ] ... } ... ] ...
>>> assert UniquenessDataCheck.uniqueness_score(y) == 0.65625
```

```
evalml.data_checks.uniqueness_data_check.warning_not_unique_enough = Input columns {} for
{} problem type are not unique enough.
```

```
evalml.data_checks.uniqueness_data_check.warning_too_unique = Input columns {} for {}
problem type are too unique.
```

utils

Utility methods for the data checks in EvalML.

Module Contents

Functions

<i>handle_data_check_action_code</i>	Handles data check action codes by either returning the DataCheckActionCode or converting from a str.
--------------------------------------	---

Contents

`evalml.data_checks.utils.handle_data_check_action_code(action_code)`

Handles data check action codes by either returning the DataCheckActionCode or converting from a str.

Parameters `action_code` (*str or DataCheckActionCode*) – Data check action code that needs to be handled.

Returns DataCheckActionCode enum

Raises

- **KeyError** – If input is not a valid DataCheckActionCode enum value.
- **ValueError** – If input is not a string or DataCheckActionCode object.

Examples

```
>>> assert handle_data_check_action_code("drop_col") == DataCheckActionCode.DROP_COL
>>> assert handle_data_check_action_code("DROP_ROWS") == DataCheckActionCode.DROP_
↳ ROWS
>>> assert handle_data_check_action_code("Impute_col") == DataCheckActionCode.
↳ IMPUTE_COL
```

Package Contents

Classes Summary

<i>ClassImbalanceDataCheck</i>	Check if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds. Use for classification problems.
<i>DataCheck</i>	Base class for all data checks.
<i>DataCheckAction</i>	A recommended action returned by a DataCheck.
<i>DataCheckActionCode</i>	Enum for data check action code.
<i>DataCheckActionOption</i>	A recommended action option returned by a DataCheck.
<i>DataCheckError</i>	DataCheckMessage subclass for errors returned by data checks.
<i>DataCheckMessage</i>	Base class for a message returned by a DataCheck, tagged by name.
<i>DataCheckMessageCode</i>	Enum for data check message code.
<i>DataCheckMessageType</i>	Enum for type of data check message: WARNING or ERROR.
<i>DataChecks</i>	A collection of data checks.
<i>DataCheckWarning</i>	DataCheckMessage subclass for warnings returned by data checks.
<i>DateTimeFormatDataCheck</i>	Check if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.
<i>DCAOPParameterAllowedValuesType</i>	Enum for data check action option parameter allowed values type.
<i>DCAOPParameterType</i>	Enum for data check action option parameter type.
<i>DefaultDataChecks</i>	A collection of basic data checks that is used by AutoML by default.
<i>IDColumnsDataCheck</i>	Check if any of the features are likely to be ID columns.
<i>InvalidTargetDataCheck</i>	Check if the target data is considered invalid.
<i>MismatchedSeriesLengthDataCheck</i>	Check if one or more unique series in a multseries dataset is of a different length than the others.
<i>MulticollinearityDataCheck</i>	Check if any set features are likely to be multicollinear.
<i>NoVarianceDataCheck</i>	Check if the target or any of the features have no variance.
<i>NullDataCheck</i>	Check if there are any highly-null numerical, boolean, categorical, natural language, and unknown columns and rows in the input.
<i>OutliersDataCheck</i>	Checks if there are any outliers in input data by using IQR to determine score anomalies.
<i>SparsityDataCheck</i>	Check if there are any columns with sparsely populated values in the input.
<i>TargetDistributionDataCheck</i>	Check if the target data contains certain distributions that may need to be transformed prior training to improve model performance. Uses the Shapiro-Wilks test when the dataset is ≤ 5000 samples, otherwise uses Jarque-Bera.
<i>TargetLeakageDataCheck</i>	Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and other correlation metrics.
<i>TimeSeriesParametersDataCheck</i>	Checks whether the time series parameters are compatible with data splitting.
<i>TimeSeriesSplittingDataCheck</i>	Checks whether the time series target data is compatible with splitting.
<i>UniquenessDataCheck</i>	Check if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.

Contents

class evalml.data_checks.**ClassImbalanceDataCheck**(*threshold=0.1, min_samples=100, num_cv_folds=3, test_size=None*)

Check if any of the target labels are imbalanced, or if the number of values for each target are below 2 times the number of CV folds. Use for classification problems.

Parameters

- **threshold** (*float*) – The minimum threshold allowed for class imbalance before a warning is raised. This threshold is calculated by comparing the number of samples in each class to the sum of samples in that class and the majority class. For example, a multiclass case with [900, 900, 100] samples per classes 0, 1, and 2, respectively, would have a 0.10 threshold for class 2 ($100 / (900 + 100)$). Defaults to 0.10.
- **min_samples** (*int*) – The minimum number of samples per accepted class. If the minority class is both below the threshold and min_samples, then we consider this severely imbalanced. Must be greater than 0. Defaults to 100.
- **num_cv_folds** (*int*) – The number of cross-validation folds. Must be positive. Choose 0 to ignore this warning. Defaults to 3.
- **test_size** (*None, float, int*) – Percentage of test set size. Used to calculate class imbalance prior to splitting the data into training and validation/test sets.

Raises

- **ValueError** – If threshold is not within 0 and 0.5
- **ValueError** – If min_samples is not greater than 0
- **ValueError** – If number of cv folds is negative
- **ValueError** – If test_size is not between 0 and 1

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any target labels are imbalanced beyond a threshold for binary and multiclass problems.

name(*cls*)

Return a name describing the data check.

validate(*self, X, y*)

Check if any target labels are imbalanced beyond a threshold for binary and multiclass problems.

Ignores NaN values in target labels if they appear.

Parameters

- **X** (*pd.DataFrame, np.ndarray*) – Features. Ignored.
- **y** (*pd.Series, np.ndarray*) – Target labels to check for imbalanced data.

Returns

Dictionary with DataCheckWarnings if imbalance in classes is less than the threshold,
and DataCheckErrors if the number of values for each target is below $2 * \text{num_cv_folds}$.

Return type dict

Examples

```
>>> import pandas as pd
...
>>> X = pd.DataFrame()
>>> y = pd.Series([0, 1, 1, 1, 1, 1, 1, 1, 1, 1])
```

In this binary example, the target class 0 is present in fewer than 10% (threshold=0.10) of instances, and fewer than $2 * \text{the number of cross folds}$ ($2 * 3 = 6$). Therefore, both a warning and an error are returned as part of the Class Imbalance Data Check. In addition, if a target is present with fewer than *min_samples* occurrences (default is 100) and is under the threshold, a severe class imbalance warning will be raised.

```
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.10)
>>> assert class_imb_dc.validate(X, y) == [
...     {
...         "message": "The number of instances of these targets is less than 2_
↳ * the number of cross folds = 6 instances: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "error",
...         "code": "CLASS_IMBALANCE_BELOW_FOLDS",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     },
...     {
...         "message": "The following labels fall below 10% of the target: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "warning",
...         "code": "CLASS_IMBALANCE_BELOW_THRESHOLD",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     },
...     {
...         "message": "The following labels in the target have severe class_
↳ imbalance because they fall under 10% of the target and have less than 100_
↳ samples: [0]",
...         "data_check_name": "ClassImbalanceDataCheck",
...         "level": "warning",
...         "code": "CLASS_IMBALANCE_SEVERE",
...         "details": {"target_values": [0], "rows": None, "columns": None},
...         "action_options": []
...     }
... ]
```

In this multiclass example, the target class 0 is present in fewer than 30% of observations, however with 1 cv fold, the minimum number of instances required is $2 * 1 = 2$. Therefore a warning, but not an error, is raised.

```
>>> y = pd.Series([0, 0, 1, 1, 1, 1, 2, 2, 2, 2])
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.30, min_samples=5, num_
↳ cv_folds=1)
>>> assert class_imb_dc.validate(X, y) == [
...     {
...         "message": "The following labels fall below 30% of the target: [0]",
```

(continues on next page)

(continued from previous page)

```

...     "data_check_name": "ClassImbalanceDataCheck",
...     "level": "warning",
...     "code": "CLASS_IMBALANCE_BELOW_THRESHOLD",
...     "details": {"target_values": [0], "rows": None, "columns": None},
...     "action_options": []
... },
... {
...     "message": "The following labels in the target have severe class
↪ imbalance because they fall under 30% of the target and have less than 5
↪ samples: [0]",
...     "data_check_name": "ClassImbalanceDataCheck",
...     "level": "warning",
...     "code": "CLASS_IMBALANCE_SEVERE",
...     "details": {"target_values": [0], "rows": None, "columns": None},
...     "action_options": []
... }
... ]
...
>>> y = pd.Series([0, 0, 1, 1, 1, 1, 2, 2, 2, 2])
>>> class_imb_dc = ClassImbalanceDataCheck(threshold=0.30, num_cv_folds=1)
>>> assert class_imb_dc.validate(X, y) == []

```

class evalml.data_checks.DataCheck

Base class for all data checks.

Data checks are a set of heuristics used to determine if there are problems with input data.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Inspect and validate the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

name(*cls*)

Return a name describing the data check.

abstract validate(*self*, *X*, *y*=None)

Inspect and validate the input data, runs any necessary calculations or algorithms, and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*) – The input data of shape [n_samples, n_features]
- **y** (*pd.Series*, *optional*) – The target data of length [n_samples]

Returns Dictionary of DataCheckError and DataCheckWarning messages

Return type dict (*DataCheckMessage*)

class evalml.data_checks.DataCheckAction(*action_code*, *data_check_name*, *metadata*=None)

A recommended action returned by a DataCheck.

Parameters

- **action_code** (*str*, *DataCheckActionCode*) – Action code associated with the action.

- **data_check_name** (*str*) – Name of data check.
- **metadata** (*dict*, *optional*) – Additional useful information associated with the action. Defaults to None.

Methods

<code>convert_dict_to_action</code>	Convert a dictionary into a DataCheckAction.
<code>to_dict</code>	Return a dictionary form of the data check action.

static `convert_dict_to_action(action_dict)`

Convert a dictionary into a DataCheckAction.

Parameters `action_dict` – Dictionary to convert into action. Should have keys “code”, “data_check_name”, and “metadata”.

Raises `ValueError` – If input dictionary does not have keys `code` and `metadata` and if the `metadata` dictionary does not have keys `columns` and `rows`.

Returns DataCheckAction object from the input dictionary.

`to_dict(self)`

Return a dictionary form of the data check action.

class `evalml.data_checks.DataCheckActionCode`

Enum for data check action code.

Attributes

DROP_COL	Action code for dropping a column.
DROP_ROWS	Action code for dropping rows.
IM- PUTE_COL	Action code for imputing a column.
REGULAR- IZE_AND_IMPUTE_DATASET	Action code for regularizing and imputing all features and target time series data.
SET_FIRST_COLUMN_ID	Action code for setting the first column as an id column.
TRANS- FORM_TARGET	Action code for transforming the target data.

Methods

<code>name</code>	The name of the Enum member.
<code>value</code>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

class `evalml.data_checks.DataCheckActionOption(action_code, data_check_name, parameters=None, metadata=None)`

A recommended action option returned by a DataCheck.

It contains an action code that indicates what the action should be, a data check name that indicates what data check was used to generate the action, and parameters and metadata which can be used to further refine the action.

Parameters

- **action_code** (`DataCheckActionCode`) – Action code associated with the action option.
- **data_check_name** (`str`) – Name of the data check that produced this option.
- **parameters** (`dict`) – Parameters associated with the action option. Defaults to None.
- **metadata** (`dict, optional`) – Additional useful information associated with the action option. Defaults to None.

Examples

```
>>> parameters = {
...     "global_parameter_name": {
...         "parameter_type": "global",
...         "type": "float",
...         "default_value": 0.0,
...     },
...     "column_parameter_name": {
...         "parameter_type": "column",
...         "columns": {
...             "a": {
...                 "impute_strategy": {
...                     "categories": ["mean", "most_frequent"],
...                     "type": "category",
...                     "default_value": "mean",
...                 },
...                 "constant_fill_value": {"type": "float", "default_value": 0},
...             },
...         },
...     },
... }
>>> data_check_action = DataCheckActionOption(DataCheckActionCode.DROP_COL, None,
↪ metadata={}, parameters=parameters)
```

Methods

<code>convert_dict_to_option</code>	Convert a dictionary into a <code>DataCheckActionOption</code> .
<code>get_action_from_defaults</code>	Returns an action based on the defaults parameters.
<code>to_dict</code>	Return a dictionary form of the data check action option.

`static convert_dict_to_option(action_dict)`

Convert a dictionary into a `DataCheckActionOption`.

Parameters `action_dict` – Dictionary to convert into an action option. Should have keys “code”, “data_check_name”, and “metadata”.

Raises `ValueError` – If input dictionary does not have keys `code` and `metadata` and if the `metadata` dictionary does not have keys `columns` and `rows`.

Returns `DataCheckActionOption` object from the input dictionary.

`get_action_from_defaults(self)`

Returns an action based on the defaults parameters.

Returns An based on the defaults parameters the option.

Return type *DataCheckAction*

to_dict(*self*)

Return a dictionary form of the data check action option.

class evalml.data_checks.**DataCheckError**(*message, data_check_name, message_code=None, details=None, action_options=None*)

DataCheckMessage subclass for errors returned by data checks.

Attributes

mes- sage_type	DataCheckMessageType.ERROR
---------------------------	----------------------------

Methods

<i>to_dict</i>	Return a dictionary form of the data check message.
----------------	---

to_dict(*self*)

Return a dictionary form of the data check message.

class evalml.data_checks.**DataCheckMessage**(*message, data_check_name, message_code=None, details=None, action_options=None*)

Base class for a message returned by a DataCheck, tagged by name.

Parameters

- **message** (*str*) – Message string.
- **data_check_name** (*str*) – Name of the associated data check.
- **message_code** (*DataCheckMessageCode, optional*) – Message code associated with the message. Defaults to None.
- **details** (*dict, optional*) – Additional useful information associated with the message. Defaults to None.
- **action_options** (*list, optional*) – A list of `DataCheckActionOption`'s` associated with the message. Defaults to None.

Attributes

mes- sage_type	None
---------------------------	------

Methods

<i>to_dict</i>	Return a dictionary form of the data check message.
----------------	---

to_dict(*self*)

Return a dictionary form of the data check message.

class evalml.data_checks.DataCheckMessageCode

Enum for data check message code.

Attributes

CLASS_IMBALANCE_BELOW_FOLDS	Message code for when number of values for each target is below 2 * number of CV folds.
CLASS_IMBALANCE_BELOW_THRESHOLD	Message code for when number of classes is less than the threshold.
CLASS_IMBALANCE_SEVERE	Message code for when balance in classes is less than the threshold and minimum class is less than minimum number of accepted samples.
COLS_WITH_NULLS	Message code for columns with null values.
DATE-TIME_HAS_MISALIGNED_VALUES	Message code for when datetime information has values that are not aligned with the inferred frequency.
DATE-TIME_HAS_NAN	Message code for when input datetime columns contain NaN values.
DATE-TIME_HAS_REDUNDANT_ROW	Message code for when datetime information has more than one row per datetime.
DATE-TIME_HAS_UNEVEN_INTERVALS	Message code for when the datetime values have uneven intervals.
DATE-TIME_INFORMATION_NOT_FOUND	Message code for when datetime information can not be found or is in an unaccepted format.
DATE-TIME_IS_MISSING_VALUES	Message code for when datetime feature has values missing between the start and end dates.
DATE-TIME_IS_NOT_MONOTONIC	Message code for when the datetime values are not monotonically increasing.
DATE-TIME_NO_FREQUENCY_INFERRED	Message code for when no frequency can be inferred in the datetime values through Woodwork.
HAS_ID_COLUMN	Message code for data that has ID columns.
HAS_ID_FIRST_COLUMN	Message code for data that has an ID column as the first column.
HAS_OUTLIERS	Message code for when outliers are detected.
HIGH_VARIANCE	Message code for when high variance is detected for cross-validation.
HIGHLY_NULL_COLUMNS	Message code for highly null columns.
HIGHLY_NULL_ROWS	Message code for highly null rows.
IN-VALID_SERIES_ID_COL	Message code for when given series_id is invalid
IS_MULTICOLLINEAR	Message code for when data is potentially multicollinear.
MIS-MATCHED_INDICES	Message code for when input target and features have mismatched indices.
MIS-MATCHED_INDICES_ORDER	Message code for when input target and features have mismatched indices order. The two series have same index values, but shuffled.
MIS-MATCHED_LENGTHS	Message code for when input target and features have different lengths.
MIS-MATCHED_SERIES_LENGTH	Message code for when one or more unique series in a multseries dataset is of a different length than the others
NATURAL_LANGUAGE_HAS_NAN	Message code for when input natural language columns contain NaN values.
NO_VARIANCE	Message code for when data has no variance (1 unique value).
NO_VARIANCE_WITH_NULL	Message code for when data has one unique value and NaN values.
NO_VARIANCE_ZERO_UNIQUE	Message code for when data has no variance (0 unique value)
NOT_UNIQUE_ENOUGH	Message code for when data does not possess enough unique values.
TARGET_BINARY_NOT_TWO_UNIQUE_VALUES	Message code for target data for a binary classification problem that does not have two unique values.

continues on next page

Table 3 – continued from previous page

TAR-GET_HAS_NULL	Message code for target data that has null values.
TAR-GET_INCOMPATIBLE_OBJECTIVE	Message code for target data that has incompatible values for the specified objective
TAR-GET_IS_EMPTY_OR_FULLY_NULL	Message code for target data that is empty or has all null values.
TAR-GET_IS_NONE	Message code for when target is None.
TAR-GET_LEAKAGE	Message code for when target leakage is detected.
TAR-GET_LOGNORMAL_DISTRIBUTION	Message code for target data with a lognormal distribution.
TAR-GET_MULTICLASS_HIGH_UNIQUE_CLASS	Message code for target data for a multi classification problem that has an abnormally large number of target values.
TAR-GET_MULTICLASS_NOT_ENOUGH_CLASSES	Message code for target data for a multi classification problem that does not have more than a minimum number of classes.
TAR-GET_MULTICLASS_NOT_TWO_EXAMPLES_PER_CLASS	Message code for target data for a multi classification problem that does not have two examples per class.
TAR-GET_UNSUPPORTED_PROBLEM_TYPE	Message code for target data that is being checked against an unsupported problem type.
TAR-GET_UNSUPPORTED_TYPE	Message code for target data that is of an unsupported type.
TAR-GET_UNSUPPORTED_TYPE_REGRESSION	Message code for target data that is incompatible with regression
TIME-SERIES_PARAMETERS_NOT_COMPATIBLE_WITH_SPLIT	Message code when the time series parameters are too large for the smallest data split.
TIME-SERIES_TARGET_IS_NOT_COMPATIBLE_WITH_SPLIT	Message code when any training and validation split of the time series target doesn't contain any non-null values.
TOO_SPARSE	Message code for when multiclass data has values that are too sparsely populated.
TOO_UNIQUE	Message code for when data possesses too many unique values.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

class evalml.data_checks.DataCheckMessageType

Enum for type of data check message: WARNING or ERROR.

Attributes

ERROR	Error message returned by a data check.
WARNING	Warning message returned by a data check.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

class evalml.data_checks.**DataChecks**(*data_checks=None, data_check_params=None*)

A collection of data checks.

Parameters

- **data_checks** (*list* (**DataCheck**)) – List of DataCheck objects.
- **data_check_params** (*dict*) – Parameters for passed DataCheck objects.

Methods

<i>validate</i>	Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.
-----------------	--

validate(*self, X, y=None*)

Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame, np.ndarray*) – The input data of shape [n_samples, n_features]
- **y** (*pd.Series, np.ndarray*) – The target data of length [n_samples]

Returns Dictionary containing DataCheckMessage objects

Return type dict

class evalml.data_checks.**DataCheckWarning**(*message, data_check_name, message_code=None, details=None, action_options=None*)

DataCheckMessage subclass for warnings returned by data checks.

Attributes

message_type	DataCheckMessageType.WARNING
---------------------	------------------------------

Methods

<i>to_dict</i>	Return a dictionary form of the data check message.
----------------	---

to_dict(*self*)

Return a dictionary form of the data check message.

class evalml.data_checks.**DateTimeFormatDataCheck**(*datetime_column='index', nan_duplicate_threshold=0.75, series_id=None*)

Check if the datetime column has equally spaced intervals and is monotonically increasing or decreasing in order to be supported by time series estimators.

If used for multiserries problem, works specifically on stacked datasets.

Parameters

- **datetime_column** (*str*, *int*) – The name of the datetime column. If the datetime values are in the index, then pass “index”.
- **nan_duplicate_threshold** (*float*) – The percentage of values in the *datetime_column* that must not be duplicate or nan before *DATETIME_NO_FREQUENCY_INFERRED* is returned instead of *DATETIME_HAS_UNEVEN_INTERVALS*. For example, if this is set to 0.80, then only 20% of the values in *datetime_column* can be duplicate or nan. Defaults to 0.75.
- **series_id** (*str*) – The name of the series_id column for multiserries. Defaults to None

Methods

<code>name</code>	Return a name describing the data check.
<code>validate</code>	Checks if the target data has equal intervals and is monotonically increasing.

`name(cls)`

Return a name describing the data check.

`validate(self, X, y)`

Checks if the target data has equal intervals and is monotonically increasing.

Will return `DataCheckError(s)` if the data is not a datetime type, is not increasing, has redundant or missing row(s), contains invalid (NaN or None) values, or has values that don’t align with the assumed frequency.

If used for multiserries problem, works specifically on stacked datasets.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Target data.

Returns List with `DataCheckErrors` if unequal intervals are found in the datetime column.

Return type dict (*DataCheckError*)

Examples

```
>>> import pandas as pd
```

The column ‘dates’ has a set of two dates with daily frequency, two dates with hourly frequency, and two dates with monthly frequency.

```
>>> X = pd.DataFrame(pd.date_range("2015-01-01", periods=2).append(pd.date_
↳ range("2015-01-08", periods=2, freq="H").append(pd.date_range("2016-03-02",
↳ periods=2, freq="M"))), columns=["dates"])
>>> y = pd.Series([0, 1, 0, 1, 1, 0])
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="dates")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "No frequency could be detected in column 'dates',
↳ possibly due to uneven intervals or too many duplicate/missing values.",
...         "data_check_name": "DateTimeFormatDataCheck",
```

(continues on next page)

(continued from previous page)

```

...         }
...     }
... ]
... ]

```

The column “Weeks” has a date that does not follow the weekly pattern, which is considered misaligned.

```

>>> X = pd.DataFrame(pd.date_range("2021-01-01", freq="W", periods=12).
    ← append(pd.date_range("2021-03-22", periods=1)), columns=["Weeks"])
>>> ww_payload = infer_frequency(X["Weeks"], debug=True, window_length=5,
    ← threshold=0.8)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Column 'Weeks' has datetime values that do not align
    ← with the inferred frequency.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_HAS_MISALIGNED_VALUES",
...         "action_options": []
...     },
...     {
...         "message": "A frequency was detected in column 'Weeks', but there
    ← are faulty datetime values that need to be addressed.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "code": "DATETIME_HAS_UNEVEN_INTERVALS",
...         "details": {'columns': None, 'rows': None},
...         "action_options": [
...             {
...                 'code': 'REGULARIZE_AND_IMPUTE_DATASET',
...                 'data_check_name': 'DateTimeFormatDataCheck',
...                 'metadata': {
...                     'columns': None,
...                     'is_target': True,
...                     'rows': None
...                 },
...             },
...             'parameters': {
...                 'time_index': {
...                     'default_value': 'Weeks',
...                     'parameter_type': 'global',
...                     'type': 'str'
...                 },
...             },
...             'frequency_payload': {
...                 'default_value': ww_payload,
...                 'parameter_type': 'global',
...                 'type': 'tuple'
...             }
...         ]
...     }
... ]

```

(continues on next page)

(continued from previous page)

```
...     ]
...     }
... ]
```

The column “Weeks” passed integers instead of datetime data, which will raise an error.

```
>>> X = pd.DataFrame([1, 2, 3, 4], columns=["Weeks"])
>>> y = pd.Series([0] * 4)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Datetime information could not be found in the data, or
was not in a supported datetime format.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_INFORMATION_NOT_FOUND",
...         "action_options": []
...     }
... ]
```

Converting that same integer data to datetime, however, is valid.

```
>>> X = pd.DataFrame(pd.to_datetime([1, 2, 3, 4]), columns=["Weeks"])
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == []
```

```
>>> X = pd.DataFrame(pd.date_range("2021-01-01", freq="W", periods=10),
columns=["Weeks"])
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == []
```

While the data passed in is of datetime type, time series requires the datetime information in `datetime_column` to be monotonically increasing (ascending).

```
>>> X = X.iloc[::-1]
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="Weeks")
>>> assert datetime_format_dc.validate(X, y) == [
...     {
...         "message": "Datetime values must be sorted in ascending order.",
...         "data_check_name": "DateTimeFormatDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "DATETIME_IS_NOT_MONOTONIC",
...         "action_options": []
...     }
... ]
```

The first value in the column “index” is replaced with NaT, which will raise an error in this data check.

```
>>> dates = [
...     ["2-1-21", "3-1-21"],
...     ["2-2-21", "3-2-21"],
```

(continues on next page)

(continued from previous page)

```

...         ["2-3-21", "3-3-21"],
...         ["2-4-21", "3-4-21"],
...         ["2-5-21", "3-5-21"],
...         ["2-6-21", "3-6-21"],
...         ["2-7-21", "3-7-21"],
...         ["2-8-21", "3-8-21"],
...         ["2-9-21", "3-9-21"],
...         ["2-10-21", "3-10-21"],
...         ["2-11-21", "3-11-21"],
...         ["2-12-21", "3-12-21"]]
>>> dates[0][0] = None
>>> df = pd.DataFrame(dates, columns=["days", "days2"])
>>> ww_payload = infer_frequency(pd.to_datetime(df["days"]), debug=True, window_
↳length=5, threshold=0.8)
>>> datetime_format_dc = DateTimeFormatDataCheck(datetime_column="days")
>>> assert datetime_format_dc.validate(df, y) == [
...     {

(continued from previous page)

```

...         }
...     }
... ]

```

For multiseries, the datacheck will go through each series and perform checks on them similar to the single series case. To denote that the datacheck is checking a multiseries, pass in the name of the `series_id` column to the datacheck.

```

>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range("2021-01-01", periods=15).repeat(2),
...         "series_id": pd.Series(list(range(2)) * 15, dtype="str")
...     }
... )
>>> X = X.drop([15])
>>> dc = DateTimeFormatDataCheck(datetime_column="date", series_id="series_id")
>>> ww_payload_expected_series1 = infer_frequency((X[X["series_id"] == "1"][
...     ↪ "date"].reset_index(drop=True)), debug=True, window_length=4, threshold=0.4)
>>> xd = dc.validate(X,y)
>>> assert dc.validate(X, y) == [
...     {
...         "message": "Column 'date' for series '1' has datetime values_
...     ↪ missing between start and end date.",

class evalml.data_checks.DCAOParameterAllowedValuesType

Enum for data check action option parameter allowed values type.

Attributes

CATEGORICAL	Categorical allowed values type. Parameters that have a set of allowed values.
NUMERICAL	Numerical allowed values type. Parameters that have a range of allowed values.

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(self)

The name of the Enum member.

value(self)

The value of the Enum member.

class evalml.data_checks.DCAOParameterType

Enum for data check action option parameter type.

Attributes

COLUMN	Column parameter type. Parameters that apply to a specific column in the data set.
GLOBAL	Global parameter type. Parameters that apply to the entire data set.

Methods

<i>all_parameter_types</i>	Get a list of all defined parameter types.
<i>handle_dcao_parameter_type</i>	Handles the data check action option parameter type by either returning the DCAOParameterType enum or converting from a str.
<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

all_parameter_types(cls)

Get a list of all defined parameter types.

Returns List of all defined parameter types.

Return type list(*DCAOPParameterType*)

static handle_dcao_parameter_type(dcao_parameter_type)

Handles the data check action option parameter type by either returning the *DCAOPParameterType* enum or converting from a str.

Parameters dcao_parameter_type (str or *DCAOPParameterType*) – Data check action option parameter type that needs to be handled.

Returns *DCAOPParameterType* enum

Raises

- **KeyError** – If input is not a valid *DCAOPParameterType* enum value.
- **ValueError** – If input is not a string or *DCAOPParameterType* object.

name(self)

The name of the Enum member.

value(self)

The value of the Enum member.

class evalml.data_checks.**DefaultDataChecks**(problem_type, objective, n_splits=3,
problem_configuration=None)

A collection of basic data checks that is used by AutoML by default.

Includes:

- *NullDataCheck*
- *HighlyNullRowsDataCheck*
- *IDColumnsDataCheck*
- *TargetLeakageDataCheck*
- *InvalidTargetDataCheck*
- *NoVarianceDataCheck*
- *ClassImbalanceDataCheck* (for classification problem types)
- *TargetDistributionDataCheck* (for regression problem types)
- *DateTimeFormatDataCheck* (for time series problem types)
- 'TimeSeriesParametersDataCheck' (for time series problem types)
- *TimeSeriesSplittingDataCheck* (for time series classification problem types)

Parameters

- **problem_type** (str) – The problem type that is being validated. Can be regression, binary, or multiclass.
- **objective** (str or *ObjectiveBase*) – Name or instance of the objective class.
- **n_splits** (int) – The number of splits as determined by the data splitter being used. Defaults to 3.

- **problem_configuration** (*dict*) – Required for time series problem types. Values should be passed in for `time_index`,
- **gap** –
- **forecast_horizon** –
- **max_delay.** (*and*) –

Methods

<i>validate</i>	Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.
-----------------	--

validate(*self*, *X*, *y=None*)

Inspect and validate the input data against data checks and returns a list of warnings and errors if applicable.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input data of shape `[n_samples, n_features]`
- **y** (*pd.Series*, *np.ndarray*) – The target data of length `[n_samples]`

Returns Dictionary containing `DataCheckMessage` objects

Return type dict

class `evalml.data_checks.IDColumnsDataCheck(id_threshold=1.0, exclude_time_index=True)`

Check if any of the features are likely to be ID columns.

Parameters

- **id_threshold** (*float*) – The probability threshold to be considered an ID column. Defaults to 1.0.
- **exclude_time_index** (*bool*) – If True, the column set as the time index will not be included in the data check. Default is True.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any of the features are likely to be ID columns. Currently performs a number of simple checks.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if any of the features are likely to be ID columns. Currently performs a number of simple checks.

Checks performed are:

- column name is “id”
- column name ends in “_id”
- column contains all unique values (and is categorical / integer type)

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input features to check.
- **y** (*pd.Series*) – The target. Defaults to None. Ignored.

Returns A dictionary of features with column name or index and their probability of being ID columns

Return type dict

Examples

```
>>> import pandas as pd
```

Columns that end in “_id” and are completely unique are likely to be ID columns.

```
>>> df = pd.DataFrame({
...     "profits": [25, 15, 15, 31, 19],
...     "customer_id": [123, 124, 125, 126, 127],
...     "Sales": [10, 42, 31, 51, 61]
... })
...
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'customer_id' are 100.0% or more likely to be an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["customer_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["customer_id"], "rows": None}
...             }
...         ]
...     }
... ]
```

Columns named “ID” with all unique values will also be identified as ID columns.

```
>>> df = df.rename(columns={"customer_id": "ID"})
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'ID' are 100.0% or more likely to be an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["ID"], "rows": None},
...         "action_options": [
```

(continues on next page)

(continued from previous page)

```

...         {
...             "code": "DROP_COL",
...             "data_check_name": "IDColumnsDataCheck",
...             "parameters": {},
...             "metadata": {"columns": ["ID"], "rows": None}
...         }
...     ]
... }
... ]

```

Despite being all unique, “Country_Rank” will not be identified as an ID column as `id_threshold` is set to 1.0 by default and its name doesn’t indicate that it’s an ID.

```

>>> df = pd.DataFrame({
...     "humidity": ["high", "very high", "low", "low", "high"],
...     "Country_Rank": [1, 2, 3, 4, 5],
...     "Sales": ["very high", "high", "high", "medium", "very low"]
... })
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == []

```

However lowering the threshold will cause this column to be identified as an ID.

```

>>> id_col_check = IDColumnsDataCheck()
>>> id_col_check = IDColumnsDataCheck(id_threshold=0.95)
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "Columns 'Country_Rank' are 95.0% or more likely to be_
...         an ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Country_Rank"], "rows": None},
...         "code": "HAS_ID_COLUMN",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["Country_Rank"], "rows": None}
...             }
...         ]
...     }
... ]

```

If the first column of the dataframe has all unique values and is named either ‘ID’ or a name that ends with ‘_id’, it is probably the primary key. The other ID columns should be dropped.

```

>>> df = pd.DataFrame({
...     "sales_id": [0, 1, 2, 3, 4],
...     "customer_id": [123, 124, 125, 126, 127],
...     "Sales": [10, 42, 31, 51, 61]
... })

```

(continues on next page)

(continued from previous page)

```

...
>>> id_col_check = IDColumnsDataCheck()
>>> assert id_col_check.validate(df) == [
...     {
...         "message": "The first column 'sales_id' is likely to be the primary_
↪key",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_FIRST_COLUMN",
...         "details": {"columns": ["sales_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "SET_FIRST_COL_ID",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["sales_id"], "rows": None}
...             }
...         ]
...     },
...     {
...         "message": "Columns 'customer_id' are 100.0% or more likely to be an_
↪ID column",
...         "data_check_name": "IDColumnsDataCheck",
...         "level": "warning",
...         "code": "HAS_ID_COLUMN",
...         "details": {"columns": ["customer_id"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "IDColumnsDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["customer_id"], "rows": None}
...             }
...         ]
...     }
... ]

```

class evalml.data_checks.InvalidTargetDataCheck(*problem_type, objective, n_unique=100, null_strategy='drop'*)

Check if the target data is considered invalid.

Target data is considered invalid if:

- Target is None.
- Target has NaN or None values.
- Target is of an unsupported Woodwork logical type.
- Target and features have different lengths or indices.
- Target does not have enough instances of a class in a classification problem.
- Target does not contain numeric data for regression problems.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. e.g. ‘binary’, ‘multiclass’, ‘regression’, ‘time series regression’
- **objective** (*str* or *ObjectiveBase*) – Name or instance of the objective class.
- **n_unique** (*int*) – Number of unique target values to store when problem type is binary and target incorrectly has more than 2 unique values. Non-negative integer. If None, stores all unique values. Defaults to 100.
- **null_strategy** (*str*) – The type of action option that should be returned if the target is partially null. The options are *impute* and *drop* (default). *impute* - Will return a *DataCheckActionOption* for imputing the target column. *drop* - Will return a *DataCheckActionOption* for dropping the null rows in the target column.

Attributes

multi-class_continuous_threshold	0.05
---	------

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the target data is considered invalid. If the input features argument is not None, it will be used to check that the target and features have the same dimensions and indices.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if the target data is considered invalid. If the input features argument is not None, it will be used to check that the target and features have the same dimensions and indices.

Target data is considered invalid if:

- Target is None.
- Target has NaN or None values.
- Target is of an unsupported Woodwork logical type.
- Target and features have different lengths or indices.
- Target does not have enough instances of a class in a classification problem.
- Target does not contain numeric data for regression problems.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features. If not None, will be used to check that the target and features have the same dimensions and indices.
- **y** (*pd.Series*, *np.ndarray*) – Target data to check for invalid values.

Returns List with *DataCheckErrors* if any invalid values are found in the target data.

Return type dict (*DataCheckError*)

Examples

```
>>> import pandas as pd
```

Target values must be integers, doubles, or booleans.

```
>>> X = pd.DataFrame({"col": [1, 2, 3, 1]})
>>> y = pd.Series(["cat_1", "cat_2", "cat_1", "cat_2"])
>>> target_check = InvalidTargetDataCheck("regression", "R2", null_strategy=
↳ "impute")
>>> assert target_check.validate(X, y) == [
...     {
...         "message": "Target is unsupported Unknown type. Valid Woodwork_
↳ logical types include: integer, double, boolean, age, age_fractional, integer_
↳ nullable, boolean_nullable, age_nullable",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None, "unsupported_type":
↳ "unknown"},
...         "code": "TARGET_UNSUPPORTED_TYPE",
...         "action_options": []
...     },
...     {
...         "message": "Target data type should be numeric for regression type_
↳ problems.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "TARGET_UNSUPPORTED_TYPE_REGRESSION",
...         "action_options": []
...     }
... ]
```

The target cannot have null values.

```
>>> y = pd.Series([None, pd.NA, pd.NaT, None])
>>> assert target_check.validate(X, y) == [
...     {
...         "message": "Target is either empty or fully null.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None},
...         "code": "TARGET_IS_EMPTY_OR_FULLY_NULL",
...         "action_options": []
...     }
... ]
...
>>> y = pd.Series([1, None, 3, None])
>>> assert target_check.validate(None, y) == [
...     {
...         "message": "2 row(s) (50.0%) of target values are null",
...         "data_check_name": "InvalidTargetDataCheck",
```

(continues on next page)

(continued from previous page)

```

...     "level": "error",
...     "details": {
...         "columns": None,
...         "rows": [1, 3],
...         "num_null_rows": 2,
...         "pct_null_rows": 50.0
...     },
...     "code": "TARGET_HAS_NULL",
...     "action_options": [
...         {
...             "code": "IMPUTE_COL",
...             "data_check_name": "InvalidTargetDataCheck",
...             "parameters": {
...                 "impute_strategy": {
...                     "parameter_type": "global",
...                     "type": "category",
...                     "categories": ["mean", "most_frequent"],
...                     "default_value": "mean"
...                 }
...             },
...             "metadata": {"columns": None, "rows": None, "is_target":
↪ True},
...         }
...     ],
... }
... ]

```

If the target values don't match the problem type passed, an error will be raised. In this instance, only two values exist in the target column, but multiclass has been passed as the problem type.

```

>>> X = pd.DataFrame([i for i in range(50)])
>>> y = pd.Series([i%2 for i in range(50)])
>>> target_check = InvalidTargetDataCheck("multiclass", "Log Loss Multiclass")
>>> assert target_check.validate(X, y) == [
...     {
...         "message": "Target has two or less classes, which is too few for
↪ multiclass problems. Consider changing to binary.",
...         "data_check_name": "InvalidTargetDataCheck",
...         "level": "error",
...         "details": {"columns": None, "rows": None, "num_classes": 2},
...         "code": "TARGET_MULTICLASS_NOT_ENOUGH_CLASSES",
...         "action_options": []
...     }
... ]

```

If the length of X and y differ, a warning will be raised. A warning will also be raised for indices that don't match.

```

>>> target_check = InvalidTargetDataCheck("regression", "R2")
>>> X = pd.DataFrame([i for i in range(5)])
>>> y = pd.Series([1, 2, 4, 3], index=[1, 2, 4, 3])
>>> assert target_check.validate(X, y) == [

```

(continues on next page)

(continued from previous page)

```

...     }
... ]

```

class evalml.data_checks.MismatchedSeriesLengthDataCheck(*series_id*)

Check if one or more unique series in a multiserries dataset is of a different length than the others.

Currently works specifically on stacked data

Parameters *series_id* (*str*) – The name of the *series_id* column for the dataset.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if one or more unique series in a multiserries dataset is of a different length than the other.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if one or more unique series in a multiserries dataset is of a different length than the other.

Currently works specifically on stacked data

Parameters

- *X* (*pd.DataFrame*, *np.ndarray*) – The input features to check. Must have a *series_id* column.
- *y* (*pd.Series*) – The target. Defaults to None. Ignored.

Returns

List with **DataCheckWarning** if there are mismatch series length in the datasets or list with **DataCheckError** if the given *series_id* is not in the dataset

Return type dict (*DataCheckWarning*, *DataCheckError*)

Examples

```
>>> import pandas as pd
```

For multiseries time series datasets, each seriesID should ideally have the same number of datetime entries as each other. If they don't, then a warning will be raised denoting which seriesID have mismatched lengths.

```
>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range(start="1/1/2018", periods=20).repeat(5),
...         "series_id": pd.Series(list(range(5)) * 20, dtype="str"),
...         "feature_a": range(100),
...         "feature_b": reversed(range(100)),
...     },
... )
>>> X = X.drop(labels=0, axis=0)
>>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("series_id")
>>> assert mismatched_series_length_check.validate(X) == [
...     {
...         "message": "Series ID ['0'] do not match the majority length of the
other series, which is 20",
...         "data_check_name": "MismatchedSeriesLengthDataCheck",
...         "level": "warning",
...         "details": {
...             "columns": None,
...             "rows": None,
...             "series_id": ['0'],
...             "majority_length": 20
...         },
...         "code": "MISMATCHED_SERIES_LENGTH",
...         "action_options": [],
...     }
... ]
```

If `MismatchedSeriesLengthDataCheck` is passed in an invalid `series_id` column name, then an error will be raised.

```
>>> X = pd.DataFrame(
...     {
...         "date": pd.date_range(start="1/1/2018", periods=20).repeat(5),
...         "series_id": pd.Series(list(range(5)) * 20, dtype="str"),
...         "feature_a": range(100),
...         "feature_b": reversed(range(100)),
...     },
... )
>>> X = X.drop(labels=0, axis=0)
>>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("not_
series_id")
>>> assert mismatched_series_length_check.validate(X) == [
...     {
```

(continues on next page)

(continued from previous page)

```

...     "message": "series_id 'not_series_id' is not in the dataset.",
...     "data_check_name": "MismatchedSeriesLengthDataCheck",
...     "level": "error",

```

If there are multiple lengths that have the same number of series (e.g. two series have length 20 and two series have length 19), this datacheck will consider the higher length to be the majority length (e.g. from the previous example length 20 would be the majority length) >>> X = pd.DataFrame(... { ... "date": pd.date_range(start="1/1/2018", periods=20).repeat(4), ... "series_id": pd.Series(list(range(4)) * 20, dtype="str"), ... "feature_a": range(80), ... "feature_b": reversed(range(80)), ... }, ...) >>> X = X.drop(labels=[0, 1], axis=0) >>> mismatched_series_length_check = MismatchedSeriesLengthDataCheck("series_id") >>> assert mismatched_series_length_check.validate(X) == [... { ... "message": "Series ID ['0', '1'] do not match the majority length of the other series, which is 20", ... "data_check_name": "MismatchedSeriesLengthDataCheck", ... "level": "warning", ... "details": { ... "columns": None, ... "rows": None, ... "series_id": ['0', '1'], ... "majority_length": 20 ... }, ... "code": "MISMATCHED_SERIES_LENGTH", ... "action_options": [], ... } ...]

class evalml.data_checks.MulticollinearityDataCheck(*threshold=0.9*)

Check if any set features are likely to be multicollinear.

Parameters **threshold** (*float*) – The threshold to be considered. Defaults to 0.9.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any set of features are likely to be multicollinear.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if any set of features are likely to be multicollinear.

Parameters

- **X** (*pd.DataFrame*) – The input features to check.
- **y** (*pd.Series*) – The target. Ignored.

Returns dict with a DataCheckWarning if there are any potentially multicollinear columns.

Return type dict

Example

```
>>> import pandas as pd
```

Columns in X that are highly correlated with each other will be identified using mutual information.

```
>>> col = pd.Series([1, 0, 2, 3, 4] * 15)
>>> X = pd.DataFrame({"col_1": col, "col_2": col * 3})
>>> y = pd.Series([1, 0, 0, 1, 0] * 15)
...
>>> multicollinearity_check = MulticollinearityDataCheck(threshold=1.0)
>>> assert multicollinearity_check.validate(X, y) == [
...     {
...         "message": "Columns are likely to be correlated: [('col_1', 'col_2'
...         ↪ ')]",
...         "data_check_name": "MulticollinearityDataCheck",
...         "level": "warning",
...         "code": "IS_MULTICOLLINEAR",
...         "details": {"columns": [("col_1", "col_2")], "rows": None},
...         "action_options": []
...     }
... ]
```

```
class evalml.data_checks.NoVarianceDataCheck(count_nan_as_value=False)
```

Check if the target or any of the features have no variance.

Parameters `count_nan_as_value` (*bool*) – If True, missing values will be counted as their own unique value. Additionally, if true, will return a `DataCheckWarning` instead of an error if the feature has mostly missing data and only one unique value. Defaults to False.

Methods

<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if the target or any of the features have no variance (1 unique value).

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if the target or any of the features have no variance (1 unique value).

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – The input features.
- **y** (*pd.Series*, *np.ndarray*) – Optional, the target data.

Returns A dict of warnings/errors corresponding to features or target with no variance.

Return type dict

Examples

```
>>> import pandas as pd
```

Columns or target data that have only one unique value will raise an error.

```
>>> X = pd.DataFrame([2, 2, 2, 2, 2, 2, 2, 2], columns=["First_Column"])
>>> y = pd.Series([1, 1, 1, 1, 1, 1, 1, 1])
...
>>> novar_dc = NoVarianceDataCheck()
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["First_Column"], "rows": None}
...             }
...         ]
...     },
...     {
...         "message": "Y has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": []
...     }
... ]
```

By default, NaNs will not be counted as distinct values. In the first example, there are still two distinct values besides None. In the second, there are no distinct values as the target is entirely null.

```
>>> X["First_Column"] = [2, 2, 2, 3, 3, 3, None, None]
>>> y = pd.Series([1, 1, 1, 2, 2, 2, None, None])
>>> assert novar_dc.validate(X, y) == []
...
>>> y = pd.Series([None] * 7)
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "Y has 0 unique values.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE_ZERO_UNIQUE",
...         "action_options": []
...     }
... ]
```

(continues on next page)

(continued from previous page)

```
...     }
... ]
```

As None is not considered a distinct value by default, there is only one unique value in X and y.

```
>>> X["First_Column"] = [2, 2, 2, 2, None, None, None, None]
>>> y = pd.Series([1, 1, 1, 1, None, None, None, None])
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["First_Column"], "rows": None}
...             },
...         ],
...     },
...     {
...         "message": "Y has 1 unique value.",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["Y"], "rows": None},
...         "code": "NO_VARIANCE",
...         "action_options": []
...     }
... ]
```

If count_nan_as_value is set to True, then NaNs are counted as unique values. In the event that there is an adequate number of unique values only because count_nan_as_value is set to True, a warning will be raised so the user can encode these values.

```
>>> novar_dc = NoVarianceDataCheck(count_nan_as_value=True)
>>> assert novar_dc.validate(X, y) == [
...     {
...         "message": "'First_Column' has two unique values including nulls.↵
↵Consider encoding the nulls for this column to be useful for machine learning.↵",
...         "data_check_name": "NoVarianceDataCheck",
...         "level": "warning",
...         "details": {"columns": ["First_Column"], "rows": None},
...         "code": "NO_VARIANCE_WITH_NULL",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "NoVarianceDataCheck",
...                 "parameters": {},
...             },
...         ],
...     },
... ]
```

(continues on next page)

(continued from previous page)

```

...         "metadata": {"columns": ["First_Column"], "rows": None}
...     },
... ]
... },
... {
...     "message": "Y has two unique values including nulls. Consider_
encoding the nulls for this column to be useful for machine learning.",
...     "data_check_name": "NoVarianceDataCheck",
...     "level": "warning",
...     "details": {"columns": ["Y"], "rows": None},
...     "code": "NO_VARIANCE_WITH_NULL",
...     "action_options": []
... }
... ]

```

```

class evalml.data_checks.NullDataCheck(pct_null_col_threshold=0.95,
                                       pct_moderately_null_col_threshold=0.2,
                                       pct_null_row_threshold=0.95)

```

Check if there are any highly-null numerical, boolean, categorical, natural language, and unknown columns and rows in the input.

Parameters

- **pct_null_col_threshold** (*float*) – If the percentage of NaN values in an input feature exceeds this amount, that column will be considered highly-null. Defaults to 0.95.
- **pct_moderately_null_col_threshold** (*float*) – If the percentage of NaN values in an input feature exceeds this amount but is less than the percentage specified in `pct_null_col_threshold`, that column will be considered moderately-null. Defaults to 0.20.
- **pct_null_row_threshold** (*float*) – If the percentage of NaN values in an input row exceeds this amount, that row will be considered highly-null. Defaults to 0.95.

Methods

<code>get_null_column_information</code>	Finds columns that are considered highly null (percentage null is greater than threshold) and returns dictionary mapping column name to percentage null and dictionary mapping column name to null indices.
<code>get_null_row_information</code>	Finds rows that are considered highly null (percentage null is greater than threshold).
<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if there are any highly-null columns or rows in the input.

```

static get_null_column_information(X, pct_null_col_threshold=0.0)

```

Finds columns that are considered highly null (percentage null is greater than threshold) and returns dictionary mapping column name to percentage null and dictionary mapping column name to null indices.

Parameters

- **X** (*pd.DataFrame*) – DataFrame to check for highly null columns.
- **pct_null_col_threshold** (*float*) – Percentage threshold for a column to be considered null. Defaults to 0.0.

Returns Tuple containing: dictionary mapping column name to its null percentage and dictionary mapping column name to null indices in that column.

Return type tuple

static get_null_row_information(*X*, *pct_null_row_threshold*=0.0)

Finds rows that are considered highly null (percentage null is greater than threshold).

Parameters

- **X** (*pd.DataFrame*) – DataFrame to check for highly null rows.
- **pct_null_row_threshold** (*float*) – Percentage threshold for a row to be considered null. Defaults to 0.0.

Returns Series containing the percentage null for each row.

Return type *pd.Series*

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if there are any highly-null columns or rows in the input.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns dict with a DataCheckWarning if there are any highly-null columns or rows.

Return type dict

Examples

```
>>> import pandas as pd
...
>>> class SeriesWrap():
...     def __init__(self, series):
...         self.series = series
...
...     def __eq__(self, series_2):
...         return all(self.series.eq(series_2.series))
```

With `pct_null_col_threshold` set to 0.50, any column that has 50% or more of its observations set to null will be included in the warning, as well as the percentage of null values identified (“all_null”: 1.0, “lots_of_null”: 0.8).

```
>>> df = pd.DataFrame({
...     "all_null": [None, pd.NA, None, None, None],
...     "lots_of_null": [None, None, None, None, 5],
...     "few_null": [1, 2, None, 2, 3],
...     "no_null": [1, 2, 3, 4, 5]
... })
...
>>> highly_null_dc = NullDataCheck(pct_null_col_threshold=0.50)
>>> assert highly_null_dc.validate(df) == [
```

(continues on next page)

(continued from previous page)

```

...     {
...         "message": "Column(s) 'all_null', 'lots_of_null' are 50.0% or more_
↪null",
...         "data_check_name": "NullDataCheck",

...         "action_options": [
...             {
...                 "code": "IMPUTE_COL",
...                 "data_check_name": "NullDataCheck",
...                 "metadata": {"columns": ["few_null"], "rows": None, "is_
↪target": False},
...                 "parameters": {
...                     "impute_strategies": {
...                         "parameter_type": "column",
...                         "columns": {
...                             "few_null": {
...                                 "impute_strategy": {"categories": ["mean",
↪"most_frequent"], "type": "category", "default_value": "mean"}
...                             }
...                         }
...                     }
...                 }
...             }
...         ]
...     }
... ]

```

With `pct_null_row_threshold` set to 0.50, any row with 50% or more of its respective column values set to null will be included in the warning, as well as the offending rows (`"rows": [0, 1, 2, 3]`). Since the default value for `pct_null_col_threshold` is 0.95, `"all_null"` is also included in the warnings since the percentage of

null values in that row is over 95%. Since the default value for `pct_moderately_null_col_threshold` is 0.20, “few_null” is included as a “moderately null” column as it has a null column percentage of 20%.

```
>>> highly_null_dc = NullDataCheck(pct_null_row_threshold=0.50)
>>> validation_messages = highly_null_dc.validate(df)
>>> validation_messages[0]["details"]["pct_null_cols"] = SeriesWrap(validation_
← messages[0]["details"]["pct_null_cols"])
>>> highly_null_rows = SeriesWrap(pd.Series([0.5, 0.5, 0.75, 0.5]))
>>> assert validation_messages == [
...     {
...         "message": "4 out of 5 rows are 50.0% or more null",
...         "data_check_name": "NullDataCheck",
...         "level": "warning",
...         "details": {
...             "columns": None,
...             "rows": [0, 1, 2, 3],
...             "pct_null_cols": highly_null_rows
...         },
...         "code": "HIGHLY_NULL_ROWS",

class evalml.data_checks.OutliersDataCheck

Checks if there are any outliers in input data by using IQR to determine score anomalies.

Columns with score anomalies are considered to contain outliers.

Methods

<code>get_boxplot_data</code>	Returns box plot information for the given data.
<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if there are any outliers in a dataframe by using IQR to determine column anomalies. Column with anomalies are considered to contain outliers.

static get_boxplot_data(data_)

Returns box plot information for the given data.

Parameters `data` (`pd.Series`, `np.ndarray`) – Input data.

Returns A payload of box plot statistics.

Return type dict

Examples

```
>>> import pandas as pd
...
>>> df = pd.DataFrame({
...     "x": [1, 2, 3, 4, 5],
...     "y": [6, 7, 8, 9, 10],
...     "z": [-1, -2, -3, -1201, -4]
... })
>>> box_plot_data = OutliersDataCheck.get_boxplot_data(df["z"])
>>> box_plot_data["score"] = round(box_plot_data["score"], 2)
>>> assert box_plot_data == {
...     "score": 0.89,
...     "pct_outliers": 0.2,
...     "values": {"q1": -4.0,
...                 "median": -3.0,
...                 "q3": -2.0,
...                 "low_bound": -7.0,
...                 "high_bound": -1.0,
...                 "low_values": [-1201],
...                 "high_values": [],
...                 "low_indices": [3],
...                 "high_indices": []}
... }
```

name(cls)

Return a name describing the data check.

validate(self, X, y=None)

Check if there are any outliers in a dataframe by using IQR to determine column anomalies. Column with anomalies are considered to contain outliers.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Input features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns A dictionary with warnings if any columns have outliers.

Return type dict

Examples

```
>>> import pandas as pd
```

The column “z” has an outlier so a warning is added to alert the user of its location.

```
>>> df = pd.DataFrame({
...     "x": [1, 2, 3, 4, 5],
...     "y": [6, 7, 8, 9, 10],
...     "z": [-1, -2, -3, -1201, -4]
... })
...
>>> outliers_check = OutliersDataCheck()
```

(continues on next page)

(continued from previous page)

```

>>> assert outliers_check.validate(df) == [
...     {
...         "message": "Column(s) 'z' are likely to have outlier data.",
...         "data_check_name": "OutliersDataCheck",
...         "level": "warning",
...         "code": "HAS_OUTLIERS",
...         "details": {"columns": ["z"], "rows": [3], "column_indices": {"z": 1,
↪ [3]}},
...         "action_options": [
...             {
...                 "code": "DROP_ROWS",
...                 "data_check_name": "OutliersDataCheck",
...                 "parameters": {},
...                 "metadata": {"rows": [3], "columns": None}
...             }
...         ]
...     }
... ]

```

class evalml.data_checks.SparsityDataCheck(*problem_type*, *threshold*, *unique_count_threshold*=10)

Check if there are any columns with sparsely populated values in the input.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. ‘multiclass’ or ‘time series multiclass’ is the only accepted problem type.
- **threshold** (*float*) – The threshold value, or percentage of each column’s unique values, below which, a column exhibits sparsity. Should be between 0 and 1.
- **unique_count_threshold** (*int*) – The minimum number of times a unique value has to be present in a column to not be considered “sparse.” Defaults to 10.

Methods

<i>name</i>	Return a name describing the data check.
<i>sparsity_score</i>	Calculate a sparsity score for the given value counts by calculating the percentage of unique values that exceed the count_threshold.
<i>validate</i>	Calculate what percentage of each column's unique values exceed the count threshold and compare that percentage to the sparsity threshold stored in the class instance.

name(*cls*)

Return a name describing the data check.

static **sparsity_score**(*col*, *count_threshold*=10)

Calculate a sparsity score for the given value counts by calculating the percentage of unique values that exceed the count_threshold.

Parameters

- **col** (*pd.Series*) – Feature values.

- **count_threshold** (*int*) – The number of instances below which a value is considered sparse. Default is 10.

Returns Sparsity score, or the percentage of the unique values that exceed count_threshold.

Return type (float)

validate (*self*, *X*, *y=None*)

Calculate what percentage of each column's unique values exceed the count threshold and compare that percentage to the sparsity threshold stored in the class instance.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored.

Returns dict with a DataCheckWarning if there are any sparse columns.

Return type dict

Examples

```
>>> import pandas as pd
```

For multiclass problems, if a column doesn't have enough representation from unique values, it will be considered sparse.

```
>>> df = pd.DataFrame({
...     "sparse": [float(x) for x in range(100)],
...     "not_sparse": [float(1) for x in range(100)]
... })
...
>>> sparsity_check = SparsityDataCheck(problem_type="multiclass", threshold=0.5,
↳ unique_count_threshold=10)
>>> assert sparsity_check.validate(df) == [
...     {
...         "message": "Input columns ('sparse') for multiclass problem type_
↳ are too sparse.",
...         "data_check_name": "SparsityDataCheck",
...         "level": "warning",
...         "code": "TOO_SPARSE",
...         "details": {
...             "columns": ["sparse"],
...             "sparsity_score": {"sparse": 0.0},
...             "rows": None
...         },
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "SparsityDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["sparse"], "rows": None}
...             }
...         ]
...     }
... ]
```

```
... >>> df["sparse"] = [float(x % 10) for x in range(100)] >>> sparsity_check = SparsityDataCheck(problem_type="multiclass", threshold=1, unique_count_threshold=5) >>> assert sparsity_check.validate(df) == [] ... >>> sparse_array = pd.Series([1, 1, 1, 2, 2, 3] * 3) >>> assert SparsityDataCheck.sparsity_score(sparse_array, count_threshold=5) == 0.6666666666666666
```

class evalml.data_checks.TargetDistributionDataCheck

Check if the target data contains certain distributions that may need to be transformed prior training to improve model performance. Uses the Shapiro-Wilks test when the dataset is <=5000 samples, otherwise uses Jarque-Bera.

Methods

<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if the target data has a certain distribution.

`name(cls)`

Return a name describing the data check.

`validate(self, X, y)`

Check if the target data has a certain distribution.

Parameters

- **X** (`pd.DataFrame`, `np.ndarray`) – Features. Ignored.
- **y** (`pd.Series`, `np.ndarray`) – Target data to check for underlying distributions.

Returns List with `DataCheckErrors` if certain distributions are found in the target data.

Return type dict (`DataCheckError`)

Examples

```
>>> import pandas as pd
```

Targets that exhibit a lognormal distribution will raise a warning for the user to transform the target.

```
>>> y = [0.946, 0.972, 1.154, 0.954, 0.969, 1.222, 1.038, 0.999, 0.973, 0.897]
>>> target_check = TargetDistributionDataCheck()
>>> assert target_check.validate(None, y) == [
...     {
...         "message": "Target may have a lognormal distribution.",
...         "data_check_name": "TargetDistributionDataCheck",
...         "level": "warning",
...         "code": "TARGET_LOGNORMAL_DISTRIBUTION",
...         "details": {"normalization_method": "shapiro", "statistic": 0.8, "p-
... value": 0.045, "columns": None, "rows": None},
...         "action_options": [
...             {
...                 "code": "TRANSFORM_TARGET",
...                 "data_check_name": "TargetDistributionDataCheck",
...                 "parameters": {},
...                 "metadata": {
...                     "transformation_strategy": "lognormal",
...                     "is_target": True,
```

(continues on next page)

```

class evalml.data_checks.TargetLeakageDataCheck(*pct_corr_threshold=0.95, method='all'*)

Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and other correlation metrics.

If *method='mutual_info'*, this data check uses mutual information and supports all target and feature types. Other correlation metrics only support binary with numeric and boolean dtypes. This method will return a value in [-1, 1] if other correlation metrics are selected and will returns a value in [0, 1] if mutual information is selected. Correlation metrics available can be found in Woodwork's [dependence_dict method](#).

Parameters

- **pct_corr_threshold** (*float*) – The correlation threshold to be considered leakage. Defaults to 0.95.
- **method** (*string*) – The method to determine correlation. Use 'all' or 'max' for the maximum correlation, or for specific correlation metrics, use their name (ie 'mutual_info' for mutual information, 'pearson' for Pearson correlation, etc). possible methods can be found in Woodwork's [config](#), under *correlation_metrics*. Defaults to 'all'.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and/or Spearman correlation.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if any of the features are highly correlated with the target by using mutual information, Pearson correlation, and/or Spearman correlation.

If *method*='mutual_info' or *method*='max', supports all target and feature types. Other correlation metrics only support binary with numeric and boolean dtypes. This method will return a value in [-1, 1] if other correlation metrics are selected and will return a value in [0, 1] if mutual information is selected.

Parameters

- *X* (*pd.DataFrame*, *np.ndarray*) – The input features to check.
- *y* (*pd.Series*, *np.ndarray*) – The target data.

Returns dict with a *DataCheckWarning* if target leakage is detected.

Return type dict (*DataCheckWarning*)

Examples

```
>>> import pandas as pd
```

Any columns that are strongly correlated with the target will raise a warning. This could be indicative of data leakage.

```
>>> X = pd.DataFrame({
...     "leak": [10, 42, 31, 51, 61] * 15,
...     "x": [42, 54, 12, 64, 12] * 15,
...     "y": [13, 5, 13, 74, 24] * 15,
... })
>>> y = pd.Series([10, 42, 31, 51, 40] * 15)
>>> target_leakage_check = TargetLeakageDataCheck(pct_corr_threshold=0.95)
>>> assert target_leakage_check.validate(X, y) == [
...     {
...         "message": "Column 'leak' is 95.0% or more correlated with the_
↪target",
...         "data_check_name": "TargetLeakageDataCheck",
...         "level": "warning",
...         "code": "TARGET_LEAKAGE",
...         "details": {"columns": ["leak"], "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "TargetLeakageDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["leak"], "rows": None}
...             }
...         ]
...     }
... ]
```

The default method can be changed to pearson from mutual_info.

```

>>> X["x"] = y / 2
>>> target_leakage_check = TargetLeakageDataCheck(pct_corr_threshold=0.8,
method="pearson")
>>> assert target_leakage_check.validate(X, y) == [
...     {
...         "message": "Columns 'leak', 'x' are 80.0% or more correlated with
the target",
...         "data_check_name": "TargetLeakageDataCheck",
...         "level": "warning",
...         "details": {"columns": ["leak", "x"], "rows": None},
...         "code": "TARGET_LEAKAGE",
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "data_check_name": "TargetLeakageDataCheck",
...                 "parameters": {},
...                 "metadata": {"columns": ["leak", "x"], "rows": None}
...             }
...         ]
...     }
... ]

```

class evalml.data_checks.**TimeSeriesParametersDataCheck**(*problem_configuration*, *n_splits*)

Checks whether the time series parameters are compatible with data splitting.

If $\text{gap} + \text{max_delay} + \text{forecast_horizon} > X.\text{shape}[0] // (\text{n_splits} + 1)$

then the feature engineering window is larger than the smallest split. This will cause the pipeline to create features from data that does not exist, which will cause errors.

Parameters

- **problem_configuration** (*dict*) – Dict containing problem_configuration parameters.
- **n_splits** (*int*) – Number of time series splits.

Methods

<i>name</i>	Return a name describing the data check.
<i>validate</i>	Check if the time series parameters are compatible with data splitting.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y=None*)

Check if the time series parameters are compatible with data splitting.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns dict with a DataCheckError if parameters are too big for the split sizes.

Return type dict

Examples

```
>>> import pandas as pd
```

The time series parameters have to be compatible with the data passed. If the window size (gap + max_delay + forecast_horizon) is greater than or equal to the split size, then an error will be raised.

```
>>> X = pd.DataFrame({
...     "dates": pd.date_range("1/1/21", periods=100),
...     "first": [i for i in range(100)],
... })
>>> y = pd.Series([i for i in range(100)])
...
>>> problem_config = {"gap": 7, "max_delay": 2, "forecast_horizon": 12, "time_
↳ index": "dates"}
>>> ts_parameters_check = TimeSeriesParametersDataCheck(problem_
↳ configuration=problem_config, n_splits=7)
>>> assert ts_parameters_check.validate(X, y) == [
...     {
...         "message": "Since the data has 100 observations, n_splits=7, and a
↳ forecast horizon of 12, the smallest "
...         "split would have 16 observations. Since 21 (gap + max_
↳ delay + forecast_horizon)"
...         " " >= 16, then at least one of the splits would be empty
↳ by the time it reaches "
...         "the pipeline. Please use a smaller number of splits,
↳ reduce one or more these "
...         "parameters, or collect more data.",
...         "data_check_name": "TimeSeriesParametersDataCheck",
...         "level": "error",
...         "code": "TIMESERIES_PARAMETERS_NOT_COMPATIBLE_WITH_SPLIT",
...         "details": {
...             "columns": None,
...             "rows": None,
...             "max_window_size": 21,
...             "min_split_size": 16,
...             "n_obs": 100,
...             "n_splits": 7
...         },
...         "action_options": []
...     }
... ]
```

class evalml.data_checks.TimeSeriesSplittingDataCheck(*problem_type*, *n_splits*)

Checks whether the time series target data is compatible with splitting.

If the target data in the training and validation of every split doesn't have representation from all classes (for time series classification problems) this will prevent the estimators from training on all potential outcomes which will cause errors during prediction.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – Problem type.
- **n_splits** (*int*) – Number of time series splits.

Methods

<code>name</code>	Return a name describing the data check.
<code>validate</code>	Check if the training and validation targets are compatible with time series data splitting.

name(*cls*)

Return a name describing the data check.

validate(*self*, *X*, *y*)

Check if the training and validation targets are compatible with time series data splitting.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Ignored. Features.
- **y** (*pd.Series*, *np.ndarray*) – Target data.

Returns dict with a `DataCheckError` if splitting would result in inadequate class representation.

Return type dict

Example

```
>>> import pandas as pd
```

Passing `n_splits` as 3 means that the data will be segmented into 4 parts to be iterated over for training and validation splits. The first split results in training indices of [0:25] and validation indices of [25:50]. The training indices of the first split result in only one unique value (0). The third split results in training indices of [0:75] and validation indices of [75:100]. The validation indices of the third split result in only one unique value (1).

```
>>> X = None
>>> y = pd.Series([0 if i < 45 else i % 2 if i < 55 else 1 for i in range(100)])
>>> ts_splitting_check = TimeSeriesSplittingDataCheck("time series binary", 3)
>>> assert ts_splitting_check.validate(X, y) == [
...     {
...         "message": "Time Series Binary and Time Series Multiclass problem "
...                     "types require every training and validation split to "
...                     "have at least one instance of all the target classes. "
...                     "The following splits are invalid: [1, 3]",
...         "data_check_name": "TimeSeriesSplittingDataCheck",
...         "level": "error",
...         "details": {
...             "columns": None, "rows": None,
...             "invalid_splits": {
...                 1: {"Training": [0, 25]},
...                 3: {"Validation": [75, 100]}
...             }
...         },
...         "code": "TIMESERIES_TARGET_NOT_COMPATIBLE_WITH_SPLIT",
...         "action_options": []
...     }
... ]
```

class evalml.data_checks.UniquenessDataCheck(*problem_type*, *threshold*=0.5)

Check if there are any columns in the input that are either too unique for classification problems or not unique enough for regression problems.

Parameters

- **problem_type** (*str* or *ProblemTypes*) – The specific problem type to data check for. e.g. ‘binary’, ‘multiclass’, ‘regression’, ‘time series regression’
- **threshold** (*float*) – The threshold to set as an upper bound on uniqueness for classification type problems or lower bound on for regression type problems. Defaults to 0.50.

Methods

<i>name</i>	Return a name describing the data check.
<i>uniqueness_score</i>	Calculate a uniqueness score for the provided field. NaN values are not considered as unique values in the calculation.
<i>validate</i>	Check if there are any columns in the input that are too unique in the case of classification problems or not unique enough in the case of regression problems.

name(*cls*)

Return a name describing the data check.

static uniqueness_score(*col*, *drop_na*=True)

Calculate a uniqueness score for the provided field. NaN values are not considered as unique values in the calculation.

Based on the Herfindahl-Hirschman Index.

Parameters

- **col** (*pd.Series*) – Feature values.
- **drop_na** (*bool*) – Whether to drop null values when computing the uniqueness score. Defaults to True.

Returns Uniqueness score.

Return type (float)

validate(*self*, *X*, *y*=None)

Check if there are any columns in the input that are too unique in the case of classification problems or not unique enough in the case of regression problems.

Parameters

- **X** (*pd.DataFrame*, *np.ndarray*) – Features.
- **y** (*pd.Series*, *np.ndarray*) – Ignored. Defaults to None.

Returns

dict with a DataCheckWarning if there are any too unique or not unique enough columns.

Return type dict

Examples

```
>>> import pandas as pd
```

Because the problem type is regression, the column “regression_not_unique_enough” raises a warning for having just one value.

```
>>> df = pd.DataFrame({
...     "regression_unique_enough": [float(x) for x in range(100)],
...     "regression_not_unique_enough": [float(1) for x in range(100)]
... })
...
>>> uniqueness_check = UniquenessDataCheck(problem_type="regression",
↳ threshold=0.8)
>>> assert uniqueness_check.validate(df) == [
...     {
...         "message": "Input columns 'regression_not_unique_enough' for
↳ regression problem type are not unique enough.",
...         "data_check_name": "UniquenessDataCheck",
...         "level": "warning",
...         "code": "NOT_UNIQUE_ENOUGH",
...         "details": {"columns": ["regression_not_unique_enough"],
↳ "uniqueness_score": {"regression_not_unique_enough": 0.0}, "rows": None},
...         "action_options": [
...             {
...                 "code": "DROP_COL",
...                 "parameters": {},
...                 "data_check_name": "UniquenessDataCheck",
...                 "metadata": {"columns": ["regression_not_unique_enough"],
↳ "rows": None}
...             }
...         ]
...     }
... ]
```

For multiclass, the column “regression_unique_enough” has too many unique values and will raise an appropriate warning. >>> y = pd.Series([1, 1, 1, 2, 2, 3, 3, 3]) >>> uniqueness_check = UniquenessDataCheck(problem_type="multiclass", threshold=0.8) >>> assert uniqueness_check.validate(df) == [... { ... “message”: “Input columns ‘regression_unique_enough’ for multiclass problem type are too unique.”, ... “data_check_name”: “UniquenessDataCheck”, ... “level”: “warning”, ... “details”: { ... “columns”: [“regression_unique_enough”], ... “rows”: None, ... “uniqueness_score”: {“regression_unique_enough”: 0.99} ... }, ... “code”: “TOO_UNIQUE”, ... “action_options”: [... { ... “code”: “DROP_COL”, ... “data_check_name”: “UniquenessDataCheck”, ... “parameters”: {}, ... “metadata”: {“columns”: [“regression_unique_enough”], “rows”: None} ... } ...] ... } ...] ... >>> assert UniquenessDataCheck.uniqueness_score(y) == 0.65625

Demos

Demo datasets.

Submodules

breast_cancer

Load the breast cancer dataset, which can be used for binary classification problems.

Module Contents

Functions

<i>load_breast_cancer</i>	Load breast cancer dataset. Binary classification problem.
---------------------------	--

Contents

`evalml.demos.breast_cancer.load_breast_cancer()`
Load breast cancer dataset. Binary classification problem.
Returns X and y
Return type (pd.DataFrame, pd.Series)

churn

Load the churn dataset, which can be used for binary classification problems.

Module Contents

Functions

<i>load_churn</i>	Load churn dataset, which can be used for binary classification problems.
-------------------	---

Contents

`evalml.demos.churn.load_churn(n_rows=None, verbose=True)`

Load churn dataset, which can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – Number of rows from the dataset to return
- **verbose** (*bool*) – Whether to print information about features and labels

Returns X and y

Return type (pd.DataFrame, pd.Series)

diabetes

Load the diabetes dataset, which can be used for regression problems.

Module Contents

Functions

<code>load_diabetes</code>	Load diabetes dataset. Used for regression problems.
----------------------------	--

Contents

`evalml.demos.diabetes.load_diabetes()`

Load diabetes dataset. Used for regression problems.

Returns X and y

Return type (pd.DataFrame, pd.Series)

fraud

Load the credit card fraud dataset, which can be used for binary classification problems.

Module Contents

Functions

<code>load_fraud</code>	Load credit card fraud dataset.
-------------------------	---------------------------------

Contents

`evalml.demos.fraud.load_fraud(n_rows=None, verbose=True)`

Load credit card fraud dataset.

The fraud dataset can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – Number of rows from the dataset to return
- **verbose** (*bool*) – Whether to print information about features and labels

Returns X and y

Return type (pd.DataFrame, pd.Series)

weather

The Australian daily-min-temperatures weather dataset.

Module Contents

Functions

<code>load_weather</code>	Load the Australian daily-min-temperatures weather dataset.
---------------------------	---

Contents

`evalml.demos.weather.load_weather()`

Load the Australian daily-min-temperatures weather dataset.

Returns X and y

Return type (pd.DataFrame, pd.Series)

wine

Load and return the wine dataset, which can be used for multiclass classification problems.

Module Contents

Functions

<code>load_wine</code>	Load wine dataset. Multiclass problem.
------------------------	--

Contents

`evalml.demos.wine.load_wine()`

Load wine dataset. Multiclass problem.

Returns X and y

Return type (pd.DataFrame, pd.Series)

Package Contents

Functions

<code>load_breast_cancer</code>	Load breast cancer dataset. Binary classification problem.
<code>load_churn</code>	Load churn dataset, which can be used for binary classification problems.
<code>load_diabetes</code>	Load diabetes dataset. Used for regression problems.
<code>load_fraud</code>	Load credit card fraud dataset.
<code>load_weather</code>	Load the Australian daily-min-temperatures weather dataset.
<code>load_wine</code>	Load wine dataset. Multiclass problem.

Contents

`evalml.demos.load_breast_cancer()`

Load breast cancer dataset. Binary classification problem.

Returns X and y

Return type (pd.DataFrame, pd.Series)

`evalml.demos.load_churn(n_rows=None, verbose=True)`

Load churn dataset, which can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – Number of rows from the dataset to return
- **verbose** (*bool*) – Whether to print information about features and labels

Returns X and y

Return type (pd.DataFrame, pd.Series)

`evalml.demos.load_diabetes()`

Load diabetes dataset. Used for regression problems.

Returns X and y

Return type (pd.DataFrame, pd.Series)

`evalml.demos.load_fraud(n_rows=None, verbose=True)`

Load credit card fraud dataset.

The fraud dataset can be used for binary classification problems.

Parameters

- **n_rows** (*int*) – Number of rows from the dataset to return
- **verbose** (*bool*) – Whether to print information about features and labels

Returns X and y**Return type** (pd.DataFrame, pd.Series)`evalml.demos.load_weather()`

Load the Australian daily-min-temperatures weather dataset.

Returns X and y**Return type** (pd.DataFrame, pd.Series)`evalml.demos.load_wine()`

Load wine dataset. Multiclass problem.

Returns X and y**Return type** (pd.DataFrame, pd.Series)**Exceptions**

Exceptions used in EvalML.

Submodules**exceptions**

Exceptions used in EvalML.

Module Contents**Classes Summary**

<i>PartialDependenceErrorCode</i>	Enum identifying the type of error encountered in partial dependence.
<i>PipelineErrorCodeEnum</i>	Enum identifying the type of error encountered while applying a pipeline.
<i>ValidationErrorCode</i>	Enum identifying the type of error encountered in hold-out validation.

Exceptions Summary

Contents

exception `evalml.exceptions.exceptions.AutoMLSearchException`

Exception raised when all pipelines in an automl batch return a score of NaN for the primary objective.

exception `evalml.exceptions.exceptions.ComponentNotYetFittedError`

An exception to be raised when `predict/predict_proba/transform` is called on a component without fitting first.

exception `evalml.exceptions.exceptions.DataCheckInitError`

Exception raised when a data check can't initialize with the parameters given.

exception `evalml.exceptions.exceptions.MethodPropertyNotFoundError`

Exception to raise when a class does not have an expected method or property.

exception `evalml.exceptions.exceptions.MissingComponentError`

An exception raised when a component is not found in `all_components()`.

exception `evalml.exceptions.exceptions.NoPositiveLabelException`

Exception when a particular classification label for the 'positive' class cannot be found in the column index or unique values.

exception `evalml.exceptions.exceptions.NullsInColumnWarning`

Warning thrown when there are null values in the column of interest.

exception `evalml.exceptions.exceptions.ObjectiveCreationError`

Exception when `get_objective` tries to instantiate an objective and required args are not provided.

exception `evalml.exceptions.exceptions.ObjectiveNotFoundError`

Exception to raise when specified objective does not exist.

exception `evalml.exceptions.exceptions.ParameterNotUsedWarning(components)`

Warning thrown when a pipeline parameter isn't used in a defined pipeline's component graph during initialization.

exception `evalml.exceptions.exceptions.PartialDependenceError(message, code)`

Exception raised for all errors that partial dependence can raise.

Parameters

- **message** (*str*) – descriptive error message
- **code** (`PartialDependenceErrorCode`) – code for specific error

class `evalml.exceptions.exceptions.PartialDependenceErrorCode`

Enum identifying the type of error encountered in partial dependence.

Attributes

ALL_OTHER_ERRORS	errors
COMPUTED_PERCENTILES_TOO_CLOSE	computed_percentiles_too_close
FEATURE_IS_ALL_NANS	feature_is_all_nans
FEATURE_IS_MOSTLY_ONE_VALUE	feature_is_mostly_one_value
FEATURES_ARGUMENT_INCORRECT_TYPES	features_argument_incorrect_types
ICE_PLOT_REQUESTED_FOR_TWO_WAY_PLOT	ice_dependence_plot
INVALID_CLASS_LABEL	invalid_class_label_requested_for_plot
INVALID_FEATURE_TYPE	invalid_feature_type
PIPELINE_IS_BASELINE	baseline
TOO_MANY_FEATURES	features
TWO_WAY_REQUESTED_FOR_DATES	dates
UNFITTED_PIPELINE	unfitted_pipeline

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

exception evalml.exceptions.exceptions.**PipelineError**(*message, code, details=None*)

Exception raised for errors that can be raised when applying a pipeline.

Parameters

- **message** (*str*) – descriptive error message
- **code** ([PipelineErrorCodeEnum](#)) – code for specific error
- **details** (*dict*) – additional details for error

class evalml.exceptions.exceptions.**PipelineErrorCodeEnum**

Enum identifying the type of error encountered while applying a pipeline.

Attributes

PRE-DICT_INPUT_SCHEMA_UNEQUAL	predict_input_schema_unequal
--------------------------------------	------------------------------

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

exception evalml.exceptions.exceptions.**PipelineNotFoundError**

An exception raised when a particular pipeline is not found in automl search results.

exception evalml.exceptions.exceptions.**PipelineNotYetFittedError**

An exception to be raised when predict/predict_proba/transform is called on a pipeline without fitting first.

exception evalml.exceptions.exceptions.**PipelineScoreError**(*exceptions, scored_successfully*)

An exception raised when a pipeline errors while scoring any objective in a list of objectives.

Parameters

- **exceptions** (*dict*) – A dictionary mapping an objective name (str) to a tuple of the form (exception, traceback). All of the objectives that errored will be stored here.
- **scored_successfully** (*dict*) – A dictionary mapping an objective name (str) to a score value. All of the objectives that did not error will be stored here.

class evalml.exceptions.exceptions.**ValidationErrorCode**

Enum identifying the type of error encountered in holdout validation.

Attributes

IN- VALID_HOLDOUT_GAP_SEPARATION	invalid_holdout_gap_separation
IN- VALID_HOLDOUT_LENGTH	invalid_holdout_length

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

exception evalml.exceptions.**PipelineError**(*message, code, details=None*)

Exception raised for errors that can be raised when applying a pipeline.

Parameters

- **message** (*str*) – descriptive error message
- **code** (**PipelineErrorCodeEnum**) – code for specific error
- **details** (*dict*) – additional details for error

class evalml.exceptions.**PipelineErrorCodeEnum**

Enum identifying the type of error encountered while applying a pipeline.

Attributes

PRE-DICT_INPUT_SCHEMA_UNEQUAL	predict_input_schema_unequal
--------------------------------------	------------------------------

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

exception evalml.exceptions.PipelineNotFoundError

An exception raised when a particular pipeline is not found in automl search results.

exception evalml.exceptions.PipelineNotYetFittedError

An exception to be raised when predict/predict_proba/transform is called on a pipeline without fitting first.

exception evalml.exceptions.PipelineScoreError(*exceptions, scored_successfully*)

An exception raised when a pipeline errors while scoring any objective in a list of objectives.

Parameters

- **exceptions** (*dict*) – A dictionary mapping an objective name (str) to a tuple of the form (exception, traceback). All of the objectives that errored will be stored here.
- **scored_successfully** (*dict*) – A dictionary mapping an objective name (str) to a score value. All of the objectives that did not error will be stored here.

class evalml.exceptions.ValidationErrorCode

Enum identifying the type of error encountered in holdout validation.

Attributes

IN- VALID_HOLDOUT_GAP_SEPARATION	invalid_holdout_gap_separation
IN- VALID_HOLDOUT_LENGTH	invalid_holdout_length

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

Model Family

Family of machine learning models.

Submodules

model_family

Enum for family of machine learning models.

Module Contents

Classes Summary

<i>ModelFamily</i>	Enum for family of machine learning models.
--------------------	---

Contents

class evalml.model_family.model_family.**ModelFamily**

Enum for family of machine learning models.

Attributes

ARIMA	ARIMA model family.
BASELINE	Baseline model family.
CAT-BOOST	CatBoost model family.
DECISION_TREE	Decision Tree model family.
ENSEMBLE	Ensemble model family.
EXPONENTIAL_SMOOTHING	Exponential Smoothing model family.
EXTRA_TREES	Extra Trees model family.
K_NEIGHBORS	K Nearest Neighbors model family.
LIGHTGBM	LightGBM model family.
LINEAR_MODEL	Linear model family.
NONE	None
PROPHET	Prophet model family.
RANDOM_FOREST	Random Forest model family.
SVM	SVM model family.
VARMAX	VARMAX model family.
VOWPAL_WABBIT	Vowpal Wabbit model family.
XGBOOST	XGBoost model family.

Methods

<i>is_tree_estimator</i>	Checks whether the estimator's model family uses trees.
<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

is_tree_estimator(*self*)

Checks whether the estimator's model family uses trees.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

utils

Utility methods for EvalML's model families.

Module Contents

Functions

<i>handle_model_family</i>	Handles model_family by either returning the ModelFamily or converting from a string.
----------------------------	---

Contents

evalml.model_family.utils.**handle_model_family**(*model_family*)

Handles model_family by either returning the ModelFamily or converting from a string.

Parameters **model_family** (*str or ModelFamily*) – Model type that needs to be handled.

Returns ModelFamily

Raises

- **KeyError** – If input is not a valid model family.
- **ValueError** – If input is not a string or ModelFamily object.

Package Contents

Classes Summary

<i>ModelFamily</i>	Enum for family of machine learning models.
--------------------	---

Functions

handle_model_family

Handles `model_family` by either returning the `ModelFamily` or converting from a string.

Contents

`evalml.model_family.handle_model_family(model_family)`

Handles `model_family` by either returning the `ModelFamily` or converting from a string.

Parameters `model_family` (*str* or `ModelFamily`) – Model type that needs to be handled.

Returns `ModelFamily`

Raises

- **KeyError** – If input is not a valid model family.
- **ValueError** – If input is not a string or `ModelFamily` object.

class `evalml.model_family.ModelFamily`

Enum for family of machine learning models.

Attributes

ARIMA	ARIMA model family.
BASELINE	Baseline model family.
CAT-BOOST	CatBoost model family.
DECISION_TREE	Decision Tree model family.
ENSEMBLE	Ensemble model family.
EXPONENTIAL_SMOOTHING	Exponential Smoothing model family.
EXTRA_TREES	Extra Trees model family.
K_NEIGHBORS	K Nearest Neighbors model family.
LIGHTGBM	LightGBM model family.
LINEAR_MODEL	Linear model family.
NONE	None
PROPHET	Prophet model family.
RANDOM_FOREST	Random Forest model family.
SVM	SVM model family.
VARMAX	VARMAX model family.
VOWPAL_WABBIT	Vowpal Wabbit model family.
XGBOOST	XGBoost model family.

Methods

<i>is_tree_estimator</i>	Checks whether the estimator's model family uses trees.
<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

is_tree_estimator(*self*)

Checks whether the estimator's model family uses trees.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

Model Understanding

Model understanding tools.

Subpackages

prediction_explanations

Prediction explanation tools.

Submodules

explainers

Prediction explanation tools.

Module Contents

Classes Summary

<i>ExplainPredictionsStage</i>	Enum for prediction stage.
--------------------------------	----------------------------

Functions

<code>abs_error</code>	Computes the absolute error per data point for regression problems.
<code>cross_entropy</code>	Computes Cross Entropy Loss per data point for classification problems.
<code>explain_predictions</code>	Creates a report summarizing the top contributing features for each data point in the input features.
<code>explain_predictions_best_worst</code>	Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

Attributes Summary

`DEFAULT_METRICS`

Contents

`evalml.model_understanding.prediction_explanations.explainers.abs_error(y_true, y_pred)`

Computes the absolute error per data point for regression problems.

Parameters

- **y_true** (*pd.Series*) – True labels.
- **y_pred** (*pd.Series*) – Predicted values.

Returns *np.ndarray*

`evalml.model_understanding.prediction_explanations.explainers.cross_entropy(y_true, y_pred_proba)`

Computes Cross Entropy Loss per data point for classification problems.

Parameters

- **y_true** (*pd.Series*) – True labels encoded as ints.
- **y_pred_proba** (*pd.DataFrame*) – Predicted probabilities. One column per class.

Returns *np.ndarray*

`evalml.model_understanding.prediction_explanations.explainers.DEFAULT_METRICS`

```
evalml.model_understanding.prediction_explanations.explainers.explain_predictions(pipeline,  
                                         in-  
                                         put_features,  
                                         y, in-  
                                         dices_to_explain,  
                                         top_k_features=3,  
                                         in-  
                                         clude_explainer_values=False,  
                                         in-  
                                         clude_expected_value=False,  
                                         out-  
                                         put_format='text',  
                                         train-  
                                         ing_data=None,  
                                         train-  
                                         ing_target=None,  
                                         algo-  
                                         rithm='shap')
```

Creates a report summarizing the top contributing features for each data point in the input features.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline's predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.
- **input_features** (*pd.DataFrame*) – Dataframe of input data to evaluate the pipeline on.
- **y** (*pd.Series*) – Labels for the input data.
- **indices_to_explain** (*list[int]*) – List of integer indices to explain.
- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point. Default is 3.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **include_expected_value** (*bool*) – Whether the expected value should be included in the table. Default is False.
- **output_format** (*str*) – Either “text”, “dict”, or “dataframe”. Default is “text”.
- **training_data** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.
- **training_target** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features to each prediction for each row of input_features.

The report will include the feature names, prediction contribution, and explainer value (optional).

Return type str, dict, or pd.DataFrame

Raises

- **ValueError** – if input_features is empty.
- **ValueError** – if an output_format outside of “text”, “dict” or “dataframe” is provided.
- **ValueError** – if the requested index falls outside the input_feature’s boundaries.

evalml.model_understanding.prediction_explanations.explainers.**explain_predictions_best_worst**(pipeline, input_features, y_true, num_to_explain, top_k_features, include_explainer_values, metric=None, output_format='call-back', training_data=None, training_target=None, algorithm='shap')

Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline’s predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.
- **input_features** (*pd.DataFrame*) – Input data to evaluate the pipeline on.
- **y_true** (*pd.Series*) – True labels for the input data.
- **num_to_explain** (*int*) – How many of the best, worst, random data points to explain.
- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **metric** (*callable*) – The metric used to identify the best and worst points in the dataset. Function must accept the true labels and predicted value or probabilities as the only arguments and lower values must be better. By default, this will be the absolute error for regression problems and cross entropy loss for classification problems.

- **output_format** (*str*) – Either “text” or “dict”. Default is “text”.
- **callback** (*callable*) – Function to be called with incremental updates. Has the following parameters: - progress_stage: stage of computation - time_elapsed: total time in seconds that has elapsed since start of call
- **training_data** (*pd.DataFrame, np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.
- **training_target** (*pd.Series, np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features for the best/worst predictions in the input_features.

For each of the best/worst rows of input_features, the predicted values, true labels, metric value, feature names, prediction contribution, and explainer value (optional) will be listed.

Return type str, dict, or pd.DataFrame

Raises

- **ValueError** – If input_features does not have more than twice the requested features to explain.
- **ValueError** – If y_true and input_features have mismatched lengths.
- **ValueError** – If an output_format outside of “text”, “dict” or “dataframe is provided.
- **PipelineScoreError** – If the pipeline errors out while scoring.

class

evalml.model_understanding.prediction_explanations.explainers.**ExplainPredictionsStage**

Enum for prediction stage.

Attributes

COM- PUTE_EXPLAINER_VALUES_STAGE	compute_explainer_value_stage
COM- PUTE_FEATURE_STAGE	compute_feature_stage
DONE	done
PRE- DICT_STAGE	predict_stage
PREPRO- CESS- ING_STAGE	preprocessing_stage

Methods

<i>name</i>	The name of the Enum member.
<i>value</i>	The value of the Enum member.

name(*self*)

The name of the Enum member.

value(*self*)

The value of the Enum member.

Package Contents

Functions

<code>explain_predictions</code>	Creates a report summarizing the top contributing features for each data point in the input features.
<code>explain_predictions_best_worst</code>	Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

Contents

`evalml.model_understanding.prediction_explanations.explain_predictions`(*pipeline*, *input_features*, *y*, *indices_to_explain*, *top_k_features*=3, *include_explainer_values*=False, *include_expected_value*=False, *output_format*='text', *training_data*=None, *training_target*=None, *algorithm*='shap')

Creates a report summarizing the top contributing features for each data point in the input features.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline's predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.
- **input_features** (*pd.DataFrame*) – Dataframe of input data to evaluate the pipeline on.
- **y** (*pd.Series*) – Labels for the input data.
- **indices_to_explain** (*list[int]*) – List of integer indices to explain.
- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point. Default is 3.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **include_expected_value** (*bool*) – Whether the expected value should be included in the table. Default is False.
- **output_format** (*str*) – Either “text”, “dict”, or “dataframe”. Default is “text”.
- **training_data** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.

- **training_target** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features to each prediction for each row of input_features.

The report will include the feature names, prediction contribution, and explainer value (optional).

Return type str, dict, or pd.DataFrame

Raises

- **ValueError** – if input_features is empty.
- **ValueError** – if an output_format outside of “text”, “dict” or “dataframe is provided.
- **ValueError** – if the requested index falls outside the input_feature’s boundaries.

```
evalml.model_understanding.prediction_explanations.explain_predictions_best_worst(pipeline,  
                                                                                 in-  
                                                                                 put_features,  
                                                                                 y_true,  
                                                                                 num_to_explain=5,  
                                                                                 top_k_features=3,  
                                                                                 in-  
                                                                                 clude_explainer_values=False,  
                                                                                 met-  
                                                                                 ric=None,  
                                                                                 out-  
                                                                                 put_format='text',  
                                                                                 call-  
                                                                                 back=None,  
                                                                                 train-  
                                                                                 ing_data=None,  
                                                                                 train-  
                                                                                 ing_target=None,  
                                                                                 algo-  
                                                                                 rithm='shap')
```

Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline’s predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.
- **input_features** (*pd.DataFrame*) – Input data to evaluate the pipeline on.
- **y_true** (*pd.Series*) – True labels for the input data.
- **num_to_explain** (*int*) – How many of the best, worst, random data points to explain.

- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **metric** (*callable*) – The metric used to identify the best and worst points in the dataset. Function must accept the true labels and predicted value or probabilities as the only arguments and lower values must be better. By default, this will be the absolute error for regression problems and cross entropy loss for classification problems.
- **output_format** (*str*) – Either “text” or “dict”. Default is “text”.
- **callback** (*callable*) – Function to be called with incremental updates. Has the following parameters: - progress_stage: stage of computation - time_elapsed: total time in seconds that has elapsed since start of call
- **training_data** (*pd.DataFrame, np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.
- **training_target** (*pd.Series, np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features for the best/worst predictions in the input_features.

For each of the best/worst rows of input_features, the predicted values, true labels, metric value, feature names, prediction contribution, and explainer value (optional) will be listed.

Return type str, dict, or pd.DataFrame

Raises

- **ValueError** – If input_features does not have more than twice the requested features to explain.
- **ValueError** – If y_true and input_features have mismatched lengths.
- **ValueError** – If an output_format outside of “text”, “dict” or “dataframe is provided.
- **PipelineScoreError** – If the pipeline errors out while scoring.

Submodules

decision_boundary

Model Understanding for decision boundary on Binary Classification problems.

Module Contents

Functions

<code>find_confusion_matrix_per_thresholds</code>	Gets the confusion matrix and histogram bins for each threshold as well as the best threshold per objective. Only works with Binary Classification Pipelines.
---	---

Contents

`evalml.model_understanding.decision_boundary.find_confusion_matrix_per_thresholds`(*pipeline*,
X, *y*,
n_bins=None,
top_k=5,
to_json=False)

Gets the confusion matrix and histogram bins for each threshold as well as the best threshold per objective. Only works with Binary Classification Pipelines.

Parameters

- **pipeline** (*PipelineBase*) – A fitted Binary Classification Pipeline to get the confusion matrix with.
- **X** (*pd.DataFrame*) – The input features.
- **y** (*pd.Series*) – The input target.
- **n_bins** (*int*) – The number of bins to use to calculate the threshold values. Defaults to None, which will default to using Freedman-Diaconis rule.
- **top_k** (*int*) – The maximum number of row indices per bin to include as samples. -1 includes all row indices that fall between the bins. Defaults to 5.
- **to_json** (*bool*) – Whether or not to return a json output. If False, returns the (DataFrame, dict) tuple, otherwise returns a json.

Returns

The dataframe has the **actual positive histogram**, **actual negative histogram**, the confusion matrix, and a sample of rows that fall in the bin, all for each threshold value. The threshold value, represented through the dataframe index, represents the cutoff threshold at that value. The dictionary contains the ideal threshold and score per objective, keyed by objective name. If json, returns the info for both the dataframe and dictionary as a json output.

Return type (tuple(pd.DataFrame, dict)), json)

Raises **ValueError** – If the pipeline isn't a binary classification pipeline or isn't yet fitted on data.

feature_explanations

Human Readable Pipeline Explanations.

Module Contents

Functions

<code>get_influential_features</code>	Finds the most influential features as well as any detrimental features from a dataframe of feature importances.
<code>readable_explanation</code>	Outputs a human-readable explanation of trained pipeline behavior.

Contents

```
evalml.model_understanding.feature_explanations.get_influential_features(imp_df,
                                                                    max_features=5,
                                                                    min_importance_threshold=0.05,
                                                                    linear_importance=False)
```

Finds the most influential features as well as any detrimental features from a dataframe of feature importances.

Parameters

- **`imp_df`** (*pd.DataFrame*) – DataFrame containing feature names and associated importances.
- **`max_features`** (*int*) – The maximum number of features to include in an explanation. Defaults to 5.
- **`min_importance_threshold`** (*float*) – The minimum percent of total importance a single feature can have to be considered important. Defaults to 0.05.
- **`linear_importance`** (*bool*) – When True, negative feature importances are not considered detrimental. Defaults to False.

Returns Lists of feature names corresponding to heavily influential, somewhat influential, and detrimental features, respectively.

Return type (list, list, list)

```
evalml.model_understanding.feature_explanations.readable_explanation(pipeline, X=None,
                                                                    y=None, importance_method='permutation',
                                                                    max_features=5,
                                                                    min_importance_threshold=0.05,
                                                                    objective='auto')
```

Outputs a human-readable explanation of trained pipeline behavior.

Parameters

- **`pipeline`** (*PipelineBase*) – The pipeline to explain.
- **`X`** (*pd.DataFrame*) – If importance_method is permutation, the holdout X data to compute importance with. Ignored otherwise.

- **y** (*pd.Series*) – The holdout y data, used to obtain the name of the target class. If importance_method is permutation, used to compute importance with.
- **importance_method** (*str*) – The method of determining feature importance. One of [“permutation”, “feature”]. Defaults to “permutation”.
- **max_features** (*int*) – The maximum number of influential features to include in an explanation. This does not affect the number of detrimental features reported. Defaults to 5.
- **min_importance_threshold** (*float*) – The minimum percent of total importance a single feature can have to be considered important. Defaults to 0.05.
- **objective** (*str*, *ObjectiveBase*) – If importance_method is permutation, the objective to compute importance with. Ignored otherwise, defaults to “auto”.

Raises **ValueError** – if any arguments passed in are invalid or the pipeline is not fitted.

force_plots

Force plots.

Module Contents

Functions

<i>force_plot</i>	Function to generate the data required to build a force plot.
<i>graph_force_plot</i>	Function to generate force plots for the desired rows of the training data.

Contents

`evalml.model_understanding.force_plots.force_plot(pipeline, rows_to_explain, training_data, y)`

Function to generate the data required to build a force plot.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to generate the force plot for.
- **rows_to_explain** (*list[int]*) – A list of the indices of the training_data to explain.
- **training_data** (*pandas.DataFrame*) – The data used to train the pipeline.
- **y** (*pandas.Series*) – The target data.

Returns

list of dictionaries where each dict contains force plot data. Each dictionary entry represents the explanations for a single row.

For single row binary force plots:

```
[{'malignant': {'expected_value': 0.37, 'feature_names': ['worst concave points', 'worst perimeter', 'worst radius'], 'shap_values': [0.09, 0.09, 0.08], 'plot': AdditiveForceVisualizer}]
```

For two row binary force plots:

```
[{'malignant': {'expected_value': 0.37, 'feature_names': ['worst concave points',
'worst perimeter', 'worst radius'], 'shap_values': [0.09, 0.09, 0.08], 'plot': Additive-
ForceVisualizer},
```

```
{'malignant': {'expected_value': 0.29, 'feature_names': ['worst concave points',
'worst perimeter', 'worst radius'], 'shap_values': [0.05, 0.03, 0.02], 'plot': Additive-
ForceVisualizer}]
```

Return type list[dict]

Raises

- **TypeError** – If rows_to_explain is not a list.
- **TypeError** – If all values in rows_to_explain aren't integers.

evalml.model_understanding.force_plots.**graph_force_plot**(pipeline, rows_to_explain, training_data, y, matplotlib=False)

Function to generate force plots for the desired rows of the training data.

Parameters

- **pipeline** (*PipelineBase*) – The pipeline to generate the force plot for.
- **rows_to_explain** (*list[int]*) – A list of the indices indicating which of the rows of the training_data to explain.
- **training_data** (*pandas.DataFrame*) – The data used to train the pipeline.
- **y** (*pandas.Series*) – The target data for the pipeline.
- **matplotlib** (*bool*) – flag to display the force plot using matplotlib (outside of jupyter) Defaults to False.

Returns

The same as force_plot(), but with an additional key in each dictionary for the plot.

Return type list[dict[shap.AdditiveForceVisualizer]]

metrics

Standard metrics used for model understanding.

Module Contents

Functions

<code>check_distribution</code>	Determines if the distribution of the predicted data is likely to match that of the ground truth data.
<code>confusion_matrix</code>	Confusion matrix for binary and multiclass classification.
<code>graph_confusion_matrix</code>	Generate and display a confusion matrix plot.
<code>graph_precision_recall_curve</code>	Generate and display a precision-recall plot.
<code>graph_roc_curve</code>	Generate and display a Receiver Operating Characteristic (ROC) plot for binary and multiclass classification problems.
<code>normalize_confusion_matrix</code>	Normalizes a confusion matrix.
<code>precision_recall_curve</code>	Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.
<code>roc_curve</code>	Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve. Works with binary or multiclass problems.

Contents

`evalml.model_understanding.metrics.check_distribution(y_true, y_pred, problem_type, threshold=0.1)`

Determines if the distribution of the predicted data is likely to match that of the ground truth data.

Will use a different statistical test based on the given problem type: - Classification (Binary or Multiclass) - chi squared test - Regression - Kolmogorov-Smirnov test - Time Series Regression - Wilcoxon signed-rank test
:param y_true: The ground truth data. :type y_true: `pd.Series`
:param y_pred: Predictions from a pipeline. :type y_pred: `pd.Series`
:param problem_type: The pipeline's problem type, used to determine the method. :type problem_type: `str` or `ProblemType`
:param threshold: The threshold for the p value where we choose to accept or reject the null hypothesis.

Should be between 0 and 1, non-inclusive. Defaults to 0.1.

Returns 0 if the distribution of predicted values is not likely to match the true distribution, 1 if it is.

Return type `int`

`evalml.model_understanding.metrics.confusion_matrix(y_true, y_predicted, normalize_method='true')`

Confusion matrix for binary and multiclass classification.

Parameters

- **y_true** (`pd.Series` or `np.ndarray`) – True binary labels.
- **y_predicted** (`pd.Series` or `np.ndarray`) – Predictions from a binary classifier.
- **normalize_method** (`{'true', 'pred', 'all', None}`) – Normalization method to use, if not None. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.

Returns Confusion matrix. The column header represents the predicted labels while row header represents the actual labels.

Return type `pd.DataFrame`

```
evalml.model_understanding.metrics.graph_confusion_matrix(y_true, y_pred,
                                                         normalize_method='true',
                                                         title_addition=None)
```

Generate and display a confusion matrix plot.

If *normalize_method* is set, hover text will show raw count, otherwise hover text will show count normalized with method 'true'.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all', None}*) – Normalization method to use, if not None. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.
- **title_addition** (*str*) – If not None, append to plot title. Defaults to None.

Returns *plotly*.Figure representing the confusion matrix plot generated.

```
evalml.model_understanding.metrics.graph_precision_recall_curve(y_true, y_pred_proba,
                                                              title_addition=None)
```

Generate and display a precision-recall plot.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the "true" label.
- **title_addition** (*str* or *None*) – If not None, append to plot title. Defaults to None.

Returns *plotly*.Figure representing the precision-recall plot generated

```
evalml.model_understanding.metrics.graph_roc_curve(y_true, y_pred_proba,
                                                  custom_class_names=None,
                                                  title_addition=None)
```

Generate and display a Receiver Operating Characteristic (ROC) plot for binary and multiclass classification problems.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a classifier, before thresholding has been applied. Note this should be a one dimensional array with the predicted probability for the "true" label in the binary case.
- **custom_class_names** (*list* or *None*) – If not None, custom labels for classes. Defaults to None.
- **title_addition** (*str* or *None*) – if not None, append to plot title. Defaults to None.

Returns *plotly*.Figure representing the ROC plot generated

Raises **ValueError** – If the number of custom class names does not match number of classes in the input data.

```
evalml.model_understanding.metrics.normalize_confusion_matrix(conf_mat,  
                                                             normalize_method='true')
```

Normalizes a confusion matrix.

Parameters

- **conf_mat** (*pd.DataFrame* or *np.ndarray*) – Confusion matrix to normalize.
- **normalize_method** (*{'true', 'pred', 'all'}*) – Normalization method. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.

Returns normalized version of the input confusion matrix. The column header represents the predicted labels while row header represents the actual labels.

Return type *pd.DataFrame*

Raises `ValueError` – If configuration is invalid, or if the sum of a given axis is zero and normalization by axis is specified.

```
evalml.model_understanding.metrics.precision_recall_curve(y_true, y_pred_proba, pos_label_idx=-1)
```

Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.
- **pos_label_idx** (*int*) – the column index corresponding to the positive class. If predicted probabilities are two-dimensional, this will be used to access the probabilities for the positive class.

Returns

Dictionary containing metrics used to generate a precision-recall plot, with the following keys:

- *precision*: Precision values.
- *recall*: Recall values.
- *thresholds*: Threshold values used to produce the precision and recall.
- *auc_score*: The area under the ROC curve.

Return type *list*

Raises `NoPositiveLabelException` – If predicted probabilities do not contain a column at the specified label.

```
evalml.model_understanding.metrics.roc_curve(y_true, y_pred_proba)
```

Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve. Works with binary or multiclass problems.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True labels.
- **y_pred_proba** (*pd.Series* or *pd.DataFrame* or *np.ndarray*) – Predictions from a classifier, before thresholding has been applied.

Returns

A list of dictionaries (with one for each class) is returned. Binary classification problems return a list with one di

Each dictionary contains metrics used to generate an ROC plot with the following keys:

- *fpr_rate*: False positive rate.
- *tpr_rate*: True positive rate.
- *threshold*: Threshold values used to produce each pair of true/false positive rates.
- *auc_score*: The area under the ROC curve.

Return type list(dict)

partial_dependence_functions

Top level functions for running partial dependence.

Module Contents

Functions

<i>graph_partial_dependence</i>	Create an one-way or two-way partial dependence plot.
<i>partial_dependence</i>	Calculates one or two-way partial dependence.

Contents

```
evalml.model_understanding.partial_dependence_functions.graph_partial_dependence(pipeline,
                                          X, features,
                                          class_label=None,
                                          grid_resolution=100,
                                          kind='average')
```

Create an one-way or two-way partial dependence plot.

Passing a single integer or string as features will create a one-way partial dependence plot with the feature values plotted against the partial dependence. Passing features a tuple of int/strings will create a two-way partial dependence plot with a contour of feature[0] in the y-axis, feature[1] in the x-axis and the partial dependence in the z-axis.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*, *np.ndarray*) – The input data used to generate a grid of values for feature where partial dependence will be calculated at.
- **features** (*int*, *string*, *tuple[int or string]*) – The target feature for which to create the partial dependence plot for. If features is an int, it must be the index of the feature to use. If features is a string, it must be a valid column name in X. If features is a tuple of strings, it must contain valid column int/names in X.

- **class_label** (*string, optional*) – Name of class to plot for multiclass problems. If None, will plot the partial dependence for each class. This argument does not change behavior for regression or binary classification pipelines. For binary classification, the partial dependence for the positive label will always be displayed. Defaults to None.
- **grid_resolution** (*int*) – Number of samples of feature(s) for partial dependence plot.
- **kind** (*{'average', 'individual', 'both'}*) – Type of partial dependence to plot. ‘average’ creates a regular partial dependence (PD) graph, ‘individual’ creates an individual conditional expectation (ICE) plot, and ‘both’ creates a single-figure PD and ICE plot. ICE plots can only be shown for one-way partial dependence plots.

Returns figure object containing the partial dependence data for plotting

Return type plotly.graph_objects.Figure

Raises

- **PartialDependenceError** – if a graph is requested for a class name that isn’t present in the pipeline.
- **PartialDependenceError** – if an ICE plot is requested for a two-way partial dependence.

```
evalml.model_understanding.partial_dependence_functions.partial_dependence(pipeline, X,  
                                                                           features,  
                                                                           percentiles=(0.05,  
                                                                           0.95),  
                                                                           grid_resolution=100,  
                                                                           kind='average',  
                                                                           fast_mode=False,  
                                                                           X_train=None,  
                                                                           y_train=None)
```

Calculates one or two-way partial dependence.

If a single integer or string is given for features, one-way partial dependence is calculated. If a tuple of two integers or strings is given, two-way partial dependence is calculated with the first feature in the y-axis and second feature in the x-axis.

Parameters

- **pipeline** (*PipelineBase or subclass*) – Fitted pipeline
- **X** (*pd.DataFrame, np.ndarray*) – The input data used to generate a grid of values for feature where partial dependence will be calculated at
- **features** (*int, string, tuple[int or string]*) – The target feature for which to create the partial dependence plot for. If features is an int, it must be the index of the feature to use. If features is a string, it must be a valid column name in X. If features is a tuple of int/strings, it must contain valid column integers/names in X.
- **percentiles** (*tuple[float]*) – The lower and upper percentile used to create the extreme values for the grid. Must be in [0, 1]. Defaults to (0.05, 0.95).
- **grid_resolution** (*int*) – Number of samples of feature(s) for partial dependence plot. If this value is less than the maximum number of categories present in categorical data within X, it will be set to the max number of categories + 1. Defaults to 100.
- **kind** (*{'average', 'individual', 'both'}*) – The type of predictions to return. ‘individual’ will return the predictions for all of the points in the grid for each sample in X. ‘average’ will return the predictions for all of the points in the grid but averaged over all of the samples in X.

- **fast_mode** (*bool, optional*) – Whether or not performance optimizations should be used for partial dependence calculations. Defaults to False. Note that user-specified components may not produce correct partial dependence results, so fast mode should only be used with EvalML-native components. Additionally, some components are not compatible with fast mode; in those cases, an error will be raised indicating that fast mode should not be used.
- **X_train** (*pd.DataFrame, np.ndarray*) – The data that was used to train the original pipeline. Will be used in fast mode to train the cloned pipelines. Defaults to None.
- **y_train** (*pd.Series, np.ndarray*) – The target data that was used to train the original pipeline. Will be used in fast mode to train the cloned pipelines. Defaults to None.

Returns

When *kind='average'*: DataFrame with averaged predictions for all points in the grid averaged over all samples of X and the values used to calculate those predictions.

When *kind='individual'*: DataFrame with individual predictions for all points in the grid for each sample of X and the values used to calculate those predictions. If a two-way partial dependence is calculated, then the result is a list of DataFrames with each DataFrame representing one sample's predictions.

When *kind='both'*: A tuple consisting of the averaged predictions (in a DataFrame) over all samples of X and the individual predictions (in a list of DataFrames) for each sample of X.

In the one-way case: The dataframe will contain two columns, “feature_values” (grid points at which the partial dependence was calculated) and “partial_dependence” (the partial dependence at that feature value). For classification problems, there will be a third column called “class_label” (the class label for which the partial dependence was calculated). For binary classification, the partial dependence is only calculated for the “positive” class.

In the two-way case: The data frame will contain grid_resolution number of columns and rows where the index and column headers are the sampled values of the first and second features, respectively, used to make the partial dependence contour. The values of the data frame contain the partial dependence data for each feature value pair.

Return type pd.DataFrame, list(pd.DataFrame), or tuple(pd.DataFrame, list(pd.DataFrame))

Raises

- **ValueError** – Error during call to scikit-learn's partial dependence method.
- **Exception** – All other errors during calculation.
- **PartialDependenceError** – if the user provides a tuple of not exactly two features.
- **PartialDependenceError** – if the provided pipeline isn't fitted.
- **PartialDependenceError** – if the provided pipeline is a Baseline pipeline.
- **PartialDependenceError** – if any of the features passed in are completely NaN
- **PartialDependenceError** – if any of the features are low-variance. Defined as having one value occurring more than the upper percentile passed by the user. By default 95%.

permutation_importance

Permutation importance methods.

Module Contents

Functions

<code>calculate_permutation_importance</code>	Calculates permutation importance for features.
<code>calculate_permutation_importance_one_column</code>	Calculates permutation importance for one column in the original dataframe.
<code>graph_permutation_importance</code>	Generate a bar graph of the pipeline's permutation importance.

Contents

`evalml.model_understanding.permutation_importance.calculate_permutation_importance(pipeline, X, y, objective, n_repeats=5, n_jobs=None, random_seed=0)`

Calculates permutation importance for features.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **objective** (*str*, *ObjectiveBase*) – Objective to score on.
- **n_repeats** (*int*) – Number of times to permute a feature. Defaults to 5.
- **n_jobs** (*int* or *None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For *n_jobs* below -1, (*n_cpus* + 1 + *n_jobs*) are used. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Mean feature importance scores over a number of shuffles.

Return type *pd.DataFrame*

Raises **ValueError** – If objective cannot be used with the given pipeline.

```
evalml.model_understanding.permutation_importance.calculate_permutation_importance_one_column(pipeline,
                                                                                             X,
                                                                                             y,
                                                                                             col_name,
                                                                                             ob-
                                                                                             jec-
                                                                                             tive,
                                                                                             n_repeats=5,
                                                                                             fast=True,
                                                                                             pre-
                                                                                             com-
                                                                                             puted_features=None,
                                                                                             ran-
                                                                                             dom_seed=0)
```

Calculates permutation importance for one column in the original dataframe.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **col_name** (*str*, *int*) – The column in X to calculate permutation importance for.
- **objective** (*str*, *ObjectiveBase*) – Objective to score on.
- **n_repeats** (*int*) – Number of times to permute a feature. Defaults to 5.
- **fast** (*bool*) – Whether to use the fast method of calculating the permutation importance or not. Defaults to True.
- **precomputed_features** (*pd.DataFrame*) – Precomputed features necessary to calculate permutation importance using the fast method. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Mean feature importance scores over a number of shuffles.

Return type float

Raises

- **ValueError** – If pipeline does not support fast permutation importance calculation.
- **ValueError** – If precomputed_features is None.

```
evalml.model_understanding.permutation_importance.graph_permutation_importance(pipeline, X,
                                                                                   y, objective,
                                                                                   impor-
                                                                                   tance_threshold=0)
```

Generate a bar graph of the pipeline’s permutation importance.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **objective** (*str*, *ObjectiveBase*) – Objective to score on.

- **importance_threshold** (*float, optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance_threshold. Defaults to 0.

Returns `plotly.Figure`, a bar graph showing features and their respective permutation importance.

Raises **ValueError** – If importance_threshold is not greater than or equal to 0.

visualizations

Visualization functions for model understanding.

Contents

`evalml.model_understanding.visualizations.binary_objective_vs_threshold(pipeline, X, y, objective, steps=100)`

Computes objective score as a function of potential binary classification decision thresholds for a fitted binary classification pipeline.

Parameters

- **pipeline** (*BinaryClassificationPipeline obj*) – Fitted binary classification pipeline.

- **X** (*pd.DataFrame*) – The input data used to compute objective score.
- **y** (*pd.Series*) – The target labels.
- **objective** (*ObjectiveBase obj, str*) – Objective used to score.
- **steps** (*int*) – Number of intervals to divide and calculate objective score at.

Returns DataFrame with thresholds and the corresponding objective score calculated at each threshold.

Return type *pd.DataFrame*

Raises

- **ValueError** – If objective is not a binary classification objective.
- **ValueError** – If objective's *score_needs_proba* is not False.

`evalml.model_understanding.visualizations.decision_tree_data_from_estimator(estimator)`

Return data for a fitted tree in a restructured format.

Parameters **estimator** (*ComponentBase*) – A fitted DecisionTree-based estimator.

Returns An OrderedDict of OrderedDicts describing a tree structure.

Return type *OrderedDict*

Raises

- **ValueError** – If estimator is not a decision tree-based estimator.
- **NotFittedError** – If estimator is not yet fitted.

`evalml.model_understanding.visualizations.decision_tree_data_from_pipeline(pipeline_)`

Return data for a fitted pipeline in a restructured format.

Parameters **pipeline** (*PipelineBase*) – A pipeline with a DecisionTree-based estimator.

Returns An OrderedDict of OrderedDicts describing a tree structure.

Return type *OrderedDict*

Raises

- **ValueError** – If estimator is not a decision tree-based estimator.
- **NotFittedError** – If estimator is not yet fitted.

`evalml.model_understanding.visualizations.get_linear_coefficients(estimator, features=None)`

Returns a dataframe showing the features with the greatest predictive power for a linear model.

Parameters

- **estimator** (*Estimator*) – Fitted linear model family estimator.
- **features** (*list[str]*) – List of feature names associated with the underlying data.

Returns Displaying the features by importance.

Return type *pd.DataFrame*

Raises

- **ValueError** – If the model is not a linear model.
- **NotFittedError** – If the model is not yet fitted.

`evalml.model_understanding.visualizations.get_prediction_vs_actual_data(y_true, y_pred, outlier_threshold=None)`

Combines `y_true` and `y_pred` into a single dataframe and adds a column for outliers. Used in `graph_prediction_vs_actual()`.

Parameters

- **y_true** (*pd.Series*, or *np.ndarray*) – The real target values of the data
- **y_pred** (*pd.Series*, or *np.ndarray*) – The predicted values outputted by the regression model.
- **outlier_threshold** (*int*, *float*) – A positive threshold for what is considered an outlier value. This value is compared to the absolute difference between each value of `y_true` and `y_pred`. Values within this threshold will be blue, otherwise they will be yellow. Defaults to `None`.

Returns

- *prediction*: Predicted values from regression model.
- *actual*: Real target values.
- *outlier*: Colors indicating which values are in the threshold for what is considered an outlier value.

Return type `pd.DataFrame` with the following columns

Raises **ValueError** – If threshold is not positive.

`evalml.model_understanding.visualizations.get_prediction_vs_actual_over_time_data(pipeline, X, y, X_train, y_train, dates)`

Get the data needed for the `prediction_vs_actual_over_time` plot.

Parameters

- **pipeline** (*TimeSeriesRegressionPipeline*) – Fitted time series regression pipeline.
- **X** (*pd.DataFrame*) – Features used to generate new predictions.
- **y** (*pd.Series*) – Target values to compare predictions against.
- **X_train** (*pd.DataFrame*) – Data the pipeline was trained on.
- **y_train** (*pd.Series*) – Target values for training data.
- **dates** (*pd.Series*) – Dates corresponding to target values and predictions.

Returns Predictions vs. time.

Return type `pd.DataFrame`

`evalml.model_understanding.visualizations.graph_binary_objective_vs_threshold(pipeline, X, y, objective, steps=100)`

Generates a plot graphing objective score vs. decision thresholds for a fitted binary classification pipeline.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline
- **X** (*pd.DataFrame*) – The input data used to score and compute scores

- **y** (*pd.Series*) – The target labels
- **objective** (*ObjectiveBase obj, str*) – Objective used to score, shown on the y-axis of the graph
- **steps** (*int*) – Number of intervals to divide and calculate objective score at

Returns *plotly.Figure* representing the objective score vs. threshold graph generated

`evalml.model_understanding.visualizations.graph_prediction_vs_actual(y_true, y_pred, outlier_threshold=None)`

Generate a scatter plot comparing the true and predicted values. Used for regression plotting.

Parameters

- **y_true** (*pd.Series*) – The real target values of the data.
- **y_pred** (*pd.Series*) – The predicted values outputted by the regression model.
- **outlier_threshold** (*int, float*) – A positive threshold for what is considered an outlier value. This value is compared to the absolute difference between each value of *y_true* and *y_pred*. Values within this threshold will be blue, otherwise they will be yellow. Defaults to *None*.

Returns *plotly.Figure* representing the predicted vs. actual values graph

Raises **ValueError** – If threshold is not positive.

`evalml.model_understanding.visualizations.graph_prediction_vs_actual_over_time(pipeline, X, y, X_train, y_train, dates, single_series=None)`

Plot the target values and predictions against time on the x-axis.

Parameters

- **pipeline** (*TimeSeriesRegressionPipeline*) – Fitted time series regression pipeline.
- **X** (*pd.DataFrame*) – Features used to generate new predictions. If problem is multiserries, *X* should be stacked.
- **y** (*pd.Series*) – Target values to compare predictions against. If problem is multiserries, *y* should be stacked.
- **X_train** (*pd.DataFrame*) – Data the pipeline was trained on.
- **y_train** (*pd.Series*) – Target values for training data.
- **dates** (*pd.Series*) – Dates corresponding to target values and predictions.
- **single_series** (*str*) – A single series id value to plot just one series in a multiserries dataset. Defaults to *None*.

Returns Showing the prediction vs actual over time.

Return type *plotly.Figure*

Raises **ValueError** – If the pipeline is not a time-series regression pipeline.

`evalml.model_understanding.visualizations.graph_t_sne(X, n_components=2, perplexity=30.0, learning_rate=200.0, metric='euclidean', marker_line_width=2, marker_size=7, **kwargs)`

Plot high dimensional data into lower dimensional space using t-SNE.

Parameters

- **X** (*np.ndarray*, *pd.DataFrame*) – Data to be transformed. Must be numeric.
- **n_components** (*int*) – Dimension of the embedded space. Defaults to 2.
- **perplexity** (*float*) – Related to the number of nearest neighbors that is used in other manifold learning algorithms. Larger datasets usually require a larger perplexity. Consider selecting a value between 5 and 50. Defaults to 30.
- **learning_rate** (*float*) – Usually in the range [10.0, 1000.0]. If the cost function gets stuck in a bad local minimum, increasing the learning rate may help. Must be positive. Defaults to 200.
- **metric** (*str*) – The metric to use when calculating distance between instances in a feature array. The default is “euclidean” which is interpreted as the squared euclidean distance.
- **marker_line_width** (*int*) – Determines the line width of the marker boundary. Defaults to 2.
- **marker_size** (*int*) – Determines the size of the marker. Defaults to 7.
- **kwargs** – Arbitrary keyword arguments.

Returns Figure representing the transformed data.

Return type `plotly.Figure`

Raises **ValueError** – If `marker_line_width` or `marker_size` are not valid values.

```
evalml.model_understanding.visualizations.t_sne(X, n_components=2, perplexity=30.0,
                                              learning_rate=200.0, metric='euclidean', **kwargs)
```

Get the transformed output after fitting X to the embedded space using t-SNE.

Parameters

- **X** (*np.ndarray*, *pd.DataFrame*) – Data to be transformed. Must be numeric.
- **n_components** (*int*, *optional*) – Dimension of the embedded space.
- **perplexity** (*float*, *optional*) – Related to the number of nearest neighbors that is used in other manifold learning algorithms. Larger datasets usually require a larger perplexity. Consider selecting a value between 5 and 50.
- **learning_rate** (*float*, *optional*) – Usually in the range [10.0, 1000.0]. If the cost function gets stuck in a bad local minimum, increasing the learning rate may help.
- **metric** (*str*, *optional*) – The metric to use when calculating distance between instances in a feature array.
- **kwargs** – Arbitrary keyword arguments.

Returns TSNE output.

Return type `np.ndarray (n_samples, n_components)`

Raises **ValueError** – If specified parameters are not valid values.

```
evalml.model_understanding.visualizations.visualize_decision_tree(estimator, max_depth=None,
                                                                rotate=False, filled=False,
                                                                filepath=None)
```

Generate an image visualizing the decision tree.

Parameters

- **estimator** (*ComponentBase*) – A fitted DecisionTree-based estimator.
- **max_depth** (*int, optional*) – The depth to which the tree should be displayed. If set to None (as by default), tree is fully generated.
- **rotate** (*bool, optional*) – Orient tree left to right rather than top-down.
- **filled** (*bool, optional*) – Paint nodes to indicate majority class for classification, extremity of values for regression, or purity of node for multi-output.
- **filepath** (*str, optional*) – Path to where the graph should be saved. If set to None (as by default), the graph will not be saved.

Returns DOT object that can be directly displayed in Jupyter notebooks.

Return type graphviz.Source

Raises

- **ValueError** – If estimator is not a decision tree-based estimator.
- **NotFittedError** – If estimator is not yet fitted.

Package Contents

Functions

<code>binary_objective_vs_threshold</code>	Computes objective score as a function of potential binary classification decision thresholds for a fitted binary classification pipeline.
<code>calculate_permutation_importance</code>	Calculates permutation importance for features.
<code>calculate_permutation_importance_one_column</code>	Calculates permutation importance for one column in the original dataframe.
<code>confusion_matrix</code>	Confusion matrix for binary and multiclass classification.
<code>explain_predictions</code>	Creates a report summarizing the top contributing features for each data point in the input features.
<code>explain_predictions_best_worst</code>	Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.
<code>find_confusion_matrix_per_thresholds</code>	Gets the confusion matrix and histogram bins for each threshold as well as the best threshold per objective. Only works with Binary Classification Pipelines.
<code>get_linear_coefficients</code>	Returns a dataframe showing the features with the greatest predictive power for a linear model.
<code>get_prediction_vs_actual_data</code>	Combines <code>y_true</code> and <code>y_pred</code> into a single dataframe and adds a column for outliers. Used in <code>graph_prediction_vs_actual()</code> .
<code>get_prediction_vs_actual_over_time_data</code>	Get the data needed for the <code>prediction_vs_actual_over_time</code> plot.
<code>graph_binary_objective_vs_threshold</code>	Generates a plot graphing objective score vs. decision thresholds for a fitted binary classification pipeline.
<code>graph_confusion_matrix</code>	Generate and display a confusion matrix plot.
<code>graph_partial_dependence</code>	Create an one-way or two-way partial dependence plot.
<code>graph_permutation_importance</code>	Generate a bar graph of the pipeline's permutation importance.
<code>graph_precision_recall_curve</code>	Generate and display a precision-recall plot.
<code>graph_prediction_vs_actual</code>	Generate a scatter plot comparing the true and predicted values. Used for regression plotting.
<code>graph_prediction_vs_actual_over_time</code>	Plot the target values and predictions against time on the x-axis.
<code>graph_roc_curve</code>	Generate and display a Receiver Operating Characteristic (ROC) plot for binary and multiclass classification problems.
<code>graph_t_sne</code>	Plot high dimensional data into lower dimensional space using t-SNE.
<code>normalize_confusion_matrix</code>	Normalizes a confusion matrix.
<code>partial_dependence</code>	Calculates one or two-way partial dependence.
<code>precision_recall_curve</code>	Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.
<code>roc_curve</code>	Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve. Works with binary or multiclass problems.
<code>t_sne</code>	Get the transformed output after fitting X to the embedded space using t-SNE.

Contents

`evalml.model_understanding.binary_objective_vs_threshold(pipeline, X, y, objective, steps=100)`

Computes objective score as a function of potential binary classification decision thresholds for a fitted binary classification pipeline.

Parameters

- **pipeline** (*BinaryClassificationPipeline obj*) – Fitted binary classification pipeline.
- **X** (*pd.DataFrame*) – The input data used to compute objective score.
- **y** (*pd.Series*) – The target labels.
- **objective** (*ObjectiveBase obj, str*) – Objective used to score.
- **steps** (*int*) – Number of intervals to divide and calculate objective score at.

Returns DataFrame with thresholds and the corresponding objective score calculated at each threshold.

Return type `pd.DataFrame`

Raises

- **ValueError** – If objective is not a binary classification objective.
- **ValueError** – If objective's `score_needs_proba` is not False.

`evalml.model_understanding.calculate_permutation_importance(pipeline, X, y, objective, n_repeats=5, n_jobs=None, random_seed=0)`

Calculates permutation importance for features.

Parameters

- **pipeline** (*PipelineBase or subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **objective** (*str, ObjectiveBase*) – Objective to score on.
- **n_repeats** (*int*) – Number of times to permute a feature. Defaults to 5.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For `n_jobs` below -1, `(n_cpus + 1 + n_jobs)` are used. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Mean feature importance scores over a number of shuffles.

Return type `pd.DataFrame`

Raises **ValueError** – If objective cannot be used with the given pipeline.

`evalml.model_understanding.calculate_permutation_importance_one_column(pipeline, X, y, col_name, objective, n_repeats=5, fast=True, precomputed_features=None, random_seed=0)`

Calculates permutation importance for one column in the original dataframe.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **col_name** (*str*, *int*) – The column in X to calculate permutation importance for.
- **objective** (*str*, *ObjectiveBase*) – Objective to score on.
- **n_repeats** (*int*) – Number of times to permute a feature. Defaults to 5.
- **fast** (*bool*) – Whether to use the fast method of calculating the permutation importance or not. Defaults to True.
- **precomputed_features** (*pd.DataFrame*) – Precomputed features necessary to calculate permutation importance using the fast method. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Returns Mean feature importance scores over a number of shuffles.

Return type float

Raises

- **ValueError** – If pipeline does not support fast permutation importance calculation.
- **ValueError** – If precomputed_features is None.

`evalml.model_understanding.confusion_matrix(y_true, y_predicted, normalize_method='true')`

Confusion matrix for binary and multiclass classification.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_predicted** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all', None}*) – Normalization method to use, if not None. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.

Returns Confusion matrix. The column header represents the predicted labels while row header represents the actual labels.

Return type *pd.DataFrame*

`evalml.model_understanding.explain_predictions(pipeline, input_features, y, indices_to_explain, top_k_features=3, include_explainer_values=False, include_expected_value=False, output_format='text', training_data=None, training_target=None, algorithm='shap')`

Creates a report summarizing the top contributing features for each data point in the input features.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline's predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.

- **input_features** (*pd.DataFrame*) – Dataframe of input data to evaluate the pipeline on.
- **y** (*pd.Series*) – Labels for the input data.
- **indices_to_explain** (*list[int]*) – List of integer indices to explain.
- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point. Default is 3.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **include_expected_value** (*bool*) – Whether the expected value should be included in the table. Default is False.
- **output_format** (*str*) – Either “text”, “dict”, or “dataframe”. Default is “text”.
- **training_data** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.
- **training_target** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features to each prediction for each row of input_features.

The report will include the feature names, prediction contribution, and explainer value (optional).

Return type str, dict, or pd.DataFrame

Raises

- **ValueError** – if input_features is empty.
- **ValueError** – if an output_format outside of “text”, “dict” or “dataframe is provided.
- **ValueError** – if the requested index falls outside the input_feature’s boundaries.

```
evalml.model_understanding.explain_predictions_best_worst(pipeline, input_features, y_true,
                                                         num_to_explain=5, top_k_features=3,
                                                         include_explainer_values=False,
                                                         metric=None, output_format='text',
                                                         callback=None, training_data=None,
                                                         training_target=None,
                                                         algorithm='shap')
```

Creates a report summarizing the top contributing features for the best and worst points in the dataset as measured by error to true labels.

XGBoost models and CatBoost multiclass classifiers are not currently supported with the SHAP algorithm. To explain XGBoost model predictions, use the LIME algorithm. The LIME algorithm does not currently support any CatBoost models. For Stacked Ensemble models, the SHAP value for each input pipeline’s predict function into the metalearner is used.

Parameters

- **pipeline** (*PipelineBase*) – Fitted pipeline whose predictions we want to explain with SHAP or LIME.
- **input_features** (*pd.DataFrame*) – Input data to evaluate the pipeline on.
- **y_true** (*pd.Series*) – True labels for the input data.

- **num_to_explain** (*int*) – How many of the best, worst, random data points to explain.
- **top_k_features** (*int*) – How many of the highest/lowest contributing feature to include in the table for each data point.
- **include_explainer_values** (*bool*) – Whether explainer (SHAP or LIME) values should be included in the table. Default is False.
- **metric** (*callable*) – The metric used to identify the best and worst points in the dataset. Function must accept the true labels and predicted value or probabilities as the only arguments and lower values must be better. By default, this will be the absolute error for regression problems and cross entropy loss for classification problems.
- **output_format** (*str*) – Either “text” or “dict”. Default is “text”.
- **callback** (*callable*) – Function to be called with incremental updates. Has the following parameters: - *progress_stage*: stage of computation - *time_elapsed*: total time in seconds that has elapsed since start of call
- **training_data** (*pd.DataFrame*, *np.ndarray*) – Data the pipeline was trained on. Required and only used for time series pipelines.
- **training_target** (*pd.Series*, *np.ndarray*) – Targets used to train the pipeline. Required and only used for time series pipelines.
- **algorithm** (*str*) – Algorithm to use while generating top contributing features, one of “shap” or “lime”. Defaults to “shap”.

Returns

A report explaining the top contributing features for the best/worst predictions in the `input_features`.

For each of the best/worst rows of `input_features`, the predicted values, true labels, metric value, feature names, prediction contribution, and explainer value (optional) will be listed.

Return type `str`, `dict`, or `pd.DataFrame`

Raises

- **ValueError** – If `input_features` does not have more than twice the requested features to explain.
- **ValueError** – If `y_true` and `input_features` have mismatched lengths.
- **ValueError** – If an `output_format` outside of “text”, “dict” or “dataframe” is provided.
- **PipelineScoreError** – If the pipeline errors out while scoring.

`evalml.model_understanding.find_confusion_matrix_per_thresholds(pipeline, X, y, n_bins=None, top_k=5, to_json=False)`

Gets the confusion matrix and histogram bins for each threshold as well as the best threshold per objective. Only works with Binary Classification Pipelines.

Parameters

- **pipeline** (*PipelineBase*) – A fitted Binary Classification Pipeline to get the confusion matrix with.
- **X** (*pd.DataFrame*) – The input features.
- **y** (*pd.Series*) – The input target.
- **n_bins** (*int*) – The number of bins to use to calculate the threshold values. Defaults to None, which will default to using Freedman-Diaconis rule.

- **top_k** (*int*) – The maximum number of row indices per bin to include as samples. -1 includes all row indices that fall between the bins. Defaults to 5.
- **to_json** (*bool*) – Whether or not to return a json output. If False, returns the (DataFrame, dict) tuple, otherwise returns a json.

Returns

The dataframe has the **actual positive histogram**, **actual negative histogram**, the confusion matrix, and a sample of rows that fall in the bin, all for each threshold value. The threshold value, represented through the dataframe index, represents the cutoff threshold at that value. The dictionary contains the ideal threshold and score per objective, keyed by objective name. If json, returns the info for both the dataframe and dictionary as a json output.

Return type (tuple(pd.DataFrame, dict)), json)

Raises ValueError – If the pipeline isn't a binary classification pipeline or isn't yet fitted on data.

`evalml.model_understanding.get_linear_coefficients(estimator, features=None)`

Returns a dataframe showing the features with the greatest predictive power for a linear model.

Parameters

- **estimator** (*Estimator*) – Fitted linear model family estimator.
- **features** (*list[str]*) – List of feature names associated with the underlying data.

Returns Displaying the features by importance.

Return type pd.DataFrame

Raises

- **ValueError** – If the model is not a linear model.
- **NotFittedError** – If the model is not yet fitted.

`evalml.model_understanding.get_prediction_vs_actual_data(y_true, y_pred, outlier_threshold=None)`

Combines `y_true` and `y_pred` into a single dataframe and adds a column for outliers. Used in `graph_prediction_vs_actual()`.

Parameters

- **y_true** (*pd.Series, or np.ndarray*) – The real target values of the data
- **y_pred** (*pd.Series, or np.ndarray*) – The predicted values outputted by the regression model.
- **outlier_threshold** (*int, float*) – A positive threshold for what is considered an outlier value. This value is compared to the absolute difference between each value of `y_true` and `y_pred`. Values within this threshold will be blue, otherwise they will be yellow. Defaults to None.

Returns

- *prediction*: Predicted values from regression model.
- *actual*: Real target values.
- *outlier*: Colors indicating which values are in the threshold for what is considered an outlier value.

Return type pd.DataFrame with the following columns

Raises ValueError – If threshold is not positive.

```
evalml.model_understanding.get_prediction_vs_actual_over_time_data(pipeline, X, y, X_train,
                                                                    y_train, dates)
```

Get the data needed for the prediction_vs_actual_over_time plot.

Parameters

- **pipeline** (*TimeSeriesRegressionPipeline*) – Fitted time series regression pipeline.
- **X** (*pd.DataFrame*) – Features used to generate new predictions.
- **y** (*pd.Series*) – Target values to compare predictions against.
- **X_train** (*pd.DataFrame*) – Data the pipeline was trained on.
- **y_train** (*pd.Series*) – Target values for training data.
- **dates** (*pd.Series*) – Dates corresponding to target values and predictions.

Returns Predictions vs. time.

Return type *pd.DataFrame*

```
evalml.model_understanding.graph_binary_objective_vs_threshold(pipeline, X, y, objective,
                                                                steps=100)
```

Generates a plot graphing objective score vs. decision thresholds for a fitted binary classification pipeline.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline
- **X** (*pd.DataFrame*) – The input data used to score and compute scores
- **y** (*pd.Series*) – The target labels
- **objective** (*ObjectiveBase obj, str*) – Objective used to score, shown on the y-axis of the graph
- **steps** (*int*) – Number of intervals to divide and calculate objective score at

Returns *plotly.Figure* representing the objective score vs. threshold graph generated

```
evalml.model_understanding.graph_confusion_matrix(y_true, y_pred, normalize_method='true',
                                                    title_addition=None)
```

Generate and display a confusion matrix plot.

If *normalize_method* is set, hover text will show raw count, otherwise hover text will show count normalized with method 'true'.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier.
- **normalize_method** (*{'true', 'pred', 'all', None}*) – Normalization method to use, if not None. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.
- **title_addition** (*str*) – If not None, append to plot title. Defaults to None.

Returns *plotly.Figure* representing the confusion matrix plot generated.

```
evalml.model_understanding.graph_partial_dependence(pipeline, X, features, class_label=None,
                                                    grid_resolution=100, kind='average')
```

Create an one-way or two-way partial dependence plot.

Passing a single integer or string as features will create a one-way partial dependence plot with the feature values plotted against the partial dependence. Passing features a tuple of int/strings will create a two-way partial dependence plot with a contour of feature[0] in the y-axis, feature[1] in the x-axis and the partial dependence in the z-axis.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*, *np.ndarray*) – The input data used to generate a grid of values for feature where partial dependence will be calculated at.
- **features** (*int*, *string*, *tuple[int or string]*) – The target feature for which to create the partial dependence plot for. If features is an int, it must be the index of the feature to use. If features is a string, it must be a valid column name in X. If features is a tuple of strings, it must contain valid column int/names in X.
- **class_label** (*string*, *optional*) – Name of class to plot for multiclass problems. If None, will plot the partial dependence for each class. This argument does not change behavior for regression or binary classification pipelines. For binary classification, the partial dependence for the positive label will always be displayed. Defaults to None.
- **grid_resolution** (*int*) – Number of samples of feature(s) for partial dependence plot.
- **kind** (*{'average', 'individual', 'both'}*) – Type of partial dependence to plot. 'average' creates a regular partial dependence (PD) graph, 'individual' creates an individual conditional expectation (ICE) plot, and 'both' creates a single-figure PD and ICE plot. ICE plots can only be shown for one-way partial dependence plots.

Returns figure object containing the partial dependence data for plotting

Return type *plotly.graph_objects.Figure*

Raises

- **PartialDependenceError** – if a graph is requested for a class name that isn't present in the pipeline.
- **PartialDependenceError** – if an ICE plot is requested for a two-way partial dependence.

```
evalml.model_understanding.graph_permutation_importance(pipeline, X, y, objective,
                                                         importance_threshold=0)
```

Generate a bar graph of the pipeline's permutation importance.

Parameters

- **pipeline** (*PipelineBase* or *subclass*) – Fitted pipeline.
- **X** (*pd.DataFrame*) – The input data used to score and compute permutation importance.
- **y** (*pd.Series*) – The target data.
- **objective** (*str*, *ObjectiveBase*) – Objective to score on.
- **importance_threshold** (*float*, *optional*) – If provided, graph features with a permutation importance whose absolute value is larger than importance_threshold. Defaults to 0.

Returns *plotly.Figure*, a bar graph showing features and their respective permutation importance.

Raises **ValueError** – If importance_threshold is not greater than or equal to 0.

```
evalml.model_understanding.graph_precision_recall_curve(y_true, y_pred_proba,  
                                                         title_addition=None)
```

Generate and display a precision-recall plot.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the “true” label.
- **title_addition** (*str* or *None*) – If not *None*, append to plot title. Defaults to *None*.

Returns *plotly*.Figure representing the precision-recall plot generated

```
evalml.model_understanding.graph_prediction_vs_actual(y_true, y_pred, outlier_threshold=None)
```

Generate a scatter plot comparing the true and predicted values. Used for regression plotting.

Parameters

- **y_true** (*pd.Series*) – The real target values of the data.
- **y_pred** (*pd.Series*) – The predicted values outputted by the regression model.
- **outlier_threshold** (*int*, *float*) – A positive threshold for what is considered an outlier value. This value is compared to the absolute difference between each value of *y_true* and *y_pred*. Values within this threshold will be blue, otherwise they will be yellow. Defaults to *None*.

Returns *plotly*.Figure representing the predicted vs. actual values graph

Raises **ValueError** – If threshold is not positive.

```
evalml.model_understanding.graph_prediction_vs_actual_over_time(pipeline, X, y, X_train, y_train,  
                                                                dates, single_series=None)
```

Plot the target values and predictions against time on the x-axis.

Parameters

- **pipeline** (*TimeSeriesRegressionPipeline*) – Fitted time series regression pipeline.
- **X** (*pd.DataFrame*) – Features used to generate new predictions. If problem is multiserries, *X* should be stacked.
- **y** (*pd.Series*) – Target values to compare predictions against. If problem is multiserries, *y* should be stacked.
- **X_train** (*pd.DataFrame*) – Data the pipeline was trained on.
- **y_train** (*pd.Series*) – Target values for training data.
- **dates** (*pd.Series*) – Dates corresponding to target values and predictions.
- **single_series** (*str*) – A single series id value to plot just one series in a multiserries dataset. Defaults to *None*.

Returns Showing the prediction vs actual over time.

Return type *plotly*.Figure

Raises **ValueError** – If the pipeline is not a time-series regression pipeline.

```
evalml.model_understanding.graph_roc_curve(y_true, y_pred_proba, custom_class_names=None,
                                           title_addition=None)
```

Generate and display a Receiver Operating Characteristic (ROC) plot for binary and multiclass classification problems.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a classifier, before thresholding has been applied. Note this should be a one dimensional array with the predicted probability for the “true” label in the binary case.
- **custom_class_names** (*list* or *None*) – If not *None*, custom labels for classes. Defaults to *None*.
- **title_addition** (*str* or *None*) – if not *None*, append to plot title. Defaults to *None*.

Returns *plotly.Figure* representing the ROC plot generated

Raises *ValueError* – If the number of custom class names does not match number of classes in the input data.

```
evalml.model_understanding.graph_t_sne(X, n_components=2, perplexity=30.0, learning_rate=200.0,
                                       metric='euclidean', marker_line_width=2, marker_size=7,
                                       **kwargs)
```

Plot high dimensional data into lower dimensional space using t-SNE.

Parameters

- **X** (*np.ndarray*, *pd.DataFrame*) – Data to be transformed. Must be numeric.
- **n_components** (*int*) – Dimension of the embedded space. Defaults to 2.
- **perplexity** (*float*) – Related to the number of nearest neighbors that is used in other manifold learning algorithms. Larger datasets usually require a larger perplexity. Consider selecting a value between 5 and 50. Defaults to 30.
- **learning_rate** (*float*) – Usually in the range [10.0, 1000.0]. If the cost function gets stuck in a bad local minimum, increasing the learning rate may help. Must be positive. Defaults to 200.
- **metric** (*str*) – The metric to use when calculating distance between instances in a feature array. The default is “euclidean” which is interpreted as the squared euclidean distance.
- **marker_line_width** (*int*) – Determines the line width of the marker boundary. Defaults to 2.
- **marker_size** (*int*) – Determines the size of the marker. Defaults to 7.
- **kwargs** – Arbitrary keyword arguments.

Returns *Figure* representing the transformed data.

Return type *plotly.Figure*

Raises *ValueError* – If *marker_line_width* or *marker_size* are not valid values.

```
evalml.model_understanding.normalize_confusion_matrix(conf_mat, normalize_method='true')
```

Normalizes a confusion matrix.

Parameters

- **conf_mat** (*pd.DataFrame* or *np.ndarray*) – Confusion matrix to normalize.

- **normalize_method** (`{'true', 'pred', 'all'}`) – Normalization method. Supported options are: 'true' to normalize by row, 'pred' to normalize by column, or 'all' to normalize by all values. Defaults to 'true'.

Returns normalized version of the input confusion matrix. The column header represents the predicted labels while row header represents the actual labels.

Return type `pd.DataFrame`

Raises **ValueError** – If configuration is invalid, or if the sum of a given axis is zero and normalization by axis is specified.

```
evalml.model_understanding.partial_dependence(pipeline, X, features, percentiles=(0.05, 0.95),
                                              grid_resolution=100, kind='average', fast_mode=False,
                                              X_train=None, y_train=None)
```

Calculates one or two-way partial dependence.

If a single integer or string is given for features, one-way partial dependence is calculated. If a tuple of two integers or strings is given, two-way partial dependence is calculated with the first feature in the y-axis and second feature in the x-axis.

Parameters

- **pipeline** (*PipelineBase or subclass*) – Fitted pipeline
- **X** (*pd.DataFrame, np.ndarray*) – The input data used to generate a grid of values for feature where partial dependence will be calculated at
- **features** (*int, string, tuple[int or string]*) – The target feature for which to create the partial dependence plot for. If features is an int, it must be the index of the feature to use. If features is a string, it must be a valid column name in X. If features is a tuple of int/strings, it must contain valid column integers/names in X.
- **percentiles** (*tuple[float]*) – The lower and upper percentile used to create the extreme values for the grid. Must be in [0, 1]. Defaults to (0.05, 0.95).
- **grid_resolution** (*int*) – Number of samples of feature(s) for partial dependence plot. If this value is less than the maximum number of categories present in categorical data within X, it will be set to the max number of categories + 1. Defaults to 100.
- **kind** (*{'average', 'individual', 'both'}*) – The type of predictions to return. 'individual' will return the predictions for all of the points in the grid for each sample in X. 'average' will return the predictions for all of the points in the grid but averaged over all of the samples in X.
- **fast_mode** (*bool, optional*) – Whether or not performance optimizations should be used for partial dependence calculations. Defaults to False. Note that user-specified components may not produce correct partial dependence results, so fast mode should only be used with EvalML-native components. Additionally, some components are not compatible with fast mode; in those cases, an error will be raised indicating that fast mode should not be used.
- **X_train** (*pd.DataFrame, np.ndarray*) – The data that was used to train the original pipeline. Will be used in fast mode to train the cloned pipelines. Defaults to None.
- **y_train** (*pd.Series, np.ndarray*) – The target data that was used to train the original pipeline. Will be used in fast mode to train the cloned pipelines. Defaults to None.

Returns

When *kind='average'*: `DataFrame` with averaged predictions for all points in the grid averaged over all samples of X and the values used to calculate those predictions.

When *kind*='individual': DataFrame with individual predictions for all points in the grid for each sample of X and the values used to calculate those predictions. If a two-way partial dependence is calculated, then the result is a list of DataFrames with each DataFrame representing one sample's predictions.

When *kind*='both': A tuple consisting of the averaged predictions (in a DataFrame) over all samples of X and the individual predictions (in a list of DataFrames) for each sample of X.

In the one-way case: The dataframe will contain two columns, "feature_values" (grid points at which the partial dependence was calculated) and "partial_dependence" (the partial dependence at that feature value). For classification problems, there will be a third column called "class_label" (the class label for which the partial dependence was calculated). For binary classification, the partial dependence is only calculated for the "positive" class.

In the two-way case: The data frame will contain grid_resolution number of columns and rows where the index and column headers are the sampled values of the first and second features, respectively, used to make the partial dependence contour. The values of the data frame contain the partial dependence data for each feature value pair.

Return type pd.DataFrame, list(pd.DataFrame), or tuple(pd.DataFrame, list(pd.DataFrame))

Raises

- **ValueError** – Error during call to scikit-learn's partial dependence method.
- **Exception** – All other errors during calculation.
- **PartialDependenceError** – if the user provides a tuple of not exactly two features.
- **PartialDependenceError** – if the provided pipeline isn't fitted.
- **PartialDependenceError** – if the provided pipeline is a Baseline pipeline.
- **PartialDependenceError** – if any of the features passed in are completely NaN
- **PartialDependenceError** – if any of the features are low-variance. Defined as having one value occurring more than the upper percentile passed by the user. By default 95%.

`evalml.model_understanding.precision_recall_curve(y_true, y_pred_proba, pos_label_idx=-1)`

Given labels and binary classifier predicted probabilities, compute and return the data representing a precision-recall curve.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True binary labels.
- **y_pred_proba** (*pd.Series* or *np.ndarray*) – Predictions from a binary classifier, before thresholding has been applied. Note this should be the predicted probability for the "true" label.
- **pos_label_idx** (*int*) – the column index corresponding to the positive class. If predicted probabilities are two-dimensional, this will be used to access the probabilities for the positive class.

Returns

Dictionary containing metrics used to generate a precision-recall plot, with the following keys:

- *precision*: Precision values.
- *recall*: Recall values.
- *thresholds*: Threshold values used to produce the precision and recall.
- *auc_score*: The area under the ROC curve.

Return type list

Raises `NoPositiveLabelException` – If predicted probabilities do not contain a column at the specified label.

`evalml.model_understanding.roc_curve(y_true, y_pred_proba)`

Given labels and classifier predicted probabilities, compute and return the data representing a Receiver Operating Characteristic (ROC) curve. Works with binary or multiclass problems.

Parameters

- **y_true** (*pd.Series* or *np.ndarray*) – True labels.
- **y_pred_proba** (*pd.Series* or *pd.DataFrame* or *np.ndarray*) – Predictions from a classifier, before thresholding has been applied.

Returns

A list of dictionaries (with one for each class) is returned. Binary classification problems return a list with one dictionary.

Each dictionary contains metrics used to generate an ROC plot with the following keys:

- *fpr_rate*: False positive rate.
- *tpr_rate*: True positive rate.
- *threshold*: Threshold values used to produce each pair of true/false positive rates.
- *auc_score*: The area under the ROC curve.

Return type list(dict)

`evalml.model_understanding.t_sne(X, n_components=2, perplexity=30.0, learning_rate=200.0, metric='euclidean', **kwargs)`

Get the transformed output after fitting X to the embedded space using t-SNE.

Parameters

- **X** (*np.ndarray*, *pd.DataFrame*) – Data to be transformed. Must be numeric.
- **n_components** (*int*, *optional*) – Dimension of the embedded space.
- **perplexity** (*float*, *optional*) – Related to the number of nearest neighbors that is used in other manifold learning algorithms. Larger datasets usually require a larger perplexity. Consider selecting a value between 5 and 50.
- **learning_rate** (*float*, *optional*) – Usually in the range [10.0, 1000.0]. If the cost function gets stuck in a bad local minimum, increasing the learning rate may help.
- **metric** (*str*, *optional*) – The metric to use when calculating distance between instances in a feature array.
- **kwargs** – Arbitrary keyword arguments.

Returns TSNE output.

Return type *np.ndarray* (n_samples, n_components)

Raises `ValueError` – If specified parameters are not valid values.

Objectives

EvalML standard and custom objectives.

Submodules

`binary_classification_objective`

Base class for all binary classification objectives.

Module Contents

Classes Summary

<i><code>BinaryClassificationObjective</code></i>	Base class for all binary classification objectives.
---	--

Contents

class `evalml.objectives.binary_classification_objective.BinaryClassificationObjective`

Base class for all binary classification objectives.

Attributes

problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
----------------------	--

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>expected_range</i>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<i>greater_is_better</i>	Returns a boolean determining if a greater score indicates better model performance.
<i>is_bounded_like_percentage</i>	Returns whether this objective is bounded between 0 and 1, inclusive.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>name</i>	Returns a name describing the objective.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>perfect_score</i>	Returns the score obtained by evaluating this objective on a perfect model.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>score_needs_proba</i>	Returns a boolean determining if the score() method needs probability estimates.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

property expected_range(*cls*)

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property greater_is_better(*cls*)

Returns a boolean determining if a greater score indicates better model performance.

property is_bounded_like_percentage(*cls*)

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

property positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

cost_benefit_matrix

Cost-benefit matrix objective.

Module Contents

Classes Summary

CostBenefitMatrix

Score using a cost-benefit matrix. Scores quantify the benefits of a given value, so greater numeric scores represents a better score. Costs and scores can be negative, indicating that a value is not beneficial. For example, in the case of monetary profit, a negative cost and/or score represents loss of cash flow.

Contents

class evalml.objectives.cost_benefit_matrix.**CostBenefitMatrix**(*true_positive*, *true_negative*, *false_positive*, *false_negative*)

Score using a cost-benefit matrix. Scores quantify the benefits of a given value, so greater numeric scores represents a better score. Costs and scores can be negative, indicating that a value is not beneficial. For example, in the case of monetary profit, a negative cost and/or score represents loss of cash flow.

Parameters

- **true_positive** (*float*) – Cost associated with true positive predictions.
- **true_negative** (*float*) – Cost associated with true negative predictions.
- **false_positive** (*float*) – Cost associated with false positive predictions.
- **false_negative** (*float*) – Cost associated with false negative predictions.

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Cost Benefit Matrix
perfect_score	None
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculates cost-benefit of the using the predicted and true values.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property can_optimize_threshold(*cls*)

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Calculates cost-benefit of the using the predicted and true values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted labels.
- **y_true** (*pd.Series*) – True labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Ignored.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Cost-benefit matrix score

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.

- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

fraud_cost

Score the percentage of money lost of the total transaction amount process due to fraud.

Module Contents

Classes Summary

<i>FraudCost</i>	Score the percentage of money lost of the total transaction amount process due to fraud.
------------------	--

Contents

class evalml.objectives.fraud_cost.**FraudCost**(*retry_percentage=0.5*, *interchange_fee=0.02*, *fraud_payout_percentage=1.0*, *amount_col='amount'*)

Score the percentage of money lost of the total transaction amount process due to fraud.

Parameters

- **retry_percentage** (*float*) – What percentage of customers that will retry a transaction if it is declined. Between 0 and 1. Defaults to 0.5.
- **interchange_fee** (*float*) – How much of each successful transaction you pay. Between 0 and 1. Defaults to 0.02.

- **fraud_payout_percentage** (*float*) – Percentage of fraud you will not be able to collect. Between 0 and 1. Defaults to 1.0.
- **amount_col** (*str*) – Name of column in data that contains the amount. Defaults to “amount”.

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	True
name	Fraud Cost
perfect_score	0.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *X*, *y_train=None*, *sample_weight=None*)

Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.

Parameters

- **y_predicted** (*pd.Series*) – Predicted fraud labels.
- **y_true** (*pd.Series*) – True fraud labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Data with transaction amounts.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Amount lost to fraud per transaction.

Return type float

Raises **ValueError** – If `amount_col` is not a valid column in the input data.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score**validate_inputs**(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

lead_scoring

Lead scoring objective.

Module Contents**Classes Summary**

<i>LeadScoring</i>	Lead scoring.
--------------------	---------------

Contents**class** evalml.objectives.lead_scoring.**LeadScoring**(*true_positives=1*, *false_positives=-1*)

Lead scoring.

Parameters

- **true_positives** (*int*) – Reward for a true positive. Defaults to 1.
- **false_positives** (*int*) – Cost for a false positive. Should be negative. Defaults to -1.

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Lead Scoring
per-fect_score	None
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculate the profit per lead.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Calculate the profit per lead.

Parameters

- **y_predicted** (*pd.Series*) – Predicted labels.
- **y_true** (*pd.Series*) – True labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Ignored.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Profit per lead

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises RuntimeError – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score

- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

multiclass_classification_objective

Base class for all multiclass classification objectives.

Module Contents

Classes Summary

<i>MulticlassClassificationObjective</i>	Base class for all multiclass classification objectives.
--	--

Contents

class

`evalml.objectives.multiclass_classification_objective.MulticlassClassificationObjective`

Base class for all multiclass classification objectives.

Attributes

problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
----------------------	--

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>expected_range</code>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<code>greater_is_better</code>	Returns a boolean determining if a greater score indicates better model performance.
<code>is_bounded_like_percentage</code>	Returns whether this objective is bounded between 0 and 1, inclusive.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>name</code>	Returns a name describing the objective.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<code>perfect_score</code>	Returns the score obtained by evaluating this objective on a perfect model.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>score_needs_proba</code>	Returns a boolean determining if the score() method needs probability estimates.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

property positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].

- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

objective_base

Base class for all objectives.

Module Contents

Classes Summary

<i>ObjectiveBase</i>	Base class for all objectives.
----------------------	--------------------------------

Contents

class evalml.objectives.objective_base.**ObjectiveBase**

Base class for all objectives.

Attributes

problem_types	None
----------------------	------

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>expected_range</i>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<i>greater_is_better</i>	Returns a boolean determining if a greater score indicates better model performance.
<i>is_bounded_like_percentage</i>	Returns whether this objective is bounded between 0 and 1, inclusive.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>name</i>	Returns a name describing the objective.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<i>perfect_score</i>	Returns the score obtained by evaluating this objective on a perfect model.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>score_needs_proba</i>	Returns a boolean determining if the score() method needs probability estimates.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property `name(cls)`

Returns a name describing the objective.

abstract classmethod `objective_function(cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property `perfect_score(cls)`

Returns the score obtained by evaluating this objective on a perfect model.

property `positive_only(cls)`

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

regression_objective

Base class for all regression objectives.

Module Contents

Classes Summary

RegressionObjective

Base class for all regression objectives.

Contents

class evalml.objectives.regression_objective.RegressionObjective

Base class for all regression objectives.

Attributes

problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
----------------------	---

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>expected_range</i>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<i>greater_is_better</i>	Returns a boolean determining if a greater score indicates better model performance.
<i>is_bounded_like_percentage</i>	Returns whether this objective is bounded between 0 and 1, inclusive.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>name</i>	Returns a name describing the objective.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<i>perfect_score</i>	Returns the score obtained by evaluating this objective on a perfect model.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>score_needs_proba</i>	Returns a boolean determining if the score() method needs probability estimates.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod calculate_percent_difference(cls, score, baseline_score)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property expected_range(*cls*)

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property greater_is_better(*cls*)

Returns a boolean determining if a greater score indicates better model performance.

property is_bounded_like_percentage(*cls*)

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property `score_needs_proba(cls)`

Returns a boolean determining if the `score()` method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

sensitivity_low_alert

Sensitivity at Low Alert Rates objective.

Module Contents**Classes Summary**

<i>SensitivityLowAlert</i>	Sensitivity at Low Alert Rates.
----------------------------	---------------------------------

Attributes Summary

<i>logger</i>

Contents

`evalml.objectives.sensitivity_low_alert.logger`

class `evalml.objectives.sensitivity_low_alert.SensitivityLowAlert(alert_rate=0.01)`

Sensitivity at Low Alert Rates.

Parameters **alert_rate** (*float*) – percentage of top scores to classify as high risk.

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Sensitivity at Low Alert Rates
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Determine if an observation is high risk given an alert rate.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculate sensitivity across all predictions, using the top alert_rate percent of observations as the predicted positive class.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, ***kwargs*)

Determine if an observation is high risk given an alert rate.

Parameters

- **ypred_proba** (*pd.Series*) – Predicted probabilities.
- ****kwargs** – Additional arbitrary parameters.

Returns Whether or not an observation is high risk given an alert rate.

Return type *pd.Series*

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, ***kwargs*)

Calculate sensitivity across all predictions, using the top alert_rate percent of observations as the predicted positive class.

Parameters

- **y_true** (*pd.Series*) – True labels.
- **y_predicted** (*pd.Series*) – Predicted labels based on alert_rate.
- ****kwargs** – Additional arbitrary parameters.

Returns sensitivity using the observations with the top scores as the predicted positive class.

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier's predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises RuntimeError – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]

- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

standard_metrics

Standard machine learning objective functions.

Module Contents

Classes Summary

<i>AccuracyBinary</i>	Accuracy score for binary classification.
<i>AccuracyMulticlass</i>	Accuracy score for multiclass classification.
<i>AUC</i>	AUC score for binary classification.
<i>AUCMacro</i>	AUC score for multiclass classification using macro averaging.
<i>AUCMicro</i>	AUC score for multiclass classification using micro averaging.
<i>AUCWeighted</i>	AUC Score for multiclass classification using weighted averaging.
<i>BalancedAccuracyBinary</i>	Balanced accuracy score for binary classification.
<i>BalancedAccuracyMulticlass</i>	Balanced accuracy score for multiclass classification.
<i>ExpVariance</i>	Explained variance score for regression.
<i>F1</i>	F1 score for binary classification.
<i>F1Macro</i>	F1 score for multiclass classification using macro averaging.
<i>F1Micro</i>	F1 score for multiclass classification using micro averaging.
<i>F1Weighted</i>	F1 score for multiclass classification using weighted averaging.
<i>Gini</i>	Gini coefficient for binary classification.
<i>LogLossBinary</i>	Log Loss for binary classification.
<i>LogLossMulticlass</i>	Log Loss for multiclass classification.
<i>MAE</i>	Mean absolute error for regression.
<i>MAPE</i>	Mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.
<i>MASE</i>	Mean absolute scaled error for time series regression.
<i>MaxError</i>	Maximum residual error for regression.
<i>MCCBinary</i>	Matthews correlation coefficient for binary classification.
<i>MCCMulticlass</i>	Matthews correlation coefficient for multiclass classification.

continues on next page

Table 4 – continued from previous page

<i>MeanSquaredLogError</i>	Mean squared log error for regression.
<i>MedianAE</i>	Median absolute error for regression.
<i>MSE</i>	Mean squared error for regression.
<i>Precision</i>	Precision score for binary classification.
<i>PrecisionMacro</i>	Precision score for multiclass classification using macro-averaging.
<i>PrecisionMicro</i>	Precision score for multiclass classification using micro averaging.
<i>PrecisionWeighted</i>	Precision score for multiclass classification using weighted averaging.
<i>R2</i>	Coefficient of determination for regression.
<i>Recall</i>	Recall score for binary classification.
<i>RecallMacro</i>	Recall score for multiclass classification using macro averaging.
<i>RecallMicro</i>	Recall score for multiclass classification using micro averaging.
<i>RecallWeighted</i>	Recall score for multiclass classification using weighted averaging.
<i>RootMeanSquaredError</i>	Root mean squared error for regression.
<i>RootMeanSquaredLogError</i>	Root mean squared log error for regression.
<i>SMAPE</i>	Symmetric mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Contents

class evalml.objectives.standard_metrics.**AccuracyBinary**

Accuracy score for binary classification.

Example

```
>>> y_true = pd.Series([0, 0, 0, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(AccuracyBinary().objective_function(y_true, y_
→pred), 0.6363636)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Accuracy Binary
per-fect_score	1.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for accuracy score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold*=0.5, *X*=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.standard_metrics.AccuracyMulticlass`

Accuracy score for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(AccuracyMulticlass().objective_function(y_true,
↪ y_pred), 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Accuracy Multiclass
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for multiclass classification.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.standard_metrics.**AUC**

AUC score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(AUC().objective_function(y_true, y_pred), 0.
↪ 5714285)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for AUC score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold*=0.5, *X*=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.standard_metrics.AUCMacro`

AUC score for multiclass classification using macro averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.1, 0.0, 0.9],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.6, 0.1, 0.3],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(AUCMacro().objective_function(y_true, y_pred), 0.
↪ 75)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Macro
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score**validate_inputs**(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.**class** evalml.objectives.standard_metrics.**AUCMicro**

AUC score for multiclass classification using micro averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.3, 0.5, 0.2],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.3, 0.1, 0.6],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(AUCMicro().objective_function(y_true, y_pred), 0.
↪ 9861111)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for AUC score for multiclass classification using micro-averaging.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC score for multiclass classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**AUCWeighted**

AUC Score for multiclass classification using weighted averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.1, 0.0, 0.9],
...           [0.1, 0.3, 0.6],
...           [0.1, 0.2, 0.7],
...           [0.6, 0.1, 0.3],
...           [0.5, 0.2, 0.3]]
>>> np.testing.assert_almost_equal(AUCWeighted().objective_function(y_true, y_pred),
→ 0.4375)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Weighted
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC Score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC Score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.BalancedAccuracyBinary`

Balanced accuracy score for binary classification.

Example

```
>>> y_true = pd.Series([0, 0, 0, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(BalancedAccuracyBinary().objective_function(y_
↪ true, y_pred), 0.60)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Balanced Accuracy Binary
per-fect_score	1.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for balanced accuracy for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for balanced accuracy for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.standard_metrics.BalancedAccuracyMulticlass

Balanced accuracy score for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(BalancedAccuracyMulticlass().objective_
↪ function(y_true, y_pred), 0.555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Balanced Accuracy Multiclass
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for balanced accuracy for multiclass classification.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for balanced accuracy for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.ExpVariance`

Explained variance score for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(ExpVariance().objective_function(y_true, y_pred),
→ 0.7760736)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	ExpVariance
per-fect_score	1.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for explained variance score for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for explained variance score for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.F1

F1 score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(F1().objective_function(y_true, y_pred), 0.25)
```

Attributes

expected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for F1 score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for F1 score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.standard_metrics.F1Macro`

F1 score for multiclass classification using macro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Macro().objective_function(y_true, y_pred), 0.
↪ 5476190)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Macro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for F1 score for multiclass classification using macro averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for F1 score for multiclass classification using macro averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**F1Micro**

F1 score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Micro().objective_function(y_true, y_pred), 0.5454545)
```

Attributes

expected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for F1 score for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for F1 score for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.standard_metrics.**F1Weighted**

F1 score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Weighted().objective_function(y_true, y_pred),
→0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Weighted
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for F1 score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for F1 score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series, or pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.Gini`

Gini coefficient for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Gini().objective_function(y_true, y_pred), 0.
↪1428571)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Gini
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for Gini coefficient for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference`(cls, score, baseline_score)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Gini coefficient for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises `RuntimeError` – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.standard_metrics.**LogLossBinary**

Log Loss for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(LogLossBinary().objective_function(y_true, y_
    ↪pred), 19.6601745)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	False
is_bounded_like_percentage	False
name	Log Loss Binary
per-fect_score	0.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for log loss for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property can_optimize_threshold(*cls*)

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for log loss for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises RuntimeError – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.standard_metrics.**LogLossMulticlass**

Log Loss for multiclass classification.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.3, 0.5, 0.2],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.3, 0.1, 0.6],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(LogLossMulticlass().objective_function(y_true, y_
↪pred), 0.4783301)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	False
is_bounded_like_percentage	False
name	Log Loss Multiclass
perfect_score	0.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for log loss for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for log loss for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.standard_metrics.**MAE**

Mean absolute error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MAE().objective_function(y_true, y_pred), 0.
↪ 2727272)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MAE
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for mean absolute error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.MAPE`

Mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Only valid for nonzero inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MAPE().objective_function(y_true, y_pred), 15.
↪ 9848484)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	True
name	Mean Absolute Percentage Error
perfect_score	0.0
problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute percentage error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for mean absolute percentage error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**MASE**

Mean absolute scaled error for time series regression.

Only valid if there exists a nonzero input in y_train. Otherwise, will throw a ValueError.

Example

```
>>> y_train = pd.Series([5, 0.5, 4, 6, 3, 5, 2])
>>> y_true = pd.Series([3, -0.5, 2, 7, 2])
>>> y_pred = pd.Series([2.5, 0.0, 2, 8, 1.25])
>>> np.testing.assert_almost_equal(MASE().objective_function(y_true, y_pred, y_
↪train), 0.18333333333333335)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	True
name	Mean Absolute Scaled Error
perfect_score	0.0
problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute scaled error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train*, *X=None*, *sample_weight=None*)

Objective function for mean absolute scaled error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**MaxError**

Maximum residual error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MaxError().objective_function(y_true, y_pred), 1.
↪ 0)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MaxError
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for maximum residual error for regression.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for maximum residual error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.MCCBinary

Matthews correlation coefficient for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(MCCBinary().objective_function(y_true, y_pred),
→0.2390457)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	MCC Binary
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for Matthews correlation coefficient for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type `bool`

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Matthews correlation coefficient for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.standard_metrics.MCCMulticlass

Matthews correlation coefficient for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(MCCMulticlass().objective_function(y_true, y_
↪pred), 0.325)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	MCC Multiclass
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for Matthews correlation coefficient for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Matthews correlation coefficient for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**MeanSquaredLogError**

Mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MeanSquaredLogError().objective_function(y_true,
→y_pred), 0.0171353)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Mean Squared Log Error
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean squared log error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for mean squared log error for regression.

positive_only(*self*)

If True, this objective is only valid for positive data.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.MedianAE`

Median absolute error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MedianAE().objective_function(y_true, y_pred), 0.
↪ 25)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MedianAE
per-fect_score	0.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for median absolute error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for median absolute error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**MSE**

Mean squared error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MSE().objective_function(y_true, y_pred), 0.
↪ 1590909)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MSE
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean squared error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for mean squared error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**Precision**

Precision score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Precision().objective_function(y_true, y_pred),
→ 1.0)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for precision score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold*=0.5, *X*=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for precision score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.standard_metrics.PrecisionMacro`

Precision score for multiclass classification using macro-averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionMacro().objective_function(y_true, y_
↪pred), 0.5555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Macro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for precision score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for precision score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**PrecisionMicro**

Precision score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionMicro().objective_function(y_true, y_
↪pred), 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for precision score for binary classification using micro-averaging.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for precision score for binary classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.standard_metrics.**PrecisionWeighted**

Precision score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionWeighted().objective_function(y_true, y_
→pred), 0.5606060)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Weighted
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for precision score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for precision score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series, or pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.R2`

Coefficient of determination for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(R2().objective_function(y_true, y_pred), 0.
↪ 7638036)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	R2
perfect_score	1
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for coefficient of determination for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for coefficient of determination for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**Recall**

Recall score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Recall().objective_function(y_true, y_pred), 0.
↪ 1428571)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.standard_metrics.**RecallMacro**

Recall score for multiclass classification using macro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallMacro().objective_function(y_true, y_pred),
→ 0.555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Macro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**RecallMicro**

Recall score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallMicro().objective_function(y_true, y_pred),
→ 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for multiclass classification using micro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for recall score for multiclass classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.RecallWeighted

Recall score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallWeighted().objective_function(y_true, y_
↪pred), 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Weighted
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for recall score for multiclass classification using weighted averaging.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**RootMeanSquaredError**

Root mean squared error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(RootMeanSquaredError().objective_function(y_true,
→ y_pred), 0.3988620)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Root Mean Squared Error
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for root mean squared error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for root mean squared error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.standard_metrics.RootMeanSquaredLogError`

Root mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(RootMeanSquaredLogError().objective_function(y_
↪true, y_pred), 0.13090204)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Root Mean Squared Log Error
per-fect_score	0.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for root mean squared log error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for root mean squared log error for regression.

positive_only(*self*)

If True, this objective is only valid for positive data.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.standard_metrics.**SMAPE**

Symmetric mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Only valid for nonzero inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(SMAPE().objective_function(y_true, y_pred), 18.
↪ 13652589)
```

Attributes

ex-pected_range	[0, 200]
greater_is_better	False
is_bounded_like_percentage	True
name	Symmetric Mean Absolute Percentage Error
perfect_score	0.0
problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for symmetric mean absolute percentage error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for symmetric mean absolute percentage error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

time_series_regression_objective

Base class for all time series regression objectives.

Module Contents

Classes Summary

<i>TimeSeriesRegressionObjective</i>	Base class for all time series regression objectives.
--------------------------------------	---

Contents

class evalml.objectives.time_series_regression_objective.**TimeSeriesRegressionObjective**

Base class for all time series regression objectives.

Attributes

problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
----------------------	---------------------------------------

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>expected_range</code>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<code>greater_is_better</code>	Returns a boolean determining if a greater score indicates better model performance.
<code>is_bounded_like_percentage</code>	Returns whether this objective is bounded between 0 and 1, inclusive.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>name</code>	Returns a name describing the objective.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<code>perfect_score</code>	Returns the score obtained by evaluating this objective on a perfect model.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>score_needs_proba</code>	Returns a boolean determining if the score() method needs probability estimates.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

property positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].

- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

utils

Utility methods for EvalML objectives.

Module Contents

Functions

<i>get_all_objective_names</i>	Get a list of the names of all objectives.
<i>get_core_objective_names</i>	Get a list of all valid core objectives.
<i>get_core_objectives</i>	Returns all core objective instances associated with the given problem type.
<i>get_default_recommendation_objectives</i>	Get the default recommendation score metrics for the given problem type.
<i>get_non_core_objectives</i>	Get non-core objective classes.
<i>get_objective</i>	Returns the Objective class corresponding to a given objective name.
<i>get_optimization_objectives</i>	Get objectives for optimization.
<i>get_ranking_objectives</i>	Get objectives for pipeline rankings.
<i>normalize_objectives</i>	Converts objectives from a [0, inf) scale to [0, 1] given a max and min for each objective.
<i>organize_objectives</i>	Generate objectives to consider, with optional modifications to the defaults.
<i>ranking_only_objectives</i>	Get ranking-only objective classes.
<i>recommendation_score</i>	Computes a recommendation score for a model given scores for a group of objectives.

Attributes Summary

DEFAULT_RECOMMENDATION_OBJECTIVES

Contents

`evalml.objectives.utils.DEFAULT_RECOMMENDATION_OBJECTIVES`

`evalml.objectives.utils.get_all_objective_names()`

Get a list of the names of all objectives.

Returns Objective names

Return type list (str)

`evalml.objectives.utils.get_core_objective_names()`

Get a list of all valid core objectives.

Returns Objective names.

Return type list[str]

`evalml.objectives.utils.get_core_objectives(problem_type)`

Returns all core objective instances associated with the given problem type.

Core objectives are designed to work out-of-the-box for any dataset.

Parameters `problem_type` (str/ProblemTypes) – Type of problem

Returns List of ObjectiveBase instances

Examples

```
>>> for objective in get_core_objectives("regression"):
...     print(objective.name)
ExpVariance
MaxError
MedianAE
MSE
MAE
R2
Root Mean Squared Error
>>> for objective in get_core_objectives("binary"):
...     print(objective.name)
MCC Binary
Log Loss Binary
Gini
AUC
Precision
F1
Balanced Accuracy Binary
Accuracy Binary
```

`evalml.objectives.utils.get_default_recommendation_objectives(problem_type, imbalanced=False)`

Get the default recommendation score metrics for the given problem type.

Parameters

- **problem_type** (str/ProblemType) – Type of problem
- **imbalanced** (boolean) – For multiclass problems, if the classes are imbalanced. Defaults to False

Returns Set of string objective names that correspond to ObjectiveBase objectives

`evalml.objectives.utils.get_non_core_objectives()`

Get non-core objective classes.

Non-core objectives are objectives that are domain-specific. Users typically need to configure these objectives before using them in AutoMLSearch.

Returns List of ObjectiveBase classes

`evalml.objectives.utils.get_objective(objective, return_instance=False, **kwargs)`

Returns the Objective class corresponding to a given objective name.

Parameters

- **objective** (*str* or *ObjectiveBase*) – Name or instance of the objective class.
- **return_instance** (*bool*) – Whether to return an instance of the objective. This only applies if objective is of type *str*. Note that the instance will be initialized with default arguments.
- **kwargs** (*Any*) – Any keyword arguments to pass into the objective. Only used when `return_instance=True`.

Returns *ObjectiveBase* if the parameter objective is of type *ObjectiveBase*. If objective is instead a valid objective name, function will return the class corresponding to that name. If `return_instance` is *True*, an instance of that objective will be returned.

Raises

- **TypeError** – If objective is *None*.
- **TypeError** – If objective is not a string and not an instance of *ObjectiveBase*.
- **ObjectiveNotFoundError** – If input objective is not a valid objective.
- **ObjectiveCreationError** – If objective cannot be created properly.

`evalml.objectives.utils.get_optimization_objectives(problem_type)`

Get objectives for optimization.

Parameters **problem_type** (*str/ProblemTypes*) – Type of problem

Returns List of *ObjectiveBase* instances

`evalml.objectives.utils.get_ranking_objectives(problem_type)`

Get objectives for pipeline rankings.

Parameters **problem_type** (*str/ProblemTypes*) – Type of problem

Returns List of *ObjectiveBase* instances

`evalml.objectives.utils.normalize_objectives(objectives_to_normalize, max_objectives, min_objectives)`

Converts objectives from a $[0, \infty)$ scale to $[0, 1]$ given a max and min for each objective.

Parameters

- **objectives_to_normalize** (*dict[str, float]*) – A dictionary mapping objectives to values
- **max_objectives** (*dict[str, float]*) – The mapping of objectives to the maximum values for normalization
- **min_objectives** (*dict[str, float]*) – The mapping of objectives to the minimum values for normalization

Returns A dictionary mapping objective names to their new normalized values

`evalml.objectives.utils.organize_objectives(problem_type, include=None, exclude=None, imbalanced=False)`

Generate objectives to consider, with optional modifications to the defaults.

Parameters

- **problem_type** (*str/ProblemType*) – Type of problem

- **include** (*list[str/ObjectiveBase]*) – A list of objectives to include beyond the defaults. Defaults to None.
- **exclude** (*list[str/ObjectiveBase]*) – A list of objectives to exclude from the defaults. Defaults to None.
- **imbalanced** (*boolean*) – For multiclass problems, if the classes are imbalanced. Defaults to False

Returns List of string objective names that correspond to ObjectiveBase objectives

Raises

- **ValueError** – If any objectives to include or exclude are not valid for the problem type
- **ValueError** – If an objective to exclude is not in the default objectives

`evalml.objectives.utils.ranking_only_objectives()`

Get ranking-only objective classes.

Ranking-only objectives are objectives that are useful for evaluating the performance of a model, but should not be used as an optimization objective during AutoMLSearch for various reasons.

Returns List of ObjectiveBase classes

`evalml.objectives.utils.recommendation_score(objectives, prioritized_objective=None, custom_weights=None)`

Computes a recommendation score for a model given scores for a group of objectives.

This recommendation score is a weighted average of the given objectives, by default all weighted equally. Passing in a prioritized objective will weight that objective with the prioritized weight, and all other objectives will split the remaining weight equally.

Parameters

- **objectives** (*dict[str, float]*) – A dictionary mapping objectives to their values. Objectives should be a float between 0 and 1, where higher is better. If the objective does not represent score this way, scores should first be normalized using the `normalize_objectives` function.
- **prioritized_objective** (*str*) – An optional name of a priority objective that should be given heavier weight (50% of the total) than the other objectives contributing to the score. Defaults to None, where all objectives are weighted equally.
- **custom_weights** (*dict[str, float]*) – A dictionary mapping objective names to corresponding weights between 0 and 1. If all objectives are listed, should add up to 1. If a subset of objectives are listed, should add up to less than 1, and remaining weight will be evenly distributed between the remaining objectives. Should not be used at the same time as `prioritized_objective`.

Returns A value between 0 and 100 representing how strongly we recommend a pipeline given a set of evaluated objectives

Raises **ValueError** – If the objective(s) to prioritize are not in the known objectives, or if the custom weight(s) are not a float between 0 and 1.

Package Contents

Classes Summary

<i>AccuracyBinary</i>	Accuracy score for binary classification.
<i>AccuracyMulticlass</i>	Accuracy score for multiclass classification.
<i>AUC</i>	AUC score for binary classification.
<i>AUCMacro</i>	AUC score for multiclass classification using macro averaging.
<i>AUCMicro</i>	AUC score for multiclass classification using micro averaging.
<i>AUCWeighted</i>	AUC Score for multiclass classification using weighted averaging.
<i>BalancedAccuracyBinary</i>	Balanced accuracy score for binary classification.
<i>BalancedAccuracyMulticlass</i>	Balanced accuracy score for multiclass classification.
<i>BinaryClassificationObjective</i>	Base class for all binary classification objectives.
<i>CostBenefitMatrix</i>	Score using a cost-benefit matrix. Scores quantify the benefits of a given value, so greater numeric scores represents a better score. Costs and scores can be negative, indicating that a value is not beneficial. For example, in the case of monetary profit, a negative cost and/or score represents loss of cash flow.
<i>ExpVariance</i>	Explained variance score for regression.
<i>F1</i>	F1 score for binary classification.
<i>F1Macro</i>	F1 score for multiclass classification using macro averaging.
<i>F1Micro</i>	F1 score for multiclass classification using micro averaging.
<i>F1Weighted</i>	F1 score for multiclass classification using weighted averaging.
<i>FraudCost</i>	Score the percentage of money lost of the total transaction amount process due to fraud.
<i>Gini</i>	Gini coefficient for binary classification.
<i>LeadScoring</i>	Lead scoring.
<i>LogLossBinary</i>	Log Loss for binary classification.
<i>LogLossMulticlass</i>	Log Loss for multiclass classification.
<i>MAE</i>	Mean absolute error for regression.
<i>MAPE</i>	Mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.
<i>MASE</i>	Mean absolute scaled error for time series regression.
<i>MaxError</i>	Maximum residual error for regression.
<i>MCCBinary</i>	Matthews correlation coefficient for binary classification.
<i>MCCMulticlass</i>	Matthews correlation coefficient for multiclass classification.
<i>MeanSquaredLogError</i>	Mean squared log error for regression.
<i>MedianAE</i>	Median absolute error for regression.
<i>MSE</i>	Mean squared error for regression.
<i>MulticlassClassificationObjective</i>	Base class for all multiclass classification objectives.
<i>ObjectiveBase</i>	Base class for all objectives.

Table 5 – continued from previous page

<i>Precision</i>	Precision score for binary classification.
<i>PrecisionMacro</i>	Precision score for multiclass classification using macro-averaging.
<i>PrecisionMicro</i>	Precision score for multiclass classification using micro averaging.
<i>PrecisionWeighted</i>	Precision score for multiclass classification using weighted averaging.
<i>R2</i>	Coefficient of determination for regression.
<i>Recall</i>	Recall score for binary classification.
<i>RecallMacro</i>	Recall score for multiclass classification using macro averaging.
<i>RecallMicro</i>	Recall score for multiclass classification using micro averaging.
<i>RecallWeighted</i>	Recall score for multiclass classification using weighted averaging.
<i>RegressionObjective</i>	Base class for all regression objectives.
<i>RootMeanSquaredError</i>	Root mean squared error for regression.
<i>RootMeanSquaredLogError</i>	Root mean squared log error for regression.
<i>SensitivityLowAlert</i>	Sensitivity at Low Alert Rates.
<i>SMAPE</i>	Symmetric mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Functions

<i>get_all_objective_names</i>	Get a list of the names of all objectives.
<i>get_core_objective_names</i>	Get a list of all valid core objectives.
<i>get_core_objectives</i>	Returns all core objective instances associated with the given problem type.
<i>get_default_recommendation_objectives</i>	Get the default recommendation score metrics for the given problem type.
<i>get_non_core_objectives</i>	Get non-core objective classes.
<i>get_objective</i>	Returns the Objective class corresponding to a given objective name.
<i>get_optimization_objectives</i>	Get objectives for optimization.
<i>get_ranking_objectives</i>	Get objectives for pipeline rankings.
<i>normalize_objectives</i>	Converts objectives from a $[0, \infty)$ scale to $[0, 1]$ given a max and min for each objective.
<i>organize_objectives</i>	Generate objectives to consider, with optional modifications to the defaults.
<i>ranking_only_objectives</i>	Get ranking-only objective classes.
<i>recommendation_score</i>	Computes a recommendation score for a model given scores for a group of objectives.

Contents

class evalml.objectives.AccuracyBinary

Accuracy score for binary classification.

Example

```
>>> y_true = pd.Series([0, 0, 0, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(AccuracyBinary().objective_function(y_true, y_
↳pred), 0.6363636)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Accuracy Binary
per-fect_score	1.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod calculate_percent_difference(cls, score, baseline_score)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.

- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property can_optimize_threshold(*cls*)

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]

- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.**AccuracyMulticlass**

Accuracy score for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(AccuracyMulticlass().objective_function(y_true,
↪y_pred), 0.5454545)
```

Attributes

expected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Accuracy Multiclass
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for multiclass classification.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod **is_defined_for_problem_type**(*cls, problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for accuracy score for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**AUC**

AUC score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(AUC().objective_function(y_true, y_pred), 0.
↪ 5714285)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC score for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference`(cls, score, baseline_score)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.**AUCMacro**

AUC score for multiclass classification using macro averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.1, 0.0, 0.9],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.6, 0.1, 0.3],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(AUCMacro().objective_function(y_true, y_pred), 0.
↪75)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Macro
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.

- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod is_defined_for_problem_type(*cls, problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for AUC score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.AUCMicro

AUC score for multiclass classification using micro averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.3, 0.5, 0.2],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.3, 0.1, 0.6],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(AUCMicro().objective_function(y_true, y_pred), 0.
↪ 9861111)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Micro
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC score for multiclass classification using micro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC score for multiclass classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class `evalml.objectives.AUCWeighted`

AUC Score for multiclass classification using weighted averaging.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.1, 0.0, 0.9],
...           [0.1, 0.3, 0.6],
...           [0.1, 0.2, 0.7],
...           [0.6, 0.1, 0.3],
...           [0.5, 0.2, 0.3]]
>>> np.testing.assert_almost_equal(AUCWeighted().objective_function(y_true, y_pred),
↪ 0.4375)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	AUC Weighted
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for AUC Score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for AUC Score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score**validate_inputs**(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.**class** evalml.objectives.BalancedAccuracyBinary

Balanced accuracy score for binary classification.

Example

```
>>> y_true = pd.Series([0, 0, 0, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(BalancedAccuracyBinary().objective_function(y_
↪true, y_pred), 0.60)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Balanced Accuracy Binary
per-fect_score	1.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for accuracy score for balanced accuracy for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for accuracy score for balanced accuracy for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.BalancedAccuracyMulticlass`

Balanced accuracy score for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(BalancedAccuracyMulticlass().objective_
↪ function(y_true, y_pred), 0.5555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Balanced Accuracy Multiclass
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for accuracy score for balanced accuracy for multiclass classification.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for accuracy score for balanced accuracy for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**BinaryClassificationObjective**

Base class for all binary classification objectives.

Attributes

problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
----------------------	--

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>expected_range</i>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<i>greater_is_better</i>	Returns a boolean determining if a greater score indicates better model performance.
<i>is_bounded_like_percentage</i>	Returns whether this objective is bounded between 0 and 1, inclusive.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>name</i>	Returns a name describing the objective.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>perfect_score</i>	Returns the score obtained by evaluating this objective on a perfect model.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>score_needs_proba</i>	Returns a boolean determining if the score() method needs probability estimates.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

property expected_range(*cls*)

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property greater_is_better(*cls*)

Returns a boolean determining if a greater score indicates better model performance.

property is_bounded_like_percentage(*cls*)

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls*, *y_true*, *y_predicted*, *y_train=None*, *X=None*,
sample_weight=None)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.CostBenefitMatrix(*true_positive*, *true_negative*, *false_positive*, *false_negative*)

Score using a cost-benefit matrix. Scores quantify the benefits of a given value, so greater numeric scores represents a better score. Costs and scores can be negative, indicating that a value is not beneficial. For example, in the case of monetary profit, a negative cost and/or score represents loss of cash flow.

Parameters

- **true_positive** (*float*) – Cost associated with true positive predictions.
- **true_negative** (*float*) – Cost associated with true negative predictions.
- **false_positive** (*float*) – Cost associated with false positive predictions.
- **false_negative** (*float*) – Cost associated with false negative predictions.

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Cost Benefit Matrix
perfect_score	None
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Calculates cost-benefit of the using the predicted and true values.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold`(*cls*)

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Calculates cost-benefit of the using the predicted and true values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted labels.
- **y_true** (*pd.Series*) – True labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Ignored.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Cost-benefit matrix score

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.ExpVariance`

Explained variance score for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(ExpVariance().objective_function(y_true, y_pred),
→ 0.7760736)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	ExpVariance
per-fect_score	1.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for explained variance score for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for explained variance score for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.F1

F1 score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(F1().objective_function(y_true, y_pred), 0.25)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for F1 score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold`(*cls*)

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for F1 score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.F1Macro`

F1 score for multiclass classification using macro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Macro().objective_function(y_true, y_pred), 0.
↪ 5476190)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Macro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for F1 score for multiclass classification using macro averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for F1 score for multiclass classification using macro averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**F1Micro**

F1 score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Micro().objective_function(y_true, y_pred), 0.5454545)
```

Attributes

expected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for F1 score for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for F1 score for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**F1Weighted**

F1 score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(F1Weighted().objective_function(y_true, y_pred),
→0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	F1 Weighted
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for F1 score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for F1 score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series, or pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.FraudCost(retry_percentage=0.5, interchange_fee=0.02, fraud_payout_percentage=1.0, amount_col='amount')`

Score the percentage of money lost of the total transaction amount process due to fraud.

Parameters

- **retry_percentage** (*float*) – What percentage of customers that will retry a transaction if it is declined. Between 0 and 1. Defaults to 0.5.
- **interchange_fee** (*float*) – How much of each successful transaction you pay. Between 0 and 1. Defaults to 0.02.

- **fraud_payout_percentage** (*float*) – Percentage of fraud you will not be able to collect. Between 0 and 1. Defaults to 1.0.
- **amount_col** (*str*) – Name of column in data that contains the amount. Defaults to “amount”.

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	True
name	Fraud Cost
per-fect_score	0.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *X*, *y_train=None*, *sample_weight=None*)

Calculate amount lost to fraud per transaction given predictions, true values, and dataframe with transaction amount.

Parameters

- **y_predicted** (*pd.Series*) – Predicted fraud labels.
- **y_true** (*pd.Series*) – True fraud labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Data with transaction amounts.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Amount lost to fraud per transaction.

Return type float

Raises **ValueError** – If `amount_col` is not a valid column in the input data.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score**validate_inputs(*self*, *y_true*, *y_predicted*)**

Validate inputs for scoring.

evalml.objectives.get_all_objective_names()

Get a list of the names of all objectives.

Returns Objective names

Return type list (str)

evalml.objectives.get_core_objective_names()

Get a list of all valid core objectives.

Returns Objective names.

Return type list[str]

evalml.objectives.get_core_objectives(*problem_type*)

Returns all core objective instances associated with the given problem type.

Core objectives are designed to work out-of-the-box for any dataset.

Parameters **problem_type** (*str/ProblemTypes*) – Type of problem

Returns List of ObjectiveBase instances

Examples

```
>>> for objective in get_core_objectives("regression"):
...     print(objective.name)
ExpVariance
MaxError
MedianAE
MSE
MAE
R2
Root Mean Squared Error
```

(continues on next page)

(continued from previous page)

```
>>> for objective in get_core_objectives("binary"):
...     print(objective.name)
MCC Binary
Log Loss Binary
Gini
AUC
Precision
F1
Balanced Accuracy Binary
Accuracy Binary
```

`evalml.objectives.get_default_recommendation_objectives(problem_type, imbalanced=False)`

Get the default recommendation score metrics for the given problem type.

Parameters

- **problem_type** (*str/ProblemType*) – Type of problem
- **imbalanced** (*boolean*) – For multiclass problems, if the classes are imbalanced. Defaults to False

Returns Set of string objective names that correspond to ObjectiveBase objectives

`evalml.objectives.get_non_core_objectives()`

Get non-core objective classes.

Non-core objectives are objectives that are domain-specific. Users typically need to configure these objectives before using them in AutoMLSearch.

Returns List of ObjectiveBase classes

`evalml.objectives.get_objective(objective, return_instance=False, **kwargs)`

Returns the Objective class corresponding to a given objective name.

Parameters

- **objective** (*str or ObjectiveBase*) – Name or instance of the objective class.
- **return_instance** (*bool*) – Whether to return an instance of the objective. This only applies if objective is of type `str`. Note that the instance will be initialized with default arguments.
- **kwargs** (*Any*) – Any keyword arguments to pass into the objective. Only used when `return_instance=True`.

Returns ObjectiveBase if the parameter objective is of type ObjectiveBase. If objective is instead a valid objective name, function will return the class corresponding to that name. If `return_instance` is True, an instance of that objective will be returned.

Raises

- **TypeError** – If objective is None.
- **TypeError** – If objective is not a string and not an instance of ObjectiveBase.
- **ObjectiveNotFoundError** – If input objective is not a valid objective.
- **ObjectiveCreationError** – If objective cannot be created properly.

`evalml.objectives.get_optimization_objectives(problem_type)`

Get objectives for optimization.

Parameters `problem_type` (*str/ProblemTypes*) – Type of problem

Returns List of ObjectiveBase instances

`evalml.objectives.get_ranking_objectives(problem_type)`

Get objectives for pipeline rankings.

Parameters `problem_type` (*str/ProblemTypes*) – Type of problem

Returns List of ObjectiveBase instances

class `evalml.objectives.Gini`

Gini coefficient for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Gini().objective_function(y_true, y_pred), 0.
↪ 1428571)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Gini
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for Gini coefficient for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold*=0.5, *X*=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Gini coefficient for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.LeadScoring(true_positives=1, false_positives=-1)`

Lead scoring.

Parameters

- **true_positives** (*int*) – Reward for a true positive. Defaults to 1.
- **false_positives** (*int*) – Cost for a false positive. Should be negative. Defaults to -1.

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	Lead Scoring
per-fect_score	None
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Calculate the profit per lead.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Calculate the profit per lead.

Parameters

- **y_predicted** (*pd.Series*) – Predicted labels.
- **y_true** (*pd.Series*) – True labels.
- **y_train** (*pd.Series*) – Ignored.
- **X** (*pd.DataFrame*) – Ignored.
- **sample_weight** (*pd.DataFrame*) – Ignored.

Returns Profit per lead

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises RuntimeError – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score

- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.**LogLossBinary**

Log Loss for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(LogLossBinary().objective_function(y_true, y_
↪pred), 19.6601745)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	False
is_bounded_like_percentage	False
name	Log Loss Binary
per-fect_score	0.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for log loss for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type `bool`

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for log loss for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.**LogLossMulticlass**

Log Loss for multiclass classification.

Example

```
>>> y_true = [0, 1, 2, 0, 2, 1]
>>> y_pred = [[0.7, 0.2, 0.1],
...           [0.3, 0.5, 0.2],
...           [0.1, 0.3, 0.6],
...           [0.9, 0.1, 0.0],
...           [0.3, 0.1, 0.6],
...           [0.5, 0.5, 0.0]]
>>> np.testing.assert_almost_equal(LogLossMulticlass().objective_function(y_true, y_
↪pred), 0.4783301)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	False
is_bounded_like_percentage	True
name	Log Loss Multiclass
per-fect_score	0.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for log loss for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for log loss for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**MAE**

Mean absolute error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MAE().objective_function(y_true, y_pred), 0.
↪ 2727272)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MAE
per-fect_score	0.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for mean absolute error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**MAPE**

Mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Only valid for nonzero inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MAPE().objective_function(y_true, y_pred), 15.
↪ 9848484)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Mean Absolute Percentage Error
perfect_score	0.0
problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute percentage error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for mean absolute percentage error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**MASE**

Mean absolute scaled error for time series regression.

Only valid if there exists a nonzero input in y_train. Otherwise, will throw a ValueError.

Example

```
>>> y_train = pd.Series([5, 0.5, 4, 6, 3, 5, 2])
>>> y_true = pd.Series([3, -0.5, 2, 7, 2])
>>> y_pred = pd.Series([2.5, 0.0, 2, 8, 1.25])
>>> np.testing.assert_almost_equal(MASE().objective_function(y_true, y_pred, y_
↪train), 0.18333333333333335)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	True
name	Mean Absolute Scaled Error
perfect_score	0.0
problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean absolute scaled error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train, X=None, sample_weight=None*)

Objective function for mean absolute scaled error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**MaxError**

Maximum residual error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MaxError().objective_function(y_true, y_pred), 1.
↪ 0)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MaxError
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for maximum residual error for regression.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for maximum residual error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns `score`

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.MCCBinary

Matthews correlation coefficient for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(MCCBinary().objective_function(y_true, y_pred),
→ 0.2390457)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	MCC Binary
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for Matthews correlation coefficient for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type `bool`

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Matthews correlation coefficient for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.**MCCMulticlass**

Matthews correlation coefficient for multiclass classification.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(MCCMulticlass().objective_function(y_true, y_
↪pred), 0.325)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	MCC Multiclass
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for Matthews correlation coefficient for multiclass classification.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for Matthews correlation coefficient for multiclass classification.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**MeanSquaredLogError**

Mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MeanSquaredLogError().objective_function(y_true,
→y_pred), 0.0171353)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Mean Squared Log Error
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean squared log error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for mean squared log error for regression.

positive_only(*self*)

If True, this objective is only valid for positive data.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series, or pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.MedianAE`

Median absolute error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MedianAE().objective_function(y_true, y_pred), 0.
↪ 25)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MedianAE
per-fect_score	0.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for median absolute error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for median absolute error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**MSE**

Mean squared error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(MSE().objective_function(y_true, y_pred), 0.
↪ 1590909)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	MSE
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for mean squared error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for mean squared error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**MulticlassClassificationObjective**

Base class for all multiclass classification objectives.

Attributes

problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
----------------------	--

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>expected_range</i>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<i>greater_is_better</i>	Returns a boolean determining if a greater score indicates better model performance.
<i>is_bounded_like_percentage</i>	Returns whether this objective is bounded between 0 and 1, inclusive.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>name</i>	Returns a name describing the objective.
<i>objective_function</i>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<i>perfect_score</i>	Returns the score obtained by evaluating this objective on a perfect model.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>score_needs_proba</i>	Returns a boolean determining if the score() method needs probability estimates.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type `float`

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property `name(cls)`

Returns a name describing the objective.

abstract classmethod `objective_function(cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None)`

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property `perfect_score(cls)`

Returns the score obtained by evaluating this objective on a perfect model.

property `positive_only(cls)`

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

evalml.objectives.normalize_objectives(*objectives_to_normalize*, *max_objectives*, *min_objectives*)

Converts objectives from a [0, inf) scale to [0, 1] given a max and min for each objective.

Parameters

- **objectives_to_normalize** (*dict[str, float]*) – A dictionary mapping objectives to values
- **max_objectives** (*dict[str, float]*) – The mapping of objectives to the maximum values for normalization
- **min_objectives** (*dict[str, float]*) – The mapping of objectives to the minimum values for normalization

Returns A dictionary mapping objective names to their new normalized values

class evalml.objectives.ObjectiveBase

Base class for all objectives.

Attributes

problem_types	None
----------------------	------

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>expected_range</code>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<code>greater_is_better</code>	Returns a boolean determining if a greater score indicates better model performance.
<code>is_bounded_like_percentage</code>	Returns whether this objective is bounded between 0 and 1, inclusive.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>name</code>	Returns a name describing the objective.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<code>perfect_score</code>	Returns the score obtained by evaluating this objective on a perfect model.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>score_needs_proba</code>	Returns a boolean determining if the score() method needs probability estimates.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

property positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].

- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

`evalml.objectives.organize_objectives(problem_type, include=None, exclude=None, imbalanced=False)`

Generate objectives to consider, with optional modifications to the defaults.

Parameters

- **problem_type** (*str/ProblemType*) – Type of problem
- **include** (*list[str/ObjectiveBase]*) – A list of objectives to include beyond the defaults. Defaults to None.
- **exclude** (*list[str/ObjectiveBase]*) – A list of objectives to exclude from the defaults. Defaults to None.
- **imbalanced** (*boolean*) – For multiclass problems, if the classes are imbalanced. Defaults to False

Returns List of string objective names that correspond to ObjectiveBase objectives

Raises

- **ValueError** – If any objectives to include or exclude are not valid for the problem type
- **ValueError** – If an objective to exclude is not in the default objectives

class `evalml.objectives.Precision`

Precision score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Precision().objective_function(y_true, y_pred),
↪ 1.0)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision
per-fect_score	1.0
prob-lem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Apply a learned threshold to predicted probabilities to get predicted classes.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for precision score for binary classification.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold*=0.5, *X*=None)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for precision score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.PrecisionMacro`

Precision score for multiclass classification using macro-averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionMacro().objective_function(y_true, y_
↪pred), 0.5555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Macro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for precision score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for precision score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.PrecisionMicro

Precision score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionMicro().objective_function(y_true, y_
→pred), 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Micro
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for precision score for binary classification using micro-averaging.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for precision score for binary classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**PrecisionWeighted**

Precision score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(PrecisionWeighted().objective_function(y_true, y_
→pred), 0.5606060)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Precision Weighted
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for precision score for multiclass classification using weighted averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod **is_defined_for_problem_type**(*cls, problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for precision score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**R2**

Coefficient of determination for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(R2().objective_function(y_true, y_pred), 0.
↪ 7638036)
```

Attributes

ex-pected_range	None
greater_is_better	True
is_bounded_like_percentage	False
name	R2
per-fect_score	1
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for coefficient of determination for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for coefficient of determination for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

evalml.objectives.ranking_only_objectives()

Get ranking-only objective classes.

Ranking-only objectives are objectives that are useful for evaluating the performance of a model, but should not be used as an optimization objective during AutoMLSearch for various reasons.

Returns List of ObjectiveBase classes

class evalml.objectives.Recall

Recall score for binary classification.

Example

```
>>> y_true = pd.Series([0, 1, 1, 0, 0, 1, 1, 1, 0, 1, 1])
>>> y_pred = pd.Series([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1])
>>> np.testing.assert_almost_equal(Recall().objective_function(y_true, y_pred), 0.
↪ 1428571)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>can_optimize_threshold</i>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<i>decision_function</i>	Apply a learned threshold to predicted probabilities to get predicted classes.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for binary classification.
<i>optimize_threshold</i>	Learn a binary classification threshold which optimizes the current objective.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, *threshold=0.5*, *X=None*)

Apply a learned threshold to predicted probabilities to get predicted classes.

Parameters

- **ypred_proba** (*pd.Series*, *np.ndarray*) – The classifier’s predicted probabilities
- **threshold** (*float*, *optional*) – Threshold used to make a prediction. Defaults to 0.5.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns predictions

classmethod is_defined_for_problem_type(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for binary classification.

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class evalml.objectives.RecallMacro

Recall score for multiclass classification using macro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallMacro().objective_function(y_true, y_pred),
→ 0.555555)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Macro
per-fect_score	1.0
prob-lem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for multiclass classification using macro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for multiclass classification using macro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.RecallMicro

Recall score for multiclass classification using micro averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallMicro().objective_function(y_true, y_pred),
→ 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Micro
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_problem	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for recall score for multiclass classification using micro-averaging.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Objective function for recall score for multiclass classification using micro-averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.RecallWeighted

Recall score for multiclass classification using weighted averaging.

Example

```
>>> y_true = pd.Series([0, 1, 0, 2, 0, 1, 2, 1, 2, 0, 2])
>>> y_pred = pd.Series([0, 0, 0, 0, 1, 1, 1, 1, 2, 2, 2])
>>> np.testing.assert_almost_equal(RecallWeighted().objective_function(y_true, y_
↪pred), 0.5454545)
```

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Recall Weighted
perfect_score	1.0
problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS]
score_needs_proba	True

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Objective function for recall score for multiclass classification using weighted averaging.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference`(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type`(*cls*, *problem_type*)

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for recall score for multiclass classification using weighted averaging.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

evalml.objectives.recommendation_score(*objectives*, *prioritized_objective=None*, *custom_weights=None*)

Computes a recommendation score for a model given scores for a group of objectives.

This recommendation score is a weighted average of the given objectives, by default all weighted equally. Passing in a prioritized objective will weight that objective with the prioritized weight, and all other objectives will split the remaining weight equally.

Parameters

- **objectives** (*dict[str, float]*) – A dictionary mapping objectives to their values. Objectives should be a float between 0 and 1, where higher is better. If the objective does not represent score this way, scores should first be normalized using the `normalize_objectives` function.
- **prioritized_objective** (*str*) – An optional name of a priority objective that should be given heavier weight (50% of the total) than the other objectives contributing to the score. Defaults to `None`, where all objectives are weighted equally.
- **custom_weights** (*dict[str, float]*) – A dictionary mapping objective names to corresponding weights between 0 and 1. If all objectives are listed, should add up to 1. If a subset of objectives are listed, should add up to less than 1, and remaining weight will be evenly distributed between the remaining objectives. Should not be used at the same time as `prioritized_objective`.

Returns A value between 0 and 100 representing how strongly we recommend a pipeline given a set of evaluated objectives

Raises ValueError – If the objective(s) to prioritize are not in the known objectives, or if the custom weight(s) are not a float between 0 and 1.

class evalml.objectives.RegressionObjective

Base class for all regression objectives.

Attributes

problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
----------------------	---

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>expected_range</code>	Returns the expected range of the objective, which is not necessarily the possible ranges.
<code>greater_is_better</code>	Returns a boolean determining if a greater score indicates better model performance.
<code>is_bounded_like_percentage</code>	Returns whether this objective is bounded between 0 and 1, inclusive.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>name</code>	Returns a name describing the objective.
<code>objective_function</code>	Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.
<code>perfect_score</code>	Returns the score obtained by evaluating this objective on a perfect model.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>score_needs_proba</code>	Returns a boolean determining if the score() method needs probability estimates.
<code>validate_inputs</code>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `expected_range(cls)`

Returns the expected range of the objective, which is not necessarily the possible ranges.

For example, our expected R2 range is from [-1, 1], although the actual range is (-inf, 1].

property `greater_is_better(cls)`

Returns a boolean determining if a greater score indicates better model performance.

property `is_bounded_like_percentage(cls)`

Returns whether this objective is bounded between 0 and 1, inclusive.

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

property name(*cls*)

Returns a name describing the objective.

abstract classmethod objective_function(*cls, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Computes the relative value of the provided predictions compared to the actual labels, according a specified metric.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns Numerical value used to calculate score

property perfect_score(*cls*)

Returns the score obtained by evaluating this objective on a perfect model.

property positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self, y_true, y_predicted, y_train=None, X=None, sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

property score_needs_proba(*cls*)

Returns a boolean determining if the score() method needs probability estimates.

This should be true for objectives which work with predicted probabilities, like log loss or AUC, and false for objectives which compare predicted class labels to the actual labels, like F1 or correlation.

validate_inputs(*self, y_true, y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].

- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises **ValueError** – If the inputs are malformed.

class evalml.objectives.**RootMeanSquaredError**

Root mean squared error for regression.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(RootMeanSquaredError().objective_function(y_true,
→ y_pred), 0.3988620)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Root Mean Squared Error
perfect_score	0.0
problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_proba	False

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for root mean squared error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod **calculate_percent_difference**(*cls*, *score*, *baseline_score*)

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for root mean squared error for regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class `evalml.objectives.RootMeanSquaredLogError`

Root mean squared log error for regression.

Only valid for nonnegative inputs. Otherwise, will throw a ValueError.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(RootMeanSquaredLogError().objective_function(y_
↪true, y_pred), 0.13090204)
```

Attributes

ex-pected_range	None
greater_is_better	False
is_bounded_like_percentage	False
name	Root Mean Squared Log Error
per-fect_score	0.0
prob-lem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for root mean squared log error for regression.
<i>positive_only</i>	If True, this objective is only valid for positive data.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for root mean squared log error for regression.

positive_only(*self*)

If True, this objective is only valid for positive data.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

class evalml.objectives.**SensitivityLowAlert**(*alert_rate=0.01*)

Sensitivity at Low Alert Rates.

Parameters **alert_rate** (*float*) – percentage of top scores to classify as high risk.

Attributes

ex-pected_range	[0, 1]
greater_is_better	True
is_bounded_like_percentage	True
name	Sensitivity at Low Alert Rates
perfect_score	1.0
problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY]
score_needs_proba	False

Methods

<code>calculate_percent_difference</code>	Calculate the percent difference between scores.
<code>can_optimize_threshold</code>	Returns a boolean determining if we can optimize the binary classification objective threshold.
<code>decision_function</code>	Determine if an observation is high risk given an alert rate.
<code>is_defined_for_problem_type</code>	Returns whether or not an objective is defined for a problem type.
<code>objective_function</code>	Calculate sensitivity across all predictions, using the top alert_rate percent of observations as the predicted positive class.
<code>optimize_threshold</code>	Learn a binary classification threshold which optimizes the current objective.
<code>positive_only</code>	If True, this objective is only valid for positive data. Defaults to False.
<code>score</code>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<code>validate_inputs</code>	Validate inputs for scoring.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

property `can_optimize_threshold(cls)`

Returns a boolean determining if we can optimize the binary classification objective threshold.

This will be false for any objective that works directly with predicted probabilities, like log loss and AUC. Otherwise, it will be true.

Returns Whether or not an objective can be optimized.

Return type bool

decision_function(*self*, *ypred_proba*, ***kwargs*)

Determine if an observation is high risk given an alert rate.

Parameters

- **ypred_proba** (*pd.Series*) – Predicted probabilities.
- ****kwargs** – Additional arbitrary parameters.

Returns Whether or not an observation is high risk given an alert rate.

Return type *pd.Series*

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, ***kwargs*)

Calculate sensitivity across all predictions, using the top `alert_rate` percent of observations as the predicted positive class.

Parameters

- **y_true** (*pd.Series*) – True labels.
- **y_predicted** (*pd.Series*) – Predicted labels based on `alert_rate`.
- ****kwargs** – Additional arbitrary parameters.

Returns sensitivity using the observations with the top scores as the predicted positive class.

Return type float

optimize_threshold(*self*, *ypred_proba*, *y_true*, *X=None*)

Learn a binary classification threshold which optimizes the current objective.

Parameters

- **ypred_proba** (*pd.Series*) – The classifier’s predicted probabilities
- **y_true** (*pd.Series*) – The ground truth for the predictions.
- **X** (*pd.DataFrame*, *optional*) – Any extra columns that are needed from training data.

Returns Optimal threshold for this objective.

Raises **RuntimeError** – If objective cannot be optimized.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length `[n_samples]`
- **y_true** (*pd.Series*) – Actual class labels of length `[n_samples]`
- **y_train** (*pd.Series*) – Observed training values of length `[n_samples]`
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape `[n_samples, n_features]` necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validate inputs for scoring.

class `evalml.objectives.SMAPE`

Symmetric mean absolute percentage error for time series regression. Scaled by 100 to return a percentage.

Only valid for nonzero inputs. Otherwise, will throw a `ValueError`.

Example

```
>>> y_true = pd.Series([1.5, 2, 3, 1, 0.5, 1, 2.5, 2.5, 1, 0.5, 2])
>>> y_pred = pd.Series([1.5, 2.5, 2, 1, 0.5, 1, 3, 2.25, 0.75, 0.25, 1.75])
>>> np.testing.assert_almost_equal(SMAPE().objective_function(y_true, y_pred), 18.
↪ 13652589)
```

Attributes

ex-pected_range	[0, 200]
greater_is_better	False
is_bounded_like_type	percentage
name	Symmetric Mean Absolute Percentage Error
per-fect_score	0.0
prob-lem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
score_needs_positive	True

Methods

<i>calculate_percent_difference</i>	Calculate the percent difference between scores.
<i>is_defined_for_problem_type</i>	Returns whether or not an objective is defined for a problem type.
<i>objective_function</i>	Objective function for symmetric mean absolute percentage error for time series regression.
<i>positive_only</i>	If True, this objective is only valid for positive data. Defaults to False.
<i>score</i>	Returns a numerical score indicating performance based on the differences between the predicted and actual values.
<i>validate_inputs</i>	Validates the input based on a few simple checks.

classmethod `calculate_percent_difference(cls, score, baseline_score)`

Calculate the percent difference between scores.

Parameters

- **score** (*float*) – A score. Output of the score method of this objective.
- **baseline_score** (*float*) – A score. Output of the score method of this objective. In practice, this is the score achieved on this objective with a baseline estimator.

Returns

The percent difference between the scores. Note that for objectives that can be interpreted as percentages, this will be the difference between the reference score and score. For all other objectives, the difference will be normalized by the reference score.

Return type float

classmethod `is_defined_for_problem_type(cls, problem_type)`

Returns whether or not an objective is defined for a problem type.

objective_function(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Objective function for symmetric mean absolute percentage error for time series regression.

positive_only(*cls*)

If True, this objective is only valid for positive data. Defaults to False.

score(*self*, *y_true*, *y_predicted*, *y_train=None*, *X=None*, *sample_weight=None*)

Returns a numerical score indicating performance based on the differences between the predicted and actual values.

Parameters

- **y_predicted** (*pd.Series*) – Predicted values of length [n_samples]
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples]
- **y_train** (*pd.Series*) – Observed training values of length [n_samples]
- **X** (*pd.DataFrame* or *np.ndarray*) – Extra data of shape [n_samples, n_features] necessary to calculate score
- **sample_weight** (*pd.DataFrame* or *np.ndarray*) – Sample weights used in computing objective value result

Returns score

validate_inputs(*self*, *y_true*, *y_predicted*)

Validates the input based on a few simple checks.

Parameters

- **y_predicted** (*pd.Series*, or *pd.DataFrame*) – Predicted values of length [n_samples].
- **y_true** (*pd.Series*) – Actual class labels of length [n_samples].

Raises ValueError – If the inputs are malformed.

Pipelines

EvalML pipelines.

Subpackages

components

EvalML component classes.

Subpackages

ensemble

Ensemble components.

Submodules

stacked_ensemble_base

Stacked Ensemble Base.

Module Contents

Classes Summary

<code>StackedEnsembleBase</code>	Stacked Ensemble Base Class.
----------------------------------	------------------------------

Contents

```
class evalml.pipelines.components.ensemble.stacked_ensemble_base.StackedEnsembleBase(final_estimator=None,
                                                                                       n_jobs=-1,
                                                                                       ran-
                                                                                       dom_seed=0,
                                                                                       **kwargs)
```

Stacked Ensemble Base Class.

Parameters

- **final_estimator** (*Estimator or subclass*) – The estimator used to combine the base estimators.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For *n_jobs* greater than -1, (*n_cpus* + 1 + *n_jobs*) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* $\neq 1$. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

model_family	ModelFamily.ENSEMBLE
modi- fies_features	True
modi- fies_target	False
train- ing_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for stacked ensemble classes.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>name</code>	Returns string name of this component.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>supported_problem_types</code>	Problem types this estimator supports.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self)`

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

`fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

property name(*cls*)

Returns string name of this component.

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`property supported_problem_types(cls)`

Problem types this estimator supports.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

stacked_ensemble_classifier

Stacked Ensemble Classifier.

Module Contents

Classes Summary

<i>StackedEnsembleClassifier</i>	Stacked Ensemble Classifier.
--	------------------------------

Contents

```
class evalml.pipelines.components.ensemble.stacked_ensemble_classifier.StackedEnsembleClassifier(final_estimator,
                                                                                               n_jobs=
                                                                                               1,
                                                                                               random_state=
                                                                                               None,
                                                                                               domain_size=
                                                                                               100,
                                                                                               **kwargs)
```

Stacked Ensemble Classifier.

Parameters

- **final_estimator** (*Estimator or subclass*) – The classifier used to combine the base estimators. If None, uses ElasticNetClassifier.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs below -1, (n_cpus + 1 + n_jobs) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* $\neq 1$. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.classifiers.decision_tree_
↳ classifier import DecisionTreeClassifier
>>> from evalml.pipelines.components.estimators.classifiers.elasticnet_classifier_
↳ import ElasticNetClassifier
...
>>> component_graph = {
...     "Decision Tree": [DecisionTreeClassifier(random_seed=3), "X", "y"],
...     "Decision Tree B": [DecisionTreeClassifier(random_seed=4), "X", "y"],
...     "Stacked Ensemble": [
...         StackedEnsembleClassifier(n_jobs=1, final_
↳ estimator=DecisionTreeClassifier()),
...         "Decision Tree.x",
...         "Decision Tree B.x",
...         "y",
...     ],
... }
...
>>> cg = ComponentGraph(component_graph)
>>> assert cg.default_parameters == {
...     'Decision Tree Classifier': {'criterion': 'gini',
...                                   'max_features': 'sqrt',

<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

stacked_ensemble_regressor

Stacked Ensemble Regressor.

Module Contents

Classes Summary

StackedEnsembleRegressor

Stacked Ensemble Regressor.

Contents

```
class evalml.pipelines.components.ensemble.stacked_ensemble_regressor.StackedEnsembleRegressor(final_estimator,
                                                                                             n_jobs=-
                                                                                             1,
                                                                                             random_seed=
                                                                                             **kwargs)
```

Stacked Ensemble Regressor.

Parameters

- **final_estimator** (*Estimator or subclass*) – The regressor used to combine the base estimators. If None, uses ElasticNetRegressor.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs greater than -1, (n_cpus + 1 + n_jobs) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* != 1. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

Package Contents

Classes Summary

<i>StackedEnsembleBase</i>	Stacked Ensemble Base Class.
<i>StackedEnsembleClassifier</i>	Stacked Ensemble Classifier.
<i>StackedEnsembleRegressor</i>	Stacked Ensemble Regressor.

Contents

`class evalml.pipelines.components.ensemble.StackedEnsembleBase`(*final_estimator=None, n_jobs=-1, random_seed=0, **kwargs*)

Stacked Ensemble Base Class.

Parameters

- **final_estimator** (*Estimator or subclass*) – The estimator used to combine the base estimators.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs greater than -1, (n_cpus + 1 + n_jobs) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* != 1. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

model_family	ModelFamily.ENSEMBLE
modifies_features	True
modifies_target	False
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for stacked ensemble classes.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>name</i>	Returns string name of this component.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>supported_problem_types</i>	Problem types this estimator supports.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters ***file_path*** (*str*) – Location to load file.

Returns ComponentBase object

property name(*cls*)

Returns string name of this component.

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters ***X*** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters ***X*** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- ***file_path*** (*str*) – Location to save file.
- ***pickle_protocol*** (*int*) – The pickle data stream format.

property supported_problem_types(*cls*)

Problem types this estimator supports.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.ensemble.StackedEnsembleClassifier(final_estimator=None,
                                                                    n_jobs=-1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Stacked Ensemble Classifier.

Parameters

- **final_estimator** (*Estimator or subclass*) – The classifier used to combine the base estimators. If None, uses ElasticNetClassifier.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For *n_jobs* below -1, (*n_cpus* + 1 + *n_jobs*) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* != 1. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.classifiers.decision_tree_
    classifier import DecisionTreeClassifier
>>> from evalml.pipelines.components.estimators.classifiers.elasticnet_classifier_
    import ElasticNetClassifier
...
>>> component_graph = {
...     "Decision Tree": [DecisionTreeClassifier(random_seed=3), "X", "y"],
...     "Decision Tree B": [DecisionTreeClassifier(random_seed=4), "X", "y"],
...     "Stacked Ensemble": [
...         StackedEnsembleClassifier(n_jobs=1, final_
    estimator=DecisionTreeClassifier()),
...         "Decision Tree.x",
...         "Decision Tree B.x",
...         "y",
...     ],
... }
...
>>> cg = ComponentGraph(component_graph)
>>> assert cg.default_parameters == {
...     'Decision Tree Classifier': {'criterion': 'gini',
...                                   'max_features': 'sqrt',
...                                   'max_depth': 6,
...                                   'min_samples_split': 2,
...                                   'min_weight_fraction_leaf': 0.0},
...     'Stacked Ensemble Classifier': {'final_estimator': ElasticNetClassifier,
...                                     'n_jobs': -1}}
```

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (bool, optional) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.ensemble.StackedEnsembleRegressor(final_estimator=None,
                                                                    n_jobs=-1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Stacked Ensemble Regressor.

Parameters

- **final_estimator** (*Estimator or subclass*) – The regressor used to combine the base estimators. If None, uses ElasticNetRegressor.
- **n_jobs** (*int or None*) – Integer describing level of parallelism used for pipelines. None and 1 are equivalent. If set to -1, all CPUs are used. For n_jobs greater than -1, (n_cpus + 1 + n_jobs) are used. Defaults to -1. - Note: there could be some multi-process errors thrown for values of *n_jobs* != 1. If this is the case, please use *n_jobs* = 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Example

```
>>> from evalml.pipelines.component_graph import ComponentGraph
>>> from evalml.pipelines.components.estimators.regressors.rf_regressor import _
↳ RandomForestRegressor
>>> from evalml.pipelines.components.estimators.regressors.elasticnet_regressor _
↳ import ElasticNetRegressor
...
>>> component_graph = {
...     "Random Forest": [RandomForestRegressor(random_seed=3), "X", "y"],
...     "Random Forest B": [RandomForestRegressor(random_seed=4), "X", "y"],
...     "Stacked Ensemble": [
...         StackedEnsembleRegressor(n_jobs=1, final_
↳ estimator=RandomForestRegressor()),
...         "Random Forest.x",
...         "Random Forest B.x",
...         "y",
...     ],
... }
...
>>> cg = ComponentGraph(component_graph)
>>> assert cg.default_parameters == {
...     'Random Forest Regressor': {'n_estimators': 100,
...                                   'max_depth': 6,
...                                   'n_jobs': -1},
...     'Stacked Ensemble Regressor': {'final_estimator': ElasticNetRegressor,
...                                     'n_jobs': -1}}
```

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for stacked ensemble classes.

Returns default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Not implemented for StackedEnsembleClassifier and StackedEnsembleRegressor.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

estimators

EvalML estimator components.

Subpackages

classifiers

Classification model components.

Submodules

baseline_classifier

Baseline classifier.

Module Contents

Classes Summary

<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.
---------------------------	--

Contents

```
class evalml.pipelines.components.estimators.classifiers.baseline_classifier.BaselineClassifier(strategy=  
    ran-  
    dom_seed=  
    **kwargs
```

Classifier that predicts using the specified strategy.
This is useful as a simple baseline classifier to compare with other classifiers.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mode”, “random” and “random_weighted”. Defaults to “mode”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS]
training_only	False

Methods

<code>classes_</code>	Returns class labels. Will return None before fitting.
<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.
<code>fit</code>	Fits baseline classifier component to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using the baseline classification strategy.
<code>predict_proba</code>	Make prediction probabilities using the baseline classification strategy.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

property `classes_(self)`

Returns class labels. Will return None before fitting.

Returns Class names

Return type list[str] or list(float)

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes

Return type `pd.Series`

fit(self, X, y=None)

Fits baseline classifier component to data.

Parameters

- **X** (`pd.DataFrame`) – The input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – The target training data of length `[n_samples]`.

Returns `self`

Raises **ValueError** – If `y` is `None`.

get_prediction_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – Target data. Ignored.
- **coverage** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (`pd.Series`) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type `dict`

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (`str`) – Location to load file.

Returns `ComponentBase` object

needs_fitting(self)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the baseline classification strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*)

Make prediction probabilities using the baseline classification strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type *pd.DataFrame*

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

catboost_classifier

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

Module Contents**Classes Summary**

CatBoostClassifier

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

Contents

`class evalml.pipelines.components.estimators.classifiers.catboost_classifier.CatBoostClassifier``(n_estimators=100, eta=0.03, max_depth=6, bootstrap_type=None, silent=True, allow_writing_files=False, random_seed=None, n_jobs=-1, **kwargs)`

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- **n_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow_writing_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(4, 100), “eta”: Real(0.000001, 1), “max_depth”: Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance of fitted CatBoost classifier.
<code>fit</code>	Fits CatBoost classifier component to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using the fitted CatBoost classifier.
<code>predict_proba</code>	Make prediction probabilities using the fitted CatBoost classifier.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self)`

Feature importance of fitted CatBoost classifier.

`fit(self, X, y=None)`

Fits CatBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].

- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type `pd.DataFrame`

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

decision_tree_classifier

Decision Tree Classifier.

Module Contents

Classes Summary

<i>DecisionTreeClassifier</i>	Decision Tree Classifier.
---	---------------------------

Contents

class `evalml.pipelines.components.estimators.classifiers.decision_tree_classifier.DecisionTreeClassifier`

Decision Tree Classifier.

Parameters

- **criterion** (*{ "gini", "entropy" }*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max_features** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.

- If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider `min_samples_split` as the minimum number.
 - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “criterion”: [“gini”, “entropy”], “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

`predict_proba`(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save`(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters`(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

elasticnet_classifier

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

Module Contents

Classes Summary

ElasticNetClassifier

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

Contents

```

class evalml.pipelines.components.estimators.classifiers.elasticnet_classifier.ElasticNetClassifier(penalty='elasticnet', C=1.0, l1_ratio=0.15, multi_class='auto', solver='liblinear', n_jobs=1, random_seed=0)

```

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

Parameters

- **penalty** (`{ "l1", "l2", "elasticnet", "none" }`) – The norm used in penalization. Defaults to “elasticnet”.
- **C** (`float`) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **l1_ratio** (`float`) – The mixing parameter, with $0 \leq \text{l1_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{l1_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **multi_class** (`{ "auto", "ovr", "multinomial" }`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver='liblinear'`. “auto” selects “ovr” if the data is binary, or if `solver='liblinear'`, and otherwise selects “multinomial”. Defaults to “auto”.
 - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
 - “liblinear” and “saga” also handle L1 penalty
 - “saga” also supports “elasticnet” penalty
 - “liblinear” does not support setting `penalty='none'`
 Defaults to “saga”.
- **n_jobs** (`int`) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "C": Real(0.01, 10), "l1_ratio": Real(0, 1)}
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted ElasticNet classifier.
<i>fit</i>	Fits ElasticNet classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted ElasticNet classifier.

fit(*self, X, y*)

Fits ElasticNet classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

et_classifier

Extra Trees Classifier.

Module Contents**Classes Summary**

ExtraTreesClassifier

Extra Trees Classifier.

Contents

```
class evalml.pipelines.components.estimators.classifiers.et_classifier.ExtraTreesClassifier(n_estimators=  
    max_features=  
    max_depth=6,  
    min_samples_split=  
    min_weight_fraction_leaf=0,  
    n_jobs=-1,  
    random_state=  
    random_seed=0,  
    **kwargs)
```

Extra Trees Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_features** (*int, float or {"sqrt", "log2"}*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.
 - If float, then max_features is a fraction and int(max_features * n_features) features are considered at each split.
 - If “sqrt”, then max_features=sqrt(n_features).
 - If “log2”, then max_features=log2(n_features).
 - If None, then max_features = n_features.The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max_features features.
- **max_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and ceil(min_samples_split * n_samples) are the minimum number of samples for each split.
- **2. (Defaults to) –**
- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_features": ["sqrt", "log2"], "max_depth": Integer(4, 10), }
model_family	ModelFamily.EXTRA_TREES
modifies_features	True
modifies_target	False
name	Extra Trees Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.

<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

kneighbors_classifier

K-Nearest Neighbors Classifier.

Module Contents

Classes Summary

<i>KNeighborsClassifier</i>	K-Nearest Neighbors Classifier.
-----------------------------	---------------------------------

Contents

```
class evalml.pipelines.components.estimators.classifiers.kneighbors_classifier.KNeighborsClassifier(n_neighbors, weights, algorithm, leaf_size, p=2, random_state=None, **kwargs)
```

K-Nearest Neighbors Classifier.

Parameters

- **n_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** (*{‘uniform’, ‘distance’} or callable*) – Weight function used in prediction. Can be:
 - ‘uniform’: uniform weights. All points in each neighborhood are weighted equally.
 - ‘distance’: weight points by the inverse of their distance. In this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
 - [callable]: a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** (*{‘auto’, ‘ball_tree’, ‘kd_tree’, ‘brute’}*) – Algorithm used to compute the nearest neighbors:
 - ‘ball_tree’ will use BallTree
 - ‘kd_tree’ will use KDTree
 - ‘brute’ will use a brute-force search.

‘auto’ will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.

- **p** (*int*) – Power parameter for the Minkowski metric. When $p = 1$, this is equivalent to using `manhattan_distance` (11), and `euclidean_distance` (12) for $p = 2$. For arbitrary p , `minkowski_distance` (1_p) is used. Defaults to 2.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_neighbors": Integer(2, 12), "weights": ["uniform", "distance"], "algorithm": ["auto", "ball_tree", "kd_tree", "brute"], "leaf_size": Integer(10, 30), "p": Integer(1, 5), }
model_family	ModelFamily.K_NEIGHBORS
modifies_features	True
modifies_target	False
name	KNN Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's matching the input number of features as <code>feature_importance</code> is not defined for KNN classifiers.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> .
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns array of 0's matching the input number of features as feature_importance is not defined for KNN classifiers.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

lightgbm_classifier

LightGBM Classifier.

Module Contents

Classes Summary

<i>LightGBMClassifier</i>	LightGBM Classifier.
---------------------------	----------------------

Contents

```
class evalml.pipelines.components.estimators.classifiers.lightgbm_classifier.LightGBMClassifier(boosting=  
    learn=  
    ing_rate=  
    n_estimat  
    max_dept  
    num_leav  
    min_chila  
    bag-  
    ging_frac  
    bag-  
    ging_freq  
    n_jobs=-  
  
    l,  
    ran-  
    dom_seea  
    **kwargs
```

LightGBM Classifier.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.

- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next k iterations. Defaults to 0.
- **n_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "learning_rate": Real(0.000001, 1), "boosting_type": ["gbdt", "dart", "goss", "rf"], "n_estimators": Integer(10, 100), "max_depth": Integer(0, 10), "num_leaves": Integer(2, 100), "min_child_samples": Integer(1, 100), "bagging_fraction": Real(0.000001, 1), "bagging_freq": Integer(0, 1), }
model_family	ModelFamily.LIGHTGBM
modifies_features	True
modifies_target	False
name	LightGBM Classifier
SEED_MAX	SEED_BOUNDS.max_bound
SEED_MIN	0
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
train_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits LightGBM classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted LightGBM classifier.
<i>predict_proba</i>	Make prediction probabilities using the fitted LightGBM classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns *self*

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted LightGBM classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.DataFrame

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted LightGBM classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type pd.DataFrame

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

logistic_regression_classifier

Logistic Regression Classifier.

Module Contents

Classes Summary

<i>LogisticRegressionClassifier</i>

Logistic Regression Classifier.

Contents

`class evalml.pipelines.components.estimators.classifiers.logistic_regression_classifier.LogisticRegressionClassifier`

Logistic Regression Classifier.

Parameters

- **penalty** (`{"l1", "l2", "elasticnet", "none"}`) – The norm used in penalization. Defaults to “l2”.
- **C** (`float`) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi_class** (`{"auto", "ovr", "multinomial"}`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when solver=“liblinear”. “auto” selects “ovr” if the data is binary, or if solver=“liblinear”, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (`{"newton-cg", "lbfgs", "liblinear", "sag", "saga"}`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
 - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
 - “liblinear” and “saga” also handle L1 penalty
 - “saga” also supports “elasticnet” penalty
 - “liblinear” does not support setting penalty=’none’Defaults to “lbfgs”.
- **n_jobs** (`int`) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "penalty": ["l2"], "C": Real(0.01, 10), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Logistic Regression Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted logistic regression classifier.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted logistic regression classifier.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

rf_classifier

Random Forest Classifier.

Module Contents

Classes Summary

RandomForestClassifier	Random Forest Classifier.
--	---------------------------

Contents

```
class evalml.pipelines.components.estimators.classifiers.rf_classifier.RandomForestClassifier(n_estimators=100,
                                                max_depth=6,
                                                n_jobs=-1,
                                                random_seed=0,
                                                **kwargs)
```

Random Forest Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(10, 1000), “max_depth”: Integer(1, 10), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict_proba*, *transform*, or *feature_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

Returns *True*.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict method or a `component_obj` that implements predict.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

svm_classifier

Support Vector Machine Classifier.

Module Contents

Classes Summary

SVMClassifier

Support Vector Machine Classifier.

Contents

```
class evalml.pipelines.components.estimators.classifiers.svm_classifier.SVMClassifier(C=1.0,
                                             kernel='rbf',
                                             gamma='auto',
                                             probability=True,
                                             random_seed=0,
                                             **kwargs)
```

Support Vector Machine Classifier.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{“poly”, “rbf”, “sigmoid”}*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{“scale”, “auto”} or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses $1 / (n_features * X.var())$ as value of gamma - If “auto” (default), uses $1 / n_features$
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0, 10), “kernel”: [“poly”, “rbf”, “sigmoid”], “gamma”: [“scale”, “auto”], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance only works with linear kernels.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if *return_dict* is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

Returns Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self, X: pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self, X: pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self, update_dict, reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

vowpal_wabbit_classifiers

Vowpal Wabbit Classifiers.

Module Contents

Classes Summary

<i>VowpalWabbitBaseClassifier</i>	Vowpal Wabbit Base Classifier.
<i>VowpalWabbitBinaryClassifier</i>	Vowpal Wabbit Binary Classifier.
<i>VowpalWabbitMulticlassClassifier</i>	Vowpal Wabbit Multiclass Classifier.

Contents

`class evalml.pipelines.components.estimators.classifiers.vowpal_wabbit_classifiers.VowpalWabbitBaseClassifier`

Vowpal Wabbit Base Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>name</i>	Returns string name of this component.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>supported_problem_types</i>	Problem types this estimator supports.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

property name(*cls*)

Returns string name of this component.

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

property supported_problem_types(*cls*)

Problem types this estimator supports.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class evalml.pipelines.components.estimators.classifiers.vowpal_wabbit_classifiers.VowpalWabbitBinaryCl

Vowpal Wabbit Binary Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Binary Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters *file_path* (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.vowpal_wabbit_classifiers.VowpalWabbitMulticla
```

Vowpal Wabbit Multiclass Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Multiclass Classifier
supported_problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

xgboost_classifier

XGBoost Classifier.

Module Contents

Classes Summary

XGBoostClassifier

XGBoost Classifier.

Contents

```
class evalml.pipelines.components.estimators.classifiers.xgboost_classifier.XGBoostClassifier(eta=0.1,
max_depth=6,
min_child_weight=1,
n_estimators=100,
random_seed=None,
eval_metric=None,
n_jobs=12,
**kwargs)
```

XGBoost Classifier.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.

- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min_child_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ “eta”: Real(0.000001, 1), “max_depth”: Integer(1, 10), “min_child_weight”: Real(1, 10), “n_estimators”: Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Classifier
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost classifier.
<i>fit</i>	Fits XGBoost classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted XGBoost classifier.
<i>predict_proba</i>	Make predictions using the fitted CatBoost classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted XGBoost classifier.

fit(*self*, *X*, *y=None*)

Fits XGBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted XGBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.DataFrame

predict_proba(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.DataFrame

save(*self*, *file_path*, *pickle_protocol*=cloudpickle.DEFAULT_PROTOCOL)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=True)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

Package Contents

Classes Summary

<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.
<i>CatBoostClassifier</i>	CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>DecisionTreeClassifier</i>	Decision Tree Classifier.
<i>ElasticNetClassifier</i>	Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.
<i>ExtraTreesClassifier</i>	Extra Trees Classifier.
<i>KNeighborsClassifier</i>	K-Nearest Neighbors Classifier.
<i>LightGBMClassifier</i>	LightGBM Classifier.
<i>LogisticRegressionClassifier</i>	Logistic Regression Classifier.
<i>RandomForestClassifier</i>	Random Forest Classifier.
<i>SVMClassifier</i>	Support Vector Machine Classifier.
<i>VowpalWabbitBinaryClassifier</i>	Vowpal Wabbit Binary Classifier.
<i>VowpalWabbitMulticlassClassifier</i>	Vowpal Wabbit Multiclass Classifier.
<i>XGBoostClassifier</i>	XGBoost Classifier.

Contents

```
class evalml.pipelines.components.estimators.classifiers.BaselineClassifier(strategy='mode',
                                                                    random_seed=0,
                                                                    **kwargs)
```

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mode”, “random” and “random_weighted”. Defaults to “mode”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS]
training_only	False

Methods

<code>classes_</code>	Returns class labels. Will return None before fitting.
<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.
<code>fit</code>	Fits baseline classifier component to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using the baseline classification strategy.
<code>predict_proba</code>	Make prediction probabilities using the baseline classification strategy.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`property classes_(self)`

Returns class labels. Will return None before fitting.

Returns Class names

Return type list[str] or list(float)

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {“name”: name, “parameters”: parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes

Return type `pd.Series`

fit(*self*, *X*, *y=None*)

Fits baseline classifier component to data.

Parameters

- **X** (`pd.DataFrame`) – The input training data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – The target training data of length `[n_samples]`.

Returns *self*

Raises **ValueError** – If *y* is None.

get_prediction_intervals(*self*, *X*: `pandas.DataFrame`, *y*: `Optional[pandas.Series]` = None, *coverage*: `List[float]` = None, *predictions*: `pandas.Series` = None) → `Dict[str, pandas.Series]`

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (`pd.DataFrame`) – Data of shape `[n_samples, n_features]`.
- **y** (`pd.Series`) – Target data. Ignored.
- **coverage** (`list[float]`) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (`pd.Series`) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the baseline classification strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*)

Make prediction probabilities using the baseline classification strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type *pd.DataFrame*

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.CatBoostClassifier(n_estimators=10,  
                                                                           eta=0.03,  
                                                                           max_depth=6,  
                                                                           boot-  
                                                                           strap_type=None,  
                                                                           silent=True, al-  
                                                                           low_writing_files=False,  
                                                                           random_seed=0,  
                                                                           n_jobs=- 1,  
                                                                           **kwargs)
```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- **n_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.

- **bootstrap_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow_writing_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(4, 100), “eta”: Real(0.000001, 1), “max_depth”: Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted CatBoost classifier.
<i>fit</i>	Fits CatBoost classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted CatBoost classifier.
<i>predict_proba</i>	Make prediction probabilities using the fitted CatBoost classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted CatBoost classifier.

fit(*self*, *X*, *y=None*)

Fits CatBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type pd.DataFrame

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.DecisionTreeClassifier(criterion='gini',
max_features='sqrt',
max_depth=6,
min_samples_split=2,
min_weight_fraction_leaf=0.0,
random_state=None,
seed=0,
**kwargs)
```

Decision Tree Classifier.

Parameters

- **criterion** (*{ "gini", "entropy" }*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max_features** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.
 - If float, then max_features is a fraction and $\text{int}(\text{max_features} * \text{n_features})$ features are considered at each split.
 - If “sqrt”, then $\text{max_features} = \text{sqrt}(\text{n_features})$.
 - If “log2”, then $\text{max_features} = \text{log2}(\text{n_features})$.
 - If None, then $\text{max_features} = \text{n_features}$.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max_features features.

- **max_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and $\text{ceil}(\text{min_samples_split} * \text{n_samples})$ are the minimum number of samples for each split.

Defaults to 2.

- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “criterion”: [“gini”, “entropy”], “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict method or a `component_obj` that implements predict.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.classifiers.ElasticNetClassifier(penalty='elasticnet',
                                                                           C=1.0,
                                                                           l1_ratio=0.15,
                                                                           multi_class='auto',
                                                                           solver='saga',
                                                                           n_jobs=-1,
                                                                           random_seed=0,
                                                                           **kwargs)
```

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

Parameters

- **`penalty`** (*{ "l1", "l2", "elasticnet", "none" }*) – The norm used in penalization. Defaults to “elasticnet”.
- **`C`** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **`l1_ratio`** (*float*) – The mixing parameter, with $0 \leq \text{l1_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{l1_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **`multi_class`** (*{ "auto", "ovr", "multinomial" }*) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver="liblinear"`. “auto” selects “ovr” if the data is binary, or if `solver="liblinear"`, and otherwise selects “multinomial”. Defaults to “auto”.

- **solver** (`{ "newton-cg", "lbfgs", "liblinear", "sag", "saga" }`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
 - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
 - “liblinear” and “saga” also handle L1 penalty
 - “saga” also supports “elasticnet” penalty
 - “liblinear” does not support setting `penalty='none'`
- Defaults to “saga”.
- **n_jobs** (`int`) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0.01, 10), “l1_ratio”: Real(0, 1)}
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted ElasticNet classifier.
<i>fit</i>	Fits ElasticNet classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if *return_dict* is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted ElasticNet classifier.

fit(*self*, *X*, *y*)

Fits ElasticNet classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = None, *coverage*: *List[float]* = None, *predictions*: *pandas.Series* = None) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.ExtraTreesClassifier(n_estimators=100,
                                                                              max_features='sqrt',
                                                                              max_depth=6,
                                                                              min_samples_split=2,
                                                                              min_weight_fraction_leaf=0.0,
                                                                              n_jobs=-1,
                                                                              random_seed=0,
                                                                              **kwargs)
```

Extra Trees Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_features** (*int, float or {"sqrt", "log2"}*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.
 - If float, then max_features is a fraction and int(max_features * n_features) features are considered at each split.
 - If “sqrt”, then max_features=sqrt(n_features).
 - If “log2”, then max_features=log2(n_features).
 - If None, then max_features = n_features.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max_features features.

- **max_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and ceil(min_samples_split * n_samples) are the minimum number of samples for each split.
- **2. (Defaults to) –**
- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_features": ["sqrt", "log2"], "max_depth": Integer(4, 10), }
model_family	ModelFamily.EXTRA_TREES
modifies_features	True
modifies_target	False
name	Extra Trees Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.KNeighborsClassifier(n_neighbors=5,  
                                                                           weights='uniform',  
                                                                           algo-  
                                                                           rithm='auto',  
                                                                           leaf_size=30,  
                                                                           p=2, ran-  
                                                                           dom_seed=0,  
                                                                           **kwargs)
```

K-Nearest Neighbors Classifier.

Parameters

- **n_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** ({*'uniform'*, *'distance'*} or *callable*) – Weight function used in prediction. Can be:
 - *'uniform'* : uniform weights. All points in each neighborhood are weighted equally.
 - *'distance'* : weight points by the inverse of their distance. in this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
 - [*callable*] : a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** ({*'auto'*, *'ball_tree'*, *'kd_tree'*, *'brute'*}) – Algorithm used to compute the nearest neighbors:
 - *'ball_tree'* will use BallTree
 - *'kd_tree'* will use KDTree
 - *'brute'* will use a brute-force search.

'auto' will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.
- **p** (*int*) – Power parameter for the Minkowski metric. When $p = 1$, this is equivalent to using `manhattan_distance` (l1), and `euclidean_distance` (l2) for $p = 2$. For arbitrary p , `minkowski_distance (l_p)` is used. Defaults to 2.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_neighbors”: Integer(2, 12), “weights”: [“uniform”, “distance”], “algorithm”: [“auto”, “ball_tree”, “kd_tree”, “brute”], “leaf_size”: Integer(10, 30), “p”: Integer(1, 5), }
model_family	ModelFamily.K_NEIGHBORS
modifies_features	True
modifies_target	False
name	KNN Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's matching the input number of features as <code>feature_importance</code> is not defined for KNN classifiers.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> .
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns array of 0's matching the input number of features as `feature_importance` is not defined for KNN classifiers.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

save(*self*, *file_path*, *pickle_protocol*=`cloudpickle.DEFAULT_PROTOCOL`)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=`True`)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.estimators.classifiers.LightGBMClassifier(boosting_type='gbdt',
                                                                            learn-
                                                                            ing_rate=0.1,
                                                                            n_estimators=100,
                                                                            max_depth=0,
                                                                            num_leaves=31,
                                                                            min_child_samples=20,
                                                                            bag-
                                                                            ging_fraction=0.9,
                                                                            bagging_freq=0,
                                                                            n_jobs=- 1,
                                                                            random_seed=0,
                                                                            **kwargs)
```

LightGBM Classifier.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.

- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next k iterations. Defaults to 0.
- **n_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "learning_rate": Real(0.000001, 1), "boosting_type": ["gbdt", "dart", "goss", "rf"], "n_estimators": Integer(10, 100), "max_depth": Integer(0, 10), "num_leaves": Integer(2, 100), "min_child_samples": Integer(1, 100), "bagging_fraction": Real(0.000001, 1), "bagging_freq": Integer(0, 1), }

<i>predict</i>	Make predictions using the fitted LightGBM classifier.
<i>predict_proba</i>	Make prediction probabilities using the fitted LightGBM classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted LightGBM classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.DataFrame

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted LightGBM classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type pd.DataFrame

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.LogisticRegressionClassifier(penalty='l2',
                                                                                      C=1.0,
                                                                                      multi_class='auto',
                                                                                      solver='lbfgs',
                                                                                      n_jobs=-
                                                                                      1,
                                                                                      ran-
                                                                                      dom_seed=0,
                                                                                      **kwargs)
```

Logistic Regression Classifier.

Parameters

- **penalty** (`{"l1", "l2", "elasticnet", "none"}`) – The norm used in penalization. Defaults to “l2”.
- **C** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi_class** (`{"auto", "ovr", "multinomial"}`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver="liblinear"`. “auto” selects “ovr” if the data is binary, or if `solver="liblinear"`, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (`{"newton-cg", "lbfgs", "liblinear", "sag", "saga"}`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
 - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
 - “liblinear” and “saga” also handle L1 penalty
 - “saga” also supports “elasticnet” penalty
 - “liblinear” does not support setting `penalty='none'`
 Defaults to “lbfgs”.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “penalty”: [“l2”], “C”: Real(0.01, 10), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Logistic Regression Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted logistic regression classifier.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for fitted logistic regression classifier.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].

- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.classifiers.RandomForestClassifier(n_estimators=100,
                                                                              max_depth=6,
                                                                              n_jobs=-1,
                                                                              random_seed=0,
                                                                              **kwargs)
```

Random Forest Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_depth": Integer(1, 10), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.SVMClassifier(C=1.0, kernel='rbf',  
                                                                    gamma='auto',  
                                                                    probability=True,  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

Support Vector Machine Classifier.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{“poly”, “rbf”, “sigmoid”}*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{“scale”, “auto”} or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses $1 / (n_features * X.var())$ as value of gamma - If “auto” (default), uses $1 / n_features$
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0, 10), “kernel”: [“poly”, “rbf”, “sigmoid”], “gamma”: [“scale”, “auto”], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance only works with linear kernels.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type `None` or dict

property feature_importance(*self*)

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

Returns Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns *self*

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.VowpalWabbitBinaryClassifier(loss_function='logistic',
                                                                                      learning_rate=0.5,
                                                                                      decay_learning_rate=1.0,
                                                                                      power_t=0.5,
                                                                                      passes=1,
                                                                                      random_seed=0,
                                                                                      **kwargs)
```

Vowpal Wabbit Binary Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Binary Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns `self`

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.classifiers.VowpalWabbitMulticlassClassifier(loss_function='lo
learn-
ing_rate=0.5,
de-
cay_learning_rat
power_t=0.5,
passes=1,
ran-
dom_seed=0,
**kwargs)
```

Vowpal Wabbit Multiclass Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Multiclass Classifier
supported_problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.classifiers.XGBoostClassifier(eta=0.1,  
                                                                           max_depth=6,  
                                                                           min_child_weight=1,  
                                                                           n_estimators=100,  
                                                                           random_seed=0,  
                                                                           eval_metric='logloss',  
                                                                           n_jobs=12,  
                                                                           **kwargs)
```

XGBoost Classifier.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min_child_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0

- **n_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ "eta": Real(0.000001, 1), "max_depth": Integer(1, 10), "min_child_weight": Real(1, 10), "n_estimators": Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Classifier
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost classifier.
<i>fit</i>	Fits XGBoost classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted XGBoost classifier.
<i>predict_proba</i>	Make predictions using the fitted CatBoost classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted XGBoost classifier.

fit(*self*, *X*, *y=None*)

Fits XGBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters *file_path* (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted XGBoost classifier.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

predict_proba(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

regressors

Regression model components.

Submodules

arima_regressor

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If "detect", this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "start_p": Integer(1, 3), "d": Integer(0, 2), "start_q": Integer(1, 3), "max_p": Integer(3, 10), "max_d": Integer(2, 5), "max_q": Integer(3, 10), "seasonal": [True, False], }

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.
<code>fit</code>	Fits ARIMA regressor to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted ARIMARegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted ARIMA regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (bool, optional) – whether to print name of component
- **return_dict** (bool, optional) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

Parameters

- **X** (pd.DataFrame) – The input training data of shape [n_samples, n_features].
- **y** (pd.Series) – The target training data of length [n_samples].

Returns `self`

Raises **ValueError** – If `y` was not passed in.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.Series* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted `ARIMARegressor`.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for `ARIMA` regressor.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type *dict*

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns `ComponentBase` object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*) → *pandas.Series*

Make predictions using fitted `ARIMA` regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If `X` was passed to `fit` but not passed in `predict`.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

baseline_regressor

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

Module Contents

Classes Summary

<i>BaselineRegressor</i>	Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.
--------------------------	---

Contents

class evalml.pipelines.components.estimators.regressors.baseline_regressor.**BaselineRegressor**(*strategy*='mean', *random_seed*=0, ***kwargs*)

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.
<i>fit</i>	Fits baseline regression component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the baseline regression strategy.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(self, X, y=None)

Fits baseline regression component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input y is None.

get_prediction_intervals (*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the baseline regression strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type pd.Series

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

catboost_regressor

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

Module Contents

Classes Summary

CatBoostRegressor

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

Contents

```
class evalml.pipelines.components.estimators.regressors.catboost_regressor.CatBoostRegressor(n_estimators=10,
eta=0.03,
max_depth=6,
bootstrap_type=None,
silent=False,
allow_writing_files=True,
random_seed=0,
n_jobs=-1,
**kwargs)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- ***n_estimators*** (*float*) – The maximum number of trees to build. Defaults to 10.
- ***eta*** (*float*) – The learning rate. Defaults to 0.03.
- ***max_depth*** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- ***bootstrap_type*** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- ***silent*** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- ***allow_writing_files*** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- ***n_jobs*** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- ***random_seed*** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(4, 100), "eta": Real(0.000001, 1), "max_depth": Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted CatBoost regressor.
<i>fit</i>	Fits CatBoost regressor component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted CatBoost regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted CatBoost regressor.

fit(*self, X, y=None*)

Fits CatBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted CatBoost regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

decision_tree_regressor

Decision Tree Regressor.

Module Contents

Classes Summary

DecisionTreeRegressor

Decision Tree Regressor.

Contents

`class evalml.pipelines.components.estimators.regressors.decision_tree_regressor.DecisionTreeRegressor`(*cr*

Decision Tree Regressor.

Parameters

- **criterion** (*{ "squared_error", "friedman_mse", "absolute_error", "poisson" }*) – The function to measure the quality of a split. Supported criteria are:
 - “squared_error” for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
 - “friedman_mse”, which uses mean squared error with Friedman’s improvement score for potential splits
 - “absolute_error” for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
 - “poisson” which uses reduction in Poisson deviance to find splits.
- **max_features** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.
 - If float, then max_features is a fraction and $\text{int}(\text{max_features} * \text{n_features})$ features are considered at each split.
 - If “sqrt”, then $\text{max_features} = \text{sqrt}(\text{n_features})$.
 - If “log2”, then $\text{max_features} = \text{log2}(\text{n_features})$.
 - If None, then $\text{max_features} = \text{n_features}$.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than max_features features.

- **max_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and $\text{ceil}(\text{min_samples_split} * \text{n_samples})$ are the minimum number of samples for each split.

Defaults to 2.

- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "criterion": ["squared_error", "friedman_mse", "absolute_error"], "max_features": ["sqrt", "log2"], "max_depth": Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

elasticnet_regressor

Elastic Net Regressor.

Module Contents

Classes Summary

ElasticNetRegressor

Elastic Net Regressor.

Contents

```
class evalml.pipelines.components.estimators.regressors.elasticnet_regressor.ElasticNetRegressor(alpha=0.0001, l1_ratio=0.15, max_iter=1000, random_seed=0, **kwargs)
```

Elastic Net Regressor.

Parameters

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1_ratio** (*float*) – The mixing parameter, with $0 \leq \text{l1_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{l1_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "alpha": Real(0, 1), "l1_ratio": Real(0, 1), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted ElasticNet regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted ElasticNet regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

et_regressor

Extra Trees Regressor.

Module Contents

Classes Summary

<i>ExtraTreesRegressor</i>	Extra Trees Regressor.
--	------------------------

Contents

```

class evalml.pipelines.components.estimators.regressors.et_regressor.ExtraTreesRegressor(n_estimators:
    int
    =
    100,
    max_features:
    str
    =
    'sqrt',
    max_depth:
    int
    =
    6,
    min_samples_split:

    1,
    random_seed:
    Union[int,
    float]
    =
    0,
    **kwargs)

```

Extra Trees Regressor.

Parameters

- ***n_estimators*** (*float*) – The number of trees in the forest. Defaults to 100.
- ***max_features*** (*int*, *float* or {"sqrt", "log2"}) – The number of features to consider when looking for the best split:
 - If int, then consider *max_features* features at each split.
 - If float, then *max_features* is a fraction and `int(max_features * n_features)` features are considered at each split.
 - If “sqrt”, then `max_features=sqrt(n_features)`.
 - If “log2”, then `max_features=log2(n_features)`.
 - If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than *max_features* features.

- ***max_depth*** (*int*) – The maximum depth of the tree. Defaults to 6.

- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If *int*, then consider `min_samples_split` as the minimum number.
 - If *float*, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(10, 1000), “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.EXTRA_TREES
modifies_features	True
modifies_target	False
name	Extra Trees Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted Extra-TreesRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted `ExtraTreesRegressor`.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

exponential_smoothing_regressor

Holt-Winters Exponential Smoothing Forecaster.

Module Contents

Classes Summary

<i>ExponentialSmoothingRegressor</i>	Holt-Winters Exponential Smoothing Forecaster.
--	--

Contents

`class evalml.pipelines.components.estimators.regressors.exponential_smoothing_regressor.ExponentialSmoo`

Holt-Winters Exponential Smoothing Forecaster.

Currently `ExponentialSmoothingRegressor` isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None.** (*but AutoMLSearch will not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "trend": [None, "additive"], "damped_trend": [True, False], "seasonal": [None, "additive"], "sp": Integer(2, 8), }
model_family	ModelFamily.EXPONENTIAL_SMOOTHING
modifies_features	True
modifies_target	False
name	Exponential Smoothing Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for Exponential Smoothing regressor.
<i>fit</i>	Fits Exponential Smoothing Regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ExponentialSmoothingRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted Exponential Smoothing regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns array of 0's with a length of 1 as `feature_importance` is not defined for Exponential Smoothing regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits Exponential Smoothing Regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`. Ignored.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns *self*

Raises **ValueError** – If *y* was not passed in.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

lightgbm_regressor

LightGBM Regressor.

Module Contents

Classes Summary

*LightGBMRegressor*LightGBM Regressor.

Contents

```

class evalml.pipelines.components.estimators.regressors.lightgbm_regressor.LightGBMRegressor(boosting_type=
    learning_
    ing_rate=0.1,
    n_estimators=
    max_depth=6,
    num_leaves=
    min_child_sa
    bag-
    ging_fraction
    bag-
    ging_freq=0,
    n_jobs=-
    1,
    ran-
    dom_seed=0,
    **kwargs)

```

LightGBM Regressor.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.

- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next k iterations. Defaults to 0.
- **n_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "learning_rate": Real(0.000001, 1), "boosting_type": ["gbdt", "dart", "goss", "rf"], "n_estimators": Integer(10, 100), "max_depth": Integer(0, 10), "num_leaves": Integer(2, 100), "min_child_samples": Integer(1, 100), "bagging_fraction": Real(0.000001, 1), "bagging_freq": Integer(0, 1), }
model_family	ModelFamily.LIGHTGBM
modifies_features	True
modifies_target	False
name	LightGBM Regressor
SEED_MAX	SEED_BOUNDS.max_bound
SEED_MIN	0
supported_problem_types	[ProblemTypes.REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits LightGBM regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted LightGBM regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*, *y=None*)

Fits LightGBM regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted LightGBM regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*: *pandas.DataFrame*) → pandas.Series

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type pd.Series

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

linear_regressor

Linear Regressor.

Module Contents

Classes Summary

<i>LinearRegressor</i>	Linear Regressor.
--	-------------------

Contents

```
class evalml.pipelines.components.estimators.regressors.linear_regressor.LinearRegressor(fit_intercept=True,
                                                                                       n_jobs=-1,
                                                                                       random_seed=0,
                                                                                       **kwargs)
```

Linear Regressor.

Parameters

- **fit_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "fit_intercept": [True, False], }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Linear Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted linear regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted linear regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

multiseries_time_series_baseline_regressor

Time series estimator that predicts using the naive forecasting approach.

Module Contents

Classes Summary

<i>MultiseriesTimeSeriesBaselineRegressor</i>	Multiseries time series regressor that predicts using the naive forecasting approach.
---	---

Contents

class `evalml.pipelines.components.estimators.regressors.multiseries_time_series_baseline_regressor.MultiseriesTimeSeriesBaselineRegressor`

Multiseries time series regressor that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for multiseries time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Multiseries Time Series Baseline Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits multiseries time series baseline regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted multiseries time series baseline regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(self, X, y=None)

Fits multiseries time series baseline regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features * n_series].
- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_features * n_series].

Returns self

Raises ValueError – If input y is None or if y is not a DataFrame with multiple columns.

get_prediction_intervals (*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted multiseries time series baseline regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

Raises **ValueError** – If the lagged columns are not present in *X*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

prophet_regressor

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

Module Contents

Classes Summary

<i>ProphetRegressor</i>	Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

    0.95,
    random_seed: Union[int, float] =
    0,
    **kwargs)

```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint_prior_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality_prior_scale** (*int*) – Similar to changepoint_prior_scale. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays_prior_scale** (*int*) – Similar to changepoint_prior_scale. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval_width** (*float*) – Determines the confidence of the prediction interval range when calling *get_prediction_intervals*. Accepts values in the range (0,1). Defaults to 0.95.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “changepoint_prior_scale”: Real(0.001, 0.5), “seasonality_prior_scale”: Real(0.01, 10), “holidays_prior_scale”: Real(0.01, 10), “seasonality_mode”: [“additive”, “multiplicative”], }
model_family	ModelFamily.PROPHET
modifies_features	True
modifies_target	False
name	Prophet Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<code>build_prophet_df</code>	Build the Prophet data to pass fit and predict on.
<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.
<code>fit</code>	Fits Prophet regressor component to data.
<code>get_params</code>	Get parameters for the Prophet regressor.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted ProphetRegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted Prophet regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

static `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*) → dict

Returns the default parameters for this component.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name*=False, *return_dict*=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_params(*self*) → dict

Get parameters for the Prophet regressor.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

rf_regressor

Random Forest Regressor.

Module Contents

Classes Summary

RandomForestRegressor

Random Forest Regressor.

Contents

```
class evalml.pipelines.components.estimators.regressors.rf_regressor.RandomForestRegressor(n_estimators:
    int
    =
    100,
    max_depth:
    int
    =
    6,
    n_jobs:
    int
    =
    -
    1,
    random_seed:
    Union[int,
    float]
    =
    0,
    **kwargs)
```

Random Forest Regressor.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_depth": Integer(1, 32), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted RandomForestRegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted RandomForestRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

svm_regressor

Support Vector Machine Regressor.

Module Contents

Classes Summary

<i>SVMRegressor</i>	Support Vector Machine Regressor.
-------------------------------------	-----------------------------------

Contents

```
class evalml.pipelines.components.estimators.regressors.svm_regressor.SVMRegressor(C=1.0,
                                          kernel='rbf',
                                          gamma='auto',
                                          random_state=0,
                                          **kwargs)
```

Support Vector Machine Regressor.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses $1 / (n_features * X.var())$ as value of gamma - If “auto” (default), uses $1 / n_features$

- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0, 10), “kernel”: [“poly”, “rbf”, “sigmoid”], “gamma”: [“scale”, “auto”], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted SVM regresor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

Returns The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

time_series_baseline_estimator

Time series estimator that predicts using the naive forecasting approach.

Module Contents

Classes Summary

<i>TimeSeriesBaselineEstimator</i>	Time series estimator that predicts using the naive forecasting approach.
------------------------------------	---

Contents

```
class evalml.pipelines.components.estimators.regressors.time_series_baseline_estimator.TimeSeriesBaselineEstimator
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Time Series Baseline Estimator
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits time series baseline estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted time series baseline estimator.
<code>predict_proba</code>	Make prediction probabilities using fitted time series baseline estimator.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self)`

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns *self*

Raises **ValueError** – If input y is None.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns *True*.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type `pd.Series`

Raises **ValueError** – If input `y` is `None`.

predict_proba(*self*, *X*)

Make prediction probabilities using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted probability values.

Return type `pd.DataFrame`

Raises **ValueError** – If input `y` is `None`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

varmax_regressor

Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (`p`, `q`) are the AR order and the MA order. More information here: <https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html>.

Module Contents

Classes Summary

VARMAXRegressor

Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (`p`, `q`) are the AR order and the MA order. More information here: <https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html>.

Contents

```
class evalml.pipelines.components.estimators.regressors.varmax_regressor.VARMAXRegressor(time_index:
    Optional[Hashable]
    =
    None,
    p:
    int
    =
    1,
    q:
    int
    =
    0,
    trend:
    Optional[str]

    bool
    =
    False,
    **kwargs)
```

Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (p, q) are the AR order and the MA order. More information here: <https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html>.

Currently VARMAXRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **p** (*int*) – Maximum Autoregressive order. Defaults to 1.
- **q** (*int*) – Maximum Moving Average order. Defaults to 0.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

- **max_iter** (*int*) – Maximum number of iterations for solver. Defaults to 10.
- **use_covariates** (*bool*) – If True, will pass exogenous variables in fit/predict methods. If False, forecasts will solely be based off of the datetimes and target values. Defaults to True.

Attributes

hyper-parameter_ranges	{ “p”: Integer(1, 10), “q”: Integer(1, 10), “trend”: Categorical(['n', 'c', 't', 'ct']), }
model_family	ModelFamily.VARMAX
modifies_features	True
modifies_target	False
name	VARMAX Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.
<i>fit</i>	Fits VARMAX regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted VARMAXRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted VARMAX regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.DataFrame] = None*)

Fits VARMAX regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_series_id_values].

Returns self

Raises **ValueError** – If y was not passed in.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: pandas.DataFrame = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted VARMAXRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values]. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for VARMAX regressor.

Returns A dict of prediction intervals, where the dict is in the format {series_id: {coverage}_lower or {coverage}_upper}.

Return type dict[dict]

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.DataFrame] = None*) → *pandas.Series*

Make predictions using fitted VARMAX regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values].

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If X was passed to *fit* but not passed in *predict*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a *predict_proba* method or a *component_obj* that implements *predict_proba*.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

vowpal_wabbit_regressor

Vowpal Wabbit Regressor.

Module Contents

Classes Summary

[*VowpalWabbitRegressor*](#)

Vowpal Wabbit Regressor.

Contents

`class evalml.pipelines.components.estimators.regressors.vowpal_wabbit_regressor.VowpalWabbitRegressor` (*le*

Vowpal Wabbit Regressor.

Parameters

- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for Vowpal Wabbit regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for Vowpal Wabbit regressor.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

                                                    12,
                                                    **kwargs)

```

XGBoost Regressor.

Parameters

- ***eta*** (*float*) – Boosting learning rate. Defaults to 0.1.
- ***max_depth*** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- ***min_child_weight*** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- ***n_estimators*** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- ***random_seed*** (*int*) – Seed for the random number generator. Defaults to 0.
- ***n_jobs*** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ "eta": Real(0.000001, 1), "max_depth": Integer(1, 20), "min_child_weight": Real(1, 10), "n_estimators": Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Regressor
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost regressor.
<i>fit</i>	Fits XGBoost regressor component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted XGBoostRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted XGBoost regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

Package Contents

Classes Summary

<i>ARIMAREgressor</i>	Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html .
<i>BaselineRegressor</i>	Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.
<i>CatBoostRegressor</i>	CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>DecisionTreeRegressor</i>	Decision Tree Regressor.
<i>ElasticNetRegressor</i>	Elastic Net Regressor.
<i>ExponentialSmoothingRegressor</i>	Holt-Winters Exponential Smoothing Forecaster.
<i>ExtraTreesRegressor</i>	Extra Trees Regressor.
<i>LightGBMRegressor</i>	LightGBM Regressor.
<i>LinearRegressor</i>	Linear Regressor.
<i>MultiseriesTimeSeriesBaselineRegressor</i>	Multiseries time series regressor that predicts using the naive forecasting approach.
<i>ProphetRegressor</i>	Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.
<i>RandomForestRegressor</i>	Random Forest Regressor.
<i>SVMRegressor</i>	Support Vector Machine Regressor.
<i>TimeSeriesBaselineEstimator</i>	Time series estimator that predicts using the naive forecasting approach.
<i>VARMAXRegressor</i>	Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (p, q) are the AR order and the MA order. More information here: https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html .
<i>VowpalWabbitRegressor</i>	Vowpal Wabbit Regressor.
<i>XGBoostRegressor</i>	XGBoost Regressor.

                                                                    = - 1, random_seed:
                                                                    Union[int, float] = 0,
                                                                    maxiter: int = 10,
                                                                    use_covariates: bool =
                                                                    True, **kwargs)
```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If “detect”, this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "start_p": Integer(1, 3), "d": Integer(0, 2), "start_q": Integer(1, 3), "max_p": Integer(3, 10), "max_d": Integer(2, 5), "max_q": Integer(3, 10), "seasonal": [True, False], }
max_cols	7
max_rows	1000
model_family	ModelFamily.ARIMA
modifies_features	True
modifies_target	False
name	ARIMA Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.
<i>fit</i>	Fits ARIMA regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ARIMARegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted ARIMA regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If y was not passed in.

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMAREgressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If *X* was passed to *fit* but not passed in *predict*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a *predict_proba* method or a *component_obj* that implements *predict_proba*.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.BaselineRegressor(strategy='mean',
                                                                           random_seed=0,
                                                                           **kwargs)
```

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.
<i>fit</i>	Fits baseline regression component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the baseline regression strategy.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(self, X, y=None)

Fits baseline regression component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input y is None.

get_prediction_intervals (*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the baseline regression strategy.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.CatBoostRegressor(n_estimators=10,  
                                                                    eta=0.03,  
                                                                    max_depth=6, boot-  
                                                                    strap_type=None,  
                                                                    silent=False, al-  
                                                                    low_writing_files=False,  
                                                                    random_seed=0,  
                                                                    n_jobs=- 1,  
                                                                    **kwargs)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- **n_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow_writing_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(4, 100), “eta”: Real(0.000001, 1), “max_depth”: Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance of fitted CatBoost regressor.
<code>fit</code>	Fits CatBoost regressor component to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using the fitted CatBoost regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted CatBoost regressor.

fit(*self*, *X*, *y=None*)

Fits CatBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted CatBoost regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.DecisionTreeRegressor(criterion='squared_error',  
                                                                           max_features='sqrt',  
                                                                           max_depth=6,  
                                                                           min_samples_split=2,  
                                                                           min_weight_fraction_leaf=0.0,  
                                                                           random_seed=0,  
                                                                           **kwargs)
```

Decision Tree Regressor.

Parameters

- **`criterion`** (*{ "squared_error", "friedman_mse", "absolute_error", "poisson" }*) – The function to measure the quality of a split. Supported criteria are:
 - “squared_error” for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
 - “friedman_mse”, which uses mean squared error with Friedman’s improvement score for potential splits
 - “absolute_error” for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
 - “poisson” which uses reduction in Poisson deviance to find splits.
- **`max_features`** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider `max_features` features at each split.
 - If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
 - If “sqrt”, then `max_features=sqrt(n_features)`.
 - If “log2”, then `max_features=log2(n_features)`.
 - If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **max_depth** (*int*) – The maximum depth of the tree. Defaults to 6.
- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and $\text{ceil}(\text{min_samples_split} * \text{n_samples})$ are the minimum number of samples for each split.
 Defaults to 2.
- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "criterion": ["squared_error", "friedman_mse", "absolute_error"], "max_features": ["sqrt", "log2"], "max_depth": Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self, X: pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self, X: pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self, update_dict, reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.ElasticNetRegressor(alpha=0.0001,  
                                                                           ll_ratio=0.15,  
                                                                           max_iter=1000,  
                                                                           random_seed=0,  
                                                                           **kwargs)
```

Elastic Net Regressor.

Parameters

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **ll_ratio** (*float*) – The mixing parameter, with $0 \leq \text{ll_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `ll_ratio=0` is equivalent to using `penalty='l2'`, while setting `ll_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{ll_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "alpha": Real(0, 1), "ll_ratio": Real(0, 1), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted ElasticNet regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for fitted ElasticNet regressor.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.ExponentialSmoothingRegressor(trend:
    Optional[str]
    =
    None,
    damped_trend:
    bool
    =
    False,
    seasonal:
    Optional[str]
    =
    None,
    sp:
    int
    = 2,
    n_jobs:
    int
    = -
    1,
    random_seed:
    Union[int, float]
    = 0,
    **kwargs)
```

Holt-Winters Exponential Smoothing Forecaster.

Currently `ExponentialSmoothingRegressor` isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **trend** (*str*) – Type of trend component. Defaults to None.
- **damped_trend** (*bool*) – If the trend component should be damped. Defaults to False.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", None}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None.** (*but AutoMLSearch will not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "trend": [None, "additive"], "damped_trend": [True, False], "seasonal": [None, "additive"], "sp": Integer(2, 8), }
model_family	ModelFamily.EXPONENTIAL_SMOOTHING
modifies_features	True
modifies_target	False
name	Exponential Smoothing Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for Exponential Smoothing regressor.
<i>fit</i>	Fits Exponential Smoothing Regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ExponentialSmoothingRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted Exponential Smoothing regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns array of 0's with a length of 1 as `feature_importance` is not defined for Exponential Smoothing regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits Exponential Smoothing Regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`. Ignored.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns *self*

Raises **ValueError** – If *y* was not passed in.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Exponential Smoothing regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.ExtraTreesRegressor(n_estimators: int
                                                                           = 100,
                                                                           max_features: str
                                                                           = 'sqrt',
                                                                           max_depth: int =
                                                                           6,
                                                                           min_samples_split:
                                                                           int = 2,
                                                                           min_weight_fraction_leaf:
                                                                           float = 0.0,
                                                                           n_jobs: int = - 1,
                                                                           random_seed:
                                                                           Union[int, float]
                                                                           = 0, **kwargs)
```

Extra Trees Regressor.

Parameters

- ***n_estimators*** (*float*) – The number of trees in the forest. Defaults to 100.
- ***max_features*** (*int*, *float* or {"sqrt", "log2"}) – The number of features to consider when looking for the best split:
 - If int, then consider *max_features* features at each split.
 - If float, then *max_features* is a fraction and $\text{int}(\text{max_features} * \text{n_features})$ features are considered at each split.
 - If “sqrt”, then $\text{max_features} = \text{sqrt}(\text{n_features})$.
 - If “log2”, then $\text{max_features} = \text{log2}(\text{n_features})$.
 - If None, then $\text{max_features} = \text{n_features}$.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than *max_features* features.

- ***max_depth*** (*int*) – The maximum depth of the tree. Defaults to 6.
- ***min_samples_split*** (*int* or *float*) – The minimum number of samples required to split an internal node:
 - If int, then consider *min_samples_split* as the minimum number.
 - If float, then *min_samples_split* is a fraction and $\text{ceil}(\text{min_samples_split} * \text{n_samples})$ are the minimum number of samples for each split.
- **2. (Defaults to) –**
- ***min_weight_fraction_leaf*** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- ***n_jobs*** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- ***random_seed*** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(10, 1000), “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.EXTRA_TREES
modifies_features	True
modifies_target	False
name	Extra Trees Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted Extra-TreesRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExtraTreesRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.LightGBMRegressor(boosting_type='gbdt',  
                                                                           learning_rate=0.1,  
                                                                           n_estimators=20,  
                                                                           max_depth=0,  
                                                                           num_leaves=31,  
                                                                           min_child_samples=20,  
                                                                           bag-  
                                                                           ging_fraction=0.9,  
                                                                           bagging_freq=0,  
                                                                           n_jobs=- 1,  
                                                                           random_seed=0,  
                                                                           **kwargs)
```

LightGBM Regressor.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select bagging_fraction * 100 % of the data to use for the next k iterations. Defaults to 0.
- **n_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted LightGBM regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type `None` or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*, *y=None*)

Fits LightGBM regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted LightGBM regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

class `evalml.pipelines.components.estimators.regressors.LinearRegressor`(*fit_intercept=True*,
n_jobs=-1,
random_seed=0,
***kwargs*)

Linear Regressor.

Parameters

- **fit_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "fit_intercept": [True, False], }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Linear Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted linear regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self)`

Feature importance for fitted linear regressor.

`fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)`

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns `self`

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

class `evalml.pipelines.components.estimators.regressors.MultiseriesTimeSeriesBaselineRegressor`(*gap=1*,
forecast_horizon,
random_seed,
***kwargs*)

Multiseries time series regressor that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for multiseries time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Multiseries Time Series Baseline Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits multiseries time series baseline regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted multiseries time series baseline regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self, X, y=None*)

Fits multiserries time series baseline regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features * n_series].
- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_features * n_series].

Returns self

Raises ValueError – If input y is None or if y is not a DataFrame with multiple columns.

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted multiseriess time series baseline regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

Raises **ValueError** – If the lagged columns are not present in *X*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```

class evalml.pipelines.components.estimators.regressors.ProphetRegressor(time_index:
    Optional[Hashable]
    = None, change-
point_prior_scale:
    float = 0.05, season-
ality_prior_scale: int
    = 10, holi-
days_prior_scale: int
    = 10,
    seasonality_mode:
    str = 'additive',
    stan_backend: str =
    'CMDSTANPY',
    interval_width: float
    = 0.95,
    random_seed:
    Union[int, float] = 0,
    **kwargs)

```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint_prior_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality_prior_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays_prior_scale** (*int*) – Similar to `changepoint_prior_scale`. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval_width** (*float*) – Determines the confidence of the prediction interval range when calling `get_prediction_intervals`. Accepts values in the range (0,1). Defaults to 0.95.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "changepoint_prior_scale": Real(0.001, 0.5), "seasonality_prior_scale": Real(0.01, 10), "holidays_prior_scale": Real(0.01, 10), "seasonality_mode": ["additive", "multiplicative"], }
model_family	ModelFamily.PROPHET
modifies_features	True
modifies_target	False
name	Prophet Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>build_prophet_df</i>	Build the Prophet data to pass fit and predict on.
<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.
<i>fit</i>	Fits Prophet regressor component to data.
<i>get_params</i>	Get parameters for the Prophet regressor.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ProphetRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted Prophet regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

static build_prophet_df(*X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *time_index*: *str* = *'ds'*) → *pandas.DataFrame*

Build the Prophet data to pass fit and predict on.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*) → *dict*

Returns the default parameters for this component.

Returns Default parameters for this component.

Return type *dict*

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits Prophet regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_params(*self*) → dict

Get parameters for the Prophet regressor.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ProphetRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.RandomForestRegressor(n_estimators:
                                                                              int = 100,
                                                                              max_depth:
                                                                              int = 6,
                                                                              n_jobs: int = -
                                                                              1,
                                                                              random_seed:
                                                                              Union[int,
                                                                              float] = 0,
                                                                              **kwargs)
```

Random Forest Regressor.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.

- **n_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(10, 1000), “max_depth”: Integer(1, 32), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted RandomForestRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted RandomForestRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(self)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(self)

Returns the parameters which were used to initialize the component.

predict(self, X: pandas.DataFrame) → pandas.Series

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(self, X: pandas.DataFrame) → pandas.Series

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(self, update_dict, reset_fit=True)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.SVMRegressor(C=1.0, kernel='rbf',  
                                                                    gamma='auto',  
                                                                    random_seed=0,  
                                                                    **kwargs)
```

Support Vector Machine Regressor.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.

- **kernel** (`{"poly", "rbf", "sigmoid"}`) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (`{"scale", "auto"}` or `float`) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses $1 / (n_features * X.var())$ as value of gamma - If “auto” (default), uses $1 / n_features$
- **random_seed** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0, 10), “kernel”: [“poly”, “rbf”, “sigmoid”], “gamma”: [“scale”, “auto”], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted SVM regressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

Returns The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.TimeSeriesBaselineEstimator(gap=1,  
                                                                                   fore-  
                                                                                   cast_horizon=1,  
                                                                                   ran-  
                                                                                   dom_seed=0,  
                                                                                   **kwargs)
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ }
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Time Series Baseline Estimator
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits time series baseline estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted time series baseline estimator.
<i>predict_proba</i>	Make prediction probabilities using fitted time series baseline estimator.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input y is None.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If input y is None.

predict_proba(*self*, *X*)

Make prediction probabilities using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type *pd.DataFrame*

Raises **ValueError** – If input y is None.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.

- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.regressors.VARMAXRegressor(time_index:
    Optional[Hashable] =
    None, p: int = 1, q: int
    = 0, trend:
    Optional[str] = 'c',
    random_seed:
    Union[int, float] = 0,
    max_iter: int = 10,
    use_covariates: bool
    = False, **kwargs)
```

Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (*p*, *q*) are the AR order and the MA order. More information here: <https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html>.

Currently VARMAXRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **p** (*int*) – Maximum Autoregressive order. Defaults to 1.
- **q** (*int*) – Maximum Moving Average order. Defaults to 0.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **max_iter** (*int*) – Maximum number of iterations for solver. Defaults to 10.
- **use_covariates** (*bool*) – If True, will pass exogenous variables in fit/predict methods. If False, forecasts will solely be based off of the datetimes and target values. Defaults to True.

Attributes

hyper-parameter_ranges	{ "p": Integer(1, 10), "q": Integer(1, 10), "trend": Categorical(['n', 'c', 't', 'ct']), }
model_family	ModelFamily.VARMAX
modifies_features	True
modifies_target	False
name	VARMAX Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.
<code>fit</code>	Fits VARMAX regressor to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted VARMAXRegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted VARMAX regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.DataFrame] = None*)

Fits VARMAX regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].

- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_series_id_values].

Returns self

Raises **ValueError** – If y was not passed in.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.DataFrame* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted VARMAXRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values]. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for VARMAX regressor.

Returns A dict of prediction intervals, where the dict is in the format {series_id: {coverage}_lower or {coverage}_upper}.

Return type dict[dict]

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.DataFrame]* = *None*) → *pandas.Series*

Make predictions using fitted VARMAX regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values].

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If X was passed to *fit* but not passed in *predict*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.regressors.VowpalWabbitRegressor(learning_rate=0.5,
                                                                              de-
                                                                              cay_learning_rate=1.0,
                                                                              power_t=0.5,
                                                                              passes=1, ran-
                                                                              dom_seed=0,
                                                                              **kwargs)
```

Vowpal Wabbit Regressor.

Parameters

- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for Vowpal Wabbit regressor.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=`cloudpickle.DEFAULT_PROTOCOL`)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=`True`)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.estimators.regressors.XGBoostRegressor(eta: float = 0.1,
                                                                    max_depth: int = 6,
                                                                    min_child_weight:
                                                                    int = 1,
                                                                    n_estimators: int =
                                                                    100, random_seed:
                                                                    Union[int, float] = 0,
                                                                    n_jobs: int = 12,
                                                                    **kwargs)
```

XGBoost Regressor.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min_child_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ "eta": Real(0.000001, 1), "max_depth": Integer(1, 20), "min_child_weight": Real(1, 10), "n_estimators": Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Regressor
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost regressor.
<i>fit</i>	Fits XGBoost regressor component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted XGBoostRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted XGBoost regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

Submodules

estimator

A component that fits and predicts given data.

Module Contents

Classes Summary

Estimator

A component that fits and predicts given data.

Contents

```
class evalml.pipelines.components.estimators.estimator.Estimator(parameters: dict = None,
                                                                    component_obj:
                                                                    Type[evalml.pipelines.components.ComponentBase]
                                                                    = None, random_seed:
                                                                    Union[int, float] = 0,
                                                                    **kwargs)
```

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

model_family	ModelFamily.NONE
modifies_features	True
modifies_target	False
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>model_family</code>	ModelFamily.NONE
<code>name</code>	Returns string name of this component.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>supported_problem_types</code>	Problem types this estimator supports.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

property model_family(*cls*)

Returns *ModelFamily* of this component.

property name(*cls*)

Returns string name of this component.

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling *predict*, *predict_proba*, *transform*, or *feature_importances*.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

Returns *True*.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

property supported_problem_types(*cls*)

Problem types this estimator supports.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

Package Contents

Classes Summary

<i>ARIMAREgressor</i>	Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html .
<i>BaselineClassifier</i>	Classifier that predicts using the specified strategy.
<i>BaselineRegressor</i>	Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

continues on next page

Table 6 – continued from previous page

<i>CatBoostClassifier</i>	CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>CatBoostRegressor</i>	CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.
<i>DecisionTreeClassifier</i>	Decision Tree Classifier.
<i>DecisionTreeRegressor</i>	Decision Tree Regressor.
<i>ElasticNetClassifier</i>	Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.
<i>ElasticNetRegressor</i>	Elastic Net Regressor.
<i>Estimator</i>	A component that fits and predicts given data.
<i>ExponentialSmoothingRegressor</i>	Holt-Winters Exponential Smoothing Forecaster.
<i>ExtraTreesClassifier</i>	Extra Trees Classifier.
<i>ExtraTreesRegressor</i>	Extra Trees Regressor.
<i>KNeighborsClassifier</i>	K-Nearest Neighbors Classifier.
<i>LightGBMClassifier</i>	LightGBM Classifier.
<i>LightGBMRegressor</i>	LightGBM Regressor.
<i>LinearRegressor</i>	Linear Regressor.
<i>LogisticRegressionClassifier</i>	Logistic Regression Classifier.
<i>MultiseriesTimeSeriesBaselineRegressor</i>	Multiseries time series regressor that predicts using the naive forecasting approach.
<i>ProphetRegressor</i>	Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.
<i>RandomForestClassifier</i>	Random Forest Classifier.
<i>RandomForestRegressor</i>	Random Forest Regressor.
<i>SVMClassifier</i>	Support Vector Machine Classifier.
<i>SVMRegressor</i>	Support Vector Machine Regressor.
<i>TimeSeriesBaselineEstimator</i>	Time series estimator that predicts using the naive forecasting approach.
<i>VARMAXRegressor</i>	Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (p, q) are the AR order and the MA order. More information here: https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html .
<i>VowpalWabbitBinaryClassifier</i>	Vowpal Wabbit Binary Classifier.
<i>VowpalWabbitMulticlassClassifier</i>	Vowpal Wabbit Multiclass Classifier.
<i>VowpalWabbitRegressor</i>	Vowpal Wabbit Regressor.
<i>XGBoostClassifier</i>	XGBoost Classifier.
<i>XGBoostRegressor</i>	XGBoost Regressor.

```

Autoregressive Integrated Moving Average Model. The three parameters (p, d, q) are the AR order, the degree of differencing, and the MA order. More information here: <https://www.statsmodels.org/devel/generated/statsmodels.tsa.arima.model.ARIMA.html>.

Currently ARIMAREgressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **start_p** (*int*) – Minimum Autoregressive order. Defaults to 2.
- **d** (*int*) – Minimum Differencing degree. Defaults to 0.
- **start_q** (*int*) – Minimum Moving Average order. Defaults to 2.
- **max_p** (*int*) – Maximum Autoregressive order. Defaults to 5.
- **max_d** (*int*) – Maximum Differencing degree. Defaults to 2.
- **max_q** (*int*) – Maximum Moving Average order. Defaults to 5.
- **seasonal** (*boolean*) – Whether to fit a seasonal model to ARIMA. Defaults to True.
- **sp** (*int or str*) – Period for seasonal differencing, specifically the number of periods in each season. If “detect”, this model will automatically detect this parameter (given the time series is a standard frequency) and will fall back to 1 (no seasonality) if it cannot be detected. Defaults to 1.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "start_p": Integer(1, 3), "d": Integer(0, 2), "start_q": Integer(1, 3), "max_p": Integer(3, 10), "max_d": Integer(2, 5), "max_q": Integer(3, 10), "seasonal": [True, False], }
max_cols	7
max_rows	1000
model_family	ModelFamily.ARIMA
modifies_features	True
modifies_target	False
name	ARIMA Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.
<i>fit</i>	Fits ARIMA regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ARIMARegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted ARIMA regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for ARIMA regressor.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits ARIMA regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises ValueError – If y was not passed in.

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: pandas.Series = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ARIMARegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for ARIMA regressor.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted ARIMA regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If *X* was passed to *fit* but not passed in *predict*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a *predict_proba* method or a *component_obj* that implements *predict_proba*.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class *evalml.pipelines.components.estimators.BaselineClassifier*(*strategy='mode'*,
random_seed=0, ***kwargs*)

Classifier that predicts using the specified strategy.

This is useful as a simple baseline classifier to compare with other classifiers.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mode”, “random” and “random_weighted”. Defaults to “mode”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS]
training_only	False

Methods

<i>classes_</i>	Returns class labels. Will return None before fitting.
<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.
<i>fit</i>	Fits baseline classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the baseline classification strategy.
<i>predict_proba</i>	Make prediction probabilities using the baseline classification strategy.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

property `classes_(self)`

Returns class labels. Will return None before fitting.

Returns Class names

Return type list[str] or list(float)

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature. Since baseline classifiers do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes

Return type `pd.Series`

fit(*self*, *X*, *y=None*)

Fits baseline classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns *self*

Raises **ValueError** – If *y* is `None`.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static `load(file_path)`

Loads component at file path.

Parameters `file_path` (*str*) – Location to load file.

Returns `ComponentBase` object

`needs_fitting(self)`

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

`predict(self, X)`

Make predictions using the baseline classification strategy.

Parameters `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted values.

Return type `pd.Series`

`predict_proba(self, X)`

Make prediction probabilities using the baseline classification strategy.

Parameters `X` (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted probability values.

Return type `pd.DataFrame`

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If `True`, will set `_is_fitted` to `False`.

class `evalml.pipelines.components.estimators.BaselineRegressor`(*strategy='mean', random_seed=0, **kwargs*)

Baseline regressor that uses a simple strategy to make predictions. This is useful as a simple baseline regressor to compare with other regressors.

Parameters

- **strategy** (*str*) – Method used to predict. Valid options are “mean”, “median”. Defaults to “mean”.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Baseline Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.
<i>fit</i>	Fits baseline regression component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the baseline regression strategy.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature. Since baseline regressors do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self*, *X*, *y=None*)

Fits baseline regression component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input y is None.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the baseline regression strategy.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*: *pandas.DataFrame*) → pandas.Series

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type pd.Series

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.CatBoostClassifier(n_estimators=10, eta=0.03,
                                                             max_depth=6,
                                                             bootstrap_type=None,
                                                             silent=True,
                                                             allow_writing_files=False,
                                                             random_seed=0, n_jobs=-1,
                                                             **kwargs)
```

CatBoost Classifier, a classifier that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- **n_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow_writing_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(4, 100), “eta”: Real(0.000001, 1), “max_depth”: Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance of fitted CatBoost classifier.
<code>fit</code>	Fits CatBoost classifier component to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using the fitted CatBoost classifier.
<code>predict_proba</code>	Make prediction probabilities using the fitted CatBoost classifier.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self)`

Feature importance of fitted CatBoost classifier.

`fit(self, X, y=None)`

Fits CatBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted CatBoost classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type `pd.DataFrame`

save(*self*, *file_path*, *pickle_protocol*=`cloudpickle.DEFAULT_PROTOCOL`)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=`True`)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.CatBoostRegressor(n_estimators=10, eta=0.03,
                                                             max_depth=6,
                                                             bootstrap_type=None,
                                                             silent=False,
                                                             allow_writing_files=False,
                                                             random_seed=0, n_jobs=- 1,
                                                             **kwargs)
```

CatBoost Regressor, a regressor that uses gradient-boosting on decision trees. CatBoost is an open-source library and natively supports categorical features.

For more information, check out <https://catboost.ai/>

Parameters

- **n_estimators** (*float*) – The maximum number of trees to build. Defaults to 10.
- **eta** (*float*) – The learning rate. Defaults to 0.03.
- **max_depth** (*int*) – The maximum tree depth for base learners. Defaults to 6.
- **bootstrap_type** (*string*) – Defines the method for sampling the weights of objects. Available methods are ‘Bayesian’, ‘Bernoulli’, ‘MVS’. Defaults to None.
- **silent** (*boolean*) – Whether to use the “silent” logging mode. Defaults to True.
- **allow_writing_files** (*boolean*) – Whether to allow writing snapshot files while training. Defaults to False.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(4, 100), "eta": Real(0.000001, 1), "max_depth": Integer(4, 10), }
model_family	ModelFamily.CATBOOST
modifies_features	True
modifies_target	False
name	CatBoost Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted CatBoost regressor.
<i>fit</i>	Fits CatBoost regressor component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.

<i>predict</i>	Make predictions using the fitted CatBoost regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted CatBoost regressor.

fit(*self, X, y=None*)

Fits CatBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict `(self, X)`

Make predictions using the fitted CatBoost regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

predict_proba `(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save `(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters `(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.DecisionTreeClassifier(criterion='gini',
                                                                    max_features='sqrt',
                                                                    max_depth=6,
                                                                    min_samples_split=2,
                                                                    min_weight_fraction_leaf=0.0,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Decision Tree Classifier.

Parameters

- **criterion** (*{ "gini", "entropy" }*) – The function to measure the quality of a split. Supported criteria are “gini” for the Gini impurity and “entropy” for the information gain. Defaults to “gini”.
- **max_features** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider max_features features at each split.
 - If float, then max_features is a fraction and `int(max_features * n_features)` features are considered at each split.

- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider `min_samples_split` as the minimum number.
 - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “criterion”: [“gini”, “entropy”], “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.DecisionTreeRegressor(criterion='squared_error',
                                                                    max_features='sqrt',
                                                                    max_depth=6,
                                                                    min_samples_split=2,
                                                                    min_weight_fraction_leaf=0.0,
                                                                    random_seed=0, **kwargs)
```

Decision Tree Regressor.

Parameters

- **`criterion`** (*{ "squared_error", "friedman_mse", "absolute_error", "poisson" }*) – The function to measure the quality of a split. Supported criteria are:
 - “squared_error” for the mean squared error, which is equal to variance reduction as feature selection criterion and minimizes the L2 loss using the mean of each terminal node
 - “friedman_mse”, which uses mean squared error with Friedman’s improvement score for potential splits
 - “absolute_error” for the mean absolute error, which minimizes the L1 loss using the median of each terminal node,
 - “poisson” which uses reduction in Poisson deviance to find splits.
- **`max_features`** (*int, float or { "sqrt", "log2" }*) – The number of features to consider when looking for the best split:
 - If int, then consider `max_features` features at each split.

- If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider `min_samples_split` as the minimum number.
 - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.

Defaults to 2.

- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “criterion”: [“squared_error”, “friedman_mse”, “absolute_error”], “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.DECISION_TREE
modifies_features	True
modifies_target	False
name	Decision Tree Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict method or a `component_obj` that implements predict.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ElasticNetClassifier(penalty='elasticnet', C=1.0,
                                                                l1_ratio=0.15,
                                                                multi_class='auto',
                                                                solver='saga', n_jobs=- 1,
                                                                random_seed=0, **kwargs)
```

Elastic Net Classifier. Uses Logistic Regression with elasticnet penalty as the base estimator.

Parameters

- **`penalty`** (*{ "l1", "l2", "elasticnet", "none" }*) – The norm used in penalization. Defaults to “elasticnet”.
- **`C`** (*float*) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **`l1_ratio`** (*float*) – The mixing parameter, with $0 \leq \text{l1_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{l1_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **`multi_class`** (*{ "auto", "ovr", "multinomial" }*) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when `solver='liblinear'`. “auto” selects “ovr” if the data is binary, or if `solver='liblinear'`, and otherwise selects “multinomial”. Defaults to “auto”.
- **`solver`** (*{ "newton-cg", "lbfgs", "liblinear", "sag", "saga" }*) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.

- “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
- “liblinear” and “saga” also handle L1 penalty
- “saga” also supports “elasticnet” penalty
- “liblinear” does not support setting `penalty='none'`

Defaults to “saga”.

- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0.01, 10), “l1_ratio”: Real(0, 1)}
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Classifier

training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted ElasticNet classifier.
<i>fit</i>	Fits ElasticNet classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type `None` or dict

property feature_importance(*self*)

Feature importance for fitted ElasticNet classifier.

fit(*self*, *X*, *y*)

Fits ElasticNet classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns `self`

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class evalml.pipelines.components.estimators.**ElasticNetRegressor**(*alpha*=0.0001, *l1_ratio*=0.15,
max_iter=1000,
random_seed=0, **kwargs)

Elastic Net Regressor.

Parameters

- **alpha** (*float*) – Constant that multiplies the penalty terms. Defaults to 0.0001.
- **l1_ratio** (*float*) – The mixing parameter, with $0 \leq \text{l1_ratio} \leq 1$. Only used if `penalty='elasticnet'`. Setting `l1_ratio=0` is equivalent to using `penalty='l2'`, while setting `l1_ratio=1` is equivalent to using `penalty='l1'`. For $0 < \text{l1_ratio} < 1$, the penalty is a combination of L1 and L2. Defaults to 0.15.
- **max_iter** (*int*) – The maximum number of iterations. Defaults to 1000.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "alpha": Real(0, 1), "l1_ratio": Real(0, 1), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Elastic Net Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted ElasticNet regressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling <code>predict</code> , <code>predict_proba</code> , <code>transform</code> , or <code>feature_importances</code> .
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted ElasticNet regressor.

fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format `{coverage}_lower` or `{coverage}_upper`.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters *file_path* (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class evalml.pipelines.components.estimators.**Estimator**(*parameters*: *dict* = *None*, *component_obj*: *Type*[evalml.pipelines.components.ComponentBase] = *None*, *random_seed*: *Union*[*int*, *float*] = *0*, ***kwargs*)

A component that fits and predicts given data.

To implement a new Estimator, define your own class which is a subclass of Estimator, including a name and a list of acceptable ranges for any parameters to be tuned during the automl search (hyperparameters). Define an `__init__` method which sets up any necessary state and objects. Make sure your `__init__` only uses standard keyword arguments and calls `super().__init__()` with a parameters dict. You may also override the `fit`, `transform`, `fit_transform` and other methods in this class if appropriate.

To see some examples, check out the definitions of any Estimator component subclass.

Parameters

- **parameters** (*dict*) – Dictionary of parameters for the component. Defaults to None.
- **component_obj** (*obj*) – Third-party objects useful in component implementation. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

model_family	ModelFamily.NONE
modifies_features	True
modifies_target	False
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>model_family</code>	ModelFamily.NONE
<code>name</code>	Returns string name of this component.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>supported_problem_types</code>	Problem types this estimator supports.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

property model_family(*cls*)

Returns ModelFamily of this component.

property name(*cls*)

Returns string name of this component.

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self, X: pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self, X: pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.

- **pickle_protocol** (*int*) – The pickle data stream format.

property supported_problem_types(*cls*)

Problem types this estimator supports.

update_parameters(*self, update_dict, reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool, optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.ExponentialSmoothingRegressor(trend:
                                                                    Optional[str] =
                                                                    None,
                                                                    damped_trend:
                                                                    bool = False,
                                                                    seasonal:
                                                                    Optional[str] =
                                                                    None, sp: int = 2,
                                                                    n_jobs: int = -1,
                                                                    random_seed:
                                                                    Union[int, float] =
                                                                    0, **kwargs)
```

Holt-Winters Exponential Smoothing Forecaster.

Currently ExponentialSmoothingRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **trend** (*str*) – Type of trend component. Defaults to *None*.
- **damped_trend** (*bool*) – If the trend component should be damped. Defaults to *False*.
- **seasonal** (*str*) – Type of seasonal component. Takes one of {"additive", *None*}. Can also be multiplicative if
- **0** (*none of the target data is*) –
- **None.** (*but AutoMLSearch wiill not tune for this. Defaults to*) –
- **sp** (*int*) – The number of seasonal periods to consider. Defaults to 2.
- **n_jobs** (*int or None*) – Non-negative integer describing level of parallelism used for pipelines. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "trend": [None, "additive"], "damped_trend": [True, False], "seasonal": [None, "additive"], "sp": Integer(2, 8), }
model_family	ModelFamily.EXPONENTIAL_SMOOTHING
modifies_features	True
modifies_target	False
name	Exponential Smoothing Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's with a length of 1 as feature_importance is not defined for Exponential Smoothing regressor.
<i>fit</i>	Fits Exponential Smoothing Regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted ExponentialSmoothingRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted Exponential Smoothing regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns array of 0's with a length of 1 as feature_importance is not defined for Exponential Smoothing regressor.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Exponential Smoothing Regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features]. Ignored.
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises ValueError – If y was not passed in.

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted ExponentialSmoothingRegressor.

Calculates the prediction intervals by using a simulation of the time series following a specified state space model.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Exponential Smoothing regressor.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None) → pandas.Series

Make predictions using fitted Exponential Smoothing regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [*n_samples*, *n_features*]. Ignored except to set forecast horizon.
- **y** (*pd.Series*) – Target data.

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: pandas.DataFrame) → pandas.Series

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=cloudpickle.DEFAULT_PROTOCOL)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=True)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ExtraTreesClassifier(n_estimators=100,  
                                                                max_features='sqrt',  
                                                                max_depth=6,  
                                                                min_samples_split=2,  
                                                                min_weight_fraction_leaf=0.0,  
                                                                n_jobs=- 1, random_seed=0,  
                                                                **kwargs)
```

Extra Trees Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_features** (*int*, *float* or {"sqrt", "log2"}) – The number of features to consider when looking for the best split:
 - If int, then consider `max_features` features at each split.

- If float, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
- If “sqrt”, then `max_features=sqrt(n_features)`.
- If “log2”, then `max_features=log2(n_features)`.
- If None, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.
- **`min_samples_split`** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider `min_samples_split` as the minimum number.
 - If float, then `min_samples_split` is a fraction and `ceil(min_samples_split * n_samples)` are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **`min_weight_fraction_leaf`** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **`n_jobs`** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “n_estimators”: Integer(10, 1000), “max_features”: [“sqrt”, “log2”], “max_depth”: Integer(4, 10), }
model_family	ModelFamily.EXTRA_TREES
modifies_features	True
modifies_target	False
name	Extra Trees Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.**Return type** *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a predict method or a `component_obj` that implements predict.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.ExtraTreesRegressor(n_estimators: int = 100,  
                                                                max_features: str = 'sqrt',  
                                                                max_depth: int = 6,  
                                                                min_samples_split: int = 2,  
                                                                min_weight_fraction_leaf: float  
                                                                = 0.0, n_jobs: int = -1,  
                                                                random_seed: Union[int, float]  
                                                                = 0, **kwargs)
```

Extra Trees Regressor.

Parameters

- **`n_estimators`** (*float*) – The number of trees in the forest. Defaults to 100.
- **`max_features`** (*int, float or {"sqrt", "log2"}*) – The number of features to consider when looking for the best split:
 - If *int*, then consider `max_features` features at each split.
 - If *float*, then `max_features` is a fraction and `int(max_features * n_features)` features are considered at each split.
 - If “sqrt”, then `max_features=sqrt(n_features)`.
 - If “log2”, then `max_features=log2(n_features)`.
 - If *None*, then `max_features = n_features`.

The search for a split does not stop until at least one valid partition of the node samples is found, even if it requires to effectively inspect more than `max_features` features.

- **`max_depth`** (*int*) – The maximum depth of the tree. Defaults to 6.

- **min_samples_split** (*int or float*) – The minimum number of samples required to split an internal node:
 - If int, then consider min_samples_split as the minimum number.
 - If float, then min_samples_split is a fraction and $\text{ceil}(\text{min_samples_split} * \text{n_samples})$ are the minimum number of samples for each split.
- **2. (Defaults to)** –
- **min_weight_fraction_leaf** (*float*) – The minimum weighted fraction of the sum total of weights (of all the input samples) required to be at a leaf node. Defaults to 0.0.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*, *optional*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted `ExtraTreesRegressor`.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters *file_path* (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.KNeighborsClassifier(n_neighbors=5,  
                                                                weights='uniform',  
                                                                algorithm='auto',  
                                                                leaf_size=30, p=2,  
                                                                random_seed=0, **kwargs)
```

K-Nearest Neighbors Classifier.

Parameters

- **n_neighbors** (*int*) – Number of neighbors to use by default. Defaults to 5.
- **weights** ({*'uniform'*, *'distance'*} or *callable*) – Weight function used in prediction. Can be:
 - *'uniform'* : uniform weights. All points in each neighborhood are weighted equally.
 - *'distance'* : weight points by the inverse of their distance. in this case, closer neighbors of a query point will have a greater influence than neighbors which are further away.
 - [*callable*] : a user-defined function which accepts an array of distances, and returns an array of the same shape containing the weights.

Defaults to “uniform”.

- **algorithm** ({*'auto'*, *'ball_tree'*, *'kd_tree'*, *'brute'*}) – Algorithm used to compute the nearest neighbors:
 - *'ball_tree'* will use BallTree
 - *'kd_tree'* will use KDTree
 - *'brute'* will use a brute-force search.

'auto' will attempt to decide the most appropriate algorithm based on the values passed to fit method. Defaults to “auto”. Note: fitting on sparse input will override the setting of this parameter, using brute force.
- **leaf_size** (*int*) – Leaf size passed to BallTree or KDTree. This can affect the speed of the construction and query, as well as the memory required to store the tree. The optimal value depends on the nature of the problem. Defaults to 30.
- **p** (*int*) – Power parameter for the Minkowski metric. When $p = 1$, this is equivalent to using `manhattan_distance` (l1), and `euclidean_distance` (l2) for $p = 2$. For arbitrary p , `minkowski_distance (l_p)` is used. Defaults to 2.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_neighbors": Integer(2, 12), "weights": ["uniform", "distance"], "algorithm": ["auto", "ball_tree", "kd_tree", "brute"], "leaf_size": Integer(10, 30), "p": Integer(1, 5), }
model_family	ModelFamily.K_NEIGHBORS
modifies_features	True
modifies_target	False
name	KNN Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns array of 0's matching the input number of features as feature_importance is not defined for KNN classifiers.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns array of 0's matching the input number of features as feature_importance is not defined for KNN classifiers.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.LightGBMClassifier(boosting_type='gbdt',
                                                                learning_rate=0.1,
                                                                n_estimators=100,
                                                                max_depth=0, num_leaves=31,
                                                                min_child_samples=20,
                                                                bagging_fraction=0.9,
                                                                bagging_freq=0, n_jobs=-1,
                                                                random_seed=0, **kwargs)
```

LightGBM Classifier.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.

- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.
- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. k means perform bagging at every k iteration. Every k-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next k iterations. Defaults to 0.
- **n_jobs** (*int or None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self*, *X*, *y=None*)

Fits LightGBM classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using the fitted LightGBM classifier.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type `pd.DataFrame`

predict_proba(*self*, *X*)

Make prediction probabilities using the fitted LightGBM classifier.

Parameters *X* (`pd.DataFrame`) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type `pd.DataFrame`

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.LightGBMRegressor(boosting_type='gbdt',
                                                             learning_rate=0.1,
                                                             n_estimators=20, max_depth=0,
                                                             num_leaves=31,
                                                             min_child_samples=20,
                                                             bagging_fraction=0.9,
                                                             bagging_freq=0, n_jobs=- 1,
                                                             random_seed=0, **kwargs)
```

LightGBM Regressor.

Parameters

- **boosting_type** (*string*) – Type of boosting to use. Defaults to “gbdt”. - ‘gbdt’ uses traditional Gradient Boosting Decision Tree - “dart”, uses Dropouts meet Multiple Additive Regression Trees - “goss”, uses Gradient-based One-Side Sampling - “rf”, uses Random Forest
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.1.
- **n_estimators** (*int*) – Number of boosted trees to fit. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners, <=0 means no limit. Defaults to 0.
- **num_leaves** (*int*) – Maximum tree leaves for base learners. Defaults to 31.
- **min_child_samples** (*int*) – Minimum number of data needed in a child (leaf). Defaults to 20.
- **bagging_fraction** (*float*) – LightGBM will randomly select a subset of features on each iteration (tree) without resampling if this is smaller than 1.0. For example, if set to 0.8, LightGBM will select 80% of features before training each tree. This can be used to speed up training and deal with overfitting. Defaults to 0.9.

- **bagging_freq** (*int*) – Frequency for bagging. 0 means bagging is disabled. *k* means perform bagging at every *k* iteration. Every *k*-th iteration, LightGBM will randomly select `bagging_fraction * 100 %` of the data to use for the next *k* iterations. Defaults to 0.
- **n_jobs** (*int* or *None*) – Number of threads to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*, *y=None*)

Fits LightGBM regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – The target training data of length `[n_samples]`.

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted LightGBM regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

predict_proba(*self*, *X*: *pandas.DataFrame*) → pandas.Series

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type pd.Series

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.LinearRegressor(fit_intercept=True, n_jobs=-1,  
                                                         random_seed=0, **kwargs)
```

Linear Regressor.

Parameters

- **fit_intercept** (*boolean*) – Whether to calculate the intercept for this model. If set to False, no intercept will be used in calculations (i.e. data is expected to be centered). Defaults to True.
- **n_jobs** (*int or None*) – Number of jobs to run in parallel. -1 uses all threads. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "fit_intercept": [True, False], }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Linear Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for fitted linear regressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance for fitted linear regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters *file_path* (*str*) – Location to load file.

Returns `ComponentBase` object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to `False` for components that do not need to be fit or whose fit methods do nothing.

Returns `True`.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape `[n_samples, n_features]`.

Returns Predicted values.

Return type `pd.Series`

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If `True`, will set `_is_fitted` to `False`.

```
class evalml.pipelines.components.estimators.LogisticRegressionClassifier(
    penalty='l2',
    C=1.0,
    multi_class='auto',
    solver='lbfgs',
    n_jobs=-1,
    random_seed=0,
    **kwargs)
```

Logistic Regression Classifier.

Parameters

- **penalty** (`{"l1", "l2", "elasticnet", "none"}`) – The norm used in penalization. Defaults to “l2”.
- **C** (`float`) – Inverse of regularization strength. Must be a positive float. Defaults to 1.0.
- **multi_class** (`{"auto", "ovr", "multinomial"}`) – If the option chosen is “ovr”, then a binary problem is fit for each label. For “multinomial” the loss minimised is the multinomial loss fit across the entire probability distribution, even when the data is binary. “multinomial” is unavailable when solver=“liblinear”. “auto” selects “ovr” if the data is binary, or if solver=“liblinear”, and otherwise selects “multinomial”. Defaults to “auto”.
- **solver** (`{"newton-cg", "lbfgs", "liblinear", "sag", "saga"}`) – Algorithm to use in the optimization problem. For small datasets, “liblinear” is a good choice, whereas “sag” and “saga” are faster for large ones. For multiclass problems, only “newton-cg”, “sag”, “saga” and “lbfgs” handle multinomial loss; “liblinear” is limited to one-versus-rest schemes.
 - “newton-cg”, “lbfgs”, “sag” and “saga” handle L2 or no penalty
 - “liblinear” and “saga” also handle L1 penalty
 - “saga” also supports “elasticnet” penalty
 - “liblinear” does not support setting penalty=“none”
 Defaults to “lbfgs”.
- **n_jobs** (`int`) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to -1.
- **random_seed** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “penalty”: [“l2”], “C”: Real(0.01, 10), }
model_family	ModelFamily.LINEAR_MODEL
modifies_features	True
modifies_target	False
name	Logistic Regression Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Feature importance for fitted logistic regression classifier.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(self)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(cls)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(self, print_name=False, return_dict=False)

Describe a component and its parameters.

Parameters

- **print_name** (bool, optional) – whether to print name of component
- **return_dict** (bool, optional) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance for fitted logistic regression classifier.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (pd.DataFrame) – The input training data of shape [n_samples, n_features].
- **y** (pd.Series, optional) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *coverage*: List[float] = None, *predictions*: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: pandas.DataFrame) → pandas.Series

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type pd.Series

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.MultiseriesTimeSeriesBaselineRegressor(gap=1,
                                                                                    fore-
                                                                                    cast_horizon=1,
                                                                                    ran-
                                                                                    dom_seed=0,
                                                                                    **kwargs)
```

Multiseries time series regressor that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for multiseries time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Multiseries Time Series Baseline Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits multiseries time series baseline regressor to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted multiseries time series baseline regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self*, *X*, *y=None*)

Fits multiserries time series baseline regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features * n_series].
- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_features * n_series].

Returns self

Raises ValueError – If input y is None or if y is not a DataFrame with multiple columns.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = None, *coverage*: *List[float]* = None, *predictions*: *pandas.Series* = None) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises MethodPropertyNotFoundError – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*)

Make predictions using fitted multiseries time series baseline regressor.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

Raises **ValueError** – If the lagged columns are not present in *X*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.ProphetRegressor(time_index: Optional[Hashable] =
    None, changepoint_prior_scale:
    float = 0.05,
    seasonality_prior_scale: int = 10,
    holidays_prior_scale: int = 10,
    seasonality_mode: str = 'additive',
    stan_backend: str =
    'CMDSTANPY', interval_width:
    float = 0.95, random_seed:
    Union[int, float] = 0, **kwargs)
```

Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects. It works best with time series that have strong seasonal effects and several seasons of historical data. Prophet is robust to missing data and shifts in the trend, and typically handles outliers well.

More information here: <https://facebook.github.io/prophet/>

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **changepoint_prior_scale** (*float*) – Determines the strength of the sparse prior for fitting on rate changes. Increasing this value increases the flexibility of the trend. Defaults to 0.05.
- **seasonality_prior_scale** (*int*) – Similar to changepoint_prior_scale. Adjusts the extent to which the seasonality model will fit the data. Defaults to 10.
- **holidays_prior_scale** (*int*) – Similar to changepoint_prior_scale. Adjusts the extent to which holidays will fit the data. Defaults to 10.
- **seasonality_mode** (*str*) – Determines how this component fits the seasonality. Options are “additive” and “multiplicative”. Defaults to “additive”.
- **stan_backend** (*str*) – Determines the backend that should be used to run Prophet. Options are “CMDSTANPY” and “PYSTAN”. Defaults to “CMDSTANPY”.
- **interval_width** (*float*) – Determines the confidence of the prediction interval range when calling *get_prediction_intervals*. Accepts values in the range (0,1). Defaults to 0.95.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “changepoint_prior_scale”: Real(0.001, 0.5), “seasonality_prior_scale”: Real(0.01, 10), “holidays_prior_scale”: Real(0.01, 10), “seasonality_mode”: [“additive”, “multiplicative”], }
model_family	ModelFamily.PROPHET
modifies_features	True
modifies_target	False
name	Prophet Regressor
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION]
training_only	False

Methods

<code>build_prophet_df</code>	Build the Prophet data to pass fit and predict on.
<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.
<code>fit</code>	Fits Prophet regressor component to data.
<code>get_params</code>	Get parameters for the Prophet regressor.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted ProphetRegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted Prophet regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

static `build_prophet_df`(*X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None, *time_index*: str = 'ds') → pandas.DataFrame

Build the Prophet data to pass fit and predict on.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*) → dict

Returns the default parameters for this component.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name*=False, *return_dict*=False)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property `feature_importance`(*self*) → numpy.ndarray

Returns array of 0's with len(1) as feature_importance is not defined for Prophet regressor.

fit(*self*, *X*: pandas.DataFrame, *y*: Optional[pandas.Series] = None)

Fits Prophet regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self**get_params**(*self*) → dict

Get parameters for the Prophet regressor.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*, *coverage*: *List[float] = None*, *predictions*: *pandas.Series = None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted ProphetRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for Prophet estimator.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.**Return type** dict**static load**(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.**Returns** ComponentBase object**needs_fitting**(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.**property parameters**(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series] = None*) → *pandas.Series*

Make predictions using fitted Prophet regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.

Returns Predicted values.**Return type** *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.RandomForestClassifier(n_estimators=100,
                                                                    max_depth=6, n_jobs=-1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Random Forest Classifier.

Parameters

- **n_estimators** (*float*) – The number of trees in the forest. Defaults to 100.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **n_jobs** (*int* or *None*) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_depth": Integer(1, 10), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns importance associated with each feature.
<code>fit</code>	Fits estimator to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted regressor.

<code>predict</code>	Make predictions using selected features.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`property feature_importance(self) → pandas.Series`

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises **MethodPropertyNotFoundError** – If estimator does not have a `feature_importance` method or a `component_obj` that implements `feature_importance`.

fit(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.Series]* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → *Dict[str, pandas.Series]*

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If *None*, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type *dict*

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to *False* for components that do not need to be fit or whose fit methods do nothing.

Returns *True*.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type `pd.Series`

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict` method or a `component_obj` that implements `predict`.

`predict_proba(self, X: pandas.DataFrame) → pandas.Series`

Make probability estimates for labels.

Parameters **`X`** (`pd.DataFrame`) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises `MethodPropertyNotFoundError` – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (`str`) – Location to save file.
- **`pickle_protocol`** (`int`) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (`dict`) – A dict of parameters to update.
- **`reset_fit`** (`bool`, *optional*) – If True, will set `_is_fitted` to False.

`class evalml.pipelines.components.estimators.RandomForestRegressor`(*n_estimators: int = 100, max_depth: int = 6, n_jobs: int = -1, random_seed: Union[int, float] = 0, **kwargs*)

Random Forest Regressor.

Parameters

- **`n_estimators`** (`float`) – The number of trees in the forest. Defaults to 100.
- **`max_depth`** (`int`) – Maximum tree depth for base learners. Defaults to 6.
- **`n_jobs`** (`int` or `None`) – Number of jobs to run in parallel. -1 uses all processes. Defaults to -1.
- **`random_seed`** (`int`) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "n_estimators": Integer(10, 1000), "max_depth": Integer(1, 32), }
model_family	ModelFamily.RANDOM_FOREST
modifies_features	True
modifies_target	False
name	Random Forest Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted RandomForestRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component

- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Returns importance associated with each feature.

Returns Importance associated with each feature.

Return type np.ndarray

Raises MethodPropertyNotFoundError – If estimator does not have a feature_importance method or a component_obj that implements feature_importance.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted RandomForestRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class `evalml.pipelines.components.estimators.SVMClassifier(C=1.0, kernel='rbf', gamma='auto', probability=True, random_seed=0, **kwargs)`

Support Vector Machine Classifier.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** (*{ "poly", "rbf", "sigmoid" }*) – Specifies the kernel type to be used in the algorithm. Defaults to “rbf”.
- **gamma** (*{ "scale", "auto" } or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses 1 / (n_features * X.var()) as value of gamma - If “auto” (default), uses 1 / n_features
- **probability** (*boolean*) – Whether to enable probability estimates. Defaults to True.

- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ "C": Real(0, 10), "kernel": ["poly", "rbf", "sigmoid"], "gamma": ["scale", "auto"], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance only works with linear kernels.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(self)

Feature importance only works with linear kernels.

If the kernel isn't linear, we return a numpy array of zeros.

Returns Feature importance of fitted SVM classifier or a numpy array of zeroes if the kernel is not linear.

fit(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(file_path)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class evalml.pipelines.components.estimators.**SVMRegressor**(*C*=*1.0*, *kernel*='rbf', *gamma*='auto', *random_seed*=*0*, ***kwargs*)

Support Vector Machine Regressor.

Parameters

- **C** (*float*) – The regularization parameter. The strength of the regularization is inversely proportional to C. Must be strictly positive. The penalty is a squared l2 penalty. Defaults to 1.0.
- **kernel** ({*"poly"*, *"rbf"*, *"sigmoid"*}) – Specifies the kernel type to be used in the algorithm. Defaults to "rbf".

- **gamma** (*{"scale", "auto"} or float*) – Kernel coefficient for “rbf”, “poly” and “sigmoid”. Defaults to “auto”. - If gamma=’scale’ is passed then it uses $1 / (n_features * X.var())$ as value of gamma - If “auto” (default), uses $1 / n_features$
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ “C”: Real(0, 10), “kernel”: [“poly”, “rbf”, “sigmoid”], “gamma”: [“scale”, “auto”], }
model_family	ModelFamily.SVM
modifies_features	True
modifies_target	False
name	SVM Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted SVM regressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted SVM regresor.

Only works with linear kernels. If the kernel isn't linear, we return a numpy array of zeros.

Returns The feature importance of the fitted SVM regressor, or an array of zeroes if the kernel is not linear.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.TimeSeriesBaselineEstimator(gap=1,
                                                                    forecast_horizon=1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Time series estimator that predicts using the naive forecasting approach.

This is useful as a simple baseline estimator for time series problems.

Parameters

- **gap** (*int*) – Gap between prediction date and target date and must be a positive integer. If gap is 0, target date will be shifted ahead by 1 time period. Defaults to 1.
- **forecast_horizon** (*int*) – Number of time steps the model is expected to predict.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{ }
model_family	ModelFamily.BASELINE
modifies_features	True
modifies_target	False
name	Time Series Baseline Estimator
supported_problem_types	[ProblemTypes.TIME_SERIES_REGRESSION, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Returns importance associated with each feature.
<i>fit</i>	Fits time series baseline estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted time series baseline estimator.
<i>predict_proba</i>	Make prediction probabilities using fitted time series baseline estimator.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Returns importance associated with each feature.

Since baseline estimators do not use input features to calculate predictions, returns an array of zeroes.

Returns An array of zeroes.

Return type np.ndarray (float)

fit(*self*, *X*, *y=None*)

Fits time series baseline estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input `y` is `None`.

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.

- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using *X*.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self, X*)

Make predictions using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If input y is None.

predict_proba(*self, X*)

Make prediction probabilities using fitted time series baseline estimator.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted probability values.

Return type *pd.DataFrame*

Raises **ValueError** – If input y is None.

save(*self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self, update_dict, reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.

- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.VARMAXRegressor(time_index: Optional[Hashable] =
    None, p: int = 1, q: int = 0, trend:
    Optional[str] = 'c', random_seed:
    Union[int, float] = 0, maxiter: int =
    10, use_covariates: bool = False,
    **kwargs)
```

Vector Autoregressive Moving Average with eXogenous regressors model. The two parameters (p, q) are the AR order and the MA order. More information here: <https://www.statsmodels.org/stable/generated/statsmodels.tsa.statespace.varmax.VARMAX.html>.

Currently VARMAXRegressor isn't supported via conda install. It's recommended that it be installed via PyPI.

Parameters

- **time_index** (*str*) – Specifies the name of the column in X that provides the datetime objects. Defaults to None.
- **p** (*int*) – Maximum Autoregressive order. Defaults to 1.
- **q** (*int*) – Maximum Moving Average order. Defaults to 0.
- **trend** (*str*) – Controls the deterministic trend. Options are ['n', 'c', 't', 'ct'] where 'c' is a constant term, 't' indicates a linear trend, and 'ct' is both. Can also be an iterable when defining a polynomial, such as [1, 1, 0, 1].
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **max_iter** (*int*) – Maximum number of iterations for solver. Defaults to 10.
- **use_covariates** (*bool*) – If True, will pass exogenous variables in fit/predict methods. If False, forecasts will solely be based off of the datetimes and target values. Defaults to True.

Attributes

hyper-parameter_ranges	{ "p": Integer(1, 10), "q": Integer(1, 10), "trend": Categorical(['n', 'c', 't', 'ct']), }
model_family	ModelFamily.VARMAX
modifies_features	True
modifies_target	False
name	VARMAX Regressor
supported_problem_types	[ProblemTypes.MULTISERIES_TIME_SERIES_REGRESSION]
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>feature_importance</code>	Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.
<code>fit</code>	Fits VARMAX regressor to data.
<code>get_prediction_intervals</code>	Find the prediction intervals using the fitted VARMAXRegressor.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>predict</code>	Make predictions using fitted VARMAX regressor.
<code>predict_proba</code>	Make probability estimates for labels.
<code>save</code>	Saves component at file path.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*) → numpy.ndarray

Returns array of 0's with a length of 1 as feature_importance is not defined for VARMAX regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.DataFrame] = None*)

Fits VARMAX regressor to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].

- **y** (*pd.DataFrame*) – The target training data of shape [n_samples, n_series_id_values].

Returns self

Raises **ValueError** – If y was not passed in.

get_prediction_intervals(*self*, *X*: *pandas.DataFrame*, *y*: *pandas.DataFrame* = *None*, *coverage*: *List[float]* = *None*, *predictions*: *pandas.Series* = *None*) → Dict[str, *pandas.Series*]

Find the prediction intervals using the fitted VARMAXRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values]. Optional.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Not used for VARMAX regressor.

Returns A dict of prediction intervals, where the dict is in the format {series_id: {coverage}_lower or {coverage}_upper}.

Return type dict[dict]

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*, *y*: *Optional[pandas.DataFrame]* = *None*) → *pandas.Series*

Make predictions using fitted VARMAX regressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.DataFrame*) – Target data of shape [n_samples, n_series_id_values].

Returns Predicted values.

Return type *pd.Series*

Raises **ValueError** – If X was passed to *fit* but not passed in *predict*.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type `pd.Series`

Raises **MethodPropertyNotFoundError** – If estimator does not have a `predict_proba` method or a `component_obj` that implements `predict_proba`.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set `_is_fitted` to False.

```
class evalml.pipelines.components.estimators.VowpalWabbitBinaryClassifier(loss_function='logistic',
                                                                    learning_rate=0.5,
                                                                    de-
                                                                    cay_learning_rate=1.0,
                                                                    power_t=0.5,
                                                                    passes=1,
                                                                    random_seed=0,
                                                                    **kwargs)
```

Vowpal Wabbit Binary Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Binary Classifier
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.TIME_SERIES_BINARY,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool, optional*) – whether to print name of component
- **return_dict** (*bool, optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series, optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self, X: pandas.DataFrame, y: Optional[pandas.Series] = None, coverage: List[float] = None, predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.VowpalWabbitMulticlassClassifier(loss_function='logistic',  
                                                                           learning_rate=0.5,  
                                                                           de-  
                                                                           cay_learning_rate=1.0,  
                                                                           power_t=0.5,  
                                                                           passes=1, ran-  
                                                                           dom_seed=0,  
                                                                           **kwargs)
```

Vowpal Wabbit Multiclass Classifier.

Parameters

- **loss_function** (*str*) – Specifies the loss function to use. One of {“squared”, “classic”, “hinge”, “logistic”, “quantile”}. Defaults to “logistic”.
- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.

- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.
- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Multiclass Classifier
supported_problem_types	[ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit classifiers. This is not implemented.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit classifiers. This is not implemented.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.VowpalWabbitRegressor(learning_rate=0.5,
                                                                decay_learning_rate=1.0,
                                                                power_t=0.5, passes=1,
                                                                random_seed=0, **kwargs)
```

Vowpal Wabbit Regressor.

Parameters

- **learning_rate** (*float*) – Boosting learning rate. Defaults to 0.5.
- **decay_learning_rate** (*float*) – Decay factor for learning_rate. Defaults to 1.0.

- **power_t** (*float*) – Power on learning rate decay. Defaults to 0.5.
- **passes** (*int*) – Number of training passes. Defaults to 1.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	None
model_family	ModelFamily.VOWPAL_WABBIT
modifies_features	True
modifies_target	False
name	Vowpal Wabbit Regressor
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance for Vowpal Wabbit regressor.
<i>fit</i>	Fits estimator to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using selected features.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

property feature_importance(*self*)

Feature importance for Vowpal Wabbit regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits estimator to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If None, will generate predictions using X.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises **MethodPropertyNotFoundError** – If the estimator does not support Time Series Regression as a problem type.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using selected features.

Parameters *X* (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict method or a component_obj that implements predict.

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters *X* (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

```
class evalml.pipelines.components.estimators.XGBoostClassifier(eta=0.1, max_depth=6,  
                                                             min_child_weight=1,  
                                                             n_estimators=100,  
                                                             random_seed=0,  
                                                             eval_metric='logloss', n_jobs=12,  
                                                             **kwargs)
```

XGBoost Classifier.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.

- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min_child_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ "eta": Real(0.000001, 1), "max_depth": Integer(1, 10), "min_child_weight": Real(1, 10), "n_estimators": Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Classifier
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.BINARY, ProblemTypes.MULTICLASS, ProblemTypes.TIME_SERIES_BINARY, ProblemTypes.TIME_SERIES_MULTICLASS,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost classifier.
<i>fit</i>	Fits XGBoost classifier component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted regressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using the fitted XGBoost classifier.
<i>predict_proba</i>	Make predictions using the fitted CatBoost classifier.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*)

Feature importance of fitted XGBoost classifier.

fit(*self*, *X*, *y=None*)

Fits XGBoost classifier component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted regressor.

This function takes the predictions of the fitted estimator and calculates the rolling standard deviation across all predictions using a window size of 5. The lower and upper predictions are determined by taking the percent point (quantile) function of the lower tail probability at each bound multiplied by the rolling standard deviation.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*list[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

Raises `MethodPropertyNotFoundError` – If the estimator does not support Time Series Regression as a problem type.

static `load(file_path)`

Loads component at file path.

Parameters `file_path` (*str*) – Location to load file.

Returns ComponentBase object

`needs_fitting(self)`

Returns boolean determining if component needs fitting before calling `predict`, `predict_proba`, `transform`, or `feature_importances`.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property `parameters(self)`

Returns the parameters which were used to initialize the component.

`predict(self, X)`

Make predictions using the fitted XGBoost classifier.

Parameters `X` (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

`predict_proba(self, X)`

Make predictions using the fitted CatBoost classifier.

Parameters `X` (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.DataFrame*

`save(self, file_path, pickle_protocol=cloudpickle.DEFAULT_PROTOCOL)`

Saves component at file path.

Parameters

- **`file_path`** (*str*) – Location to save file.
- **`pickle_protocol`** (*int*) – The pickle data stream format.

`update_parameters(self, update_dict, reset_fit=True)`

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool, optional*) – If True, will set `_is_fitted` to False.

class `evalml.pipelines.components.estimators.XGBoostRegressor`(*eta: float = 0.1, max_depth: int = 6, min_child_weight: int = 1, n_estimators: int = 100, random_seed: Union[int, float] = 0, n_jobs: int = 12, **kwargs*)

XGBoost Regressor.

Parameters

- **eta** (*float*) – Boosting learning rate. Defaults to 0.1.
- **max_depth** (*int*) – Maximum tree depth for base learners. Defaults to 6.
- **min_child_weight** (*float*) – Minimum sum of instance weight (hessian) needed in a child. Defaults to 1.0
- **n_estimators** (*int*) – Number of gradient boosted trees. Equivalent to number of boosting rounds. Defaults to 100.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
- **n_jobs** (*int*) – Number of parallel threads used to run xgboost. Note that creating thread contention will significantly slow down the algorithm. Defaults to 12.

Attributes

hyper-parameter_ranges	{ "eta": Real(0.000001, 1), "max_depth": Integer(1, 20), "min_child_weight": Real(1, 10), "n_estimators": Integer(1, 1000), }
model_family	ModelFamily.XGBOOST
modifies_features	True
modifies_target	False
name	XGBoost Regressor
SEED_MAX	None
SEED_MIN	None
supported_problem_types	[ProblemTypes.REGRESSION, ProblemTypes.TIME_SERIES_REGRESSION,]
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>feature_importance</i>	Feature importance of fitted XGBoost regressor.
<i>fit</i>	Fits XGBoost regressor component to data.
<i>get_prediction_intervals</i>	Find the prediction intervals using the fitted XGBoostRegressor.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>predict</i>	Make predictions using fitted XGBoost regressor.
<i>predict_proba</i>	Make probability estimates for labels.
<i>save</i>	Saves component at file path.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

property feature_importance(*self*) → pandas.Series

Feature importance of fitted XGBoost regressor.

fit(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*)

Fits XGBoost regressor component to data.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

get_prediction_intervals(*self*, *X: pandas.DataFrame*, *y: Optional[pandas.Series] = None*, *coverage: List[float] = None*, *predictions: pandas.Series = None*) → Dict[str, pandas.Series]

Find the prediction intervals using the fitted XGBoostRegressor.

Parameters

- **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].
- **y** (*pd.Series*) – Target data. Ignored.
- **coverage** (*List[float]*) – A list of floats between the values 0 and 1 that the upper and lower bounds of the prediction interval should be calculated for.
- **predictions** (*pd.Series*) – Optional list of predictions to use. If `None`, will generate predictions using `X`.

Returns Prediction intervals, keys are in the format {coverage}_lower or {coverage}_upper.

Return type dict

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns ComponentBase object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

predict(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make predictions using fitted XGBoost regressor.

Parameters **X** (*pd.DataFrame*) – Data of shape [n_samples, n_features].

Returns Predicted values.

Return type *pd.Series*

predict_proba(*self*, *X*: *pandas.DataFrame*) → *pandas.Series*

Make probability estimates for labels.

Parameters **X** (*pd.DataFrame*) – Features.

Returns Probability estimates.

Return type *pd.Series*

Raises **MethodPropertyNotFoundError** – If estimator does not have a predict_proba method or a component_obj that implements predict_proba.

save(*self*, *file_path*, *pickle_protocol*=*cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

update_parameters(*self*, *update_dict*, *reset_fit*=*True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

transformers

Components that transform data.

Subpackages

dimensionality_reduction

Transformers that reduce the dimensionality of the input data.

Submodules

lda

Component that reduces the number of features by using Linear Discriminant Analysis.

Module Contents

Classes Summary

<i>LinearDiscriminantAnalysis</i>	Reduces the number of features by using Linear Discriminant Analysis.
-----------------------------------	---

Contents

class evalml.pipelines.components.transformers.dimensionality_reduction.lda.**LinearDiscriminantAnalysis**(

Reduces the number of features by using Linear Discriminant Analysis.

Parameters

- **n_components** (*int*) – The number of features to maintain after computation. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	{}
modifies_features	True
modifies_target	False
name	Linear Discriminant Analysis Transformer
training_only	False

Methods

<i>clone</i>	Constructs a new component with the same parameters and random state.
<i>default_parameters</i>	Returns the default parameters for this component.
<i>describe</i>	Describe a component and its parameters.
<i>fit</i>	Fits the LDA component.
<i>fit_transform</i>	Fit and transform data using the LDA component.
<i>load</i>	Loads component at file path.
<i>needs_fitting</i>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<i>parameters</i>	Returns the parameters which were used to initialize the component.
<i>save</i>	Saves component at file path.
<i>transform</i>	Transform data using the fitted LDA component.
<i>update_parameters</i>	Updates the parameter dictionary of the component.

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

fit(*self*, *X*, *y*)

Fits the LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns *self*

Raises **ValueError** – If input data is not all numeric.

fit_transform(*self*, *X*, *y=None*)

Fit and transform data using the LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises **ValueError** – If input data is not all numeric.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

transform(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises `ValueError` – If input data is not all numeric.

`update_parameters`(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **`update_dict`** (*dict*) – A dict of parameters to update.
- **`reset_fit`** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

pca

Component that reduces the number of features by using Principal Component Analysis (PCA).

Module Contents

Classes Summary

<i>PCA</i>	Reduces the number of features by using Principal Component Analysis (PCA).
------------	---

Contents

```
class evalml.pipelines.components.transformers.dimensionality_reduction.pca.PCA(variance=0.95,
                                         n_components=None,
                                         random_seed=0,
                                         **kwargs)
```

Reduces the number of features by using Principal Component Analysis (PCA).

Parameters

- **`variance`** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **`n_components`** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.
- **`random_seed`** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

hyper-parameter_ranges	Real(0.25, 1)}:type: {"variance"}
modifies_features	True
modifies_target	False
name	PCA Transformer
training_only	False

Methods

<code>clone</code>	Constructs a new component with the same parameters and random state.
<code>default_parameters</code>	Returns the default parameters for this component.
<code>describe</code>	Describe a component and its parameters.
<code>fit</code>	Fits the PCA component.
<code>fit_transform</code>	Fit and transform data using the PCA component.
<code>load</code>	Loads component at file path.
<code>needs_fitting</code>	Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.
<code>parameters</code>	Returns the parameters which were used to initialize the component.
<code>save</code>	Saves component at file path.
<code>transform</code>	Transform data using fitted PCA component.
<code>update_parameters</code>	Updates the parameter dictionary of the component.

`clone(self)`

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

`default_parameters(cls)`

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

`describe(self, print_name=False, return_dict=False)`

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if return_dict is True, else None.

Return type None or dict

`fit(self, X, y=None)`

Fits the PCA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input data is not all numeric.

fit_transform(*self*, *X*, *y=None*)

Fit and transform data using the PCA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises **ValueError** – If input data is not all numeric.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

transform(*self*, *X*, *y=None*)

Transform data using fitted PCA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises **ValueError** – If input data is not all numeric.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

Package Contents

Classes Summary

<i>LinearDiscriminantAnalysis</i>	Reduces the number of features by using Linear Discriminant Analysis.
<i>PCA</i>	Reduces the number of features by using Principal Component Analysis (PCA).

Contents

`class evalml.pipelines.components.transformers.dimensionality_reduction.LinearDiscriminantAnalysis(n_components, random_seed, **kwargs)`

Reduces the number of features by using Linear Discriminant Analysis.

Parameters

- **n_components** (*int*) – The number of features to maintain after computation. Defaults to None.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.

Attributes

clone(*self*)

Constructs a new component with the same parameters and random state.

Returns A new instance of this component with identical parameters and random state.

default_parameters(*cls*)

Returns the default parameters for this component.

Our convention is that `Component.default_parameters == Component().parameters`.

Returns Default parameters for this component.

Return type dict

describe(*self*, *print_name=False*, *return_dict=False*)

Describe a component and its parameters.

Parameters

- **print_name** (*bool*, *optional*) – whether to print name of component
- **return_dict** (*bool*, *optional*) – whether to return description as dictionary in the format {"name": name, "parameters": parameters}

Returns Returns dictionary if `return_dict` is `True`, else `None`.

Return type None or dict

fit(*self*, *X*, *y*)

Fits the LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns self

Raises **ValueError** – If input data is not all numeric.

fit_transform(*self*, *X*, *y=None*)

Fit and transform data using the LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises **ValueError** – If input data is not all numeric.

static load(*file_path*)

Loads component at file path.

Parameters **file_path** (*str*) – Location to load file.

Returns *ComponentBase* object

needs_fitting(*self*)

Returns boolean determining if component needs fitting before calling predict, predict_proba, transform, or feature_importances.

This can be overridden to False for components that do not need to be fit or whose fit methods do nothing.

Returns True.

property parameters(*self*)

Returns the parameters which were used to initialize the component.

save(*self*, *file_path*, *pickle_protocol=cloudpickle.DEFAULT_PROTOCOL*)

Saves component at file path.

Parameters

- **file_path** (*str*) – Location to save file.
- **pickle_protocol** (*int*) – The pickle data stream format.

transform(*self*, *X*, *y=None*)

Transform data using the fitted LDA component.

Parameters

- **X** (*pd.DataFrame*) – The input training data of shape [n_samples, n_features].
- **y** (*pd.Series*, *optional*) – The target training data of length [n_samples].

Returns Transformed data.

Return type *pd.DataFrame*

Raises **ValueError** – If input data is not all numeric.

update_parameters(*self*, *update_dict*, *reset_fit=True*)

Updates the parameter dictionary of the component.

Parameters

- **update_dict** (*dict*) – A dict of parameters to update.
- **reset_fit** (*bool*, *optional*) – If True, will set *_is_fitted* to False.

class *evalml.pipelines.components.transformers.dimensionality_reduction.PCA*(*variance=0.95*,
n_components=None,
random_seed=0,
***kwargs*)

Reduces the number of features by using Principal Component Analysis (PCA).

Parameters

- **variance** (*float*) – The percentage of the original data variance that should be preserved when reducing the number of features. Defaults to 0.95.
- **n_components** (*int*) – The number of features to maintain after computing SVD. Defaults to None, but will override variance variable if set.
- **random_seed** (*int*) – Seed for the random number generator. Defaults to 0.
